Abstract
Either by ensuring the continuing availability of information, or by deliberately caching content that might get deleted or removed, Web archiving services play an increasingly important role in today’s information ecosystem. Among these, the Wayback Machine has been proactively archiving, since 2001, versions of a large number of Web pages, while newer services like archive.is allow users to create on-demand snapshots of specific Web pages, which serve as time capsules that can be shared across the Web.

In this paper, we present a large-scale analysis of Web archiving services and their use on social media, aiming to shed light on the actors involved in this ecosystem, the content that gets archived, and how it is shared. To this end, we crawl and study: 1) 21M URLs, spanning almost two years, from archive.is; and 2) 356K archive.is plus 391K Wayback Machine URLs that were shared on four social networks: Reddit, Twitter, Gab, and 4chan’s Politically Incorrect board (/pol/) over 14 months. We observe that news and social media posts are the most common types of content archived, likely due to their perceived ephemeral and/or controversial nature. Moreover, URLs of archiving services are extensively shared on “fringe” communities within Reddit and 4chan to preserve possibly contentious content. Lastly, we find evidence of moderators nudging or even forcing users to use archives, instead of direct links, for news sources with opposing ideologies, potentially depriving them of ad revenue.

1 Introduction
In today’s digital society, the availability and persistence of Web resources are very relevant issues. A substantial number of URLs shared on the Web becomes unavailable after some time as websites are shutdown or redesigned in a way that does not preserve old URLs – a phenomenon known as “link rot” [19]. Moreover, content might be taken down by authorities on a legal basis, deleted by users who have shared it on social media, removed as per the “right to be forgotten” [8], etc. Overall, the ephemerality of Web content often prompts debate with respect to its impact on the availability of information, accountability, or even censorship.

In this context, an important role is played by services like the Wayback Machine (archive.org), which proactively archives large portions of the Web, allowing users to search and retrieve the history of more than 300 billion pages. At the same time, on-demand archiving services like archive.is have also become popular: users can take a snapshot of a Web page by entering its URL, which the system crawls and archives, returning a permanent short URL serving as a time capsule that can be shared across the Web.

Archiving services serve a variety of purposes beyond addressing link rot. Platforms like archive.is are reportedly used to preserve controversial blogs and tweets that the author may later opt to delete [24]. Moreover, they also reduce Web traffic toward “source URLs” when the original content is still accessible, thus depriving them of potential ad revenue streams (users do not visit the original site, but just the archived copy). In fact, anecdotal evidence has emerged that alt-right communities target outlets they disagree with by nudging their users to share archive URLs instead [18], or discrediting them by pointing at earlier versions of articles [28].

Given the role in helping content persist, their use on social networks, as well as anecdotal evidence of their misuse in contexts where information could be weaponized [22], archiving services are arguably impactful actors that should be thoroughly analyzed. To this end, we aim to shed light on the Web archiving ecosystem, aiming to answer the following research questions: How are archive URLs disseminated across popular social networks? What kind of content gets archived, by whom and why? Are archiving services misused in any way?

To answer these questions, we perform a large-scale quantitative analysis of Web archives, based on two data sources: 1) 21M URLs collected from the archive.is live feed, and 2) 356K archive.is plus 391K Wayback Machine URLs that were shared on four social networks: Reddit, Twitter, Gab, and 4chan’s Politically Incorrect board (/pol/).

Our main findings include:

1. News and social media posts are the most common types of content archived, likely due to their (perceived) ephemeral and/or controversial nature.

2. URLs of archiving services are extensively shared on “fringe” communities within Reddit and 4chan to preserve possibly contentious content, or to refer to it without increasing the Web traffic to the source. We also find that /pol/ and Gab users favor archive.is over Wayback
Machine (respectively, 15x and 16x), highlighting a particular use case in "controversial" online communities.

3. Web archives are exploited by users to bypass censorship policies in some communities: for instance, /pol/ users post archive.is URLs to share content from 8chan and Facebook, which are banned on the platform, or to circumvent accidental censorship of some news sources because of substitution filters (e.g., ‘smh’ becomes ‘baka’, so links to smh.com.au are unusable).

4. Reddit bots are responsible for posting a very large portion of archive URLs in Reddit (respectively, 44% and 85% of archive.is and Wayback Machine URLs). This is due to moderators aiming to alleviate the effects of link rot on the platform; however, this proactive archival of content also impact traffic to archived sites originating from Reddit.

