The Main Causes of Absenteeism Disease Among Nursing Professionals - An Integrative Literature Review

Bruno Vilas Boas Dias*, Amanda Príncipe Pagano, Bruna Guedes Miguel Gomes, Débora Aline de Souza, Maryana Cristina de Souza Marcondes, Michelle Gualassi Zacari, et al. The Main Causes of Absenteeism Disease Among Nursing Professionals - An Integrative Literature Review. Biomed J Sci & Tech Res 16(4)-2019. BJSTR. MS.ID.002888.

ABSTRACT

Nursing plays a fundamental role in the various health sectors, since it is the professional category with the highest number of professionals working in this area. However, much has been discussed about the working conditions that these professionals are subjected to, unhealthy conditions, low pay, long hours, excessive physical and mental exhaustion, lack of autonomy and appreciation of the work done. These situations have contributed to increase absenteeism. The objective of this study was to carry out a survey, within the literature, of the main diseases listed by the articles, which compromised the health of nursing workers, leading them to absenteeism. The study was carried out by an integrative review of the literature, using the databases BDENF, LILACS, MEDLINE and Scielo, where three descriptors were defined: Absenteeism, Nursing and Worker's Health, associating the term Boolean and. The historical cut was from 2013 to 2018. As a result, a total of 3,287 articles were found and selected, according to the inclusion criteria, 12 of them. The study concluded that among the 12 articles that were part of the study, there were 6,431 medical licenses per disease, where five pathologies were cited in greater numbers, with a high prevalence of musculoskeletal diseases (25.96%), followed by Mental Disorders as depression and stress (14.72%), diseases of the respiratory system (14.21%), infectious and parasitic diseases with 6.86% and diseases of the digestive system with 6.85%. In a smaller number, eye diseases, lesions, diseases of the genitourinary system, diseases of the circulatory system, nervous system, complications during pregnancy, childbirth and puerperium, neoplasias, skin diseases, ear infections and accidents of work.

Introduction

Nursing plays a fundamental role in the various health sectors, since it is the professional category with the highest number of professionals working in this field. Faced with this scenario, there are many problems encountered in this field due to the labor demands that arise but are not adequately addressed. The most frequently encountered problems are the overload of work and the work shift in the work schedule, as well as the inadequacy of the nursing staff, which are the major risk factors for the health of the professional and also for patient safety [1]. In the hospital, the nursing team suffers the most from the unhealthy environment. All of these factors contribute to job failure [2]. These absences at work are translated by absenteeism, a word of French origin (absenteeism) which means lack of attendance at work. Absenteeism is an expression used to denote the worker’s absence...
from work activities not motivated by unemployment, prolonged illness or legal leave [3]. The absenteeism is the frequency or duration of work time lost when professionals do not attend work and absences correspond when they are expected to be present. Misconduct leave of absence for participation in training and development programs, among others, constitute absences [4].

Absenteeism is classified into five types: absenteeism-illness (absence justified by health leave); absenteeism due to professional pathology (occupational accidents and/or occupational disease); legal absenteeism (supported by laws such as gestation, disgust, gala, blood donation and military service); compulsory absenteeism (suspension imposed by the employer; imprisonment or other impediment to attend work); and voluntary absenteeism (unjustified private reasons) [5]. Faced with this classification, the absenteeism due to illness, which refers to removal from medical certificates, is the main cause of non-programmed work absences, reaching 71 to 81% of the total. These high levels of absenteeism are disruptive and bring major losses, for example, the annual cost of absenteeism to the UK national economy was estimated at about £1.5 billion in 2013. In Brazil, a nursing worker from a single hospital in São Paulo in 2008 showed that absenteeism-illness cost the employer equivalent to R$389,817.76 referring to the 2,538 days of absences in a year. These financial charges cause damage to the service and to the workers, be it in the economic, operational, physical and mental order, with decreasing productivity, cost increases, job dissatisfaction and overloading of other health workers [6].

