Angular Distribution and CP Asymmetries in the Decays

\[ \bar{B} \to K^-\pi^+e^-e^+ \text{ and } \bar{B} \to \pi^-\pi^+e^-e^+ \]

Abstract

The short-distance Hamiltonian describing \( b \to s(d)e^-e^+ \) in the standard model is used to obtain the decay spectrum of \( \bar{B} \to K^-\pi^+e^-e^+ \) and \( \bar{B} \to \pi^-\pi^+e^-e^+ \), assuming the \( K\pi \) and \( \pi\pi \) systems to be the decay products of \( K^* \) and \( \rho \) respectively. Specific features calculated are (i) angular distribution of \( K^- \) (or \( \pi^- \)) in the \( K^-\pi^+(or \pi^-\pi^+) \) centre-of-mass (c.m.) frame; (ii) angular
distribution of $e^-$ in the $e^-e^+$ c.m. frame; and (iii) the correlation between the meson and lepton planes. We also derive CP-violating observables obtained by combining the above decays with the conjugate processes $B \rightarrow K^+\pi^-e^-e^+$ and $B \rightarrow \pi^-\pi^+e^-e^+$.

I. INTRODUCTION

The purpose of this paper is to investigate the angular distribution of the decays $\bar{B} \to K^-\pi^+e^-e^+$ and $\bar{B} \to \pi^-\pi^+e^-e^+$, when the $K\pi$ and $\pi\pi$ systems are the decay products of $K^*$ and $\rho$ respectively. The aim is to derive the detailed consequences of the effective short-distance Hamiltonian describing the four-fermion interaction $b \to s(d)e^-e^+$. This work may be regarded as an extension of previous studies of the exclusive processes $\bar{B} \to K^*(\rho)e^-e^+$ that were limited to the kinematical variables $s_l$ (the invariant mass of the lepton pair) and $\cos \theta_l$ (the angular distribution of $l^-$ in the $l^-l^+$ c.m. system). The additional information we provide is the distribution in $\cos \theta_P$, where $\theta_P$ is the angle of the $K^-(\pi^-)$ in the $K^-\pi^+(\pi^-\pi^+)$ c.m. frame, and the dependence on the angle $\phi$ between the $e^-e^+$ and $K^-\pi^+$ or $\pi^-\pi^+$ planes. This information is sensitive to the polarization state of the vector meson $K^*(\rho)$, and thus provides a new probe of the effective Hamiltonian.

An important aspect of the calculation is the prediction of CP-violating observables that can be obtained by combining information from $B$ and $\bar{B}$ decays. These observables probe a term in the Hamiltonian proportional to $\text{Im} (V_{ub}V_{us}^*/V_{tb}V_{ts}^*)$ (in the case of $B \to K^*$) and $\text{Im} (V_{ub}V_{ud}^*/V_{tb}V_{td}^*)$ (in the case of $B \to \rho$). While the numerical estimates of these asymmetries in the standard model turn out to be small, the formalism we present is also applicable to more general Hamiltonians transcending the standard model. The dependence on the variable $\phi$ can be an especially useful probe of CP violation, as has been demonstrated in the analogous case of $K_L \to \pi^+\pi^-e^+e^-$.

II. MATRIX ELEMENT

We are concerned with the matrix element of the decay $\bar{B}(p) \to P(k_1)P'(k_2)l^+(q_1)l^-(q_2)$, where $PP' = K^-\pi^+$ or $\pi^-\pi^+$ and $l = e, \mu$. Introducing the linear combinations

$$k = k_1 + k_2, \quad K = k_1 - k_2, \quad q = q_1 + q_2, \quad Q = q_1 - q_2,$$

(2.1)

the short-distance Hamiltonian for $b \to fl^+l^-$ ($f = s$ or $d$) is...
\[ H_{\text{eff}} = \frac{G_F \alpha}{\sqrt{2\pi}} V_{tb} V_{tj}^* \left\{ c_9^\text{eff} (\bar{f}_\gamma \gamma \mu b) \bar{l} \gamma^\mu l + c_{10} (\bar{f}_\gamma \gamma \mu P_L b) \bar{l} \gamma^\mu \gamma^5 l \right. \]
\[ - 2 c_7^\text{eff} \bar{f} i \sigma_{\mu\nu} \frac{q^\nu}{q^2} (m_b P_R + m_f P_L) b \bar{l} \gamma^\mu l \right\}, \quad (2.2) \]

where \( P_{L,R} = (1 \mp \gamma_5)/2 \) and

\[
c_7^\text{eff} = -0.315, \quad c_{10} = -4.642, \quad (2.3) \]

\[
c_9^\text{eff} = c_9 + (3 c_1 + c_2) \left\{ g(m_c, s_l) + \lambda_u \left[ g(m_c, s_l) - g(m_u, s_l) \right] \right\} + \cdots \]
\[ = 4.224 + 0.361 \left[ (1 + \lambda_u) g(m_c, s_l) - \lambda_u g(m_u, s_l) \right] + \cdots, \quad (2.4) \]

with

\[
\lambda_u \equiv \frac{V_{ub} V_{uj}^*}{V_{tb} V_{tj}^*}, \quad (2.5) \]

