Abstract: In this paper, we study a modified viscosity type subgradient extragradient-line method with a parallel monotone hybrid algorithm for approximating a common solution of variational inequality problems. Under suitable conditions in Hilbert spaces, the strong convergence theorem of the proposed algorithm to such a common solution is proved. We then give numerical examples in both finite and infinite dimensional spaces to justify our main theorem. Finally, we can show that our proposed algorithm is flexible and has good quality for use with common types of blur effects in image recovery.

Keywords: variational inequality problems; viscosity-type subgradient extragradient-line method; monotone mapping; Hilbert space

1. Introduction

Let H be a real Hilbert space with the inner product $\langle . , . \rangle$ and the induced norm $\| . \|$. Let C be a nonempty closed and convex subset of H. A mapping $f : C \to C$ is said to be a strict contraction if there exists $k \in [0, 1)$ such that

$$\| fx - fy \| \leq k \| x - y \|, \forall x, y \in C. \quad (1)$$

A mapping $A : C \to H$ is said to be

1. **Monotone** if

$$\langle Ax - Ay, x - y \rangle \geq 0 \text{ for all } x, y \in C; \quad (2)$$

2. **Pseudo-monotone** if

$$\langle Ay, x - y \rangle \geq 0 \Rightarrow \langle Ax, x - y \rangle \geq 0 \text{ for all } x, y \in C; \quad (3)$$

3. **L-Lipschitz continuous** if there exists a positive constant $L$ such that

$$\| Ax - Ay \| \leq L \| x - y \| \text{ for all } x, y \in C. \quad (4)$$
In this paper, we study the following variational inequality problem (VIP) for the operator $A$ to find $x^*\in C$ such that

\[ \langle Ax^*, y - x^* \rangle \geq 0, \forall y \in C. \quad (5) \]

The set of solutions of VIP (5) is denoted by $\text{VI}(A,C)$. The VIP was introduced and studied by Hartman and Stampacchia in 1966 [1]. The variational inequality theory is an important tool based on studying a wide class of problems—unilateral and equilibrium problems arising in structural analysis, economics, optimization, operations research, and engineering sciences (see [2–7] and the references therein). Several algorithms have been improved for solving variational inequality and related optimization problems (see [6,8–15] and the references therein). It is well known that $x$ is the solution of the VIP (5) if and only if $x$ is the fixed point of the mapping $P_C(I - rA)$, $r > 0$ (see [4] for details)

\[ x = P_C(x - \gamma Ax), \quad \gamma > 0 \quad \text{and} \quad r_{\gamma}(x) := x - P_C(x - \gamma Ax) = 0. \]

Therefore, we can find the fixed point of the mapping $P_C(I - rA)$ replaces finding the solution of VIP (5) (see [7,9]). For solving VIP (5), the projection on closed and convex sets have been used. The gradient method is the simplest projection method, in which only one projection on the feasible set needs to be computed. However, strongly monotone or inverse strongly monotone operators have been required to obtain the convergence result. In 1976, Korpelevich [16] proposed another projection method called the extragradient method for finding a saddle point, and then it was extended to finding a solution of VIP for Lipschitz continuous and monotone (even pseudomonotone) mappings $A$. The extragradient method is designed as follows:

\[
\begin{align*}
    y_n &= P_C(x_n - \lambda A(x_n)), \\
    x_{n+1} &= P_C(x_n - \lambda A(y_n)),
\end{align*}
\]

(6)

where $P_C$ is the metric projection onto $C$ and $\lambda$ is a suitable parameter. When the structure of $C$ is simple, the extragradient method is computable and very useful because the projection onto $C$ can be found easily. However, the computation of a projection onto a closed convex subset is generally difficult, and two distance optimization problems in the extragradient method are solved to obtain the next approximation $x_{n+1}$ over each iteration. This can be precious and seriously affect the efficiency of the used method. In 2011, the subgradient extragradient method was proposed in [17] for solving VIPs in Hilbert spaces. A projection onto a closed convex subset is reduced into one step and a special half-space is constructed for the projection in the second step. The method is generated as follows:

\[
\begin{align*}
    y_n &= P_C(x_n - \lambda A(x_n)), \\
    x_{n+1} &= P_{T_n}(x_n - \lambda A(y_n)),
\end{align*}
\]

(7)

where $T_n$ is a half-space whose bounding hyperplane is supported on $C$ at $y_n$, that is,

\[ T_n = \{ v \in H : ((x_n - \lambda A(x_n)) - y_n, v - y_n) \}. \]

The authors in [17] proved that two sequences $\{x_n\}, \{y_n\}$ generated by (7) converge weakly to a solution of the VIP.

Recently, Gibali [18] proposed a new subgradient extragradient method by using adopting Armijo-like searches, called the self-adaptive subgradient extragradient method. Under the assumption of pseudomonotonicity and continuity of the operator, it has been proven that the convergence result for VIP (5) is $\mathbb{R}^n$. Gibali [9] remarked that the Armijo-like searches can be viewed as a local approximation of the Lipschitz constant of $A$. 

where \( T_n = \{ w \in \mathbb{R}^n \mid \langle x_n - a_n A(x_n) - y_n, w - y_n \rangle \leq 0 \} \), \( a_1 \in (0, \infty) \), and \( \epsilon, \beta \in (0, 1) \).

Very recently, solving the VIP (5) when \( A \) is a Lipschitz continuous monotone mapping such that the Lipschitz constant is unknown in Hilbert spaces by using the following viscosity-type subgradient extragradient-like method was proposed by Shehu and Iyiola [19].

\[
\begin{aligned}
\{ y_n = P_C(x_n - \lambda_n A x_n), \quad \lambda_n = \beta^n, \\
\{ l_n \text{ is the smallest non-negative integer } l \text{ such that } \lambda_n \| A x_n - A y_n \| \leq \mu \| r_{\rho^n} (x_n) \|, \\
z_n = P_{T_n}(x_n - \lambda_n A y_n), \\
x_{n+1} = a_n f(x_n) + (1 - a_n) z_n, \quad n \geq 1,
\end{aligned}
\]

where \( T_n = \{ z \in H : \langle x_n - \lambda_n A x_n - y_n, z - y_n \rangle \leq 0 \} \) with \( \rho, \mu \in (0, 1) \) and \( \{ a_n \} \subseteq (0, 1) \). It was proved that the sequence \( \{ x_n \} \) generated by (9) converges strongly to \( x^* \in VI(C, A) \), where \( x^* = P_{VI(C, A)} f(x^*) \) is the unique solution of the variational inequality

\[
\langle (I - f)x^*, x - x^* \rangle \geq 0, \forall x \in VI(C, A),
\]

where \( f : H \to H \) is a strict contraction mapping such that constant \( k \in [0, 1) \) under the following conditions:

\[ (C_1) \lim_{n \to \infty} a_n = 0 \quad \text{and} \quad (C_2) \sum_{n=1}^{\infty} a_n = \infty. \]

Our interest in this paper is to study the finding of common solutions of variational inequality problems (CSVIPs). The CSVIP is stated as follows: Let \( C \) be a nonempty closed and convex subset of \( H \). Let \( A_i : H \to H, i = 1, 2, ..., N \) be mappings. The CSVIP is to find \( x^* \in C \) such that

\[
\langle A_i x^*, x - x^* \rangle \geq 0, \forall x \in C, \quad i = 1, 2, ..., N.
\]

If \( N = 1 \), CSVIP (11) becomes VIP (5).