5. The Donald subreddit systematically targets ad revenue of news sources with conflicting ideologies: moderation bots block URLs from those sites and prompt users to post archive URLs instead (some domains, e.g., nydailynews.com, have up to 46% of their content censored). According to our conservative estimates, popular news sources like the Washington Post lose yearly approximately $70K from their ad revenue because of the use of archiving services on Reddit.

2 Related Work

Web archives. Alnoamany et al. [2] analyze 6M access logs from the Wayback Machine, aiming to understand what users are looking for, and why they use it. They find that users visit the site predominantly via referrals, and that they mostly look for English pages, while most popular country-specific domains are from Japan, Russia, and Germany. Alonso et al. [3] simulate a Web archiving service, studying social discourse through the URLs as well as relevant entities and metadata, by analyzing millions of tweets as well as a case study related to fake news. Ainsworth et al. [1] measure how much content is available on Web archiving services: they sample URL shorteners and search engines, query 12 public archives, and find that 35%-90% of URLs have at least one archived copy. According to our conservative estimates, popular news sources like the Washington Post lose yearly approximately $70K from their ad revenue because of the use of archiving services on Reddit.

3 Background

We now provide an overview of the Web archiving services studied in this paper. As we aim to characterize their use on social networks, we review these social networks as well.

3.1 Web Archives

Our analysis focuses on two popular archiving services: archive.is and the Wayback Machine (archive.org). The former stores snapshots of Web pages upon request, while the latter is run by a non-profit organization (the Internet Archive) aiming to archive pages mainly through a constant crawling process. Archive.is offers a free, on-demand archival service of Web pages: a user visits the service and enters a URL to be archived. It also acts as a link shortener which obfuscates the source URL, by generating a 5-character URL. For instance, http://archive.is/HVbU shows the snapshot of Google’s homepage, archived on July, 03, 2012 at 07:03:24. Wayback Machine. Launched in 2001, the Wayback Machine archives a large portion of Web content, storing periodic snapshots of various pages. It mainly works through a proactive crawler, which visits various sites and captures a snapshot of the content. However, users can also trigger information archival on demand. When a page is archived, an archive URL is created in the following format: https://web.archive.org/web/[time of archival]/[source URL]. For example, the archive URL https://web.archive.org/web/20100205062719/http://www.google.com/ returns the version of Google’s homepage on February 5, 2010, at 06:27:19 (UTC). In the rest of the paper, we refer to the URLs generated by archiving services as archive URLs, and to the archived URL as source URLs.

http://crawler.archive.org/index.html
We opt to study the Wayback Machine and archive.is for a few reasons. First of all, they are popular services: as of Jan 2018, their Alexa Global Rank is, resp., 300 and 2,920. The Wayback Machine is actually one of the oldest initiatives, with about 300 billion pages archived as of 2017. We also choose these two because of some important differences between them. The Wayback Machine is run by a 501(c)(3) non-profit organization, while archive.is is hosted by Russian provider Hostkey (interestingly, it is only accessible via HTTP in Russia). Moreover, the former respects robots exclusion standards (even retroactively) and generally gives website owners the right to request removal of pages from the archive, while the latter only complies (albeit inconsistently) with DMCA take-down requests. Finally, archive.is is reportedly used in “fringe” Web communities within 4chan and Reddit, which are known for generating [31] and incubating [16] fake news stories, and for their influence on the information ecosystem [35].

3.2 Social Networks

Twitter is a micro-blogging social network where users broadcast short “tweets” to their followers. Search and discussion around specific topics is facilitated by hashtags, while the action of “retweeting” rebroadcasts a tweet.

Reddit is a social news aggregator site that lets users post URLs along with a title. Posts get up- or down-voted and this determines the order in which they are displayed on the site. Users can also comment on threads. Communities on Reddit are primarily formed via so-called “subreddits,” i.e., forums created by users and dedicated to specific topics (e.g., /r/politics or /r/The_Donald).

4chan is an imageboard discussion forum. We focus on the Politically Incorrect board (/pol/) – the main board for politics and world events – because archive.is is among the most popular domains shared on the board [14] –we also examined other boards like International (/int/) and Sports (/sp/) but found only 84 and 713 posts that include archive URLs for /sp/ and /int/, respectively. Two of the key features of 4chan are anonymity and ephemerality. There are no accounts on 4chan and posts are displayed by default as being authored by “Anonymous.” The only indication of identity is the “flag” attribute reporting the country from the user is posting from (based on IP geo-location) or user-chosen ones, known as “troll” flags (e.g., Nazi, European, Muslim, Anarchist flags, etc.). There is only a limited number of threads that can be active on a board (on /pol/ it is 200): when a new thread is created, an old one is purged based on the “bump” system. Although several boards have a temporary archive for purged posts, all threads are permanently deleted after 7 days.