\[
g(m_i, s_l) = -\frac{8}{9} \ln(m_i/m_b) + \frac{8}{27} + \frac{4}{9} y_i - \frac{2}{9} (2 + y_i) \sqrt{|1 - y_i|} \]
\[ \times \left\{ \Theta(1 - y_i) \left( \ln \left( \frac{1 + \sqrt{1 - y_i}}{1 - \sqrt{1 - y_i}} \right) - i\pi \right) + \Theta(y_i - 1) 2 \arctan \frac{1}{\sqrt{y_i - 1}} \right\}, \quad (2.6) \]

where \( s_l \equiv q^2 \) and \( y_i = 4m_i^2/s_l \). The ellipses in the above represent numerically insignificant terms involving the Wilson coefficients \( c_3, \ldots, c_6 \) (see, e.g., Ref. [2]). The corresponding matrix element is

\[
\mathcal{M}_{\text{SD}} = \frac{G_F \alpha}{\sqrt{2\pi}} V_{tb} V_{tj}^* \left\{ \left[ (c_9^\text{eff} - c_{10}) \langle P(k_1) P'(k_2) | \bar{f}_\gamma \gamma \mu P_L b | \bar{B}(p) \rangle \right. \right. \]
\[ - \frac{2 c_7^\text{eff}}{q^2} \langle P(k_1) P'(k_2) | \bar{f} i \sigma_{\mu\nu} q^\nu (m_b P_R + m_f P_L) b | \bar{B}(p) \rangle \left[ \bar{c}_9^\text{eff} \rightarrow -c_{10} \right] \bar{l} \gamma^\mu P_R l \right\}. \quad (2.7) \]

Observe that the coefficient \( c_9^\text{eff} \) contains both a weak phase (associated with the imaginary part of \( \lambda_u \)) and a strong phase [connected with the imaginary part of \( g(m_i, s_l) \)], thus opening the way to CP-violating asymmetries between \( B \) and \( \bar{B} \) decays.

The hadronic part of the matrix element, describing the transition \( \bar{B} \to PP' \), can be written in terms of \( B \to V \) form factors (\( V = K^* \) or \( \rho \))
\begin{align}
\langle P(k_1)P'(k_2)\bar{f}\gamma_\mu P_L b|B(p)\rangle
&= -D_V(k^2) \left\{ i\epsilon_{\mu\nu\alpha\beta} K^\nu p^\alpha k^\beta g(q^2) + \frac{1}{2} K_\mu f(q^2) + k_\mu \left[ (q \cdot W) a_+(q^2) - \frac{1}{2} \xi f(q^2) \right] + \cdots \right\}, \\
&= -D_V(k^2) \left\{ i\epsilon_{\mu\nu\alpha\beta} K^\nu p^\alpha k^\beta g(q^2) + \frac{1}{2} K_\mu f(q^2) + k_\mu \left[ (q \cdot W) a_+(q^2) - \frac{1}{2} \xi f(q^2) \right] + \cdots \right\}, \\
&= D_V(k^2) \left\{ -i\epsilon_{\mu\nu\alpha\beta} K^\nu p^\alpha k^\beta g_+(q^2) + \frac{1}{2} K_\mu \left[ g_+(q^2) \Delta + q^2 g_-(q^2) \right] \\
&\quad \pm \left[ (q \cdot W) \left[ g_+(q^2) + \frac{1}{2} q^2 h(q^2) \right] + \frac{1}{2} \xi \left[ g_+(q^2) \Delta + q^2 g_-(q^2) \right] \right] + \cdots \right\},
\end{align}

with the convention \( \epsilon_{0123} = +1 \),

\begin{align}
\langle P(k_1)P'(k_2)|\bar{f}\sigma_\mu q^\nu P_{R,L} b|\bar{B}(p)\rangle
&= D_V(k^2) \left\{ -i\epsilon_{\mu\nu\alpha\beta} K^\nu p^\alpha k^\beta g_+(q^2) + \frac{1}{2} K_\mu \left[ g_+(q^2) \Delta + q^2 g_-(q^2) \right] \\
&\quad \pm \left[ (q \cdot W) \left[ g_+(q^2) + \frac{1}{2} q^2 h(q^2) \right] + \frac{1}{2} \xi \left[ g_+(q^2) \Delta + q^2 g_-(q^2) \right] \right] + \cdots \right\},
\end{align}

where the ellipses denote terms proportional to \( q_\mu \) which may be dropped in the case of massless leptons and

\begin{equation}
\Delta = (M_B^2 - M_V^2), \quad W^\mu = K^\mu - \xi k^\mu, \quad \xi = \frac{M_{P_R}^2 - M_{P_L}^2}{k^2}.
\end{equation}

Throughout this paper, we neglect the lepton mass, and assume the above form factors to be real, the absorptive parts due to real \( c\bar{c} \) and \( u\bar{u} \) states having been included in the functions \( g(m_c, s_l) \) and \( g(m_u, s_l) \) appearing in the short-distance coefficient \( c_\text{eff}^9 \) [Eq. (2.4)]. Furthermore, we will limit ourselves to neutral \( B \) mesons, i.e. \( \bar{B} \equiv \bar{B}^0 \).

