Abstract

The algebra of multi-species anyons characterized by different statistical parameters $\nu_{ij} = e_i e_j \Phi_i \Phi_j / (2\pi)$, $i, j = 1, \ldots, n$ is redefined by basing on fermions and $k_i$-fermions ($k_i \in \mathbb{N}/\{0, 1\}$ with $i \in \mathbb{N}$) and its superalgebra is constructed. The so-called fractional supersymmetry of multi-species anyons is realized on 2d lattice.

PACS: 03.65.Fd, 03.65.-w

1 Introduction

The idea of supersymmetry (SUSY) has stimulated new approaches in many branches of physics. An evidence example has been found for a dynamical SUSY related even-even and even-odd nuclei [1, 2]. SUSY is a theoretically attractive possibility for several reasons. It is the unique possibility for non-trivial extension of the known symmetries of space and time [3]. Many Physicists have developed theories of SUSY, particularly in the context of Grand Unified Theories, which successfully attempt to combine the strong and electroweak interactions [4].

In SUSY quantum mechanics one is considering a simple realization of SUSY algebra, involving the fermionic and bosonic operators [5], which had to move beyond Lie algebra to “graded” Lie algebras. Graded Lie algebras are just like Lie algebras except they use anti-commutation and commutation relations.

In view of the fact that the SUSY provided us with an elegant symmetry between fermions and bosons, it was natural to enquire if there exists a generalization which includes the exotic statistics. Various kinds of such extensions were realized: paraSUSY (with parafermions), fractional SUSY (using the $q$-bosons with $q$ a root of unity) and nonlinear SUSY (bosonization of supersymmetric quantum mechanics) [6-14]. Another generalization can be treated concerning the case of anyons. An attempt in this sense is considered, in this work, combining two different kinds of anyons.

On other had, during roughly 20 years, anyons have attracted a great attention to understand the physics of lower dimensions. Wilczek is generally credited to others earlier [15, 16]. He defined these new particles as being a vortex of the gauge-field which are...
the intersection of a plane and tubes of magnetic flux electrically charged [17]. Owing
the work [18] of Leinaas and Merhyeim on identical particles, we all know that anyons
have a lot to do with braids. Thus, the quantum algebras seems to be a good candidates
describing their symmetries [19, 20, 21]. The realization of these algebras had been started
by Lerda and Sciuto [22] and others.

Now, let us pay close attention to extend the notion of symmetry for these new systems.
So, what about “super”-symmetry (SUSY) of nyons? and what kind of SUSY could exist
in 2d space? In our present work, we will consider a system of n types of anyons (those we
call multi-species anyons [21]) characterized by different statistical parameters denoted
\[ \nu_{ij} = e_i e_j \Phi_i \Phi_j / (2\pi), \quad i, j = 1, \ldots, n \]
e_i is charge of the i\textsuperscript{th} particle and \( \Phi_i \) is its flux. Each statistical parameter \( \nu_{ij} \) describes
the interaction of the i\textsuperscript{th} anyon and the j\textsuperscript{th} one and defines the existence of different
fractional statistics.

In this context, this work will discuss the construction of SUSY describing a system of
multi-species anyons. First, we redefine the algebra of anyons by basing on fermions and
\( k_i \)-fermions [23, 24] (\( k_i \in \mathbb{N}/0,1 \)) i 2d square lattice. Let us denote here that the spatial
coordinates \( x \) are restricted to a multiple of a lattice spacing \( a \), i.e. \( x = na \) with \( n \) an
integer. By removing the lattice structure the algebraic results don’t change. Second, we
generalize the definiton of anyonic algebra by taking into account all kind of anyons. So
we construct the ”super”-algebra associated to our system. By introducing supercharges
in terms of two different anyonic operators we realize the SUSY of multi-species anyons
system which can be called as fractional one since the construction is based on the nature
of anyons.

This paper is organized as follows: In section 2, we introduce the definition of multi-
species anyonic oscillators and their algebras on 2d square lattice based on fermionic
ones. In section 3, we define the \( k_i \)-fermions and we extend the Lerda-Sciuto definiton
to construct the multi-species \( k_i \)-fermionic anyons and their algebras. In section 4, we
construct the anyonic superalgebra by considering a system of different species of anyons.
In section 5, we use the generators of anyonic superalgebra to construct the supercharges
of multi-species anyons SUSY. In section 6, we discuss the irreducible representations of
anyonic algebras and superalgebra. In the last section, we summarize the main result of
the paper.

