Abstract

The asynchronous systems are the non-deterministic real time-binary models of the asynchronous circuits from electrical engineering. Autonomy means that the circuits and their models have no input. Regularity means analogies with the dynamical systems, thus such systems may be considered to be the real time dynamical systems with a ‘vector field’ \( \Phi : \{0, 1\}^n \to \{0, 1\}^n \). Universality refers to the case when the state space of the system is the greatest possible in the sense of the inclusion. The purpose of the paper is that of defining, by analogy with the dynamical systems theory, the \( \omega \)-limit sets, the invariance and the basins of attraction of the universal regular autonomous asynchronous systems.

MSC: 94C10

keywords: asynchronous system, \( \omega \)-limit set, invariance, basin of attraction

1 Foreword

Adelina Georgescu founded ROMAI, the Romanian Society of Applied and Industrial Mathematics in 1992 and I met her in 1993 in Oradea, at the first Conference on Applied and Industrial Mathematics CAIM. She was a severe woman, strongly dominant. We got closer in February 2007, when she asked me which are my mathematical interests -the asynchronous systems- and I asked her which are her mathematical interests -the dynamical systems. I realized instantly that the two theories may interact, the first one made on \( R \to \{0, 1\} \) functions, the second one made on \( R \to R \) functions, since the reasoning in asynchronous systems is often made by following analogies with the real numbers concepts and
the dynamical systems looked to be a real source of inspiration in the sense of creating analogies. I told her my thoughts and in the months that followed I received from her by mail many books in dynamical systems written by herself and by her PhD students. In August that year, near Athens, I presented at a WSEAS plenary lecture my first work in asynchronous systems considered as Boolean dynamical systems.

I was deeply impressed by the evolution of her disease and by her disappearance. She has encouraged me to continue studying the asynchronous systems, a direction of research that is not popular, she published my papers, she gave me suggestions of research and consistent bibliography. She will always remain a model for us, those that had the chance to meet her, with her idealism, with her wish to construct and with her disappointments, with her strength and with her fragility. It is a tender pleasure for me to dedicate to her memory this paper, that is a direct consequence of our friendship.

2 Introduction

The mathematical theory of modeling the asynchronous circuits from electrical engineering has developed in the 50’s and the 60’s under the name of switching theory. Afterwards the mathematicians seem to have lost their interest in this field (or maybe their studies continue, under an unpublished form) and their work was continued by the engineers. This situation has generated great theoretical needs in time. In 2007 when our book Asynchronous Systems Theory was published the bibliography was poor, consisting mainly in engineering works that give intuition and we were not sure which MSC it should have, due to its distance from the general accepted directions of mathematical research. The ’asynchronous systems theory’ is a well known syntagm to the engineers, however the mathematicians do not know it. Professor Valeriu Prepelita helped in this sense by suggesting, as reviewer, *93-02 Research monographs (systems and control), 93A05 Axiomatic system theory and 93A10 General systems. We have adopted in this paper 94C10 Switching theory, application of Boolean algebra, with the remark that this is a modern point of view of what has been done 50 years ago in switching theory.

Since 2007 our efforts were those of taking the old-newborn asynchronous systems theory away from its isolation and making it ’socialize’ with the existing systems theory.

The $\mathbb{R} \to \{0,1\}$ functions give the deterministic\(^2\) real time-binary

---

1http://www.romai.ro/lucrari/teoria_sistemelor_asincrone_en.pdf
2‘Deterministic’ means that each signal is modeled by exactly one $\mathbb{R} \to \{0,1\}$ function.
models of the digital electrical signals and they are not studied in literature. An asynchronous circuit without input, considered as a collection of \( n \) signals, should be deterministically modelled by a function \( x : \mathbb{R} \to \{0, 1\}^n \) called state. We have however several parameters related with the asynchronous circuit that are either unknown, or perhaps variable or simply ignored in modeling such as the temperature, the tension of the mains and the delays the occur in the computation of the Boolean functions. For this reason, instead of a function \( x \) we have in general a set \( X \) of functions \( x \), called state space, or non-deterministic autonomous asynchronous system, where each function \( x \) represents a possibility of modeling the circuit. When \( X \) is constructed by making use of a 'vector field' \( \Phi : \{0, 1\}^n \to \{0, 1\}^n \), the system \( X \) is called regular. The universal regular autonomous asynchronous systems are the Boolean dynamical systems and they can be identified with \( \Phi \).

The dynamic of these systems is described by the so called state portraits. For example in Figure 1 we have the function \( \Phi : \{0, 1\}^2 \to \{0, 1\}^2 \) that is defined by the formula \( \forall \mu \in \mathbb{B}^2, (\Phi_1(\mu_1, \mu_2), \Phi_2(\mu_1, \mu_2)) = (\overline{\mu}_1 \cup \mu_1 \mu_2, \overline{\mu}_1 \cup \mu_1 \mu_2) \) and the arrows show the increase of time. For any \( i \in \{1, 2\} \), the coordinate \( \mu_i \) is underlined if \( \Phi_i(\mu_1, \mu_2) \neq \mu_i \) and it is called unstable, or enabled, or excited in this case. The coordinates \( \mu_i \) that are not underlined satisfy by definition \( \Phi_i(\mu_1, \mu_2) = \mu_i \) and are called stable, or disabled, or not excited. Three arrows start from the point \((0, 0)\) where both coordinates are unstable, showing the fact that \( \Phi_1(0, 0) \) may be computed first, \( \Phi_2(0, 0) \) may be computed first or \( \Phi_1(0, 0), \Phi_2(0, 0) \) may be computed simultaneously. Note that the two possibilities of defining the system, state portrait and formula, are equivalent. Note also that the system was identified with the function \( \Phi \).

The existence of several possibilities of evolution of the system (three possibilities in \((0, 0)\)) is the key characteristic of asynchronicity, as opposed to synchronicity where the coordinates \( \Phi_i(\mu) \) are always computed

---

\[\text{Figure 1: Example of state portrait.}\]
simultaneously, \( i \in \{1, ..., n\} \) for all \( \mu \in \{0, 1\}^n \) and the system’s run is: 
\( \mu, \Phi(\mu), (\Phi \circ \Phi)(\mu), ..., (\Phi \circ ... \circ \Phi)(\mu), ... \)

Our present aim is to show how the well known concepts of \( \omega \)-limit set, invariance and basin of attraction from the dynamical systems theory, by real to binary translation, create asynchronous meanings.

3 Preliminaries

Notation 1 The set \( B = \{0, 1\} \) is the binary Boole algebra, endowed with the usual algebraical laws and with the discrete topology.

Definition 2 i) The sequence \( \alpha : N \rightarrow B^n, \forall k \in N, \alpha(k) \oplus \alpha^k \) is called progressive if the sets \( \{k|k \in N, \alpha_i^k = 1\} \) are infinite for all \( i \in \{1, ..., n\} \). We denote the set of the progressive sequences by \( \Pi_n \).

ii) \( \chi_A : R \rightarrow B \) is the notation of the characteristic function of the set \( A \subset R: \forall t \in R, \chi_A(t) = \begin{cases} 1, t \in A \\ 0, t \notin A \end{cases} \) and we also denote by \( \text{Seq} \) the set of the sequences \( t_0 < t_1 < ... < t_k < ... \) of real numbers that are unbounded from above. The functions \( \rho : R \rightarrow B^n \) of the form \( \forall t \in R, \rho(t) = \alpha^0(t) \oplus \alpha^1(t) \oplus ... \oplus \alpha_k(t) \oplus ... \) (1)

where \( \alpha \in \Pi_n \) and \( (t_k) \in \text{Seq} \) are called progressive and their set is denoted by \( P_n \).