Gab2 is a relatively new social network, launched in August 2016 to “champion free speech, individual liberty, and the free flow of information online.” In a way, it is a hybrid of Twitter and Reddit: users can broadcast 300 character messages (called “gabs”) to their followers, while a voting system determines the popularity of content. Gab has been criticized for exhibiting a high degree of racism [5], hate [27], and attracting alt-right users that are banned from mainstream communities like Twitter [34]. In fact, Gab’s app has been deleted from Google’s Play Store for violating hate speech policy and rejected by Apple’s App Store for pornographic content.

4 Datasets

We now present the datasets studied in our paper as well as our data collection methodology. We perform two crawls: 1) archive.is URLs obtained from the live feed page and 2) Wayback Machine and archive.is URLs posted on four social networks, namely, Twitter, Reddit, Gab, and 4chan’s /pol/. The resulting datasets are summarized in Table 1.

| Platform | Archive | #Posts with Archive | Archive | Source | Source Filtered |
|----------|---------|---------------------|---------|--------|-----------------|
| Live Feed | archive.is | 21,537,554 20,608,834 5,388,112 | - | - | - |
| Reddit | archive.is 327,050 (2.9·10^-5%) | 310,392 291,382 15,994 35.70% | Wayback 320,379 (2.8·10^-5%) | 387,081 343,851 21,124 17.20% |
| /pol/ | archive.is 46,912 (1.1·10^-5%) | 36,277 33,824 3,970 4.67% | Wayback 3,848 (0.7·10^-5%) | 2,325 2,207 976 83.12% |
| Gab | archive.is 6,602 (3.4·10^-5%) | 5,943 5,773 1,300 5.54% | Wayback 478 (5.1·10^-5%) | 361 349 240 61.18% |
| Twitter | archive.is 6,750 (3.1·10^-5%) | 3,772 3,669 845 8.23% | Wayback 1,905 (9.0·10^-5%) | 1,290 1,257 846 7.49% |

Table 1: Overview of our datasets: number and percentage of posts that include archive URLs, unique number of archive URLs, source URLs, and source domains. We also filter URLs that are malformed, unreachable, or point to resources other than Web pages.

For

\[\text{https://gab.ai/}\]

\[\text{https://dev.twitter.com/streaming/overview}\]
returned by Gab’s API, and iteratively collecting posts for all their followers and users they follow.

Overall, the resulting dataset includes 50K posts from /pol/, 528K posts from Reddit, 7K posts from Gab, and about 9K tweets. Note that we have some gaps due to failure of our data collection infrastructure, specifically, there are 70 and 13 days missing for Twitter and /pol/, respectively.

**Basic Statistics.** In Table 1, we report statistics from our archive.is live-feed crawl as well as the crawl of archive.is and Wayback Machine URLs shared on Twitter, Reddit, /pol/, and Gab. We report the number of posts with archive URLs, along with the percentage over the total number of posts, as well as the number of unique archive URLs, unique source URLs, and the percentage of URLs that are filtered out. Specifically, besides malformed URLs, we exclude, for archive.is, URLs unreachable between Aug 29 and Oct 7, 2017, while for Wayback Machine those pointing to types of information other than Web pages (e.g., images, videos, software, etc.).

Overall, /pol/ and Gab users often share Wayback Machine URLs that point to non-Web pages: around 83% and 61% of the total, respectively, suggesting that archive.is is used mostly for the dissemination of Web pages, while Wayback Machine is preferred for other content. Also, a high percentage of malformed archive.is URLs are shared on Reddit (35%), due to bots trying to pro-actively archive resources but failing. From the normalized percentages, we observe that Twitter users rarely share URLs from archiving services, while Reddit users do so from both archiving services. On /pol/ and Gab, we find 15 and 16 times, respectively, more archive.is URLs than Wayback Machine ones.

**Ethical Considerations.** Although we only collect publicly available data, we have obtained clearance by our institutional ethics review board. Datasets and backups are stored encrypted, and we make no attempt to harm, re-identify or de-anonymize users, following standard ethical principles [29].

## 5 Cross-Platform Analysis

In this section, we present a cross-platform analysis of archive URLs collected from the archive.is live feed, as well as Wayback Machine and archive.is URLs shared on Twitter, Reddit, Gab, and /pol/. We focus on understanding what kind of content gets archived, as well as the related temporal characteristics, and on assessing whether archived content is still available from the source.