The CSVIP has received a great deal of attention due to its applications in a large variety of problems arising in structural analysis, convex feasibility problems, common fixed point problems, common minimizer problems, common saddle-point problems, and common variational inequality problems [20]. These problems have practical applicabilities in signal processing, network resource allocation, image processing, and many other fields [21,22]. Recently, many mathematicians have been widely studying this problem both theoretically and algorithmically; see [23–27] and the references therein.

Very recently, Anh and Hieu [28,29] proposed an important method for finding a common fixed point of a finite family of quasi \( \ominus \)-nonexpansive mappings \( \{ S_i \}_{i=1}^{N} \) in Banach spaces, which they called the parallel monotone hybrid algorithm. This algorithm is related to Hilbert spaces as follows:

\[
\begin{aligned}
x_0 \in C, \\
y_n = a_n x_n + (1 - a_n) S_i x_n, i = 1, ..., N, \\
i_n = \arg\max\{ \| y_n^i - x_n \| : i = 1, ..., N \}, \quad y_n^i := y_n^{i_n}, \\
C_{n+1} = \{ v \in C : \| v - y_n^i \| \leq \| v - x_n \| \}, \\
x_{n+1} = P_{C_{n+1}} x_0,
\end{aligned}
\]
where $0 < \alpha_n < 1$, $\limsup_{n \to \infty} \alpha_n < 1$. We see that a parallel algorithm is an algorithm that can execute several directions simultaneously on different processing devices and then combine all the individual outputs.

Inspired and encouraged by the previous results, in this paper we introduce a modified parallel method with a viscosity-type subgradient extragradient-like method for finding a common solution of variational inequality problems. Numerical experiments are also conducted to illustrate the efficiency of the proposed algorithms. Moreover, the problem of multiblur effects in an image is solved by applying our proposed algorithm.

2. Preliminaries

In order to prove our main result, we recall some basic definitions and lemmas needed for further investigation. In a Hilbert space $H$, let $C$ be a nonempty closed and convex subset of $H$. For every point $x \in H$, there exists a unique nearest point of $C$, denoted by $P_Cx$, such that $\|x - P_Cx\| \leq \|x - y\|$ for all $y \in C$. Such a $P_C$ is called the metric projection from $H$ onto $C$.

**Lemma 1 ([30]).** Let $C$ be a nonempty closed and convex subset of a real Hilbert space $H$ and let $P_C$ be the metric projection of $H$ onto $C$. Let $x \in H$ and $z \in C$. Then, $z = P_Cx$ if and only if

$$
\langle x - z, y - z \rangle \leq 0, \ \forall y \in C.
$$

**Lemma 2 ([30]).** The following statements hold in any real Hilbert space $H$:

1. $\|x + y\|^2 = \|x\|^2 + 2\langle x, y \rangle + \|y\|^2$, $\forall x, y \in H$.
2. $\|x + y\|^2 \leq \|x\|^2 + 2\langle y, x + y \rangle$, $\forall x, y \in H$.

**Lemma 3 (Xu, [31]).** Let $\{\alpha_n\}_{n=0}^{\infty}$ be a sequence of non-negative real numbers satisfying the following relation:

$$
a_{n+1} \leq (1 - \alpha_n)a_n + \alpha_n\sigma_n + \gamma_n, \ n \geq 1,
$$

where

(i) $\{\alpha_n\}_{n=0}^{\infty} \subset [0, 1], \sum_{n=1}^{\infty} \alpha_n = \infty$;

(ii) $\limsup_{n \to \infty} \sigma_n \leq 0$;

(iii) $\gamma_n \geq 0$ ($n \geq 1$), $\sum_{n=1}^{\infty} \gamma_n < \infty$.

Then, $a_n \to 0$ as $n \to \infty$.

**Lemma 4 ([8]).** Let $C$ be a nonempty closed and convex subset of a real Hilbert space $H$ and $P_C : H \to C$ is the metric projection from $H$ onto $C$. Then, the following inequality holds:

$$
\|x - y\|^2 \geq \|x - P_Cx\|^2 + \|y - P_Cx\|^2 \ \forall x \in H, \forall y \in C. \quad (13)
$$

**Lemma 5 ([19]).** There exists a nonnegative integer $l_n$ satisfying (9).

**Lemma 6 ([32]).** For each $x_1, x_2, ..., x_m \in H$ and $\alpha_1, \alpha_2, ..., \alpha_m \in [0, 1]$ with $\sum_{i=1}^{m} \alpha_i = 1$, we have

$$
\|\alpha_1x_1 + ... + \alpha_mx_m\|^2 = \sum_{i=1}^{m} \alpha_i\|x_i\|^2 - \sum_{1 \leq i < j \leq m} \alpha_i\alpha_j\|x_i - x_j\|^2.
$$
3. Main Results

In this section, we propose the parallel method with the viscosity-type subgradient extragradient-like method modified for solving common variational inequality problems. Let C be a nonempty closed and convex subset of a real Hilbert space H. Let \( A_i : C \to H \) be a monotone mapping and \( L_i \)-Lipschitz continuous on H but \( L_i \) is unknown for all \( i = 1, 2, ..., N \) such that \( F := \bigcap_{i=1}^{N} \text{VI}(C, A_i) \neq \emptyset \). Let \( f : C \to C \) be a strict contraction mapping with constant \( k \in (0, 1] \).