The function \( D_V(k^2) \) appearing in Eqs. (2.8) and (2.9) is defined via

\begin{equation}
|D_V(k^2)|^2 = \frac{48\pi^2}{\beta^3 M_V^2} \delta(k^2 - M_V^2),
\end{equation}

where we have used a narrow-width approximation, and

\begin{equation}
\beta = \lambda^{1/2}(k^2, M_{P_R}^2, M_{P_L}^2),
\end{equation}

with the triangle function

\begin{equation}
\lambda(a, b, c) = a^2 + b^2 + c^2 - 2(ab + bc + ac).
\end{equation}

We adopt the \( B \to K^* \) and \( B \to \rho \) form factors \( g, f, h, g_+, a_+ \) given by Melikhov and Nikitin [9] (see Appendix A). The matrix element (2.7) can then be written compactly as

\begin{equation}
\mathcal{M}_{SD} = \frac{G_F^\alpha}{\sqrt{2\pi}} V_{tb} V_{tf}^* \left\{ (i\epsilon_{\mu\nu\alpha\beta} K^\nu k^\alpha q^\beta x_L + K_\mu y_L + k_\mu z_L) \bar{\gamma}_\mu P_L l + (L \rightarrow R) \right\}.
\end{equation}
where
\[ x_{L,R} = D_V(k^2) \left\{ (c_9^{\text{eff}} \mp c_{10}) g(q^2) - \frac{2c_7^{\text{eff}}}{q^2} (m_b + m_f) g_+(q^2) \right\}, \] (2.15)
\[ y_{L,R} = -\frac{1}{2} D_V(k^2) \left\{ (c_9^{\text{eff}} + c_{10}) f(q^2) - \frac{2c_7^{\text{eff}}}{q^2} (m_b - m_f) [g_+(q^2) \Delta + q^2 g_-(q^2)] \right\}, \] (2.16)
\[ z_{L,R} = (q \cdot W) z'_{L,R} - \xi y_{L,R}, \] (2.17)
with
\[ z'_{L,R} = -D_V(k^2) \left\{ (c_9^{\text{eff}} + c_{10}) a_+ (q^2) + \frac{2c_7^{\text{eff}}}{q^2} (m_b - m_f) \left[ g_+(q^2) + \frac{1}{2} q^2 h(q^2) \right] \right\}. \] (2.18)

The matrix element for the corresponding antiparticle channel can be obtained from (2.14) by means of CPT invariance. In fact, we have
\[ \overline{\mathcal{M}}_{\text{SD}} = \mathcal{M}_{\text{SD}}(x_{L,R} \to \bar{x}_{L,R}; y_{L,R} \to \bar{y}_{L,R}; z_{L,R} \to \bar{z}_{L,R}) \] (2.19)
for the conjugate processes \( B \to K^+ \pi^- e^- e^+ \) and \( B \to \pi^- \pi^+ e^- e^+ \), where \( \bar{x}, \bar{y}, \bar{z} \) are related to \( x, y, z \) by\[ \phi_w \to -\phi_w, \quad \delta \to \delta. \] (2.20)

Here \( \phi_w \) and \( \delta \) denote the weak and strong phases respectively that appear in the matrix element \( \mathcal{M}_{\text{SD}} \).

**III. DIFFERENTIAL DECAY RATE**

Squaring the matrix element (2.14) and summing over spins, we obtain for the decay \( \bar{B} \to PP' l^- l^+ \) \[ |\mathcal{M}_{\text{SD}}(\bar{B} \to PP' l^- l^+)|^2 = \frac{G_F^2 q^2}{2 \pi^2} |V_{tb} V_{t'f}^*|^2 \]
\[ \times \left\{ 2 \text{Re} \left( y_L^* z_L + y_R^* z_R \right) (k \cdot q)(q \cdot K) - (k \cdot Q)(K \cdot Q) - s_i (k \cdot K) \right\} \]
\[ + 2 \text{Re} \left( x_L^* z_L - x_R^* z_R \right) (k \cdot q)(k \cdot Q) (q \cdot K) + s_i s_P (K \cdot Q) - (k \cdot q)^2 (K \cdot Q) \]
\[
- s_l(k \cdot K)(k \cdot Q)
+ 2\text{Re}(x_R y_R^* - x_L y_L^*) \left[ s_l K^2(k \cdot Q) - (k \cdot Q)(q \cdot K)^2 + (k \cdot q)(q \cdot K)(K \cdot Q)
- s_l(k \cdot K)(K \cdot Q) \right]
+ (|x_L|^2 + |x_R|^2) \left[ -2(k \cdot q)(k \cdot Q)(K \cdot Q) - s_l s_P(K \cdot Q)^2 + (k \cdot q)^2(K \cdot Q)^2
- s_l K^2(k \cdot Q)^2 + (k \cdot Q)^2(q \cdot K)^2 + 2s_l(k \cdot K)(k \cdot Q)(K \cdot Q) \right]
+ (|y_L|^2 + |y_R|^2) \left[ -s_l K^2 + (q \cdot K)^2 - (K \cdot Q)^2 \right]
+ (|z_L|^2 + |z_R|^2) \left[ -s_l s_P + (k \cdot q)^2 - (k \cdot Q)^2 \right]
+ 2\epsilon_{\mu \nu \alpha \beta} k^\mu K^\nu q^\alpha Q^\beta \left[ (K \cdot Q)\text{Im}(x_L y_L^* + x_R y_R^*) + \text{Im}(y_R^* z_R - y_L^* z_L)
- (k \cdot Q)\text{Im}(x_L^* z_L + x_R^* z_R) \right],
\]

