Figure S6. Oxygen preference assessments of *R. solanacearum* phylotype representatives. CPG overnight cultures of each strain were pelleted and re-suspended in water to an O.D.\textsubscript{600} of 1.0. 10μL of these cell suspensions were stab inoculated and slowly released by a pipette into a plastic tube filled with 20 mL 0.2% semisolid VDM agar with or without nitrate added. Following one week of 28°C incubation without shaking, tubes were imaged. To the right, diagrams depict the general trends.