Suppose \( \{x_n\}_{n=1}^{\infty} \) is the unique solution of the variational inequality:

\[
\langle f(x^*) - x^*, x - x^* \rangle \geq 0, \forall x \in F.
\]

Then the sequence \( \{x_n\}_{n=1}^{\infty} \) generated by Algorithm 1 strongly converges to \( x^* \in F \), where \( x^* = P_f f(x^*) \) is the unique solution of the variational inequality:

\[
\langle (I - f)x^*, x - x^* \rangle \geq 0, \forall x \in F.
\]

**Proof.** Let \( x^* \in F \) and \( u^i_n = x_n - \lambda^i_n A_i y^i_n, \forall n \geq 1, i = 1, 2, ..., N \)

\[
\| z^i_n - x^* \|^2 = \langle P_{T^i_n}(u^i_n) - x^*, P_{T^i_n}(u^i_n) - x^* \rangle = \| P_{T^i_n}(u^i_n) - u^i_n \|^2 + 2 \langle P_{T^i_n}(u^i_n) - u^i_n, u^i_n - x^* \rangle + \| u^i_n - x^* \|^2 = \| u^i_n - x^* \|^2 + 2 \langle P_{T^i_n}(u^i_n) - u^i_n, u^i_n - x^* \rangle.
\]

By the characterization of the metric projection \( P^i_{T^i_n} \) and \( x^* \in F \subseteq C \subseteq T^i_n \), we get

\[
2 \| u^i_n - P_{T^i_n}(u^i_n) \|^2 + 2 \langle P_{T^i_n}(u^i_n) - u^i_n, u^i_n - x^* \rangle
\]
We then obtain by the definition of Algorithm 1 that

\[ 2\langle u^i_n - P_{T_n}(u^i_n), x^* - P_{T_n}(u^i_n) \rangle \leq 0. \]  \hfill (18)

This implies that

\[ \| u^i_n - P_{T_n}(u^i_n) \|^2 + 2\langle P_{T_n}(u^i_n) - u^i_n, u^i_n - x^* \rangle \leq -\| u^i_n - P_{T_n}(u^i_n) \|^2. \]  \hfill (19)

We then obtain by the definition of Algorithm 1 that

\[
\| z^i_n - x^* \|^2 \leq \| u^i_n - x^* \|^2 - \| u^i_n - z^i_n \|^2 \\
= \| (x_n - \lambda^i_n A_i y^i_n) - x^* \|^2 - \| (x_n - \lambda^i_n A_i y^i_n) - z^i_n \|^2 \\
= \| x_n - x^* \|^2 - \| x_n - z^i_n \|^2 + 2\lambda^i_n \langle -x_n + x^*, A_i y^i_n \rangle \\
+ 2\lambda^i_n \langle x_n - z^i_n, A_i y^i_n \rangle \\
= \| x_n - x^* \|^2 - \| x_n - z^i_n \|^2 + 2\lambda^i_n \langle x^* - z^i_n, A_i y^i_n \rangle. \]  \hfill (20)

By the monotonicity of the operator \( A_i \), we have

\[
0 \leq \langle A_i y^i_n - A_i x^*, y^i_n - x^* \rangle \\
= \langle A_i y^i_n, y^i_n - x^* \rangle - \langle A_i x^*, y^i_n - x^* \rangle \\
\leq \langle A_i y^i_n, y^i_n - x^* \rangle + \langle A_i y^i_n, z^i_n - x^* \rangle.
\]

Thus

\[
\langle x^* - z^i_n, A_i y^i_n \rangle \leq \langle A_i y^i_n, y^i_n - z^i_n \rangle. \]  \hfill (21)

Using (20) in (21), we obtain

\[
\| z^i_n - x^* \|^2 \leq \| x_n - x^* \|^2 - \| x_n - z^i_n \|^2 + 2\lambda^i_n \langle A_i y^i_n, y^i_n - z^i_n \rangle \\
= \| x_n - x^* \|^2 + 2\lambda^i_n (\lambda^i_n - 1) x_n - y^i_n, \| y^i_n - z^i_n \|^2 \\
= \| x_n - x^* \|^2 + 2\lambda^i_n (\lambda^i_n - 1) x_n - y^i_n, \| y^i_n - z^i_n \|^2 \\
= \| x_n - x^* \|^2 + 2\lambda^i_n (\lambda^i_n - 1) x_n - y^i_n, \| y^i_n - z^i_n \|^2 \\
= \| x_n - x^* \|^2 - \| x_n - z^i_n \|^2. \]  \hfill (22)

Observe that

\[
\langle x_n - \lambda^i_n A_i y^i_n - y^i_n, z^i_n - y^i_n \rangle = \langle x_n - \lambda^i_n A_i x_n - y^i_n, z^i_n - y^i_n \rangle + \langle \lambda^i_n A_i x_n - \lambda^i_n A_i y^i_n, z^i_n - y^i_n \rangle \\
\leq \langle \lambda^i_n A_i x_n - \lambda^i_n A_i y^i_n, z^i_n - y^i_n \rangle.
\]

Using the last inequality in (22) and Lemma 5, we have

\[
\| z^i_n - x^* \|^2 \leq \| x_n - x^* \|^2 + 2\lambda^i_n \| x_n - x^* \|^2 + 2\mu \| x_n - y^i_n \| \| z^i_n - y^i_n \| \| x_n - y^i_n \|^2 - \| y^i_n - z^i_n \|^2 \\
\leq \| x_n - x^* \|^2 + 2\mu \| x_n - y^i_n \| \| z^i_n - y^i_n \| \| x_n - y^i_n \|^2 - \| y^i_n - z^i_n \|^2 \\
\leq \| x_n - x^* \|^2 + \mu \| x_n - y^i_n \|^2 + \| z^i_n - y^i_n \|^2 - \| x_n - y^i_n \|^2 - \| y^i_n - z^i_n \|^2 \\
= \| x_n - x^* \|^2 - (1 - \mu) \| x_n - y^i_n \|^2 - (1 - \mu) \| y^i_n - z^i_n \|^2. \]  \hfill (23)

It follows from (15) and (23) that

\[
\| x_{n+1} - x^* \| = \| a^0_n f(x_n) + \sum_{i=1}^N a^i_n z^i_n - x^* \|
\]
Let \( z = P_f(z) \). From (15) and (23), we have

\[
\| x_{n+1} - z \|^2 = \| a_n^0 f(x_n) - \sum_{i=1}^{N} a_n^i z_n^i - z \|^2 \\
= \| a_n^0 (f(x_n) - z) + \sum_{i=1}^{N} a_n^i (z_n^i - z) \|^2 \\
\leq a_n^0 \| f(x_n) - z \|^2 + \sum_{i=1}^{N} a_n^i \| z_n^i - z \|^2 \\
\leq a_n \| f(x_n) - z \|^2 + \sum_{i=1}^{N} a_n^i \| x_n - z \|^2 \\
- (1 - \mu) \| x_n - y_n \|^2 - (1 - \mu) \| y_n - z_n \|^2 \\
= \sum_{i=1}^{N} a_n^i \| x_n - z \|^2 + a_n^0 \| f(x_n) - z \|^2 \\
- \sum_{i=1}^{N} a_n^i (1 - \mu) \| x_n - y_n \|^2 - \sum_{i=1}^{N} a_n^i (1 - \mu) \| y_n - z_n \|^2 \\
\leq \| x_n - z \|^2 + a_n^0 \| f(x_n) - z \|^2 - \sum_{i=1}^{N} a_n^i (1 - \mu) \| x_n - y_n \|^2 \\
- \sum_{i=1}^{N} a_n^i (1 - \mu) \| y_n - z_n \|^2 .
\]