### 5.1 Source Domains

**Live Feed.** In Fig. 1(a), we plot the CDF of the number of distinct URLs per domain in our archive.is live feed dataset. The vast majority (90%) of domains only appear once, while a few domains yield a large numbers of archive URLs – e.g., there are 1.2M distinct archive.is URLs for which twitter.com is the source domain. In Table 2, we report the top 20 source domains as well as the top 20 domain suffixes (Sx). Surprisingly, the top domain (11.8%) is actually the Wayback Machine’s archive.org. Mainstream social networks like Twitter and Facebook are also included, likely due to their (perceived) ephemeral nature, i.e., users want to preserve social network posts before they are removed or deleted. As for the suffixes, we observe that common ones, such as .com and .org, are the majority, followed by domains from Germany (de) and Japan (jp) with 7% and 5.6% of the URLs, respectively. This suggests that a substantial portion of archive.is’s user base might be in Germany and Japan.

**Social Networks.** In Figs 1(b)–1(e), we plot the CDF of the number of URLs for each source domain in each dataset, finding that over 40% of the source domains only appear once. Wayback Machine generally archives more URLs per source domain than archive.is, although for Reddit the distributions are quite similar. Then, in Tables 3–6, we report the top 20 source domains observed on each platform, along with their archival fraction (AF), i.e., the number of times a source domain appears in an archive over the total number of times it appears in the dataset (either archived or not).

On all platforms except for Gab, the most popular domain archived through archive.is is the platform itself, e.g., archives of tweets are the most shared ones on Twitter. This also happens for Wayback Machine URLs, but only on Reddit. On Reddit, this may be due to meta-subreddits focused on the preservation and discussion of dramatic happenings, e.g., flame wars and intra-Reddit conflict, that would otherwise be lost when deleted by moderators after some time. These meta-subreddits tend to make use of bots that automatically archive drama submitted by their members.

Overall, we notice a strong presence of both mainstream (e.g., Washington Post) and alternative (e.g., Breitbart) news sources archived and shared on Reddit, /pol/, and Gab. Moreover, on /pol/, archive.is is often used for links to hypothes.is, a service that lets users annotate news articles, possibly due to the fact that /pol/ users often “unravel” conspiracy theories by researching and commenting on news articles. On Twitter, where the footprint of archive URLs is relatively low, we find a relatively large number of Japanese domains, which might possibly indicate a stronger presence of Japanese Twitter users relying on archives.

The AFs are quite low overall, implying that archiving services disseminate a small fraction of most domains. However, on /pol/, specific domains have extremely high AFs. For instance, we find that facebook.com (AF = 0.96) and 8ch.net (AF = 1.0) are marked as spam from /pol/, and posts including links to them are rejected, a phenomenon we re-
fer to as platform-specific censorship. We manually analyze other domains with high AF values, specifically, hypothes.is, chetlyzarko.com, tdbmng.com, justice4germans.com, and jeffreyescoinscience.com, without finding evidence of censorship on /pol/. There is also “accidental” censorship on /pol/ for instance, the Australian newspaper smh.com.au, is affected because of a substitution filter (used for fun), which replace one word with another, as the word “smh” is automatically replaced on /pol/ with “baka.”

![CDF of the number of distinct URLs per source domain.](image)

**Figure 1:** CDF of the number of distinct URLs per source domain.

| Domain (archive.is) (%) | AF | Domain (Wayback) (%) | AF |
|------------------------|----|----------------------|----|
| reddit.com             | 31.21% < 0.01 | reddit.com           | 36.88% < 0.01 |

**Table 4:** Top 20 source domains of archive.is and Wayback Machine URLs, and archival fraction (AF), in the /pol/ dataset.

5.2 URL Characterization

We now proceed to characterize the type of content archived. To this end, we extract the domain categories of source URLs using the free Virus Total API (virustotal.com), which we choose since it consolidates categories from multiple services including Bit Defender, TrendMicro, Alexa, etc. Although categorization is done at domain-level, results are presented at a per-URL level (a URL is assigned the same category as its domain) in order to capture the popularity of each domain in our datasets.

**Live Feed.** Due to throttling enforced by the API, we are not able to categorize all the 20.6M source URLs in our archive.
are often used to disseminate URLs from news sources, social networks, and marketing sites on all social networks. However, there are interesting differences for the two archiving services: Education and Government URLs appear as top categories for the Wayback Machine (see Fig. 3(b), 3(c), and 3(d)), while sites that contain obscene language only for archive.is (see Fig. 3(c)). This suggests that the latter is used more extensively for “questionable” content.