Definition 3 Let be the function \( \Phi : B^n \rightarrow B^n \). i) For \( \nu \in B^n \) we define \( \Phi^\nu : B^n \rightarrow B^n \) by \( \forall \mu \in B^n, \Phi^\nu(\mu) = (\nu_1 \mu_1 \oplus \nu_1 \Phi_1(\mu), ..., \nu_n \mu_n \oplus \nu_n \Phi_n(\mu)) \).

ii) The functions \( \Phi^0, ..., \Phi^k : B^n \rightarrow B^n \) are defined for \( k \in N \) and \( \alpha^0, ..., \alpha^k \in B^n \) iteratively: \( \forall \mu \in B^n, \Phi^0(\mu) = \Phi^0(\mu), \Phi^k+1(\mu) = \Phi^{k+1}(\mu) \).

iii) The function \( \Phi^\rho : B^n \times R \rightarrow B^n \) that is defined in the following way \( \Phi^\rho(\mu, t) = \mu \chi_{(-\infty, t_0]}(t) \oplus \Phi^{\nu_1}(\mu) \chi_{[t_0, t_1]}(t) \oplus \Phi^{\nu_2}(\mu) \chi_{[t_1, t_2]}(t) \oplus ... \oplus \Phi^{\nu_\rho}(\mu) \chi_{[t_\rho, t_{\rho+1}]}(t) \oplus ... \) is called flow, motion or orbit (of \( \mu \in B^n \)).

We have assumed that \( \rho \in P_n \) is like at [7].

iv) The set \( Or(\mu) = \{\Phi^\rho(\mu, t)|t \in R\} \) is also called orbit (of \( \mu \)).

Remark 4 The function \( \Phi^\nu \) shows how an asynchronous iteration of \( \Phi \) is made: for any \( i \in \{1, ..., n\} \), if \( \nu_i = 0 \) then \( \Phi_i \) is not computed, since \( \Phi_i^\nu(\mu) = \mu_i \) and if \( \nu_i = 1 \) then \( \Phi_i \) is computed, since \( \Phi_i^\nu(\mu) = \Phi_i(\mu) \).

The definition of \( \Phi^0, ..., \Phi^k \) generalizes this idea to an arbitrary number \( k + 1 \) of asynchronous iterations, with the supplementary request that each coordinate \( \Phi_i \) is computed infinitely many times in the sequence \( \mu, \Phi^0(\mu), \Phi^0\alpha^1(\mu), ..., \Phi^0, ..., \Phi^k(\mu), ... \) whenever \( \alpha \in \Pi_n \).
The sequences \((t_k) \in \text{Seq}\) make the pass from the discrete time \(\mathbb{N}\) to the continuous time \(\mathbb{R}\) and each \(\rho \in \mathcal{P}_n\) shows, in addition to \(\alpha \in \Pi_n\), the time instants \(t_k\) when \(\Phi\) is computed (asynchronously). Thus \(\Phi^r(\mu, t) \in \mathbb{R}\) is the continuous time computation of the sequence \(\mu\), \(\Phi^0(\mu), \Phi^{0\alpha^1}(\mu), \ldots, \Phi^{0\ldots\alpha^k}(\mu), \ldots\) made in the following way: if \(t < t_0\) nothing is computed, if \(t \in [t_0, t_1)\), \(\Phi^0(\mu)\) is computed, if \(t \in [t_1, t_2)\), \(\Phi^{0\alpha^1}(\mu)\) is computed, \ldots, if \(t \in [t_k, t_{k+1})\), \(\Phi^{0\ldots\alpha^k}(\mu)\) is computed, \ldots

When \(\alpha\) runs in \(\Pi_n\) and \((t_k)\) runs in \(\text{Seq}\) we get the 'unbounded delay model' of computation of the Boolean function \(\Phi\) represented in discrete time by the sequences \(\mu\), \(\Phi^0(\mu), \Phi^{0\alpha^1}(\mu), \ldots, \Phi^{0\ldots\alpha^k}(\mu), \ldots\) and in continuous time by the orbits \(\Phi^r(\mu, t)\) respectively. We shall not insist on the non-formalized way that the engineers describe this model; we just mention that the 'unbounded delay model' is a reasonable way of starting the analysis of a circuit in which the delays occurring in the computation of the Boolean functions \(\Phi\) are arbitrary positive numbers. If we restrict suitably the ranges of \(\alpha\) and \((t_k)\) we get the 'bounded delay model' of computation of \(\Phi\) and if both \(\alpha\), \((t_k)\) are fixed, then we obtain the 'fixed delay model' of computation of \(\Phi\), determinism.

**Theorem 5** Let \(\alpha \in \Pi_n, (t_k) \in \text{Seq}\) be arbitrary and the function \(\rho(t) = \alpha^0\chi(t_0)(t) \oplus \alpha^1\chi(t_1)(t) \oplus \ldots \oplus \alpha^k\chi(t_k)(t) \oplus \ldots, \rho \in \mathcal{P}_n\). The following statements are true:

a) \(\{\alpha^k|k \geq k_1\} \in \Pi_n\) for any \(k_1 \in \mathbb{N}\);

b) \((t_k) \cap (t', \infty) \in \text{Seq}\) for any \(t' \in \mathbb{R}\);

c) \(\rho\chi(t', \infty) \in \mathcal{P}_n\) for any \(t' \in \mathbb{R}\);

d) \(\forall \mu \in \mathcal{B}^n, \forall \mu' \in \mathcal{B}^n, \forall t' \in \mathbb{R}, \Phi^r(\mu, t') = \mu' \implies \forall t \geq t', \Phi^r(\mu, t) = \Phi^{\rho\chi(t', \infty)}(\mu', t).

**Proof.** a) If \(\{k|k \in \mathbb{N}, \alpha^k_i = 1\}\) is infinite, then \(\{k|k \geq k_1, \alpha^k_i = 1\}\) is also infinite, \(\forall i \in \{1, \ldots, n\}\).

b) If \(t_0 < t_1 < t_2 < \ldots\) is unbounded from above, then any sequence of the form \(t_{k_1} < t_{k_1+1} < t_{k_1+2} < \ldots\) is unbounded from above, \(k_1 \in \mathbb{N}\).

c) This is a consequence of a) and b).

d) We presume that \(t' < t_0\). In this situation \(\mu = \mu', \rho = \rho\chi(t', \infty)\) and the statement is obvious, so that we may assume now that \(t' \geq t_0\). In this case, some \(k_1 \in \mathbb{N}\) exists with \(t' \in [t_{k_1}, t_{k_1+1})\) and \(\mu' = \Phi^{0\ldots\alpha^1_{k_1}}(\mu)\).

Because

\[
\rho\chi(t', \infty)(t) = \alpha^{k_1+1}\chi(t_{k_1+1})(t) \oplus \alpha^{k_1+2}\chi(t_{k_1+2})(t) \oplus \ldots,
\]

\[
\Phi^{\rho\chi(t', \infty)}(\mu', t) = \mu'\chi(-\infty, t_{k_1+1})(t) \oplus \Phi^{\alpha^{k_1+1}}(\mu') \chi(t_{k_1+1}, t_{k_1+2})(t) \oplus \Phi^{\alpha^{k_1+2}}(\mu') \chi(t_{k_1+2}, t_{k_1+3})(t) \oplus \ldots
\]
we get
\[
\forall t \in [t', t_{k_1+1}],
\]
\[
\Phi^\rho(\mu, t) = \Phi^{\alpha_0 \ldots \alpha_{k_1}}(\mu),
\]
\[
\Phi^{\rho\chi}(\mu', t) = \mu' = \Phi^{\alpha_0 \ldots \alpha_{k_1}}(\mu);
\]
\[
\forall t \in [t_{k_1+1}, t_{k_1+2}],
\]
\[
\Phi^\rho(\mu, t) = \Phi^{\alpha_0 \ldots \alpha_{k_1} \alpha_{k_1+1}}(\mu),
\]
\[
\Phi^{\rho\chi}(\mu', t) = \Phi^{\alpha_{k_1+1}}(\mu') = \Phi^{\alpha_{k_1+1}}(\Phi^{\alpha_0 \ldots \alpha_{k_1}}(\mu)) = \Phi^{\alpha_0 \ldots \alpha_{k_1} \alpha_{k_1+1}}(\mu);
\]

... The statement of the Theorem holds.