This implies that \( \{ x_n \} \) is bounded. Consequently, \( \{ f(x_n) \} \), \( \{ y_n \} \), and \( \{ z_n \} \) are also bounded.
Furthermore, using Lemma 2 (ii) in (15), we obtain

\[ \| x_{n+1} - z \|^2 = \| a_n^0 f(x_n) + \sum_{i=1}^{N} a_n^i (x_n^i - z) \|^2 \]

\[ = \| a_n^0 (f(x_n) - z) + \sum_{i=1}^{N} a_n^i (z_n^i - z) \|^2 \]

\[ = \| \sum_{i=1}^{N} a_n^i (z_n^i - z) + a_n^0 (f(x_n) - z) \|^2 \]

\[ \leq (1 - a_n^0)^2 \| x_n - z \|^2 + 2a_n^0 \langle f(x_n) - z, x_{n+1} - z \rangle \]

\[ = (1 - a_n^0)^2 \| x_n - z \|^2 + 2a_n^0 \langle f(x_n) - f(z), x_{n+1} - z \rangle + 2a_n^0 \langle f(z), z, x_{n+1} - z \rangle \]

\[ \leq (1 - a_n^0)^2 \| x_n - z \|^2 + 2a_n^0 k \| x_n - z \| \| x_{n+1} - z \| \]

\[ + 2a_n^0 \langle f(z) - z, x_{n+1} - z \rangle \]

\[ \leq (1 - a_n^0)^2 \| x_n - z \|^2 + 2a_n^0 k (\| x_n - z \|^2 + \| x_{n+1} - z \|^2) \]

\[ + 2a_n^0 \langle f(z) - z, x_{n+1} - z \rangle \]

which implies that for some \( M > 0, \)

\[ \| x_{n+1} - z \|^2 \leq \frac{(1 - a_n^0)^2 + a_n^0 k}{1 - a_n^0 k} \| x_n - z \|^2 + \frac{2a_n^0}{1 - a_n^0 k} \langle f(z) - z, x_{n+1} - z \rangle \]

\[ = \frac{1 - 2a_n^0 + a_n^0 k}{1 - a_n^0 k} \| x_n - z \|^2 + \frac{2(1 - k)a_n^0}{1 - a_n^0 k} \| x_n - z \|^2 + \frac{2a_n^0}{1 - a_n^0 k} \langle f(z) - z, x_{n+1} - z \rangle \]

\[ \leq \left( 1 - \frac{2(1 - k)a_n^0}{1 - a_n^0 k} \right) \| x_n - z \|^2 + 2(1 - k)a_n^0 \frac{1}{1 - a_n^0 k} \| x_n - z \|^2 + \frac{2a_n^0}{1 - a_n^0 k} \langle f(z) - z, x_{n+1} - z \rangle \]

\[ \times \left[ \frac{a_n^0}{2(1 - k)} M + \frac{1}{1 - k} \langle f(z) - z, x_{n+1} - z \rangle \right]. \]  

(25)

We will divide the next proof into two parts.

**Case 1** Suppose that there exists \( n_0 \in \mathbb{N} \) such that \( \{ \| x_n - z \| \}_{n=n_0}^{\infty} \) is non-increasing. Then, \( \{ \| x_n - z \| \}_{n=1}^{\infty} \) converges and \( \| x_n - z \|^2 - \| x_{n+1} - z \|^2 \rightarrow 0, n \rightarrow \infty. \) From (24), we have

\[ \sum_{i=1}^{N} a_n^i (1 - \mu) \| x_n - y_n^i \|^2 \leq \| x_n - z \|^2 - \| x_{n+1} - z \|^2 + a_n^0 \| f(x_n) - z \|^2. \]  

(27)

It follows from our assumptions (i) and (ii) that

\[ \lim_{n \rightarrow \infty} \| x_n - y_n^i \| = 0, \quad \forall i = 1, 2, ..., N. \]

(28)

Similarly, from (24), we obtain that

\[ \lim_{n \rightarrow \infty} \| y_n^i - z_n^i \| = 0, \quad \forall i = 1, 2, ..., N. \]  

(29)
Set \( t_n = \alpha_n^0 x_n + \sum_{i=1}^{N} \alpha_n^i z_n^i \) and \( s_n = \alpha_n^0 x_n + \sum_{i=1}^{N} \alpha_n^i y_n^i \). It follows from our assumption (i) and (29) that
\[
\lim_{n \to \infty} \| x_{n+1} - t_n \| = \lim_{n \to \infty} \| f(x_n) - x_n \| = 0
\] (30)
and
\[
\lim_{n \to \infty} \| t_n - s_n \| \leq \lim_{n \to \infty} \sum_{i=1}^{N} \alpha_n^i \| z_n^i - y_n^i \| = 0.
\] (31)

It follows from (28) that
\[
\lim_{n \to \infty} \| s_n - x_n \| \leq \lim_{n \to \infty} \sum_{i=1}^{N} \alpha_n^i \| y_n^i - x_n \| = 0.
\] (32)

It follows from (30), (31), and (32) that
\[
\| x_{n+1} - x_n \| \leq \| x_{n+1} - t_n \| + \| t_n - s_n \| + \| s_n - x_n \| \to 0.
\]

Since \( \{x_n\} \) is bounded, it has a subsequence \( \{x_{n_j}\} \) such that \( \{x_{n_j}\} \) converges weakly to some \( \omega \in H \) and \( \limsup_{n \to \infty} \langle f(z) - z, x_{n_j} - z \rangle = \lim_{j \to \infty} \langle f(z) - z, x_{n_j} - z \rangle \). We show that \( \omega \in F \). Now, \( x_n - y_n^i \to 0 \) implies that \( y_n^i \to \omega \) and since \( y_n^i \in C \), we then obtain \( \omega \in C \). For all \( x \in C \) and using the property of the projection \( P_C \), we have (since \( A_i \) is monotone):
\[
0 \leq \langle y_n^i - x_{n_j} - \lambda_{n_j} A_i x_{n_j}, x - y_n^i \rangle
= \langle y_n^i - x_{n_j}, x - y_n^i \rangle + \lambda_{n_j} \langle A_i x_{n_j}, x - x_{n_j} \rangle + \lambda_{n_j} \langle A_i x_{n_j}, x - y_n^i \rangle
\leq \langle y_n^i - x_{n_j}, x - y_n^i \rangle + \lambda_{n_j} \langle A_i x_{n_j}, x - x_{n_j} \rangle + \lambda_{n_j} \langle A_i x_{n_j}, x - y_n^i \rangle.
\]