Moreover, we observe that Adult Content is among the top categories for all social networks except Twitter, while Gab and Reddit users often share archive URLs for domains related to Boards and Forums. Also, on /pol/, archive.is is used to archive and disseminate pages with obscene language, which is somewhat in line with previous observations [14] showing that /pol/ conversations often include hate speech and aggressive behavior, and so archive.is URLs likely point to similar content.

5.3 Temporal Dynamics

Next, we study, from a temporal point of view, how archive URLs are created and shared on social networks.

Live Feed. In Fig. 4, we plot the day and hour of day of the creation of the archive.is URLs. Each day, between 1K and 10K URLs are archived (Fig. 4(a)), mostly between 11AM and 4PM UTC time, with a peak at 2PM (Fig. 4(b)), which seems to suggest that a great number of users may be located in Europe and the US. According to Alexa, the top country for archive.is is the US, with 37% of the visitors.

Social Networks. Next, we measure the time interval between the archiving of a URL and its appearance on one of the four social networks. In Fig. 5, we plot the CDF of these time intervals, finding that the interval between archiving and sharing times of a URL ranges from a few seconds (in which case, Reddit/4chan/Twitter/Gab users themselves might be creating the archive) to years. Reddit is the “fastest” platform for Wayback Machine URLs, mainly because of bots that actively archive URLs (as we show later in the paper), while for archive.is it is Gab.

We also focus on the top source domains shared via archive URLs: Figs 6–7 plot the CDF of the slack time of the top four domains for archive.is and Wayback Machine URLs, respectively. On Reddit, the top domains archived via Wayback Machine follow very similar distributions, likely due to bots, while for archive.is URLs, distributions vary, with the fastest domain being reddit.com itself. On Twitter, slack times vary for URLs
archived via archive.is, with the fastest domain being Twitter and the slowest nhk.or.jp. The same applies for the Wayback Machine, with the fastest domain being Twitter and the slowest ameblo.jp. We also find that, on /pol/, archive.is URLs pointing to 4chan are considerably slower, suggesting that users are more interested in archiving the URL for persistence rather than sharing the content within /pol/. Based on anecdotal observations, we believe users might be archiving threads with “evidence” for conspiracy theories/false narratives, and using them in the future to perpetuate mis/disinformation. This is not the case for news sources like the Washington Post or Guardian, as /pol/ users might be more focused on reducing Web traffic to the source domain instead (indeed we find users explicitly mentioning this when manually examining posts). Finally, on Gab, the faster domain is Twitter, and Reddit the slowest.

### 5.4 Original Content Availability

We then assess the availability of the original content that gets archived; this allow us to determine whether users are archiving URLs that are subsequently deleted. To this end, we make an HTTP request for each source URL in our datasets, on October 4–5, 2017 for the live feed dataset, on October 14–21, 2017 for Reddit, Twitter, /pol/ datasets and on January 3, 2018 for Gab dataset. We treat each URL as unavailable if we receive HTTP codes 404/410/451/5xx, or if the request times out.

**Live Feed.** We find that 12% of the source URLs corresponding to archive URLs on archive.is live feed are no longer available. Domains with most unavailable content include twitter.com (6%), nhk.or.jp (6%), googleusercontent.com (3%), aaaaarg.fail (3%), 4chan.org (3%), and 8ch.net (2%).

**Social Networks.** In Reddit, source URLs corresponding to both archive.is and Wayback Machine are still available to a large degree (93% and 89% of them, respectively). This can be explained by the fact that Reddit bots archive URLs without considering the content. In /pol/, the original content is available 82% and 66% of the times, while on Gab 87% and 48% for archive.is and Wayback Machine URLs, respectively. Percentages decrease further for Twitter; 76% and 49% for archive.is and Wayback Machine URLs, respectively.

We also find that the top domains for which content is no longer available differ across platforms. Except for Gab, the top unavailable domain are the social networks themselves: 10%, 54%, and 28%, for Reddit, /pol/, and Twitter, respectively. URLs from cache servers (i.e., googleusercontent.com) and Twitter are also frequently unavailable; 9% and 10% in Reddit, 5% and 4% in /pol/, 8% and 28% in Twitter, and 12% and 19% in Gab, for googleusercontent.com and Twitter, respectively. We also note the presence of unavailable 8ch.net URLs (another ephemeral imageboard) with 5% and 4% on /pol/ and Gab, respectively.