## 2 Multi-species anyonic oscillators

Let \( \Omega \) be a 2d square lattice with spacing \( a = 1 \). We give a two-component fermionic
spinor field by
\[ S^- = \begin{pmatrix} s_1^-(x) \\ s_2^-(x) \end{pmatrix}, \tag{1} \]
and its conjugate hermitian by
\[ S^+ = (s_1^+(x), s_2^+(x)), \tag{2} \]
such that the components of these fields satisfy the following standard anti-commutation relations
\[
\{ s_i^-(x), s_j^-(y) \} = 0 \\
\{ s_i^+(x), s_j^+(y) \} = 0 \\
\{ s_i^-(x), s_j^+(y) \} = \delta_{ij} \delta(x, y),
\]
\( \forall i, j \in \{1, 2\} \) and \( \forall x, y \in \Omega \). Here, \( \delta(x, y) \) is the conventional lattice \( \delta \)-function: \( \delta(x, y) = 1 \) if \( x = y \) and vanishes if \( x \neq y \).

The expression of anyonic oscillators are given in terms of fermionic spinors as follows
\[
b_{ij}^-(x_\pm) = e^{i\nu_{ij} \Delta_i(x_\pm)} s_i^-(x) \\
b_{ij}^+(x_\pm) = s_i^+(x) e^{-i\nu_{ij} \Delta_i(x_\pm)},
\]
where \( \nu_{ij} \) are called statistical parameters and the elements \( \Delta_i(x_\pm) \) are given by
\[
\Delta_i(x_\pm) = \sum_{y \in \Omega} s_i^+(x) \Theta_{\pm \Gamma_x}(x, y) s_i^-(y),
\]
with \( \Theta_{\pm \Gamma_x}(x, y) \) are the so-called angle functions and its definition 0 2d square lattice was recited in the references [12] and [13], where \( \Gamma_x \) is the curve associated to each site \( x \in \Omega \) and the signs + and - indicates the two kinds of rotation direction on \( \Omega \).

The elements \( \Delta_i(x_\pm) \) satisfy the following commutation relations
\[
[\Delta_i(x_\pm), s_j^-(y)] = -\delta_{ij} \Theta_{\pm \Gamma_x}(x, y) s_i^-(y) \\
[\Delta_i(x_\pm), s_j^+(y)] = \delta_{ij} \Theta_{\pm \Gamma_x}(x, y) s_i^+(y) \\
[\Delta_i(x_\pm), \Delta_j(y_\pm)] = 0
\]
Now, we can show that the anyonic oscillators satisfy the following algebraic relations
\[
[b_{ij}^-(x_\pm), b_{ik}^+(y_\pm)]_{\Lambda_{ij}^\pm} = 0, \quad x > y \\
[b_{ij}^-(x_\pm), b_{ik}^+(y_\pm)]_{\Lambda_{ijk}^\pm} = 0, \quad x > y \\
[b_{ij}^+(x_\pm), b_{ik}^-(y_\pm)]_{\Lambda_{ij}^\pm} = 0, \quad x > y \\
[b_{ij}^+(x_\pm), b_{ik}^-(y_\pm)]_{\Lambda_{ijk}^\pm} = 0, \quad x > y \\
[b_{ij}^+(x_\pm), b_{ik}^+(y_\pm)] = 1, \quad x > y \\
[b_{ij}^+(x_\pm), b_{ik}^+(y_\pm)] = 0, \quad i \neq j \\
[b_{ij}^+(x_\pm), b_{ik}^-(y_\pm)] = 0, \quad i \neq j \\
[b_{ij}^-(x_\pm), b_{ik}^+(y_\pm)] = 0, \quad i \neq j \\
[b_{ij}^+(x_\pm), b_{ik}^+(y_\pm)] = 0, \quad \forall i, j, k, l
\]
where
\[
\Lambda_{ij}^\pm = e^{\pm i(v_{ij} \Theta_{- \Gamma_x}(x, y) - v_{ik} \Theta_{+ \Gamma_x}(y, x))}, \\
\Gamma_{ijk} = e^{i \sum (v_{ij} \Theta_{- \Gamma_x}(x, z) - v_{ik} \Theta_{+ \Gamma_x}(z, x))} \\
[X, Y]_A = XY + \Lambda YX
\]
and

\[
x > y \iff \begin{cases} 
  x_+ > y_+ & \iff x_2 > y_2 \\
  x_1 > y_1, x_2 = x_1 \\
  x_2 < y_2 & \iff x_1 < y_1, x_1 = x_2 
\end{cases}
\]

One obtains also

\[
(b_i^\pm(x_\pm))^2 = 0, \tag{7}
\]

which is known as the hard core condition.