Taking \( j \to \infty \), we get (recall that \( \inf_{n \geq 1} \lambda_{n_j} > 0 \) by Remark 3.2 in [19])
\[
\langle A_i \omega, x - \omega \rangle \geq 0, \quad \forall x \in C.
\]

This implies that \( \omega \in F \). Since \( z = P_F f(z) \), we have
\[
\limsup_{n \to \infty} \langle f(z) - z, x_{n_j} - z \rangle = \lim_{j \to \infty} \langle f(z) - z, x_{n_j} - z \rangle = \langle f(z) - z, \omega - z \rangle \leq 0.
\]

Since \( \lim_{n \to \infty} \| x_{n+1} - x_n \| = 0 \), we have
\[
\limsup_{n \to \infty} \langle f(z) - z, x_{n+1} - z \rangle \leq 0.
\]

In (26), let \( a_n = \| x_n - z \|^2, \beta_n := \frac{2(1-k)\alpha_0^0}{1-n_0^2 k} \), and \( c_n := \frac{\alpha_0^0}{2(1-k)} M + \frac{1}{1-k} \langle f(z) - z, x_{n+1} - z \rangle \). Then, we can write (26) as
\[
a_{n+1} \leq (1 - \beta_n) a_n + \beta_n c_n.
\] (33)

It is easy to see that \( \lim_{n \to \infty} \beta_n = 0, \sum_{n=1}^{\infty} \beta_n = \infty \), and \( \limsup c_n \leq 0 \).

Using Lemma 3 in (33), we obtain \( \lim_{n \to \infty} \| x_n - z \| = 0 \). Thus, \( x_n \to z, n \to \infty \).

**Case 2** Assume that \( \{ \| x_n - z \| \} \) is not a monotone and decreasing sequence. Set \( F_n = \| x_n - z \|^2 \) and let \( \tau : \mathbb{N} \to \mathbb{N} \) be a mapping defined for all \( n \geq n_0 \) (for some \( n_0 \) large enough) by
\[
\tau(n) := \max \{ k \in \mathbb{N} : k \leq n_0, F_k \leq F_{k+1} \}.
\]

It is clear that \( \tau \) is a non-decreasing sequence such that \( \tau(n) \to \infty \) as \( n \to \infty \) and
\[
0 \leq F_{\tau(n)} \leq F_{\tau(n)+1}, \quad \forall n \geq n_0.
\]
This implies that \( \| x_{\tau(n)} - z \| \leq \| x_{\tau(n)+1} - z \|, \forall n \geq n_0 \). Thus, \( \lim_{n \to \infty} \| x_{\tau(n)} - z \| \) exists. By (27), we obtain
\[
\sum_{i=1}^{N} a_{\tau(n)}^i (1 - \mu) \| x_{\tau(n)} - y_{\tau(n)}^i \|^2 \leq \| x_{\tau(n)} - z \|^2 - \| x_{\tau(n)+1} - z \|^2 + a_0^0 \| f(x_{\tau(n)}) - z \|^2 \to 0,
\]
as \( n \to \infty \). Thus,
\[
\| x_{\tau(n)} - y_{\tau(n)}^i \| \to 0
\]
as \( n \to \infty \). As in Case 1, we can prove that
\[
\lim_{n \to \infty} \| y_{\tau(n)}^i - z_{\tau(n)} \| = \lim_{n \to \infty} \| x_{\tau(n)+1} - z_{\tau(n)} \| = \lim_{n \to \infty} \| x_{\tau(n)+1} - x_{\tau(n)} \| = 0.
\]
Since \( \{ x_{\tau(n)} \} \) is bounded, there exists a subsequence of \( \{ x_{\tau(n)} \} \) that converges weakly to \( \omega \). Without loss of generality, we assume that \( x_{\tau(n)} \to \omega \). Observe that since \( \lim_{n \to \infty} \| x_{\tau(n)} - y_{\tau(n)}^i \| = 0 \) we also have \( y_{\tau(n)}^i \to \omega \). By similar argument in Case 1, we can show that \( \omega \in F \) and
\[
\limsup_{n \to \infty} \langle f(z) - z, x_{\tau(n)} - z \rangle \leq 0.
\]
Observe that since \( \lim_{n \to \infty} \| x_{\tau(n)+1} - x_{\tau(n)} \| = 0 \) and \( \limsup_{n \to \infty} \langle f(z) - z, x_{\tau(n)} - z \rangle \leq 0 \), this implies that
\[
\limsup_{n \to \infty} \langle f(z) - z, x_{\tau(n)+1} - z \rangle \leq 0.
\]
By (26), we obtain that
\[
\| x_{\tau(n)+1} - z \|^2 \leq \left( 1 - \frac{2(1-k)\sigma_{\tau(n)}^0}{1 - \sigma_{\tau(n)}^2} \right) \| x_{\tau(n)} - z \|^2 + \frac{2(1-k)\sigma_{\tau(n)}^0}{1 - \sigma_{\tau(n)}^2} \| f(x_{\tau(n)}) - z \|^2 + \frac{1}{1-k} \langle f(z) - z, x_{\tau(n)+1} - z \rangle
\]
where \( \beta_{\tau(n)} := \frac{2(1-k)\sigma_{\tau(n)}^0}{1 - \sigma_{\tau(n)}^2} \). Hence, we have (since \( F_{\tau(n)} \leq F_{\tau(n)+1} \))
\[
\beta_{\tau(n)} \| x_{\tau(n)} - z \|^2 \leq \| x_{\tau(n)} - z \|^2 - \| x_{\tau(n)+1} - z \|^2 + \beta_{\tau(n)} \left( \frac{\sigma_{\tau(n)}^0}{2(1-k)} M + \frac{1}{1-k} \langle f(z) - z, x_{\tau(n)+1} - z \rangle \right)
\]
\[
\leq \beta_{\tau(n)} \left( \frac{\sigma_{\tau(n)}^0}{2(1-k)} M + \frac{1}{1-k} \langle f(z) - z, x_{\tau(n)+1} - z \rangle \right).
\]
Since \( \sigma_{\tau(n)}^0 > 0 \) and \( k \in [0,1) \), we have that \( \beta_{\tau(n)} > 0 \). So, we get
\[
\| x_{\tau(n)} - z \|^2 \leq \frac{\sigma_{\tau(n)}^0}{2(1-k)} M + \frac{1}{1-k} \langle f(z) - z, x_{\tau(n)+1} - z \rangle,
\]
and this implies that
\[
\limsup_{n \to \infty} \| x_{\tau(n)} - z \|^2 \leq \limsup_{n \to \infty} \frac{\sigma_{\tau(n)}^0}{2(1-k)} M + \frac{1}{1-k} \langle f(z) - z, x_{\tau(n)+1} - z \rangle \leq 0.
\]
Therefore,
\[
\lim_{n \to \infty} \| x_{\tau(n)} - z \| = 0
\]
and
\[ \lim_{n \to \infty} \| x_{\tau(n)+1} - z \| = 0. \]