### 5.5 Take-Aways

Overall, we find that archiving services play an important role in the information ecosystem, as they are used to preserve news sources as well as ephemeral or controversial content. Also, users on fringe communities such as /pol/ and Gab favor less popular Web archiving services like archive.is to archive and disseminate Web pages. This prompts questions as to why less popular, and seemingly less durable, archiving services are favored by more controversial communities like /pol/ and Gab. Although this would be out of the scope of this work, we do find one potential answer in that these communities also use archiving services to bypass platform-specific censorship policies.
We also observe that temporal dynamics of how archive URLs are shared on social networks differ according to their content: for instance, on /pol/, content from news sources has a considerably larger time lag between first appearing on the platform and archival compared to 4chan threads. Lastly, a non-negligible percentage of archived content is no longer available at the source; in particular, a substantial percentage of posts from social networks like Twitter are eventually deleted from the platform, yet remain stored in the archives.

6 Social-Network-based Analysis

In this section, we present a social-network-specific analysis by taking into account the fundamental differences of each platform. We analyze the users involved in the dissemination of archive URLs as well as the content that is shared along with those URLs. Lastly, we discuss a case study of ad revenue deprivation on Reddit.

6.1 User Base

Reddit. Our analysis shows that archiving services are extensively used by Reddit bots. In fact, 31% of all archive.is URLs and 82% of Wayback Machine URLs in our Reddit dataset are posted by a specific bot, namely, SnapshillBot (which is used by subreddit moderators to preserve “drama-related” happenings discussed earlier or just as a subreddit specific policy to preserve every submission). Other bots include AutoModerator, 2016VotBot, yankbot, and autotldr. We also attempt to quantify the percentage of archive URLs posted from bots, assuming that, if a username includes “bot” or “auto”, it is likely a bot. This is a reasonable strategy since Reddit bots are extensively used for moderation purposes, and do not usually try to obfuscate the fact that they are bots.\footnote{This is somewhat evident from the list of Reddit bots available at https://www.reddit.com/r/autowikibot/wiki/redditbots} Using this heuristic, we find that bots are responsible for disseminating 44% of all the archive.is and 85% of all the Wayback Machine URLs that appear on Reddit between July 1, 2016 and August 31, 2017.

We also use the score of each Reddit post to get an intuition of users’ appreciation for posts that include archive URLs. In Fig. 8(a), we plot the CDF of the scores of posts with archive.is and Wayback Machine URLs, as well as all posts that contain URLs as a baseline, differentiating between bots and non-bots. For both archiving services, posts by bots have a substantially smaller score: 80% of them have score of at most one, as opposed to 37% for non-bots and 59% of the baseline.

Reddit Sub-Communities. We then study how specific subreddits share URLs from archiving services. In Table 7, we report the top subreddits that share the most archive URLs from archive.is and the Wayback Machine. Among these, we find a variety of subreddits ranging from politics (e.g., EnoughTrumpSpam, The_Donald, politics) to gaming (e.g., Gamingcirclejerk) and “drama-related” communities (e.g., SubredditDrama and Drama). Several subreddits prefer to use archive.is rather than the Wayback Machine, e.g., KotakuInAction, which historically covers the GamerGate controversy [7], The_Donald, which discusses politics with a focus on Donald Trump, and Conspiracy, which focuses on various conspiracy theories.

Gab. On Gab, each post has a score that determines the popularity of the content. In Fig. 8(b), we report the CDF of the
scores in posts that contain archive.is and Wayback Machine URLs, between August 2016 and August 2017. Once again, we also include a baseline, which is the scores for all the posts with URLs. We find that posts with Wayback Machine URLs have higher scores than those with archive.is URLs, and the baseline. Specifically, the mean score for Wayback Machine is 90, while for archive.is and the baseline the mean score is 35 and 30, respectively. This trend mirrors the one observed on Reddit for posts not authored by bots.

/pol/. As mentioned earlier, 4chan is an anonymous image-board, which prevents us from performing user-level analysis. However, we can use the flag attribute to provide a country-level estimation. The top country sharing archive URLs is the USA, which is in line with previous characterizations of the board [14]. We also find a substantial percentage of “troll” flags: 9% and 5% for archive.is and Wayback Machine, respectively. This is somewhat surprising, since troll flags were re-introduced to /pol/ on June 13, 2017, thus they were only available for about 3 months of our 14-month dataset.

Due to space limitations, we exclude the Twitter dataset from our user-level analysis, given the relatively small footprint of archive URLs on that platform (see Table 1).