**Theorem 6** Let be \( \mu \in \mathbf{B}_n, \rho \in \mathbf{P}_n \) and \( \tau \in \mathbf{R} \). The function \( \rho'(t) = \rho(t - \tau) \) is progressive and we have \( \Phi^{\rho'}(\mu, t) = \Phi^{\rho}(\mu, t - \tau) \).

**Proof.** We put \( \rho \) under the form
\[
\rho(t) = \alpha^0 \chi\{t_0\}(t) \oplus \ldots \oplus \alpha^k \chi\{t_k\}(t) \oplus ..., \]
\( \alpha \in \Pi_n, (t_k) \in \text{Seq} \) and we note that
\[
\rho'(t) = \rho(t - \tau) = \alpha^0 \chi\{t_0+\tau\}(t) \oplus \ldots \oplus \alpha^k \chi\{t_k+\tau\}(t) \oplus ...
\]
where \( (t_k + \tau) \in \text{Seq} \). We infer
\[
\Phi^{\rho'}(\mu, t) = \mu \chi(-\infty, t_0+\tau)(t) \oplus \Phi^{\alpha^0}(\mu) \chi\{t_0+\tau, t_1+\tau\}(t) \oplus ...
\]
\[
\ldots \oplus \Phi^{\alpha^0 \ldots \alpha^k}(\mu) \chi\{t_k+\tau, t_{k+1}+\tau\}(t) \oplus ... = \Phi^{\rho}(\mu, t - \tau).
\]

**Definition 7** The **universal regular autonomous asynchronous system** that is generated by \( \Phi : \mathbf{B}_n \rightarrow \mathbf{B}_n \) is by definition \( \Xi_\Phi = \{ \Phi^\rho(\mu, \cdot) | \mu \in \mathbf{B}_n, \rho \in \mathbf{P}_n \} \); any \( x(t) = \Phi^\rho(\mu, t) \) is called **state** (of \( \Xi_\Phi \)), \( \mu \) is called **initial value** (of \( x \)), or **initial state** (of \( \Xi_\Phi \)) and \( \Phi \) is called **generator function** (of \( \Xi_\Phi \)).

**Remark 8** The asynchronous systems are non-deterministic in general, due to the uncertainties that occur in the modeling of the asynchronous circuits. Non-determinism is produced, in the case of \( \Xi_\Phi \), by the fact that the initial state \( \mu \) and the way \( \rho \) of iterating \( \Phi \) are not known.
Definition 9 Let $v : \mathbb{N} \to \mathbb{B}^n, x : \mathbb{R} \to \mathbb{B}^n$ be some functions. If $\exists k' \in \mathbb{N}, \forall k \geq k', v(k) = v(k')$, we say that the limit $\lim_{k \to \infty} v(k)$ exists and we use the notation $\lim_{k \to \infty} v(k) = v(k')$. Similarly, if $\exists t' \in \mathbb{R}, \forall t \geq t', x(t) = x(t')$, we say that the limit $\lim_{t \to \infty} x(t)$ exists and we denote $\lim_{t \to \infty} x(t) = x(t')$. Sometimes $\lim_{k \to \infty} v(k), \lim_{t \to \infty} x(t)$ are called the final values of $v, x$.

Theorem 10 [7] $\forall \mu \in \mathbb{B}^n, \forall \mu' \in \mathbb{B}^n, \forall \rho \in P_n, \lim_{t \to \infty} \Phi_\rho(\mu, t) = \mu' \implies \Phi_\rho(\mu') = \mu'$, if the final value of $\Phi_\rho(\mu, \cdot)$ exists, it is a fixed point of $\Phi$.

Proof. Let $\mu \in \mathbb{B}^n, \mu' \in \mathbb{B}^n, \rho \in P_n$ be arbitrary and fixed. The hypothesis states the existence of $t' \in \mathbb{R}$ with

$$\forall t \geq t', \Phi_\rho(\mu, t) = \mu'$$

thus, from Theorem 5(d),

$$\forall t \geq t', \Phi_\rho^{x(t', \infty)}(\mu', t) = \mu'.$$

We infer that $\forall i \in \{1, \ldots, n\}, \exists t'' > t'$ such that

$$\rho_i(t'') = \rho_i(\chi_{(t', \infty)}(t'')) = 1,$$

$$\Phi_i^{x(\infty)}(\mu', t'') = \Phi_i(\mu') = \mu'_i.$$

Theorem 11 [7] $\forall \mu \in \mathbb{B}^n, \forall \mu' \in \mathbb{B}^n, \forall \rho \in P_n, (\Phi(\mu') = \mu' \text{ and } \exists t' \in \mathbb{R}, \Phi_\rho(\mu, t') = \mu') \implies \forall t \geq t', \Phi_\rho(\mu, t) = \mu'$, meaning that if the fixed point $\mu'$ of $\Phi$ is accessible, then it is the final value of $\Phi_\rho(\mu, \cdot)$.

Proof. Let $\mu \in \mathbb{B}^n, \mu' \in \mathbb{B}^n, \rho \in P_n$ be arbitrary and fixed. From the hypothesis and Theorem 5(d) we infer

$$\forall t \geq t', \Phi_\rho(\mu, t) = \Phi_\rho^{x(t', \infty)}(\mu', t)$$

thus $\forall i \in \{1, \ldots, n\}, \exists \varepsilon > 0, \forall t \in [t', t' + \varepsilon], \Phi_i^{x(t', \infty)}(\mu', t)$ can take one of the values $\mu'_i$ and $\Phi_i(\mu')$. But $\mu'_i = \Phi_i(\mu')$, wherefrom the previous property takes place for arbitrary $\varepsilon$ and

$$\forall t \geq t', \Phi_\rho(\mu, t) = \mu'.$$

Corollary 12 $\forall \mu \in \mathbb{B}^n, \forall \rho \in P_n, \Phi(\mu) = \mu \implies \forall t \in \mathbb{R}, \Phi_\rho(\mu, t) = \mu$.

Proof. From Theorem 11 with $\mu = \mu'$, where $t'$ may be chosen such that $\forall t < t', \rho(t) = 0$. 
Figure 2: \( \exists \rho \in P_2, \omega_\rho((1,0)) = \{(0,0), (0,1)\} \) and \( \exists \rho' \in P_2, \omega_{\rho'}((1,0)) = \{(1,1)\} \)

4 \( \omega \)-limit sets

**Definition 13** For \( \mu \in B^n \) and \( \rho \in P_n \), the set \( \omega_\rho(\mu) = \{\mu' | \mu' \in B^n, \exists (t_k) \in Seq, \lim_{k \to \infty} \Phi^\rho(\mu, t_k) = \mu' \} \) is called the \( \omega \)-limit set of the orbit \( \Phi^\rho(\mu, \cdot) \).

**Remark 14** The previous definition agrees with the usual definitions of the \( \omega \)-limit sets of the real time or discrete time dynamical systems see [2] page 5, [5] page 26, [1] page 20.