(3.1)

with \( s_P \equiv k^2 \). Introducing the shorthand notation
\[
X = \left[ (k \cdot q)^2 - s_l s_P \right]^{1/2} = \frac{1}{2} \lambda^{1/2}(M_B^2, s_l, s_P),
\]

(3.2)

we find that \((m_l = 0)\)
\[
k \cdot K = M_P^2 - M_P^2 = \lambda s_P,
\]

(3.3a)
\[
k \cdot q = \frac{1}{2}(M_B^2 - s_l - s_P),
\]

(3.3b)
\[
k \cdot Q = X \cos \theta_l,
\]

(3.3c)
\[
q \cdot K = \beta X \cos \theta_P + \xi(k \cdot q),
\]

(3.3d)
\[
q \cdot W = \beta X \cos \theta_P,
\]

(3.3e)
\[
K \cdot Q = \xi(k \cdot Q) + \beta \left[ (k \cdot q) \cos \theta_l \cos \theta_P - (s_l s_P)^{1/2} \sin \theta_l \sin \theta_P \cos \phi \right],
\]

(3.3f)
\[
\epsilon_{\mu \nu \alpha \beta} k^\mu K^\nu q^\alpha Q^\beta = -(s_l s_P)^{1/2} \beta X \sin \theta_l \sin \theta_P \sin \phi,
\]

(3.3g)
\[ K^2 = 2(M_P^2 + M_{P'}^2) - s_P = (\xi^2 - \beta^2)s_P, \quad Q^2 = -s_l. \] (3.3h)

To write the differential decay rate in compact form, we define the auxiliary functions

\[ F_{1L,R} = \beta [X^2 z_{L,R} + (k \cdot q)y_{L,R}], \] (3.4)

\[ F_{2L,R} = \beta (s_l s_P)^{1/2} y_{L,R}, \] (3.5)

\[ F_{3L,R} = \beta X (s_l s_P)^{1/2} x_{L,R}, \] (3.6)

so that

\[ d^5 \Gamma = \frac{G_F^2 \alpha^2}{2^{10} \pi^8 M_B^2} |V_{tb} V_{tL}^*|^2 \beta X I(s_l, s_P, \theta_l, \theta_P, \phi) ds_l ds_P d \cos \theta_l d \cos \theta_P d \phi, \] (3.7)

with

\[ I = I_1 + I_2 \cos 2\theta_l + I_3 \sin^2 \theta_l \cos 2\phi + I_4 \sin 2\theta_l \cos \phi + I_5 \sin \theta_l \cos \phi + I_6 \cos \theta_l \]
\[ + I_7 \sin \theta_l \sin \phi + I_8 \sin 2\theta_l \sin \phi + I_9 \sin^2 \theta_l \sin 2\phi. \] (3.8)

The functions \( I_1, \ldots, I_9 \) have the following form (see Appendix B for details):

\[ I_1 = \left[ \frac{3}{2} (|F_{3L}|^2 + |F_{2L}|^2) \sin^2 \theta_P + |F_{1L}|^2 \cos^2 \theta_P \right] + (L \rightarrow R), \] (3.9a)

\[ I_2 = \left[ \frac{1}{2} (|F_{3L}|^2 + |F_{2L}|^2) \sin^2 \theta_P - |F_{1L}|^2 \cos^2 \theta_P \right] + (L \rightarrow R), \] (3.9b)

\[ I_3 = (|F_{3L}|^2 - |F_{2L}|^2) \sin^2 \theta_P + (L \rightarrow R), \] (3.9c)

\[ I_4 = \text{Re} (F_{1L} F_{2L}^*) \sin 2\theta_P + (L \rightarrow R), \] (3.9d)

\[ I_5 = 2\text{Re} (F_{1L} F_{3L}^*) \sin 2\theta_P - (L \rightarrow R), \] (3.9e)

\[ I_6 = 4\text{Re} (F_{2L} F_{3L}^*) \sin^2 \theta_P - (L \rightarrow R), \] (3.9f)
\[ I_7 = 2 \text{Im} (F_{1L} F_{2L}^*) \sin 2\theta_P - (L \rightarrow R), \] (3.9g)

\[ I_8 = \text{Im} (F_{1L} F_{3L}^*) \sin 2\theta_P + (L \rightarrow R), \] (3.9h)

\[ I_9 = -2 \text{Im} (F_{2L} F_{3L}^*) \sin^2 \theta_P + (L \rightarrow R). \] (3.9i)

The physical region of phase space is defined through

\[ 0 \leq s_l \leq (M_\overline{B} - \sqrt{s_P})^2, \quad (M_P + M_{P'})^2 \leq s_P \leq M_B^2, \] (3.10a)

\[ 0 \leq \phi \leq 2\pi, \quad -1 \leq \cos \theta_P \leq 1, \quad -1 \leq \cos \theta_l \leq 1. \] (3.10b)