Hence,
\[ \lim_{n \to \infty} F_{\tau(n)} = \lim_{n \to \infty} F_{\tau(n)+1} = 0. \]

Furthermore, for \( n \geq n_0 \), it is easy to see that \( F_{\tau(n)} \leq F_{\tau(n)+1} \) if \( n \neq \tau(n) \) (that is \( \tau(n) < n \)), because \( F_j \geq F_{j+1} \) for \( \tau(n) + 1 \leq j \leq n \). As a consequence, we obtain for all \( n \geq n_0 \),
\[ 0 \leq F_n \leq \max\{F_{\tau(n)}, F_{\tau(n)+1}\} = F_{\tau(n)+1}. \]

Hence, \( \lim_{n \to \infty} F_n = 0 \), that is, \( \lim_{n \to \infty} \| x_n - z \| = 0 \). Hence, \( \{x_n\} \) converges strongly to \( z \).

This completes the proof. \( \square \)

We now give an example in Euclidian space \( \mathbb{R}^3 \) where \( \| \cdot \| \) is \( \ell_2 \)-norm defined by \( \| x \| = \sqrt{x_1^2 + x_2^2 + x_3^2} \) where \( x = (x_1, x_2, x_3) \) to support the main theorem.

**Example 1.** Let \( A_1, A_2, A_3 : \mathbb{R}^3 \to \mathbb{R}^3 \) be defined by \( A_1 x = 4x \), \( A_2 x = 7x + (5, -2, 1) \) and \( A_3 x = \left( \begin{array}{c} 10 \\ 5 \\ 10 \\ 5 \\ 10 \end{array} \right) + (4, 2, 1) \) for all \( x = (x_1, x_2, x_3) \). Let \( f : \mathbb{R}^3 \to \mathbb{R}^3 \) be defined by \( f(x) = \frac{x}{2} \) for all \( x \in \mathbb{R}^3 \). Let \( C = \{ x \in \mathbb{R}^3 | \| x \| \leq 4 \} \). We can choose \( \alpha_n^0 = \frac{1}{n+1} \), \( \alpha_n^1 = \frac{1}{2n} \), \( \alpha_n^2 = \frac{n}{n+1} \) and \( \alpha_n^3 = 1 - \alpha_n^0 - \alpha_n^1 - \alpha_n^2 \).

The stopping criterion is defined by \( \| x_n - x_{n-1} \| < 10^{-15} \) (See in Figures 1–3). The different choices of \( x_1 \) are given in Table 1 as follows in Example 1.

| Inputting | \( x_1 = (-3, -5, 8) \) | \( x_1 = (-1, 7, 6) \) | \( x_1 = (6.13, -5.24, -1.19) \) |
|-----------|-----------------|-----------------|-----------------|
| CPU Time | Iter No. | CPU Time | Iter No. | CPU Time | Iter No. |
| \( A_1 \) | 0.0000068 | 592 | 0.0000056 | 591 | 0.00001 | 589 |
| \( A_2 \) | 0.0003795 | 230 | 0.0002848 | 230 | 0.0002887 | 229 |
| \( A_3 \) | 0.0004619 | 230 | 0.0007852 | 230 | 0.000766 | 229 |

**Table 1.** Comparison of the number of iterations in Example 1.

**Figure 1.** The error plotting \( \| x_n - x_{n-1} \| \) for choice 1 in Example 1.
For infinitely dimensional space, we give an example in function space $L^2[0,1]$ such that $\|\cdot\|$ is $L^2$-norm defined by $\|x(t)\| = \sqrt{\int_0^1 |x(t)|^2 dt}$ where $x(t) \in L^2[0,1]$.

**Example 2.** Let $A_1, A_2, A_3 : L^2[0,1] \to L^2[0,1]$ be defined by $A_1x(t) = \int_0^t 4x(s)ds$, $A_2x(t) = \int_0^t tx(s)ds$ and $A_3x(t) = \int_0^t (t^2 - 1)x(s)ds$ where $x(t) \in L^2[0,1]$. Let $f : L^2[0,1] \to L^2[0,1]$ be defined by $f(x(t)) = \frac{x(t)}{2}$ where $x(t) \in L^2[0,1]$. Let $C = \{x(t) \in L^2[0,1] : \int_0^1 (t^2 + 1)x(t)dt\}$. We can choose $a_n^0 = \frac{1}{(n+1)^3}$, $a_n^1 = \frac{1}{2n}$, $a_n^2 = \frac{n}{(n+1)^3}$ and $a_n^3 = 1 - a_n^0 - a_n^1 - a_n^2$. The stopping criterion is defined by $\|x_n(t) - x_{n-1}(t)\| < 10^{-5}$ (See in Figures 4–6).

The different choices of $x_1(t)$ are given in Table 2 as follows:

- **Choice 1** Bernstein initial data: $x_1(t) = -120t^7(t-1)^3$;
- **Choice 2** Chebyshev initial data: $x_1(t) = 64t^7 - 112t^5 + 56t^3 - 7t$;
- **Choice 3** Legendre initial data: $x_1(t) = \frac{315}{128}t - \frac{1155}{32}t^3 + \frac{9009}{64}t^5 - 6435t^7 + \frac{12155}{128}t^9$. 

---

**Figure 2.** The error plotting $\|x_n - x_{n-1}\|$ for choice 2 in Example 1.

**Figure 3.** The error plotting $\|x_n - x_{n-1}\|$ for choice 3 in Example 1.
From Tables 1 and 2, we see that the advantage of the parallel viscosity type subgradient extragradient-line method Algorithm 1 when the common solution of two or more inputting $A_i$ gives the number of iterations smaller than one inputting.

**Table 2.** Comparison of the number of iterations in Example 2.

**Figure 5.** The error plotting $\|x_n(t) - x_{n-1}(t)\|$ for choice 2 in Example 2.
4. Application to Image Restoration Problems

The image restoration problem can be modeled in one-dimensional vectors by the following linear equation system:

$$b = Ax + v,$$  \hspace{1cm} (34)

where $x \in \mathbb{R}^{n \times 1}$ is an original image, $b \in \mathbb{R}^{m \times 1}$ is the observed image, $v$ is additive noise, and $A \in \mathbb{R}^{m \times n}$ is the blurring matrix. For solving problem (34), we aim to approximate the original image, vector $x$, by minimizing the additive noise, which is called a least squares (LS) problem as follows:

$$\min_{x} \frac{1}{2} \|b - Ax\|^2,$$  \hspace{1cm} (35)

where $\|\cdot\|$ is $\ell_2$-norm defined by $\|x\| = \sqrt{\sum_{i=1}^{n} |x_i|^2}$. The solution of the problem (35) can be approximated by many well-known iteration methods.