The nursing is the profession that suffers most from illness, being more subject to the effects of stress than other professions. Because of this, there is growing concern on the part of government agencies and researchers about the working conditions of health professionals, especially nursing, since both the working conditions and the environment in which it is exercised, in general, does not always provide effective safety for workers. Among these nursing professionals, absenteeism should receive special attention due to the characteristics of the work and to directly influence the quality of care provided [7]. Through this, since the 1930s, the International Labor Organization (ILO), together with the World Health Organization (WHO), work with studies that have identified the precarious situation of the work of nursing professionals. The focus of these studies has been the unsatisfactory conditions of nursing work, due to long hours of work, absence of rest periods, on Sundays and holidays without fair compensation, and lack of participation in planning and decision-making in relation to nursing. professional practice, teaching and working conditions [8]. Faced with this problematic that surrounds the difficult working conditions of nursing professionals, and justifies our choice for this subject, it becomes imperative to understand what are the main diseases that are compromising the health of these workers and that are resulting in increased absenteeism. Whereas, emphasizing the results found, it will enable the search for solutions that will improve the quality of life and health of these professionals.

**Objective**

To carry out a survey, within the literature, of the main diseases listed in the articles, which compromised the health of nursing workers, leading them to absenteeism.

**Method**

Integrative literature review. For the bibliographic survey, the electronic databases were used: Nursing Database (BDENF), Latin American and Caribbean Literature in Health Sciences (LILACS), Medical Literature Analysis and Retrieval System Online (MEDLINE) and virtual health library Scientific Electronic Library On Line (Scielo). Three descriptors were defined: Absenteeism, Nursing and Worker Health, associated with the Boolean operator "AND". The research was carried out in the first and second semester of 2018, obeying the inclusion criteria: articles published in Portuguese between 2013 and 2018; available in the databases consulted and in full text. The exclusion criteria adopted were: bibliographic review articles; editorials; abstracts, dissertations and theses.

**Result**

(Table 1) shows the descriptors used, databases, number of articles found and articles selected, according to an integrative review of the literature. And (Chart 1) presents the articles in relation to the base, year, author, theme and conclusion. After analyzing the 12 articles selected to be part of this study, the diseases that most caused absenteeism among the nursing team were raised in relation to the number of sick leave, as shown in Table 2.

**Table 1:** Relation of the association of the descriptors used, databases, number of articles found and articles selected.

| Descriptors                  | Base   | Articles Found | Selected Articles |
|------------------------------|--------|----------------|-------------------|
| Absenteeism and Nursing      | Scielo | 48             | 2                 |
| Absenteeism and Worker’s health | Scielo | 34             | 0                 |
| Worker’s health and Nursing  | Scielo | 357            | 0                 |
| Absenteeism and Nursing      | Lilacs | 128            | 5                 |
| Absenteeism and Worker’s health | Lilacs | 203            | 0                 |