Let us remark that if we suppose \( i = j \) in the expression of \( \nu_{ij} \) given in section 1, we refine the algebraic relations of anyons constructed by Lerda and Sciuto in [12]. Also, we would like to stress that despite the deformation of our above algebraic relations, the anyonic oscillators don’t have anything to do with the \( k_i \)-fermions which have deformed algebraic relations (will be discussed in the next section) for several reasons: (i) the \( k_i \)-fermions can be defined in any dimensions whereas the ayons are strictly two-dimensional objects, (ii) the ayons are non-local contrary to the \( k_i \)-fermions constitute a mathematical, introduces in the context of quantum algebras, which is used to go beyond the conventional statistics in any dimension and can take into account some perturbation (deformation) responsible of small deviations from the Fermi-Dirac and Bose-Einstein usual statistics.

3 Multi-species \( k_i \)-fermionic anyons on 2d square lattice

In this part of work, we will construct the \( k_i \)-fermionic anyons on 2d square lattice \( \Omega \) from the \( k_i \)-fermions.

To define the \( k_i \)-fermionic anyons, we extend the Lerda and Sciuto definition as

\[
a_{ij}(x_\pm) = e^{i\nu_{ij}D_i(x_\pm)}f_i^-(x) \\
a_{ij}(x_\pm) = f_i^+(x)e^{-i\nu_qD_i(x_\pm)}, \tag{8}
\]

where \( D_i(x_\pm) \) is given by

\[
\sum_{y \in \Omega} \Theta_{\pm y_\pm}(x,y)N_i(y), \tag{9}
\]

\( N_i(y) \) is the number operator of \( k_i \)-fermions on 2d square lattice defined by \( f_i^-(x) \) and \( f_i^+(x) \) the \( k_i \)-fermionic annihilation and creation operators respectively as follows

\[
f_i^+(x)f_i^-(x) = [N_i(x)]_{q_i}, \\
f_i^-(x)f_i^+(x) = 1 + [N_i(x)]_{q_i},
\]

with 1 the identity, \( q_i = \frac{e^{2\pi i}}{k_i} \) \((k_i \in \mathbb{N}/0,1,i \in \mathbb{N})\) and the notion \( [x]_q = \frac{x^q - 1}{q-1} \).

The \( k_i \)-fermionic operators satisfy the algebraic relations

\[
\begin{align*}
[f_i^-(x), f_j^+(y)]_{q_i} & = \delta_{ij}\delta(x,y) \\
[N_i(x), f_j^-(y)]_{q_i} & = 0 \quad \forall x, y, \forall i, j \\
[N_i(x), f_j^+(y)]_{q_i} & = 0 \quad \forall x, y, \forall i, j \\
(f_i^-(x))^k_i = (f_i^+(x))^k_i = 0.
\end{align*}
\tag{10}
\]
By using the previous tools, the operators $a_i^\pm(x_\pm)$ constructed from $k_i$-fermionic oscillators satisfy the following algebraic relations

\[
\begin{align*}
[a_{ij}^-(x_\pm), a_{ik}^-(y_\pm)]_{p_{ijk}^-} &= 0, & x > y \\
[a_{ij}^+(x_\pm), a_{ik}^+(y_\pm)]_{p_{ijk}^+} &= 0, & x > y \\
[a_{ij}^+(x_\pm), a_{ik}^-(y_\pm)]_{p_{ijk}^-} &= 0, & x > y \\
[a_{ij}^-(x_\pm), a_{ik}^+(y_\pm)]_{p_{ijk}^+} &= 0, & x > y \\
[a_{ij}^-(x_\pm), a_{kl}^+(y_\pm)]_{p_{ijk}^+} &= 0, & i \neq k \\
[a_{ij}^+(x_\pm), a_{kl}^-(y_\pm)]_{p_{ijk}^-} &= 0, & i \neq k \\
[a_{ij}^-(x_-), a_{kl}^+(y_+)]_{q_i} &= 0, & x, y, z \in \Omega, \\
[a_{ij}^-(x_-), a_{kl}^-(y_+)]_{q_i} &= 0, & x, y, z \in \Omega.
\end{align*}
\] (11)

∀i, j, k, l = 1, ..., n. In this equation

\[p_{ijk}^- = q_i e^{-i(\nu_{ij} \Theta_+ - \gamma_+)(y_+)}\]

and

\[p_{ijk}^+ = q_i e^{i(\nu_{ij} \Theta_+ - \gamma_+)(y_+)}\],

and $q_i = e^{i\pi k_i}$ ($k_i \in \mathbb{N}^*)$.