**Example 15** In Figure 2, we consider

\[
\rho(t) = (1,1)\chi_{(0)}(t) \oplus (0,1)\chi_{(1)}(t) \oplus (1,1)\chi_{(2)}(t) \oplus (0,1)\chi_{(3)}(t) \oplus \ldots,
\]

\[
\rho'(t) = (1,1)\chi_{(0)}(t) \oplus (1,1)\chi_{(1)}(t) \oplus (1,1)\chi_{(2)}(t) \oplus \ldots
\]

and we have

\[
\Phi^\rho((1,0), t) = (1,0)\chi_{(-\infty,0)}(t) \oplus (0,0)\chi_{[0,1)}(t) \oplus (0,1)\chi_{[1,2)}(t) \oplus (0,0)\chi_{[2,3)}(t) \oplus (0,1)\chi_{[3,4)}(t) \oplus \ldots,
\]

\[
\Phi^\rho'((1,0), t) = (1,0)\chi_{(-\infty,0)}(t) \oplus (0,0)\chi_{[0,1)}(t) \oplus (1,1)\chi_{[1,\infty)}(t),
\]

thus \( \omega_\rho((1,0)) = \{(0,0), (0,1)\} \), \( \omega_{\rho'}((1,0)) = \{(1,1)\} \).

**Theorem 16** For any \( \mu \in B^n \) and any \( \rho \in P_n \), we have:

a) \( \omega_\rho(\mu) \neq \emptyset \);

b) \( \forall t' \in \mathbb{R}, \omega_\rho(\mu) \subset \{\Phi^\rho(\mu, t) | t \geq t'\} \subset Or_{\rho}(\mu) \);

c) \( \exists t' \in \mathbb{R}, \omega_\rho(\mu) = \{\Phi^\rho(\mu, t) | t \geq t'\} \) and any \( t'' \geq t' \) fulfills \( \omega_\rho(\mu) = \{\Phi^\rho(\mu, t) | t \geq t''\} \);

d) \( \forall t' \in \mathbb{R}, \forall t'' \geq t', \{\Phi^\rho(\mu, t) | t \geq t'\} = \{\Phi^\rho(\mu, t) | t \geq t''\} \) implies \( \omega_\rho(\mu) = \{\Phi^\rho(\mu, t) | t \geq t''\} \);

e) we presume that \( \omega_\rho(\mu) = \{\Phi^\rho(\mu, t) | t \geq t'\} \), \( t' \in \mathbb{R} \). Then \( \forall \mu' \in \omega_\rho(\mu), \forall t'' \geq t', \Phi^\rho(\mu, t'') = \mu' \) we get \( \omega_\rho(\mu) = \{\Phi^{\rho \chi_{[t'', \infty)}}(\mu', t) | t \geq t''\} = Or_{\rho \chi_{[t'', \infty)}}(\mu') = \omega_{\rho \chi_{[t'', \infty)}}(\mu') \).

8
Proof. We put $\rho(t) = \alpha^0 \chi(t_0)(t) + \ldots + \alpha^k \chi(t_k)(t) + \ldots$

where $\alpha \in \Pi_n$ and $(t_k) \in Seq$. We ask, without losing the generality, that $\alpha^0 = (0, \ldots, 0) \in B^n$, hence $\Phi^\rho(\mu, t_0) = \mu$ and $Or_\rho(\mu) = \{\Phi^\rho(\mu, t_k) | k \in N\}$.

a) If $Or_\rho(\mu) = \{\mu^1, \ldots, \mu^p\}, p \in \{1, \ldots, 2^n\}$, we denote with $I_1, \ldots, I_p \subset N$ the sets

$I_j = \{k | k \in N, \Phi^\rho(\mu, t_k) = \mu^j\}, j = 1, \ldots, p$.

Because $I_1 \cup \ldots \cup I_p = N$, some of these sets are infinite, let them be without losing the generality $I_1, \ldots, I_{p'}, p' \leq p$. We infer $\omega_\rho(\mu) = \{\mu^1, \ldots, \mu^{p'}\}$.

b) For $t' \in R$, we define

$k_1 = \begin{cases} 0, t' < t_0 \\ k, t' \in [t_k, t_{k+1}] \end{cases}$

and we obtain

$\omega_\rho(\mu) = \{\mu^1, \ldots, \mu^{p'}\} = \{\Phi^\rho(\mu, t_k) | k \in I_1 \cup \ldots \cup I_{p'}\}$

$= \{\Phi^\rho(\mu, t_k) | k \in (I_1 \cup \ldots \cup I_{p'}) \cap [k_1, \infty)\}$

$\subset \{\Phi^\rho(\mu, t_k) | k \in (I_1 \cup \ldots \cup I_p) \cap [k_1, \infty)\} = \{\Phi^\rho(\mu, t) | t \geq t'\}$

$c) \text{If} p' = p, \text{then} \forall t' \in R, \omega_\rho(\mu) = \{\Phi^\rho(\mu, t) | t \geq t'\} = Or_\rho(\mu)$

from b) and the property holds, thus we can assume that $p' < p$. In this case we define

$k'' = \min\{k | k \in N, \forall k' \geq k, k' \in I_1 \cup \ldots \cup I_{p'}\}$

$= 1 + \max(I_{p'+1} \cup \ldots \cup I_p)$

for which we have

$(I_{p'+1} \cup \ldots \cup I_p) \cap [k'', \infty) = \emptyset$

and $t' = t_{k''}$ fulfills

$\omega_\rho(\mu) = \{\mu^1, \ldots, \mu^{p'}\} = \{\Phi^\rho(\mu, t_k) | k \in I_1 \cup \ldots \cup I_{p'}\}$

$= \{\Phi^\rho(\mu, t_k) | k \in (I_1 \cup \ldots \cup I_{p'}) \cap [k'', \infty)\}$

$= \{\Phi^\rho(\mu, t_k) | k \in (I_1 \cup \ldots \cup I_p) \cap [k'', \infty)\} = \{\Phi^\rho(\mu, t) | t \geq t'\};$
any $t'' \geq t'$ gives

$$\omega_{\rho}(\mu)^{b)} \subset \{ \Phi_{\rho}(\mu, t)| t \geq t'' \} \subset \{ \Phi_{\rho}(\mu, t)| t \geq t' \} = \omega_{\rho}(\mu).$$

d) Let be $t' \in \mathbb{R}$ such that $\forall t'' \geq t'$,

$$\{ \Phi_{\rho}(\mu, t)| t \geq t' \} = \{ \Phi_{\rho}(\mu, t)| t \geq t'' \}$$

and we claim that in this case we have

$$\forall \mu' \in \{ \Phi_{\rho}(\mu, t)| t \geq t' \}, \exists (t'_k) \in Seq, \forall k \in \mathbb{N}, \Phi_{\rho}(\mu, t'_k) = \mu'. \quad (3)$$

We assume against all reason that (3) is false, meaning that

$$\exists \mu' \in \{ \Phi_{\rho}(\mu, t)| t \geq t' \}, \text{ the set } \{ t_k | k \in \mathbb{N}, \Phi_{\rho}(\mu, t_k) = \mu' \} \text{ is finite.}$$