| Chart 1: List of articles according to the database, year, author, theme and conclusions. |
|---|---|---|---|
| **Base** | **Year/Author** | **Theme** | **Conclusion** |
| **BDENF** | Moisés et al. [7] | Main causes of absenteeism in nursing professionals. | Among the 17 interviewees who were absent due to personal illness, 5 were due to stress, 2 due to musculoskeletal problems, 1 due to work accident 9 due to other problems such as chronic renal failure, dengue, pharyngitis, ovary cyst, pneumonia, conjunctivitis and abdominal pain. |
| **Lilacs** | Trindade et al. [14] | Absenteeism in the nursing team in the hospital environment. | Of the 1,378 interviewees, 450 different diseases were found that led the professionals to absenteeism, in which parasitic diseases prevailed with 4%, musculoskeletal diseases with 2.8% and depressive episodes with 1.8%. |
| **Lilacs** | Rodrigues et al. [9] | Absenteeism of nursing professionals from a university hospital in the state of São Paulo, Brazil. | Among the 4,049 professionals interviewed who were absent for health reasons, diseases of the musculoskeletal system prevailed with 20.97%, followed by diseases of the respiratory system with 11.7%, mental disorders with 8.90%, diseases of the digestive system with 8.37% and infectious or parasitic infections with 6.25%. |
| **Lilacs** | Mantovani et al. [13] | Absenteeism due to illness in nursing professionals. | The main reasons for sick leave in the study population prevailed musculoskeletal diseases and respiratory diseases. |
| **Scielo** | Marques et al. [11] | Absenteeism - Illness of the nursing team of a university hospital. | A total of 1,574 professionals were interviewed, with a prevalence of musculoskeletal and connective tissue diseases at 19.70%, followed by mental disorders with 18.04%, respiratory diseases with 6.35%, diseases of the digestive system with 5.02% and diseases infectious and parasitic diseases with 2.48%. |
| **BDENF** | Gonçalves et al. | Absenteeism - Disease: its relation with the nursing team of the Colíder Regional Hospital. | A total of 266 leave / sick leave were consulted, with musculoskeletal diseases accounting for 35.30%, followed by mental disorders with 15.60%, diseases of the genitourinary system with 8.38%, respiratory disorders with 5.92% and diseases of the digestive system with 2.40%. |
| **Lilacs** | Heylmann et al. | Absenteeism among nursing professionals: study in a university hospital in Santa Catarina. | Of the 136 interviewees, there was a prevalence in the number of departures from eye diseases and adnexa with 21.32%, accompanied by diseases of the musculoskeletal system with 19.11%, diseases of the respiratory tract with 14.07%, diseases of the genito-urinary tract with 7.35%, infectious and parasitic diseases with 7.35%. |
| **Scielo** | Quadros et al. | Analysis of managerial and assistance indicators after the adequacy of nursing personnel. | A total of 308 professionals were interviewed, of which 25% were mental disorders, 16.60% were dorsopathies, 8.9% were respiratory system diseases, 7.1% were gestational complications and 0.7% were diseases of the genital system-urinary. |
| **BDENF** | Vasconcelos et al. | Absenteeism in two public hospitals in Minas Gerais: epidemiological profile. | A total of 309 licenses for diseases were analyzed, 76 cases of mental disorders, 56 cases of conjunctivitis, 60 cases of sinusitis, 28 cases of hypertension, 51 cases of soft tissue disorders and 38 cases of diarrhea. |
| **Lilacs** | Varges Barbosa | Factors related to the removal of nurses from a public hospital in the city of Vitória da Conquista. | Considering a total of 146 certificates, 15.8% were diseases of the respiratory system, 11% of musculoskeletal diseases and 9.6% of diseases of the digestive system. |
| **Lilacs** | Galindo et al. | Reasons for absenteeism in an outpatient nursing team. | Of the 23 sick leave analyzed, 52.5% were caused by musculoskeletal diseases, 26% were mental disorders, 13% were diseases of the circulatory system, 4.3% were infectious and parasitic, and 4.1% were due to surgeries. |
| **Lilacs** | Silva et al. | Absenteeism in the nursing team in a hospital in the interior of Minas Gerais. | The highest rates of absenteeism were due to diarrhea, with 55 certificates, low back pain, 25 attestations, sinusitis, 20 attestations and, finally, depressive episodes, with 15 attestations. |
Table 2: Relation between the main diseases that caused absenteeism and the number of sick leave in the nursing team.

| Diseases that Cause Absenteeism                              | Number of Licenses | %    |
|-------------------------------------------------------------|--------------------|------|
| Diseases of osteomuscular and tissue systems                | 1,702              | 25.96|
| Mental Disorders such as Depression and Stress             | 965                | 14.72|
| Respiratory system diseases                                | 932                | 14.21|
| Infectious and parasitic diseases                          | 450                | 6.86 |
| Diseases of the digestive system                           | 449                | 6.85 |
| Eye diseases and appendages                                | 395                | 6.02 |
| Injuries and poisonings                                    | 376                | 5.73 |
| Diseases of the genitourinary system                       | 311                | 4.74 |
| Diseases of the circulatory system                         | 262                | 4.00 |
| Diseases of the nervous system                             | 160                | 2.44 |
| Complications during pregnancy, delivery and puerperium     | 126                | 1.92 |
| Neoplasms                                                   | 126                | 1.92 |
| Skin and subcutaneous tissue disorders                     | 97                 | 1.48 |
| Diseases of the ear                                         | 19                 | 0.29 |
| Work accident                                               | 7                  | 0.11 |
| Other diseases not mentioned                               | 180                | 2.75 |
| Total                                                       | 6,557              | 100  |

Discussion

Based on the results found, it was verified that in the 12 articles that were part of this study, there were a total of 6,557 medical licenses per disease. According to the data in Table 2, diseases of the musculoskeletal system and tissues were the ones that caused the most absenteeism by disease with 25.96% of the licenses, followed by mental disorders such as depression and stress that presented 14.72%, diseases of the respiratory system with infectious and parasitic diseases with 6.86%, diseases of the digestive system with 6.85%, ocular diseases and attachments with 6.02%, lesions and poisonings with 5.73%, diseases of the genito-complications during pregnancy, delivery and puerperium with 1.92%, neoplasms with the same 1.92%, diseases of the circulatory system with 4%, diseases of the nervous system with 2.44% skin and subcutaneous tissue with 1.48%, diseases of the auricular apparatus with 0.29%, work accident with 0.11% and other diseases that were not pointed out by the works researched corresponded to 2.75%. The group of musculoskeletal diseases was the main cause of absenteeism, according to the survey, corresponding to about a quarter of all licenses. These data reveal physical overload and unsatisfactory ergonomic conditions in the performance of the work.