The Richardson iteration, which is often called the Landweber method [33–36], is generally used as an iterative regularization method to solve (35). The basic iteration takes the form:

$$x_{n+1} = x_n + \tau A^T (b - Ax_n).$$  \hspace{1cm} (36)

Here the step size $\tau$ remains constant for each iteration. The convergence can be proved under the step size $\tau$ such that $0 < \tau < \frac{2}{\sigma_{max}}$, where $\sigma_{max}$ is the largest singular value of $A$.

The goal in image restoration is to deblur an image without knowing which one is the blurring operator. Thus, we focus on the following problem:

$$\min_{x \in \mathbb{R}^{n}} \frac{1}{2} \|A_1 x - b_1\|^2, \quad \min_{x \in \mathbb{R}^{n}} \frac{1}{2} \|A_2 x - b_2\|^2, \quad \ldots, \quad \min_{x \in \mathbb{R}^{n}} \frac{1}{2} \|A_N x - b_N\|^2$$  \hspace{1cm} (37)

where $x$ is the original true image, $A_i$ is the blurred matrix, $b_i$ is the blurred image by the blurred matrix $A_i$ for all $i = 1, 2, \ldots, N$. For solving this problem, we designed the following flowchart:
Where $\tilde{X}$ is the deblurred image or the common solutions of the problem (37) and as seen in Figure 7. We can apply the algorithm in Theorem 1 to solve the problem (37), and as a result, we know that $A_i^T (A_ix - b_i)$ is Lipschitz continuous for each $i = 1, 2, \ldots, N$. Let $f : \mathbb{R}^n \to \mathbb{R}^n$ be a strict contraction mapping with constant $k \in (0, 1]$. Suppose $\{x_n\}_{n=1}^{\infty}$ is generated in the following Algorithm 2:

**Algorithm 2.** Given $\rho \in (0, 1), \mu \in (0, 1)$. Let $\{\alpha_n\}_{n=1}^{\infty}$ be a real sequence in $(0, 1)$. Let $x_1 \in H$ be arbitrary.

*Step 1:* Compute for all $i = 1, 2, \ldots, N$ by

$$y_n^i = P_{C}(x_n - \lambda_n^i A_i^T (A_ix_n - b_i)), \forall n \geq 1,$$

where $\lambda_n^i = \rho^l_n$ and $l_n^i$ is the smallest nonnegative integer $l^i$ such that

$$\lambda_n^i \parallel A_ix_n - A_iy_n^i \parallel \leq \mu \parallel r_{\rho^l_n} (x_n) \parallel .$$

*Step 2:* Compute

$$z_n^i = P_{T_n^i}(x_n - \lambda_n^i A_i^T (A_iy_n^i - b_i)),$$

where $T_n^i := \{z \in H : \langle x_n - \lambda_n^i A_i x_n - y_n^i, z - y_n^i \rangle \leq 0\}$.

*Step 3:* Compute

$$x_{n+1} = \alpha_n^0 f(x_n) + \sum_{i=1}^{N} \alpha_n^i z_n^i, n \geq 1.$$

Set $n + 1 \rightarrow n$ and go to Step 1.

We will present restoration of images corrupted by the following blur types:

1. Gaussian blur of filter size $9 \times 9$ with standard deviation $\sigma = 4$ (the original image was degraded by the blurring matrix $A_1$).
2. Out-of-focus blur (disk) with radius $r = 6$ (the original image was degraded by the blurring matrix $A_2$).
3. Motion blur specifying with motion length of 21 pixels (len = 21) and motion orientation $11^\circ$ ($\theta = 11$) (the original image was degraded by the blurring matrix $A_3$).

The performance of the studied proposed Algorithm 2 with the following original grey and RGB images was tested, as can be seen in Figures 8 and 9.
The matrix size of grey image is $276 \times 490$.

The matrix size of RGB image is $280 \times 497 \times 3$.

The parameter $\alpha^i_n$ on the implemented algorithm for solving the problem (VIP) was set as

$$\alpha^i_n = \frac{n}{n+1}, \quad i = 1, 2, 3.$$

Three different types of blurred grey and RGB images degraded by the blurring matrices $A_1, A_2$ and $A_3$ are shown in Figures 10–15.

Figure 10. Three degraded grey image by blurred matrices $A_1, A_2$, and $A_3$, respectively.
Out of Focus Blurred Image with radius = 6

**Figure 11.** Three degraded grey image by blurred matrices $A_1$, $A_2$, and $A_3$, respectively.

Motion Blurred Image with len = 21 and $\theta = 11$

**Figure 12.** Three degraded grey image by blurred matrices $A_1$, $A_2$, and $A_3$, respectively.

Gaussian Blurred Image with hsize = [9x9] and $\sigma = 4$

**Figure 13.** Three degraded RGB image by blurred matrices $A_1$, $A_2$, and $A_3$, respectively.
Figure 14. Three degraded RGB image by blurred matrices $A_1$, $A_2$, and $A_3$, respectively.

We applied the proposed algorithm to obtain the solution of the deblurring problem (VIP) with ($N = 1$) by inputting $A_1$, $A_2$, and $A_3$. The results of the proposed algorithm with 10,000 iterations for the following three cases:

Case I: Inputting $A_1$ in the proposed algorithm;
Case II: Inputting $A_2$ in the proposed algorithm; and
Case III: Inputting $A_3$ in the proposed algorithm

are shown in Figures 16–21 that are composed of the restored images and their peak signal-to-noise ratios (PSNRs).

Figure 16. The reconstructed grey image with their PSNRs for three different cases using the proposed algorithm presented in 10,000 iterations, respectively.
Case II

PSNR = 26.479

Figure 17. The reconstructed grey image with their PSNRs for three different cases using the proposed algorithm presented in 10,000 iterations, respectively.

Case III

PSNR = 29.508

Figure 18. The reconstructed grey image with their PSNRs for three different cases using the proposed algorithm presented in 10,000 iterations, respectively.

Case I

PSNR = 23.229

Figure 19. The reconstructed RGB image with their PSNRs for three different cases using the proposed algorithm presented in 10,000 iterations, respectively.
Case II

PSNR = 25.292

Figure 20. The reconstructed RGB image with their PSNRs for three different cases using the proposed algorithm presented in 10,000 iterations, respectively.

Case III

PSNR = 28.533

Figure 21. The reconstructed RGB image with their PSNRs for three different cases using the proposed algorithm presented in 10,000 iterations, respectively.