Then $\exists t'' > \max\{ \max\{ t_k | k \in \mathbb{N}, \Phi_{\rho}(\mu, t_k) = \mu' \}, t' \}$ that fulfills $\mu' \in \{ \Phi_{\rho}(\mu, t)| t \geq t' \} \setminus \{ \Phi_{\rho}(\mu, t)| t \geq t'' \}$, contradiction with (2). The truth of (3) shows that $\mu' \in \omega_{\rho}(\mu)$, i.e. $\{ \Phi_{\rho}(\mu, t)| t \geq t' \} \subset \omega_{\rho}(\mu)$. For all $t'' \geq t'$ we have then

$$\omega_{\rho}(\mu)^{b)} \subset \{ \Phi_{\rho}(\mu, t)| t \geq t'' \} = \{ \Phi_{\rho}(\mu, t)| t \geq t' \} \subset \omega_{\rho}(\mu).$$

e) We note that for $t'' \geq t'$ and $\Phi_{\rho}(\mu, t'') = \mu'$ we can write

$$\omega_{\rho}(\mu) = \{ \Phi_{\rho}(\mu, t)| t \geq t' \} \supseteq \{ \Phi_{\rho}(\mu, t)| t \geq t'' \}$$

The fact that $\forall t''' \geq t''$,

$$\{ \Phi_{\rhoX(t'', \infty)}(\mu', t)| t \geq t''' \} \supseteq \{ \Phi_{\rho}(\mu, t)| t \geq t'' \} \supseteq \{ \Phi_{\rho}(\mu, t)| t \geq t' \}$$

shows, by taking into account d), that

$$\{ \Phi_{\rhoX(t'', \infty)}(\mu', t)| t \geq t''' \} = \omega_{\rhoX(t'', \infty)}(\mu').$$

\[\quad\]

**Remark 17** If in Theorem 10 e) we take $t'' \in \mathbb{R}$ arbitrarily, the equation

$$\omega_{\rho}(\mu) = \omega_{\rhoX(t'', \infty)}(\Phi_{\rho}(\mu, t'')) \quad (4)$$

is still true. Indeed, for sufficiently great $t'''$, the terms in (4) are equal with

$$\{ \Phi_{\rho}(\mu, t)| t \geq t''' \} = \{ \Phi_{\rhoX(t'', \infty)}(\Phi_{\rho}(\mu, t''), t)| t \geq t''' \}.$$
Theorem 18. For arbitrary \( \mu \in \mathbb{B}^n, \rho \in P_n \) the following statements are true:

a) \( \lim_{t \to \infty} \Phi^\rho(\mu, t) \) exists \( \iff \text{card}(\omega_\rho(\mu)) = 1; \)

b) if \( \exists \mu' \in \mathbb{B}^n, \omega_\rho(\mu) = \{\mu'\}, \) then \( \lim_{t \to \infty} \Phi^\rho(\mu, t) = \mu' \) and \( \Phi(\mu') = \mu'; \)

c) if \( \exists \mu' \in \mathbb{B}^n, \Phi(\mu) = \mu' \) and \( \mu' \in \text{Or}_\rho(\mu), \) then \( \omega_\rho(\mu) = \{\mu'\}. \)

Proof. a) Let \( \mu \in \mathbb{B}^n, \rho \in P_n \) be arbitrary. We get

\[
\lim_{t \to \infty} \Phi^\rho(\mu, t) \text{ exists } \iff \exists \mu' \in \mathbb{B}^n, \exists t' \in \mathbb{R}, \forall t \geq t', \Phi^\rho(\mu, t) = \mu'
\]

\[
\iff \exists \mu' \in \mathbb{B}^n, \exists t' \in \mathbb{R}, \{\Phi^\rho(\mu, t)|t \geq t'\} = \{\mu'\}
\]

\[
\iff \exists \mu' \in \mathbb{B}^n, \omega_\rho(\mu) = \{\mu'\} \iff \text{card}(\omega_\rho(\mu)) = 1.
\]

b) We assume that \( \exists \mu' \in \mathbb{B}^n, \omega_\rho(\mu) = \{\mu'\}, \) i.e. \( \exists \mu' \in \mathbb{B}^n, \exists t' \in \mathbb{R}, \{\Phi^\rho(\mu, t)|t \geq t'\} = \{\mu'\} \) in other words \( \lim_{t \to \infty} \Phi^\rho(\mu, t) = \mu'. \) The fact that \( \Phi(\mu') = \mu' \) results from Theorem 10.

c) This is a consequence of Theorem 11. □

Theorem 19. Let be \( \mu \in \mathbb{B}^n, \rho \in P_n, \tau \in \mathbb{R} \). The function \( \rho' \in P_n, \rho'(t) = \rho(t - \tau) \) fulfills \( \omega_\rho(\mu) = \omega_{\rho'}(\mu). \)

Proof. We use Theorem 6 and we infer the existence of \( t' \in \mathbb{R} \) such that

\[
\omega_\rho(\mu) = \{\Phi^\rho(\mu, t)|t \geq t'\} = \{\Phi^\rho(\mu, t - \tau)|t - \tau \geq t'\}
\]

\[
= \{\Phi^\rho(\mu, t)|t \geq t' + \tau\} = \omega_{\rho'}(\mu).
\]

□

5 P-invariant and n-invariant sets

Theorem 20. We consider the function \( \Phi : \mathbb{B}^n \to \mathbb{B}^n \) and let be the set \( A \in P^*(\mathbb{B}^n) \). For any \( \mu \in A \), the following properties are equivalent

\[
\exists \rho \in P_n, \text{Or}_\rho(\mu) \subset A,
\]

\( (5) \)

\[
\exists \rho \in P_n, \forall t \in \mathbb{R}, \Phi^\rho(\mu, t) \in A,
\]

\( (6) \)

\[
\exists \alpha \in \Pi_n, \forall k \in \mathbb{N}, \Phi^{\alpha_{\cdots \cdots}^k}(\mu) \in A
\]

\( (7) \)

and the following properties are also equivalent

\[
\forall \rho \in P_n, \text{Or}_\rho(\mu) \subset A,
\]

\( (8) \)

\[
\forall \rho \in P_n, \forall t \in \mathbb{R}, \Phi^\rho(\mu, t) \in A,
\]

\( (9) \)

\[
\forall \alpha \in \Pi_n, \forall k \in \mathbb{N}, \Phi^{\alpha_{\cdots \cdots}^k}(\mu) \in A,
\]

\( (10) \)

\[
\forall \lambda \in \mathbb{B}^n, \Phi^\lambda(\mu) \in A.
\]

(11)
Remark 22 In the previous terminology, the letter 'p' comes from 'possibly' and the letter 'n' comes from 'necessarily'. Both 'p' and 'n' refer to the quantification of $\rho$. Such kind of p-definitions and n-definitions recalling logic are caused by the fact that we translate 'real' concepts into 'binary' concepts and the former have no $\rho$ parameters, thus after translation $\rho$ may appear quantified in two ways. The obvious implication is $n$-invariance $\implies$ p-invariance.

Example 23 Let $\Phi : B^2 \to B^2$ be defined by $\forall \mu \in B^2, \Phi(\mu_1, \mu_2) = (\overline{\mu_1}, \overline{\mu_2})$ and $\rho(t) = (1, 1) \cdot \chi_{(0,1,2,...)}(t)$. The set $A = \{(0, 1), (1, 0)\}$ fulfills $\forall \mu \in A, \forall t \in R, \Phi^\rho(\mu, t) \in A$ i.e. it satisfies (6):

$$\Phi^\rho((0, 1), t) = (0, 1) \cdot \chi_{(\infty, 0)}(t) \oplus (1, 0) \cdot \chi_{(0,1)}(t) \oplus (0, 1) \cdot \chi_{(1,2)}(t) \oplus ...$$

$$\Phi^\rho((1, 0), t) = (1, 0) \cdot \chi_{(\infty, 0)}(t) \oplus (0, 1) \cdot \chi_{(0,1)}(t) \oplus (0, 1) \cdot \chi_{(1,2)}(t) \oplus ...$$

see Figure 3. $A = \{(0, 0), (1, 1)\}$ satisfies the same invariance property.
Figure 3: The sets \{ (0,1), (1,0) \} and \{ (0,0), (1,1) \} are p-invariant.