Note that \( \theta_l \) is the angle of the \( l^- \) in the \( l^-l^+ \) c.m. frame; \( \theta_P \) is the angle of \( \pi^- \) (or \( K^- \)) in the \( \pi^--\pi^+ \) (or \( K^-\pi^+ \)) system; \( \phi \) is the angle between \( p_{\pi^-} \times p_{\pi^+} \) and \( p_{l^-} \times p_{l^+} \) (in the case of the \( \pi^-\pi^+ \) final state) and between \( p_{K^-} \times p_{\pi^+} \) and \( p_{l^-} \times p_{l^+} \) (in the case of the \( K^-\pi^+ \) final state), \( p_i \) denoting the 3-momentum vectors of the corresponding particles in the \( \overline{B} \) rest frame. The \( z \)-axis is chosen along the total momentum vector of the \( PP' \) system in the \( \overline{B} \) rest frame. This definition will also be retained in the case of the antiparticle reactions \( B \rightarrow \pi^-\pi^+e^-e^+ \) and \( B \rightarrow K^+\pi^-e^-e^+ \) (with \( p_{K^+} \) replacing \( p_{K^-} \) in the latter case).

The amplitudes \( F_{iL,R} \) \( (i = 1, 2, 3) \) defined in Eqs. (3.4)–(3.6) are closely related to the transversity amplitudes \( A_0, A_\parallel, A_\perp \) sometimes used in connection with the angular distribution of the four-body final state arising from decays of the form \( B \rightarrow V_1V_2 \) [11]. The differential decay rate in this alternative notation is again given by Eqs. (3.7)–(3.9), with the functions \( F_{iL,R} \) written in terms of \( A_0, A_\parallel, A_\perp \) as follows:

\[ F_{1L,R} = \frac{A_{0L,R}}{N}, \] (3.11a)

\[ F_{2L,R} = \frac{A_{\parallel L,R}}{N \sqrt{2}}, \] (3.11b)

\[ F_{3L,R} = \frac{A_{\perp L,R}}{N \sqrt{2}}, \] (3.11c)

where the normalization factor

\[ N = \frac{1}{3} \left[ \frac{G_F^2 \alpha^2}{2^{11/2} \pi^7 M_B^3} |V_{tb} V_{tf}^*|^2 |\beta X| \right]^{1/2}, \] (3.12)

has been chosen in such a way that \( \Gamma = |A_0|^2 + |A_\parallel|^2 + |A_\perp|^2 \).
IV. ANGULAR DISTRIBUTIONS

We derive from the differential decay rate, Eq. (3.7), one-dimensional angular distributions of interest, namely $d\Gamma/d\cos\theta_P$, $d\Gamma/d\cos\theta_l$, and $d\Gamma/d\phi$. These distributions, as well as the observables calculated in Sec. V, depend on different combinations of the short-distance coefficients $c_7^{\text{eff}}$, $c_9^{\text{eff}}$, $c_{10}$ and the form factors $g$, $f$, $h$, $g_{\pm}$, $a_+$.  

A. Decay rate as a function of $\cos\theta_P$

Integrating $d^5\Gamma$ over the variables $s_l$, $s_P$, $\cos\theta_l$, and $\phi$, we obtain

$$
\frac{d\Gamma}{d\cos\theta_P} = \frac{G_F^2 M_B^2 \alpha^2}{2^{11} \pi^7} |V_{tb}V_{tf}^*|^2 \left( J_1 - \frac{1}{3} J_2 \right),
$$

(4.1)

where $J_i \equiv J_i^s \sin^2 \theta_P + J_i^c \cos^2 \theta_P$, $J_i^{s,c} = \frac{1}{M_B^8} \int I_i^{s,c} \beta X ds_l ds_P$, $i = 1, 2$, (4.2)

where $I_i^{s,c}$ stand for the coefficients of $\sin^2 \theta_P$ and $\cos^2 \theta_P$ in the expressions for $I_{1,2}$ given in Eqs. (B1) and (B2) of the Appendix. The absence of a term odd in $\cos\theta_P$ is connected with the fact that the $PP'$ system is in a pure $L = 1$ state. As a consequence, the forward-backward (FB) asymmetry in the $PP'$ system, defined as

$$
A_{FB}^P = \frac{\int_0^1 \frac{d\Gamma}{d\cos\theta_P} d\cos\theta_P - \int_{-1}^0 \frac{d\Gamma}{d\cos\theta_P} d\cos\theta_P}{\int_0^1 \frac{d\Gamma}{d\cos\theta_P} d\cos\theta_P + \int_{-1}^0 \frac{d\Gamma}{d\cos\theta_P} d\cos\theta_P},
$$

(4.3)

vanishes. The predictions for $J_i^{s,c}$ are contained in Table I.

| $\bar{B} \to K^- \pi^+ e^- e^+$  | 534.4 | 69.6  | 64.6  | 0     | 0     | 179.0 | 0     | 0     | -0.4  |