### 6.2 Content Analysis

Next, we focus on the content that gets shared along with archive URLs on social platforms. We aim to evaluate if users share the same information for a given archive URL on multiple platforms. We do so using Latent Dirichlet Allocation (LDA) [6]. Due to space limitations, we only study Reddit and /pol/. Before running LDA, we exclude /pol/ and Reddit threads that contain less than 100 posts, so that the LDA can extract topics from a reasonable amount of documents. We then select only threads that have archive URLs appearing in both Reddit and /pol/ datasets; there are 425 such threads on /pol/ and 299 on Reddit. Next, we run LDA on all the posts within these threads and extract terms for 10 topics per thread.

In Fig. 9, we plot the CDF of the cosine similarities on the terms extracted from LDA topics on the two platforms when sharing the same archive URLs. We observe that 80% of the terms have similarity under 0.3, which is expected given the fact that the two communities discuss topics in a different way. By manually observing terms with high similarity scores, we find that a number of them relate to well-known conspiracy theories, like the Seth Rich murder [32] or Pizzagate [33], as well as general discussions around politics (e.g., tensions between North Korea and the USA). Once again, this highlights that archiving services are used to preserve content related to controversial stories and conspiracy theories. A more detailed analysis is deferred to the extended version of the paper.

### 6.3 Ad Revenue Deprivation

During our experiments, we find evidence that at least one Reddit bot, AutoModerator5, is used to remove links to unwanted domains and nudge users to share archive.is instead. In particular, it posts:

5https://www.reddit.com/r/AutoModerator/

| News Source           | Count | (%)  | News Source       | Count | (%)  |
|-----------------------|-------|------|-------------------|-------|------|
| washingtonpost.com    | 3,814 | 44.13% | change.org       | 96    | 7.52%|
| cnn.com               | 3,354 | 39.39% | huffpost.com      | 62    | 13.39%|
| nydailynews.com       | 1,070 | 46.32% | fusion.net       | 60    | 44.77%|
| huffingtonpost.com    | 978   | 43.77% | cnn.it           | 58    | 44.61%|
| nationalreview.com    | 774   | 45.58% | alternet.org      | 26    | 20.01%|
| theblaze.com          | 704   | 46.74% | infostormer.com   | 16    | 27.11%|
| buzzfeed.com          | 588   | 45.97% | dailynwsbin.com   | 4     | 26.67%|
| salon.com             | 373   | 44.88% | todayvibes.com    | 4     | 7.27% |
| vice.com              | 372   | 45.14% | usanewsbeta.g    | 4     | 10.52%|
| vox.com               | 323   | 45.23% | fullycucked.com   | 1     | 1.78% |
| weeklystandard.com    | 253   | 46.25% | northerncrane.com | 1     | 0.13% |

Table 8: Number and percentage of submissions deleted from The_Donald with links to different news sources.

Your submission was removed because it is from cnn.com, which has been identified as a severely anti-Trump domain. Please submit a cached link or screenshot when submitting content from this domain. We recommend using www.archive.is for this purpose.

This kind of notification appears in five different subreddits that discuss mainly politics and news, specifically, The_Donald, Mr_Trump, TheNewRight, Vote_Trump, and Republicans. In particular, in The_Donald, there are 13K such comments. AutoModerator blocks URLs from 23 news sources likely to be considered as anti-Trump by that community. In Table 8 we report the number of submissions deleted for each of the sources, along with the percentage over all submissions that include that source. Mainstream news outlets like Washington Post and CNN are the top domains that get removed from The_Donald (3.8K and 3.3K submissions, respectively), and this happens slightly less than half the times (44% and 39% of the submissions, respectively). Interestingly, only URLs posted via the URL submission field are censored by AutoModerator, but not URLs that are inserted as part of the title field.

We attempt to estimate possible ad revenue deprivation due to the practice of nudging users to share archive URLs instead of source URLs on Reddit. We do so by providing a conservative approximation of the ad revenue loss. Since we do not have knowledge of how many times a particular URL is clicked, we use the up- and down-votes of a post. That is, we assume that when a user up-votes or down-votes a post, he also clicks on the URL included on the post. This constitutes a best-effort technique as prior work shows that a substantial portion of users on Reddit do not vote [10], while, at the same time, users that do vote do not necessarily read or click on the articles [11].
Table 9: Top 20 domains with the largest ad revenue losses because of the use of archiving services on Reddit. We report an estimate of the average monthly visits from Reddit as well as the average monthly ad revenue loss.