Figure 4: The sets \{ (0,0), (0,1) \} and \{ (1,0), (1,1) \} are n-invariant.

Example 24 We define the function \( \Phi : B^2 \rightarrow B^2 \) by \( \forall \mu \in B^2, \Phi(\mu_1, \mu_2) = (\mu_1, \overline{\mu_2}) \), see Figure 4. We notice that the sets \( A = \{ (0,0), (0,1) \} \) and \( A = \{ (1,0), (1,1) \} \) are n-invariant, as they fulfill \( \forall \mu \in A, \forall \rho \in P_2, \text{Or}_\rho(\mu) = A \).

Theorem 25 Let be \( \mu \in B^n \) and \( \rho' \in P_n \).

a) If \( \Phi(\mu) = \mu \), then \( \{ \mu \} \) is an n-invariant set and the set Eq of the fixed points of \( \Phi \) is also n-invariant;

b) the set \( \text{Or}_{\rho'}(\mu) \) is p-invariant and \( \bigcup_{\rho \in P_n} \text{Or}_\rho(\mu) \) is n-invariant;

c) the set \( \omega_{\rho'}(\mu) \) is p-invariant.

Proof. a) From Corollary 12 we have that
\( \forall \rho \in P_n, \forall t \in R, \Phi^\rho(\mu, t) = \mu \in \{ \mu \} \).

Furthermore, we infer \( \forall \mu' \in \text{Eq}, \forall \rho \in P_n, \forall t \in R, \)
\( \Phi^\rho(\mu', t) = \mu' \in \text{Eq} \).

b) Let be \( \mu' \in \text{Or}_{\rho'}(\mu) \), thus \( t' \in R \) exists such that \( \mu' = \Phi^{\rho'}(\mu, t') \).
Then \( \forall t \in R, \)
\( \Phi^{\rho' \cdot X(\nu, \infty)}(\mu', t) = \begin{cases} \Phi^{\rho'}(\mu, t), t > t' \\ \mu', t \leq t' \end{cases} \in \text{Or}_{\rho'}(\mu) \).

We have proved that \( \text{Or}_{\rho'}(\mu) \) is p-invariant.
We remark the equality
\[ \bigcup_{\rho \in P_n} Or_\rho(\mu) = \bigcup_{\alpha \in \Pi_n} \{ \Phi^{\alpha_0 \ldots \alpha_k}(\mu) | k \in \mathbb{N} \} \]
and let us take an arbitrary \( \mu' \in \bigcup_{\rho \in P_n} Or_\rho(\mu) \). If \( \mu' = \mu \) then the statement of the theorem is proved, thus we can assume that \( \mu' \neq \mu, \mu' = \Phi^{\alpha_0 \ldots \alpha_k}(\mu), \alpha_0, \ldots, \alpha_k \in B^n \). For any \( \rho'' \in P_n \),
\[ \rho'' = \beta^0 \cdot \chi(\{t'_0\}) \oplus \ldots \oplus \beta^k \cdot \chi(\{t'_k\}) \oplus \ldots \]
\( \beta \in \Pi_n, (t'_k) \in \text{Seq} \) and any \( t \in \mathbb{R} \), we have that \( \Phi^{\rho''}(\mu', t) \) is an element of the sequence \( \Phi^{\alpha_0 \ldots \alpha_k}(\mu), \Phi^{\alpha_0 \ldots \alpha_k \beta^0}(\mu), \ldots, \Phi^{\alpha_0 \ldots \alpha_k \beta^0 \ldots \beta^{k'}}(\mu), \ldots \) where \( \alpha_0, \ldots, \alpha_k, \beta_0, \ldots, \beta^{k'}, \ldots \in \Pi_n \). The conclusion is that \( \Phi^{\rho''}(\mu', t) \in \bigcup_{\rho \in P_n} Or_\rho(\mu) \).

c) This is a consequence of Theorem 16 e). ■

6 The basin of p-attraction and the basin of n-attraction

Theorem 26 We consider the set \( A \in P^*(B^n) \). For any \( \mu \in B^n \), the following statements are equivalent
\[ \exists \rho \in P_n, \omega_\rho(\mu) \subset A, \quad (13) \]
\[ \exists \rho \in P_n, \exists t' \in R, \forall t \geq t', \Phi^\rho(\mu, t) \in A, \quad (14) \]
\[ \exists \alpha \in \Pi_n, \exists k' \in \mathbb{N}, \forall k \geq k', \Phi^{\alpha_0 \ldots \alpha_k}(\mu) \in A \quad (15) \]
and the following statements are equivalent too
\[ \forall \rho \in P_n, \omega_\rho(\mu) \subset A, \quad (16) \]
\[ \forall \rho \in P_n, \exists t' \in R, \forall t \geq t', \Phi^\rho(\mu, t) \in A, \quad (17) \]
\[ \forall \alpha \in \Pi_n, \exists k' \in \mathbb{N}, \forall k \geq k', \Phi^{\alpha_0 \ldots \alpha_k}(\mu) \in A. \quad (18) \]

Proof. 13 \( \Rightarrow \) 14 We presume that 13 is true. Some \( t' \) exists with
\[ \omega_\rho(\mu) = \{ \Phi^\rho(\mu, t) | t \geq t' \} \]
and we conclude that \( \forall t \geq t' \),
\[ \Phi^\rho(\mu, t) \in \omega_\rho(\mu) \subset A. \]
As $t'' \in \mathbb{R}$ exists with
\[
\omega_\rho(\mu) = \{\Phi^\rho(\mu, t) | t \geq t''\},
\]
from the truth of (14) we have that
\[
\omega_\rho(\mu) \subset \{\Phi^\rho(\mu, t) | t \geq \max\{t', t''\}\} \subset A.
\]

Definition 27 The basin (or kingdom, or domain) of $p$-attraction or the $p$-stable set of the set $A \in P^*(B^n)$ is given by $\overline{W}(A) = \{\mu | \mu \in B^n, \exists \rho \in P_n, \omega_\rho(\mu) \subset A\}$; the basin (or kingdom, or domain) of $n$-attraction or the $n$-stable set of the set $A$ is given by $W(A) = \{\mu | \mu \in B^n, \forall \rho \in P_n, \omega_\rho(\mu) \subset A\}$.

Remark 28 Definition 27 makes use of the properties (13) and (16). We can make use also in this Definition of the other equivalent properties from Theorem 26.

In Definition 27, one or both basins of attraction $\overline{W}(A), W(A)$ may be empty.

Theorem 29 We have:
1) $\overline{W}(B^n) = W(B^n) = B^n$;
2) if $A \subset A'$, then $\overline{W}(A) \subset \overline{W}(A')$ and $W(A) \subset W(A')$ hold.

Definition 30 When $\overline{W}(A) \neq \emptyset$, $A$ is said to be $p$-attractive and for any non-empty set $B \subset \overline{W}(A)$, we say that $A$ is $p$-attractive for $B$ and that $B$ is $p$-attracted by $A$; $A$ is by definition partially $p$-attractive if $\overline{W}(A) \notin \{\emptyset, B^n\}$ and totally $p$-attractive whenever $\overline{W}(A) = B^n$.

The fact that $\overline{W}(A) \neq \emptyset$ makes us say that $A$ is $n$-attractive and in this situation for any non-empty $B \subset \overline{W}(A)$, $A$ is called $n$-attractive for $B$ and $B$ is called to be $n$-attracted by $A$; we use to say that $A$ is partially $n$-attractive if $\overline{W}(A) \notin \{\emptyset, B^n\}$ and totally $n$-attractive if $\overline{W}(A) = B^n$.