B. Decay rate as a function of $\cos \theta_l$

Integration of $d^5 \Gamma$ over $s_l$, $s_P$, $\cos \theta_P$, and $\phi$ yields

$$\frac{d \Gamma}{d \cos \theta_l} = \frac{G_F^2 M_B^2 \alpha^2}{2^{15} \pi^7} |V_{tb} V_{t\bar{f}}^*|^2 (K_1 + K_2 \cos 2 \theta_l + K_6 \cos \theta_l),$$

where

$$K_i = \frac{1}{M_B^8} \int I_i \beta X ds_l ds_P d \cos \theta_P.$$  

(4.5)

Our results for the parameters $K_i$ are tabulated in Table II. Observe that $K_4$, $K_5$, $K_7$, and $K_8$ vanish in our model. The FB asymmetry of $l^-$ in the $l^- l^+$ c.m. system is

$$A_{FB} = \frac{K_6/2}{K_1 - K_2/3} = \begin{cases} 
-0.19 & \text{for } \pi^- \pi^+, \\
-0.16 & \text{for } K^- \pi^+. 
\end{cases}$$

(4.6)

This result reproduces the FB asymmetry of the lepton calculated in previous analyses of the exclusive channels $\bar{B} \to K^*(\rho) e^- e^+$. 

C. Decay rate as a function of $\phi$

Finally, the distribution in the angle $\phi$ between the lepton and meson planes, after integration over other variables, takes the simple form

$$\frac{d \Gamma}{d \phi} = \frac{G_F^2 M_B^2 \alpha^2}{2^{15} \pi^8} |V_{tb} V_{t\bar{f}}^*|^2 \left[ (K_1 - \frac{1}{3} K_2) + \frac{2}{3} (K_3 \cos 2 \phi + K_9 \sin 2 \phi) \right],$$

(4.7)

with the $K_i$’s shown in Table II.
V. CP-VIOLATING OBSERVABLES

We now focus on CP-violating observables that can be constructed by combining information on $\bar{B}$ and $B$ decays, namely

$$\bar{B} \rightarrow K^-\pi^+e^-e^+ \quad \text{and} \quad B \rightarrow K^+\pi^-e^-e^+, \quad (5.1a)$$

or

$$\bar{B} \rightarrow \pi^-\pi^+e^-e^+ \quad \text{and} \quad B \rightarrow \pi^-\pi^+e^-e^+. \quad (5.1b)$$

With the definition of $\cos\theta_P$, $\cos\theta_l$, and $\phi$ given after Eq. (3.10), the differential decay rate for $\bar{B}$ and $B$ decays is

$$d^5\Gamma|_{\bar{B}} = \mathcal{N} I(s_l, s_P, \theta_l, \theta_P, \phi) \beta X dPS, \quad (5.2a)$$

$$d^5\Gamma|_{B} = \mathcal{N} \bar{I}(s_l, s_P, \theta_l, \theta_P, \phi) \beta X dPS, \quad (5.2b)$$

where $\mathcal{N}$ is a normalization factor

$$\mathcal{N} = \frac{G^2_F\alpha^2}{2^{16}\pi^8 M_B^3} |V_{tb}V_{tj}|^2, \quad (5.3)$$

and $dPS$ represents the phase-space element

$$dPS = ds_1 ds_P d\cos\theta_l d\cos\theta_P d\phi. \quad (5.4)$$

The function $I$ is given in Eq. (3.8), whereas the function $\bar{I}$ is obtained from $I$ by the substitution

$$I_{1,2,3,4,7}(x_{L,R}; y_{L,R}; z_{L,R}) \rightarrow I_{1,2,3,4,7}(\bar{x}_{L,R}; \bar{y}_{L,R}; \bar{z}_{L,R}) \equiv \bar{I}_{1,2,3,4,7}, \quad (5.5a)$$

$$I_{5,6,8,9}(x_{L,R}; y_{L,R}; z_{L,R}) \rightarrow -I_{5,6,8,9}(\bar{x}_{L,R}; \bar{y}_{L,R}; \bar{z}_{L,R}) \equiv -\bar{I}_{5,6,8,9}, \quad (5.5b)$$

where $\bar{x}$, $\bar{y}$, $\bar{z}$ are defined via Eq. (2.20).
We now define the sum and the difference of the differential spectra $d\delta \Gamma|_B$ and $d\delta \Gamma|_\bar{B}$ as follows:

\[
d\Gamma_{\text{diff}} = N \left[ (I_1 - \bar{I}_1) + (I_2 - \bar{I}_2) \cos 2\theta_t + (I_3 - \bar{I}_3) \sin^2 \theta_t \cos 2\phi + (I_4 - \bar{I}_4) \sin 2\theta_t \cos \phi \\
+ (I_5 + \bar{I}_5) \sin \theta_t \cos \phi + (I_6 + \bar{I}_6) \cos \theta_t + (I_7 - \bar{I}_7) \sin \theta_t \sin \phi + (I_8 + \bar{I}_8) \sin 2\theta_t \sin \phi \\
+ (I_9 + \bar{I}_9) \sin^2 \theta_t \sin 2\phi \right] \beta X dPS,
\]

\[
d\Gamma_{\text{sum}} = N \left[ (I_1 + \bar{I}_1) + (I_2 + \bar{I}_2) \cos 2\theta_t + (I_3 + \bar{I}_3) \sin^2 \theta_t \cos 2\phi + (I_4 + \bar{I}_4) \sin 2\theta_t \cos \phi \\
+ (I_5 - \bar{I}_5) \sin \theta_t \cos \phi + (I_6 - \bar{I}_6) \cos \theta_t + (I_7 + \bar{I}_7) \sin \theta_t \sin \phi + (I_8 - \bar{I}_8) \sin 2\theta_t \sin \phi \\
+ (I_9 - \bar{I}_9) \sin^2 \theta_t \sin 2\phi \right] \beta X dPS.
\]