| Domain                  | Visits | Loss ($) | Domain               | Visits | Loss ($) |
|-------------------------|--------|----------|----------------------|--------|----------|
| washingtonpost.com       | 79,880 | 5,928    | wg.com               | 11,389 | 845      |
| cnn.com                 | 70,483 | 5,231    | breitbart.com        | 11,357 | 842      |
| nytimes.com             | 64,462 | 3,446    | bbc.com              | 10,708 | 794      |
| huffingtonpost.com      | 27,125 | 2,013    | salon.com            | 10,364 | 769      |
| thehill.com             | 18,643 | 1,383    | buzzfeed.com         | 10,359 | 768      |
| theguardian.com         | 16,376 | 1,215    | foxnews.com          | 9,638  | 715      |
| politico.com            | 15,774 | 1,170    | yahoo.com            | 9,407  | 704      |
| dailymail.co.uk         | 14,442 | 1,071    | latimes.com          | 9,277  | 688      |
| dailycaller.com         | 12,735 | 945      | vox.com              | 8,976  | 667      |
| google.com              | 11,576 | 859      | washingtontimes.com  | 8,862  | 657      |

That said, this approach is reasonably conservative considering the complex influence that Reddit has with respect to news dissemination [35].

We then calculate the potential revenue loss using only ad impressions, i.e., we conservatively estimate the revenue generated when a user visits the website without taking into account any potential further action (e.g., clicking on the actual ad). To this end, we use an average Cost per 1,000 impressions (CPM) of $24.74, as reported by Statista, while we assume an average of 3 ads per page [4]. In other words, we calculate the monthly revenue loss, for each domain, based on the average CPM value as well as the conservative estimate of the visits using the up- and down-votes. Overall, replacing URLs with archive URLs, as done, e.g., by the AutoModerator bot, yields an estimate of $30K per month in revenue loss (for the top 20 domains in terms of views). This is detailed in Table 9, where we break down the estimate for each of the top 20 revenue-deprived domains.

On a purely pragmatic level, consider that our estimate of ad revenue deprivation is around $70K per year for the Washington Post alone. Although a more detailed impact analysis is out of the scope of this work, we suspect that even $70K could have a real world effect, e.g., on intern budgets or even early career hires. In light of recent criticism of their credibility by President Donald Trump [17], Trump-supporting communities’ deliberate use of archive.is, and the conservative nature of our revenue loss estimate, we believe this attack on the Fourth Estate is particularly worrying and in need of future exploration.

6.4 Take-Aways

In summary, our social-network-specific analysis shows, among other things, that moderation bots on Reddit proactively leverage Web archiving services to ensure that content shared on their community persists. In particular, we find that 44% and 85% of archive.is and Wayback Machine URLs are shared by Reddit moderation bots.

Also, Web archiving services are extensively used for the archival and dissemination of content related to conspiracy theories (e.g., Pizzagate) as well as other world events related to politics (e.g., tensions between North Korea and the USA), thus suggesting that these services play an important role in the (false) information ecosystem and need to be taken into account when designing systems to detect and contain the cascade of mis/disinformation on the Web.

Finally, we find evidence that moderators from specific Reddit sub-communities force users to misuse Web archiving services so as to ideologically target certain news sources by depriving them of traffic and potential ad revenue. We also provide a best-effort conservative estimate of ad revenue loss of popular news sources showing that they can lose up to $70K per year.

7 Conclusion

This paper presented a large-scale analysis of how popular Web archiving services such as archive.is and the Wayback Machine are used on social media. Our study is based two data crawls: 1) 21M URLs, spanning almost two years, obtained from the archive.is live feed; and 2) 356K archive.is plus 391K Wayback Machine URLs that were shared on four social networks: Reddit, Twitter, Gab, and 4chan’s Politically Incorrect board (/pol/) over 14 months. Among other things, we showed that these services are extensively used to archive and disseminate news, social network posts, and controversial content—in particular by users of fringe Web communities within Reddit and 4chan. We also found that users not only use them to ensure persistence of Web content, but also to bypass censorship policies enforced on some social networks.

We uncovered evidence that certain subreddits, as well as 4chan’s Politically Incorrect board (/pol/), actually nudge users to share archive URLs instead of links to news sources they perceive as having contrasting ideologies, taking away potentially hundreds of thousands of dollars in ad revenue. Overall, our measurements illustrate the importance of archiving services in the Web’s information and ad ecosystems, and the need to carefully consider them when studying such ecosystems.