We also have the following nilpotency condition

\[(a_{ij}^\pm(x_\pm))^{k_i} = 0\] (12)

which can be interpreted as a hard core condition generalizing the Pauli exclusion principle. In the particular case $k_i = 2$ (undeformed ferions), we recover the multi-species anyonic algebra of section 2.

4 Anyonic Superalgebra

In this section, we will consider $n$ species of $k_i$-fermionic anyons ($i = 0, 1, ..., n - 1$) having different fractional spin and characterized by different fractional statistical parameters $\nu_{ij}$. To construct the associate algebra the new generators will be defined as direct sum of $k_i$-fermionic anyons oscillators given by the equations (8). This definition will be in a cyclic order to take into account all kind of anyons can exist in the combined system. So, the constructed algebra will be in a ”graded” form, and we will call it anyonic superalgebra. We define its generators as follows

\[
\begin{align*}
A_{ij}^-(x_\pm) &= a_{ij}^-(x_\pm) \oplus a_{i+1,j}^-(x_\pm) \oplus ... \oplus a_{i+(n-1),j}^-(x_\pm) \\
A_{ij}^+(x_\pm) &= a_{ij}^+(x_\pm) \oplus a_{i+1,j}^+(x_\pm) \oplus ... \oplus a_{i+(n-1),j}^+(x_\pm).
\end{align*}
\] (13)
In a straightforward calculation, we prove that these operators obey to the following commutation relations

\[
\begin{align*}
[A_{ij}^-(x), A_{ik}^+(y)]_{P^{-}_{ijk}} &= 0, & x > y \\
[A_{ij}^+(x), A_{ik}^+(y)]_{P^{+}_{ijk}} &= 0, & x > y \\
[A_{ij}^-(x), A_{ik}^-(y)]_{P^{-}_{ijk}} &= 0, & x > y \\
[A_{ij}^+(x), A_{ik}^-(y)]_{P^{+}_{ijk}} &= 0, & x > y \\
[A_{ij}^-(x), A_{ik}^-(y)]_{Q_i} &= 11, \\
[A_{ij}^+(x), A_{ik}^-(y)]_{Q_i} &= 0, & \forall x, y \in \Omega
\end{align*}
\] (14)

Let us denote here that \(Q_k^x = 11\), \(k = k_0k_1...k_{n-1}\). The new operators \(A_{ij}^-(x)\) and \(A_{ij}^+(x)\) also satisfy the following nilpotency condition

\[
(A_{ij}^-(x))^k = (A_{ij}^+(x))^k = 0, \quad k \in \mathbb{N}^*
\] (15)

with \(k = k_0...k_{n-1}\), and \(\forall i, j, k = 1, ..., n\), with

\[
\Gamma_{[ijk]} = \begin{pmatrix}
\vdots \\
\sum_{x \neq a} (\nu_{ij} \Theta_{-\Gamma_x} - \nu_{ik} \Theta_{+\Gamma_x}) N_i(z) \\
\vdots
\end{pmatrix}
\]

\[
P_{ijk}^- = \begin{pmatrix}
p_{-}^{i,j,k} \\
p_{-}^{i+1,j,k} \\
p_{-}^{i+2,j,k} \\
\vdots \\
p_{-}^{i+(n-1),j,k}
\end{pmatrix}
\]

\[
P_{ijk}^+ = \begin{pmatrix}
p_{+}^{i,j,k} \\
p_{+}^{i+1,j,k} \\
p_{+}^{i+2,j,k} \\
\vdots \\
p_{+}^{i+(n-1),j,k}
\end{pmatrix}
\]

\[
Q_i = \begin{pmatrix}
q_i \\
q_{i+1} \\
q_{i+2} \\
\vdots \\
q_{i+n-1}
\end{pmatrix}
\] (16)
The equation (15) generalizes the hard core condition for combined anyonic system. This means that no more that \((k_i - 1)\) particles can live in the same state of anyons constructed from \(k_i\)-fermions \((i = 0, 1, \ldots, n - 1)\).