The nursing team, during the work activities, helps the patient move in and out of the bed. As coworkers move away, there is overhead for others in a situation of continuous demand. Inadequate posture is another aggravating factor, which is associated with psychic load. In addition, the incidence of complaints has a greater impact on women, due not only to the biological characteristics of women, but also to the unequal division of sex at work today. Other causes are associated with overtime, work pace and working conditions [9]. Besides that, the musculoskeletal disorders are the most common cause of withdrawal. In a study cited by him, it was shown that 80 to 93% of the occurrences of musculoskeletal disorders are associated with the nursing work conditions in the hospital setting. The regions most affected were the cervical, shoulders and knees, the lumbar region being the most evident [10]. Mental disorders such as depression and stress were the second major cause of absenteeism. The nursing professional coexists constantly with pain, suffering and death. These conditions can lead you to develop psychiatric illness. With regard to the relationship between stress and work, it is observed that the human being is faced with a professional universe that often makes demands beyond its capacity in contemporary society. This fact generates a constant state of stress among the workers. It is the stress of occupational character.

Illnesses arise when an individual's ability to respond to work in a healthy way is exhausted. Stress is recognized as one of the most serious risks to the individual's psychosocial well-being [11]. The work environment, too is a social variable, can be an important source of mental suffering. Workplace factors, related to the health-disease process, include noise, inadequate lighting, temperature extremes, vibration, aesthetics, hygiene and care. As factors related to work organization, overload or underload of physical and mental work; participation and involvement in work; interpersonal relationships at work; work pace and time pressure; making it impossible for functional ascension, due to the lack of implementation of job and salary plans [12]. Respiratory system diseases are the third major cause of absenteeism in the study. Respiratory diseases can be caused by the risk of aspiration of chemical and biological elements present in the work environment, or related to influenza, pneumonia or other respiratory disease.
addition, the team is susceptible and is constantly in contact with patients with diseases transmitted by droplets and aerosols and are not always diagnosed immediately [13]. That infectious and parasitic diseases, including bacterial food poisoning, infectious diarrhea and gastroenteritis, are considered to be preventable pathologies.

These may be associated with professional burnout, which undermines self-care. In most cases the onset of symptoms and the development of the disease are related to the ingestion of food or water contaminated with pathogenic microorganisms and/or their toxins. The occurrence of these pathologies suggests the fragility in hand hygiene among professionals, which increase the risks to their health and the health users under their care [14]. In relation to diseases of the digestive system, cardiovascular diseases, located in this study as diseases of the circulatory system, neoplasms and diseases related to low immunity, the nursing profession requires day and night work professionals in their work, which is characterized as an aggravating factor in the development of these diseases. In addition, the nursing profession allows more than one job to be accumulated; in some cases, workers accumulate up to three employment links [10]. That because of this intense working day, professionals have a greater habit of eating pre-cooked, frozen foods and also pinching. Some companies also do not care about the quality of the menu served, especially at night, including even feijoada for this population. With this, the complaints of the workers of heartburn, abdominal pains, constipation, are frequent, being able to aggravate and to arrive at cases of chronic gastritis or ulcers. Poor diet may favor the onset of digestive, cardiovascular, coronary and certain types of neoplasms [15].

**Conclusion**

Coming to the conclusion of this study, it can be concluded that the main diseases that led to absenteeism among nursing professionals were, according to the researched literature, musculoskeletal diseases, followed by mental disorders, diseases of the respiratory system, infectious and parasitic diseases and diseases of the digestive system. This survey confirmed that nursing staff, due to their work overload, long working hours, physical and mental exhaustion are contributing negatively to the incidence of these diseases and leading to absenteeism, especially in the number of medical licenses for musculoskeletal disorders and mental disorders.