Recalling Eq. (4.5) and defining

\[
K_D^i = \frac{1}{M_B^8} \int \beta X ds_l ds_P \left[ \int_{-1}^{0} - \int_{0}^{1} \right] I_i d\cos \theta_P,
\]

we can then construct the following CP-violating observables:

\[
\langle A_{\text{CP}} \rangle = \frac{1}{I_0} \left[ (K_1 - \bar{K}_1) - \frac{1}{3} (K_2 - \bar{K}_2) \right],
\]

\[
\langle A_3 \rangle = \frac{1}{I_0} (K_3 - \bar{K}_3),
\]

\[
\langle A_4 \rangle = \frac{1}{I_0} (K_4^D - \bar{K}_4^D),
\]

\[
\langle A_5 \rangle = \frac{1}{I_0} (K_5^D - \bar{K}_5^D),
\]

\[
\langle A_6 \rangle = \frac{1}{I_0} (K_6 - \bar{K}_6),
\]

\[
\langle A_7 \rangle = \frac{1}{I_0} (K_7^D - \bar{K}_7^D),
\]

\[
\langle A_8 \rangle = \frac{1}{I_0} (K_8^D - \bar{K}_8^D),
\]
\begin{align}
\langle A_0 \rangle &= \frac{1}{I_0} (K_9 - \bar{K}_9), \tag{5.9h} \\
I_0 &= (K_1 + \bar{K}_1) - \frac{1}{3} (K_2 + \bar{K}_2). \tag{5.10}
\end{align}

in which the quantity \( I_0 \) is defined as

\[ I_0 = (K_1 + \bar{K}_1) - \frac{1}{3} (K_2 + \bar{K}_2). \]

Note that the asymmetries \( \langle A_{CP} \rangle, \langle A_{3,4,7} \rangle \) involving the differences \( (I_i - \bar{I}_i), i = 1, 2, 3, 4, 7 \), can be obtained from a measurement of the difference \( d\Gamma_{\text{diff}} \). On the other hand, the asymmetries \( \langle A_{5,6,8,9} \rangle \) require only a measurement of \( d\Gamma_{\text{sum}} \) and, in principle, can be determined even for an untagged equal mixture of \( B \) and \( \bar{B} \).

The asymmetry \( \langle A_{CP} \rangle \) is simply the asymmetry in the partial decay rates of \( B \to K^-\pi^+\pi^-\pi^- \) and \( B \to K^+\pi^-\pi^-\pi^- \) (or \( \bar{B} \to \pi^-\pi^+\pi^-\pi^- \) and \( B \to \pi^-\pi^+\pi^-\pi^- \)). The other asymmetries represent CP-violating effects in the angular distribution of these processes. All of these effects have their origin in the CP-violating imaginary part of the coefficient \( \lambda_u \equiv \frac{V_{ub}V_{uf}^*}{V_{tb}V_{tf}^*} \approx \left\{ \begin{array}{ll}
-\lambda^2 (\rho - i\eta) & \text{for } f = s, \\
\frac{\rho(1 - \rho) - \eta^2}{(1 - \rho)^2 + \eta^2} - \frac{i\eta}{(1 - \rho)^2 + \eta^2} & \text{for } f = d.
\end{array} \right. \tag{5.11} \)

In the case \( f = d \), this imaginary part is of order \( \eta \), but in the case \( f = s \) it is reduced by an extra factor \( \lambda^2 \). In both cases, the weak phase present in the coefficient \( c_{9}^{\text{eff}} \) [Eq. (2.4)] is further suppressed by a factor of order \( (3c_1 + c_2)/c_9 \simeq 0.085 \). All of these factors explain the very small magnitude of the asymmetries listed in Table I. The result for the partial width asymmetry \( \langle A_{CP} \rangle \) reproduces that obtained in previous literature [2].

The small value of \( \langle A_6 \rangle \) implies that the FB asymmetry of the electron is opposite in sign for \( B \) and \( \bar{B} \) decay [Eq. (1.0)]. This result agrees with the statement in Ref. [13].