Example 31 We consider the system from Figure 5. The set $A = \{(0, 0, 0)\}$ is neither $p$-invariant, nor $n$-invariant: $\overline{W}(A) = W(A) = \emptyset$.

The set $A = \{(0, 0, 0), (1, 1, 0), (1, 1, 1)\}$ is $p$-invariant but not $n$-invariant: $\overline{W}(A) = B^3 \setminus \{(0, 0, 1)\}$, $W(A) = \{(0, 0, 0), (0, 1, 0), (1, 0, 0), (1, 1, 0), (1, 1, 1)\}$.

We take $A = \{(1, 1, 0), (1, 1, 1), (0, 0, 1)\}$ which is both $p$-invariant and $n$-invariant. $A$ is totally $p$-attractive, $\overline{W}(A) = B^3$ and it is not totally $n$-attractive, since $\overline{W}(A) = B^3 \setminus \{(0, 1, 1), (1, 0, 1)\}$.

The set $A = \{(1, 1, 0), (1, 1, 1), (0, 1, 1), (0, 0, 1), (1, 0, 1)\}$ is $p$-invariant, $n$-invariant, totally $p$-attractive and totally $n$-attractive because $\overline{W}(A) = W(A) = B^3$.
Example 32  The set $B^*$ is totally $p$-attractive and totally $n$-attractive (Theorem 29 i)).

Theorem 33  Let $A \in P^*(B^n)$ be some set. If $A$ is $p$-invariant, then $A \subset W(A)$ and $A$ is also $p$-attractive; if $A$ is $n$-invariant, then $A \subset W(A)$ and $A$ is also $n$-attractive.

Proof. Let $\mu \in A$ be arbitrary. The existence of $\rho \in P_n$ such that $\text{Or}_{\rho}(\mu) \subset A$ (from the $p$-invariance of $A$) and the inclusion $\omega_{\rho}(\mu) \subset \text{Or}_{\rho}(\mu)$ show that $\omega_{\rho}(\mu) \subset A$, thus $\mu \in \overline{W}(A)$. As $\mu$ was arbitrary, we get that $A \subset \overline{W}(A)$ and finally that $\overline{W}(A) \neq \emptyset$. $A$ is $p$-attractive. 

Remark 34  The previous Theorem shows the connection that exists between invariance and attractiveness. If $A$ is $p$-attractive, then $\overline{W}(A)$ is the greatest set that is $p$-attracted by $A$ and the point is that this really happens when $A$ is $p$-invariant. The other situation is dual.

Theorem 35  Let be $A \in P^*(B^n)$. If $A$ is $p$-attractive, then $\overline{W}(A)$ is $p$-invariant and if $A$ is $n$-attractive, then $\overline{W}(A)$ is $n$-invariant.

Proof. If $A$ is $p$-attractive then $\overline{W}(A) \neq \emptyset$ and we prove that $\overline{W}(A)$ is $p$-invariant. Let $\mu \in \overline{W}(A)$ be arbitrary and fixed. From the definition of $\overline{W}(A)$ some $\rho \in P_n$ exists with the property that $\omega_{\rho}(\mu) \subset A$. We show that

$$\forall t' \in \mathbb{R}, \Phi^\rho(\mu, t') \in \overline{W}(A),$$

i.e.

$$\forall t' \in \mathbb{R}, \exists \rho' \in P_n, \omega_{\rho'}(\Phi^\rho(\mu, t')) \subset A.$$ 

Indeed, we fix arbitrarily some $t' \in \mathbb{R}$. With

$$\rho' = \rho_{X(t', \infty)}$$

we can write, from Remark 17 equation (4) that

$$\omega_{\rho'}(\Phi^\rho(\mu, t')) = \omega_{\rho_{X(t', \infty)}}(\Phi^\rho(\mu, t')) = \omega_{\rho}(\mu) \subset A.$$
We prove now that \( W(A) \), which is non-empty from the n-attractiveness of \( A \), is also n-invariant. The property
\[
\forall \mu' \in W(A), \forall \rho' \in \mathcal{P}_n, Or_{\rho'}(\mu') \subset W(A),
\]
that is equivalent with
\[
\forall \mu' \in W(A), \forall \rho' \in \mathcal{P}_n, \forall \mu'' \in Or_{\rho'}(\mu'), \mu'' \in W(A)
\]
and with
\[
\forall \mu' \in \mathcal{B}_n, \forall \rho \in \mathcal{P}_n, \omega_{\rho}(\mu') \subset A \implies \forall \rho' \in \mathcal{P}_n, \forall \rho'' \in \mathcal{P}_n, \omega_{\rho''}(\mu') \subset A,
\]
means the following. Let \( \mu' \in \mathcal{B}_n \) and \( \rho'' \in \mathcal{P}_n \) be arbitrary and fixed. The hypothesis states that for any
\[
\rho = \alpha^0 \cdot \chi_{\{t_0\}} \oplus ... \oplus \alpha^k \cdot \chi_{\{t_k\}} \oplus ...
\]
\( \alpha \in \Pi_n, (t_k) \in \text{Seq} \) we have
\[
\exists k_1 \in \mathbb{N}, \{ \Phi_{\alpha^0 ... \alpha^k}(\mu') | k \geq k_1 \} (= \omega_{\rho}(\mu')) \subset A. \quad (19)
\]
We consider arbitrarily the function \( \rho' \in \mathcal{P}_n, \)
\[
\rho' = \alpha^0 \cdot \chi_{\{t'_0\}} \oplus ... \oplus \alpha^k \cdot \chi_{\{t'_k\}} \oplus ...
\]
\( \alpha' \in \Pi_n, (t'_k) \in \text{Seq} \) and the point \( \mu'' \in Or_{\rho'}(\mu') \), thus \( k' \in \mathbb{N} \) exists with the property
\[
\mu'' = \Phi_{\alpha^0 ... \alpha^{k'}}(\mu').
\]
We put \( \rho'' \) under the form
\[
\rho'' = \alpha'^0 \cdot \chi_{\{t''_0\}} \oplus ... \oplus \alpha'^k \cdot \chi_{\{t''_k\}} \oplus ...
\]
\( \alpha'' \in \Pi_n, (t''_k) \in \text{Seq} \). The sequence
\[
\Phi_{\alpha'^0 ... \alpha'^{k'}}(\mu'') = \Phi_{\alpha'^0 ... \alpha'^{k'}}(\Phi_{\alpha^0 ... \alpha^{k'}}(\mu')) = \Phi_{\alpha'^0 ... \alpha'^{k'} \alpha^{k+1} ... \alpha^{k'}}(\mu'),
\]
k \( \in \mathbb{N} \) fulfills the property \( (19) \), thus
\[
\exists k_2 \in \mathbb{N}, \{ \Phi_{\alpha'^0 ... \alpha'^{k'}}(\mu'') | k \geq k_2 \} (= \omega_{\rho''}(\mu'')) \subset A.
\]

\[\Box\]

**Corollary 36** If the set \( A \in P^*(\mathcal{B}_n) \) is p-invariant, then \( W(A) \) is p-invariant and if \( A \) is n-invariant, then the basin of n-attraction \( W(A) \) is n-invariant.