Next found the common solutions of a deblurring problem (VIP) with \((N = 2)\) by using the proposed algorithm. So, we can consider the results of the proposed algorithm with 10,000 iterations in the following three cases:

- Case I: Inputting \(A_1\) and \(A_2\) in the proposed algorithm;
- Case II: Inputting \(A_1\) and \(A_3\) in the proposed algorithm; and
- Case III: Inputting \(A_2\) and \(A_3\) in the proposed algorithm.

It can be seen from Figures 22–27 that the quality of restored images by using the proposed algorithm in solving the common solutions of the deblurring problem (VIP) with \((N = 2)\) was improved compared with the previous results in Figures 16–21.

Finally, the common solution of the deblurring problem (VIP) with \((N = 3)\) using the proposed algorithm was also tested (inputting \(A_1, A_2,\) and \(A_3\) in the proposed algorithm).
Case I

$\text{PSNR} = 28.596$

**Figure 22.** The reconstructed grey image with their PSNRs for three different cases using the proposed algorithm presented in 10,000 iterations, respectively.

Case II

$\text{PSNR} = 32.372$

**Figure 23.** The reconstructed grey image with their PSNRs for three different cases using the proposed algorithm presented in 10,000 iterations, respectively.

Case III

$\text{PSNR} = 33.477$

**Figure 24.** The reconstructed grey image with their PSNRs for three different cases using the proposed algorithm presented in 10,000 iterations, respectively.
Case I

PSNR = 27.035

Figure 25. The reconstructed RGB image with their PSNRs for three different cases using the proposed algorithm presented in 10,000 iterations, respectively.

Case II

PSNR = 31.057

Figure 26. The reconstructed RGB image with their PSNRs for three different cases using the proposed algorithm presented in 10,000 iterations, respectively.

Case III

PSNR = 32.490

Figure 27. The reconstructed RGB image with their PSNRs for three different cases using the proposed algorithm presented in 10,000 iterations, respectively.

Figures 28 and 29 show the reconstructed grey and RGB images with 10,000 iterations. The quality of the recovered grey and RGB images obtained by this algorithm were the highest compared to the previous two algorithms.
Figure 28. The reconstructed grey image from the blurring operators $A_1$, $A_2$, and $A_3$ using the proposed algorithm presented in 10,000 iterations, respectively.

Figure 29. The reconstructed RGB image from the blurring operators $A_1$, $A_2$, and $A_3$ using the proposed algorithm presented in 10,000 iterations, respectively.

Moreover, the Cauchy error, the figure error, and the peak signal-to-noise ratio (PSNR) for recovering the degraded grey and RGB images by using the proposed method within the first 10,000 iterations are shown in Figures 30–35.

Figure 30. Cauchy error plots of the proposed algorithm in all cases of grey images.
Figure 31. Figure error plots of the proposed algorithm in all cases of grey images.

Figure 32. PSNR quality plots of the proposed algorithm in all cases of grey images.

Figure 33. Cauchy error plots of the proposed algorithm in all cases of RGB images.
Figure 34. Figure error plots of the proposed algorithm in all cases of RGB images.

Figure 35. PSNR quality plots of the proposed algorithm in all cases of RGB images.

The Cauchy error is defined as \( \| x_n - x_{n-1} \| < 10^{-8} \). The figure error is defined as \( \| x_n - x \| \), where \( x \) is the solution of the problem (VIP). The performance of the proposed algorithm at \( x_n \) in the image restoration process was measured quantitatively by the means of the peak signal-to-noise ratio (PSNR), which is defined by

\[
\text{PSNR}(x_n) = 20 \log_{10} \left( \frac{255^2}{\text{MSE}} \right),
\]

where \( \text{MSE} = \| x_n - x \|^2 \), \( x_n - x \) is the \( \ell_2 \)-norm of \( \text{vec}(x_n - x) \) and \( \text{vec}(x_n - x) = A \) reshape matrix \( x_n - x \) as vector.

The Cauchy error plot shows the validity of the proposed method, while the figure error plot confirms the convergence of the proposed method and the PSNR quality plot shows the measured quantitatively of the image. From Figures 30–35, it is clearly seen that the common solution of the deblurring problem (VIP) with \( N \geq 2 \) obtained quality improvements in the reconstructed grey and RGB images. Another advantage of the proposed method when the common solution of two or more image deblurring problems was used to restore the image is that the received image is more consistent than usual (see Figures 36–49). Figures 36–49 show the reconstructed grey and RGB images using the proposed algorithm in obtaining the common solution of the following problem with the same PSNR.

1. Deblurring problem (VIP) with \( N = 1 \) by inputting \( A_1, A_2, \) and \( A_3 \) in the proposed algorithm.
2. Deblurring problem (VIP) with \( N = 2 \) by inputting \( A_1 \) and \( A_2, A_1, \) and \( A_3, A_2, \) and \( A_3 \) in the proposed algorithm respectively.
(3) Deblurring problem (VIP) with $(N = 3)$ by inputting $A_1$, $A_2$, and $A_3$ in the proposed algorithm.

**Gaussian Blurred**

PSNR = 24 (4921\textsuperscript{th} Iteration)

**Figure 36.** The reconstructed grey image of all cases using the proposed method (2) with PSNR = 24.

**Out of Focus Blurred**

PSNR = 24 (2775\textsuperscript{th} Iteration)

**Figure 37.** The reconstructed grey image of all cases using the proposed method (2) with PSNR = 24.

**Motion Blurred**

PSNR = 24 (801\textsuperscript{th} Iteration)

**Figure 38.** The reconstructed grey image of all cases using the proposed method (2) with PSNR = 24.
Gaussian and Out of Focus Blurred

PSNR = 24 (975th Iteration)

**Figure 39.** The reconstructed grey image of all cases using the proposed method (2) with PSNR = 24.

Gaussian and Motion Blurred

PSNR = 24 (446th Iteration)

Gaussian and Motion Blurred

PSNR = 23 (483\textsuperscript{th} Iteration)

Figure 47. The reconstructed RGB image of all cases using the proposed method (2) with PSNR = 23.
5. Conclusions

In this work, we considered the problem of finding a common solution of variational inequalities with monotonic and Lipschitz operators in a Hilbert space. Under some suitable conditions imposed on the parameters, we proved the strong convergence of the algorithm. Several numerical examples in both finite and infinite dimensional spaces were performed to illustrate the performance of the proposed algorithm (see Tables 1 and 2 and Figures 1–6). We applied our proposed algorithm to image recovery (2) under a situation without knowing the type of matrix blurs to demonstrate the computational performance (see Figures 10–35). We found that the advantage of our proposed algorithm was its ability to restore two or more multiblur effects in an image, giving a restoration performance better than one (see Figures 36–49).