**VI. CONCLUSIONS**

Our results for \( d\Gamma/d\cos \theta_P \) and \( d\Gamma/d\phi \) are new consequences of the short-distance Hamiltonian for \( b \to s(d)e^-e^+ \), which test the polarization state of the vector meson in \( \bar{B} \to K^* (\rho)e^-e^+ \). The asymmetries \( \langle A_k \rangle \) are CP-violating observables that can be obtained
TABLE III. Estimates of the average CP-violating asymmetries $\langle A_k \rangle$ in units of $10^{-4}$ ($10^{-2}$) for the $B \to K^*$ ($B \to \rho$) transition.

| $B \to K^- \pi^+ e^- e^+$ vs $B \to K^+ \pi^- e^- e^+$ | $\langle A_{CP} \rangle$ | $\langle A_3 \rangle$ | $\langle A_4 \rangle$ | $\langle A_5 \rangle$ | $\langle A_6 \rangle$ | $\langle A_7 \rangle$ | $\langle A_8 \rangle$ | $\langle A_9 \rangle$ |
|-----------------------------------------------------|---------------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|
| $\bar{B} \to K^- \pi^+ e^- e^+$ vs $B \to K^+ \pi^- e^- e^+$ | 2.7                       | -0.6              | -2.0              | 5.2               | -4.6              | 0                 | 0.6               | -0.04             |

Numerical estimates have been obtained within the framework of the standard model, but the formalism presented can be applied to other Hamiltonians. As seen from Table III, the asymmetries predicted for $B \to K^*$ are exceedingly small, and any significant effect would signal a non-standard source of CP violation. In the case of $B \to \rho$, asymmetries of 1–2% are predicted for $\langle A_{CP} \rangle$, $\langle A_5 \rangle$, and $\langle A_6 \rangle$. It should be noted that our predictions apply to $K^*$ ($\rho$) production on the mass shell. This implies that the $PP'$ system is in a pure $p$-wave state, and explains why the distribution in $\cos \theta_P$ given in Eq. (11) is forward-backward symmetric. In the continuum region of $K\pi$ or $\pi\pi$ masses, there will be additional partial waves, as well as long-range effects associated with bremsstrahlung from $B \to K\pi$ and $B \to \pi\pi$, followed by internal conversion of the photon. While such effects are difficult to calculate, it is conceivable that they lead to larger CP-violating asymmetries in the continuum region of $B \to K\pi e\bar{e}$ and $B \to \pi\pi e\bar{e}$.

| $g_-(q^2)$   | $0.24 \left( 1 - \frac{q^2}{6.59^2} \right)^{-2.58}$ | $0.18 \left( 1 - \frac{q^2}{6.50^2} \right)^{-2.73}$ |

**APPENDIX B: THE FUNCTIONS $I_1, \ldots, I_9$**

The functions $I_1, \ldots, I_9$ appearing in the expression for $I(s_l, s_P, \theta_l, \theta_P, \phi)$, Eq. (3.8), are given by

I_1 = \beta^2 \left\{ \frac{3}{2} s_l s_P \left[ X^2(|x_L|^2 + |x_R|^2) + (|y_L|^2 + |y_R|^2) \right] \sin^2 \theta_P + \left[ (k \cdot q)^2 (|y_L|^2 + |y_R|^2) 

+ X^4(|z_L|^2 + |z_R|^2) + 2X^2(k \cdot q) \Re (y_L z_L' + y_R z_R') \right] \cos^2 \theta_P \right\}, \quad (B1)

I_2 = \beta^2 \left\{ \frac{1}{2} s_l s_P \left[ X^2(|x_L|^2 + |x_R|^2) + (|y_L|^2 + |y_R|^2) \right] \sin^2 \theta_P - \left[ (k \cdot q)^2 (|y_L|^2 + |y_R|^2) 

+ X^4(|z_L|^2 + |z_R|^2) + 2X^2(k \cdot q) \Re (y_L z_L' + y_R z_R') \right] \cos^2 \theta_P \right\}, \quad (B2)

I_3 = \beta^2 s_l s_P \left\{ X^2(|x_L|^2 + |x_R|^2) - (|y_L|^2 + |y_R|^2) \right\} \sin^2 \theta_P, \quad (B3)
\[ I_4 = \beta^2 (s_1 s_P)^{1/2} \left\{ X^2 \text{Re} \left( y_L^* z'_L + y_R^* z'_R \right) + (k \cdot q) (|y_L|^2 + |y_R|^2) \right\} \sin 2\theta_P, \]  
(B4)

\[ I_5 = 2\beta^2 X (s_1 s_P)^{1/2} \left\{ X^2 \text{Re} \left( x_L^* z'_L - x_R^* z'_R \right) + (k \cdot q) \text{Re} \left( x_L^* y_L - x_R^* y_R \right) \right\} \sin 2\theta_P, \]  
(B5)

\[ I_6 = 4\beta^2 X s_1 s_P \text{Re} \left( x_L^* y_L - x_R^* y_R \right) \sin^2 \theta_P, \]  
(B6)

\[ I_7 = 2\beta^2 X^2 (s_1 s_P)^{1/2} \text{Im} \left( y_L^* z'_L - y_R^* z'_R \right) \sin 2\theta_P, \]  
(B7)

\[ I_8 = \beta^2 X (s_1 s_P)^{1/2} \left\{ X^2 \text{Im} \left( x_L^* z'_L + x_R^* z'_R \right) + (k \cdot q) \text{Im} \left( x_L^* y_L + x_R^* y_R \right) \right\} \sin 2\theta_P, \]  
(B8)

\[ I_9 = -2\beta^2 X s_1 s_P \text{Im} \left( x_L^* y_L + x_R^* y_R \right) \sin^2 \theta_P, \]  
(B9)

where \( k \cdot q = (M_B^2 - s_1 - s_P)/2 \).