**Proof.** These result from Theorem \ref{thm33} and Theorem \ref{thm35} \[\Box\]
7 Discussion

Some notes on the terminology:
- universality means the greatest in the sense of inclusion. Any $X \subset \Xi$ is a system, but we did not study such systems in the present paper;
- regularity means the existence of a generator function $\Phi$, i.e. analogies with the dynamical systems theory;
- autonomy means here that no input exists. We mention the fact that autonomy has another non-equivalent definition also, a system is called autonomous if its input set has exactly one element;
- asynchronicity refers (vaguely) to the fact that we work with real time and binary values. Its antonym synchronicity means that 'discrete time' (and binary values) in which the iterates of $\Phi$ are: $\Phi^0, \Phi^0 \circ \Phi, \ldots, \Phi^0 \circ \ldots \circ \Phi, \ldots$ i.e. in the sequence $\Phi^0(x), \Phi^0 \circ \Phi^0(x), \ldots, \Phi^0 \circ \ldots \circ \Phi^0(x), \ldots$ all $\alpha^k$ are $(1, \ldots, 1), k \in \mathbb{N}$. That is the discrete time of the dynamical systems.

Our concept of invariance from Definition 21 reproduces the point of view expressed in [4], page 11, where the dynamical system $S = (T, X, \Phi)$ is given, with $T = \mathbb{R}$ the time set, $X$ the state space and $\Phi : T \times X \to X$ the flow: the set $A \subset X$ is said to be invariant for the system $S$ if $\forall x \in A, \forall t \in T, \Phi_t(x) \in A$. This idea coincides with the one from [5], page 27 where the state space $X$ is a differentiable manifold $M$.

In [3], page 92 the set $A \subset X$ is called globally invariant via $\Phi$ if $\forall t \in T, \Phi_t(A) = A$, recalling the situation of Example 24 and Figure 4. In [6], page 3, the global invariance and the invariance of $A \subset X$ are defined like at [3] and [4].

We mention also the definition of invariance from [11], page 19. Let $P = (T, X, \Phi)$ be a process, where $T = \mathbb{R}$, $X$ is the state space and $\Phi : T \times X \to X$ is the flow of $P$; we have denoted $T = \{(t', t) \mid t', t \in T, t \leq t'\}$. Then $A \subset X$ is invariant relative to $\Phi$ if $\Phi_{t', t}(A) \subset A$ for any $(t', t) \in T$. This last definition agrees itself with ours in the special case when $t' = 0$ but it is more general since it addresses systems which are not time invariant.

Stability is defined in [5], page 27 where $M$ is a differentiable manifold and the evolution operator $\Phi_t : M \to M, t \in T$ is given. The subset $A \subset M$ is stable for $\Phi$ if for any sufficiently small neighborhood $U$ of $A$ a neighborhood $V$ of $A$ exists such that $\forall x \in V, \forall t \geq 0, \Phi_t(x) \in U$. In our case when $M = \mathbb{B}^n$ has the discrete topology, $A \subset \mathbb{B}^n$ and $U = V = A$, this comes to the invariance of $A$.

In [4], page 16 the closed invariant set $A \subset X$ is called stable for $(T, X, \Phi)$ if i) for any sufficiently small neighborhood $U$ of $A$ there exists a neighborhood $V \supset A$ such that $\forall t > 0, \forall x \in V, \Phi_t(x) \in U$ and ii) there exists a neighborhood $W \supset A$ such that $\forall x \in W, \Phi_t(x) \to A$ as $t \to \infty$. We see that i) is the same request like at [5] and ii) brings nothing new.
(item i) means $Or_r(\mu) \subset A$, thus a stronger request than item ii) which is $\omega_r(\mu) \subset A$ in our case).

In a series of works ([5], page 27), either the set $A \subset M$ is called asymptotically stable if it is stable and attractive, where $M$ is a differentiable manifold, or ([3], page 112, [6], page 5) the fixed point $x_0 \in X$ is called asymptotically stable if it is stable and attractive. We interpret stability as invariance and stating that $A$ or $x_0$ is stable and attractive means that it is invariant and a weaker property than invariance takes place (see Theorem 33) and finally asymptotic stability means invariance too.

In [2], page 132 the statement is made that many times, in applications, by stability is understood attractiveness. This would mean, in the conditions of Theorem 33, weakening the invariance request and we cannot accept this point of view.

In literature, [2] defines at page 6 the basin of attraction of a chaotic attractor $A \subset X$ as the set of the points whose $\omega-$limit set is contained in $A$. This was reproduced at (13) and (16), where $A \in P^*(B^n)$ was considered arbitrary however.

The work [3] defines at page 124 the kingdom of attraction of an attractive set $A \subset X$ as the greatest set of points of $X$ whose dynamic ends (for $t \to \infty$) in $A$; when the kingdom of attraction is an open set, it is called basin of attraction. For us, all the subsets $A \subset B^n$ are open in the discrete topology of $B^n$.

In [3], page 123 the invariant set $A \subset X$ is called attractive set for $B \subset X$ if the distance between $A$ and $\Phi_t(B)$ tends to 0 for $t \to \infty$; a set $A$ is attractive if $B \neq \emptyset$ exists that is attracted by $A$. A slightly different idea is expressed in [6], page 4 where the invariant set $A$ is called attractive for $B$ if $\lim_{t \to \infty} \Phi_t(B) = A$. Unlike these definitions, in Definition 30 the set $A \subset B^n$ is not required to be invariant and the statement $B \subset \overline{W}(A)$ showing that $B$ is $p$-attracted by $A$, i.e. $\forall \mu \in B, \exists \rho \in P_n, \omega_r(\mu) \subset A$, reproduces the fact that the distance between $A$ and $\Phi_t(B)$ tends to 0 for $t \to \infty$.

In [5], page 27 $M$ is a differentiable manifold and the subset $A \subset M$ is called attractive for $\Phi$ if a neighborhood $U$ of $A$ exists such that $\forall x \in U, \lim_{t \to \infty} \Phi_t(x) \in A$; in this case we say that $U$ is attracted by $A$. We have reached (13), (16) and the requests of attractiveness $\overline{W}(A) \neq \emptyset, W(A) \neq \emptyset$ from Definition 30.

In [2], page 5 (Wiggins and Georgescu are cited) a closed invariant set $A \subset X$ is called attractive if a neighborhood $U$ of $A$ exists such that $\forall x \in U, \forall t \geq 0, \Phi_t(x) \in U$ and $\Phi_t(x) \to A$ when $t \to \infty$. Then the set $\bigcup_{t \leq 0} \Phi_t(U)$ is called the basin (the domain) of attraction of the set $A$. 

19
In [6], page 4 the open set $W(A) \subset X$ representing the greatest set of points of $X$ which is attracted by the attractive set $A$ is called basin of attraction. This definition represents exactly $\overline{W}(A)$ from Definition 30 in the circumstances that (Definition 27) the attractiveness of $A$ means that the previous sets are non-empty.

We have the definition of the basin of attraction from [5], page 27: the maximal set attracted by an attractor $A \subset X$ (invariant set, attractive for one of its neighborhoods) is called the kingdom of attraction of $A$; when the kingdom of attraction is an open set, it is called basin of attraction. We conclude, related with the real to binary translation of this definition, that if $A \in P^*(B^n)$ is $p$-invariant, then it is $p$-attractive for itself and thus an ‘attractor’; its basin of attraction $\overline{W}(A)$ is non-empty in this case and it is the maximal set attracted by $A$.

We note that the stable manifold of the equilibrium point $x_0 \in X$ is defined in [6], page 4 and [3], page 93 for the dynamical system $(T, X, \Phi)$ by $W(x_0) = \{x \in X | \lim_{t \to \infty} \Phi_t(x) = x_0\}$. In [4], page 46 the terminology of stable set is used for this concept and [6] mentions this terminology too. Thus, by replacing $x_0 \in X$ with $A \subset B^n$ and $\lim_{t \to \infty} \Phi_t(x) = x_0$ with $\omega_p(\mu) \subset A$ we get for $\overline{W}(A)$, $\overline{W}(A)$ the alternative terminology of stable sets (i.e. invariant sets) of $A$.