5 Multi-species \(k_i\)-fermionic Anyons Supersymmetry

In this section, We will consider a combined system of multi-species \(k_i\)-fermionic anyons. We define the supercharges of the SUSY associated to the present system in terms of the generators of anyonic superalgebra given in section 4 as follows

\[
\begin{align*}
C_{ijrs}^{-+}(x) &= A_{ij}^-(x_-)A_{rs}^+(x_+) \\
C_{ijrs}^{++}(x) &= A_{ij}^+(x_+)A_{rs}^-(x_-)
\end{align*}
\] (17)

with \(i, j, r, s = 1, \ldots, n\) and \(i \neq r\).

Using the above tools, these new supercharges obey to the following commutation relation

\[
Q_iC_{ijrs}^{+}(x)C_{ijrs}^{-}(y) - Q_rC_{ijrs}^{-}(y)C_{ijrs}^{+}(x) = \delta(x, y)[B_rQ_i[N_i(x)]q_i - B_iQ_r[N_r(x)]q_r]
\] (18)

with

\[
B_i = \begin{pmatrix}
(\sum_{z>x} - \sum_{z<x})N_i(z) \\
d_{i+1,j} \\
\vdots \\
(\sum_{z>x} - \sum_{z<x})N_{i+n-1}(z) \\
d_{i+n-1,j}
\end{pmatrix}
\] (19)

\[
[N_i(x)]q_i = \begin{pmatrix}
[N_i(x)]q_i \\
[N_{i+1}(x)]q_{i+1} \\
\vdots \\
[N_{i+n-1}(x)]q_{i+n-1}
\end{pmatrix}
\]

\[
d_{ij} = e^{i\nu_{ij}x},
\]

here \(N_i(x) = a_{ij}^+(x)\) \(a_{ij}^-(x)\).

To have an invariant expression under the hermitian conjugate we are doing the following step by computing the hermitian conjugate of Eq.(18)

\[
Q_i^{-1}C_{ijrs}^{++}(y)C_{ijrs}^{+}(x) - Q_r^{-1}C_{ijrs}^{-+}(x)C_{ijrs}^{+}(y) = \delta(x, y)[B_r^{-1}Q_i^{-1}[N_i(x)]q_i^{-1} - B_i^{-1}Q_r^{-1}[N_r(x)]q_r^{-1}],
\] (20)

where \(C_{ijrs}^{++}(x)\) are the hermitian conjugates of the generalized supercharges \(C_{ijrs}^{\pm}(x)\). We write

\[
C_{ijrs}^{--}(x) = A_{rs}^-(x_+)A_{ij}^+(x_-)
\]

\[
C_{ijrs}^{+-}(x) = A_{rs}^+(x_-)A_{ij}^-(x_+).
\] (21)
Let us remark here that these generators satisfy

\[(C_{ijrs}^{\pm+}(x))^k = (C_{ijrs}^{\pm-}(x))^k = 0, \quad k = k_0k_1...k_{n-1}. \quad (22)\]

Now we introduce a hermetic operator denoted \(H(x)\) as the sum of the equalities (18) and (20), then we get

\[
H(x) = B_rQ_i[\mathbb{N}_i(x)]Q_i - B_iQ_r[\mathbb{N}_r(x)]Q_r \\
+ B_r^{-1}Q_i^{-1}[\mathbb{N}_i(x)]Q_i^{-1} - B_i^{-1}Q_r^{-1}[\mathbb{N}_r(x)]Q_r^{-1}. \quad (23)
\]

In a straightforward computation we get the following relation

\[
[N_i(x)]_{q_i^{-1}} = q_i^{-N_i(x)}[N_i(x)]_{q_i}, \quad (24)
\]

then the operator \([\mathbb{N}_i(x)]_{Q_i^{-1}}\) (Eq.(19)) can be written as

\[
[\mathbb{N}_i(x)]_{Q_i^{-1}} = \begin{pmatrix}
q_i^{1-N_i(x)} & q_{i+1}^{1-N_{i+1}(x)} & \cdots & q_{i+n-1}^{1-N_{i+n-1}(x)}
\end{pmatrix} [\mathbb{N}_i(x)]_{Q_i} \quad (25)
\]

Thus the equality (23) will be rewritten as

\[
H(x) = (B_rQ_i + B_r^{-1}J_i)[\mathbb{N}_i(x)]_{Q_i} \\
-(B_iQ_r + B_i^{-1}J_r)[\mathbb{N}_{i+1}(x)]_{Q_{i+1}}, \quad (26)
\]

where

\[
J_i = \begin{pmatrix}
q_i^{-N_i(x)} & q_{i+1}^{-N_{i+1}(x)} & \cdots & q_{i+n-1}^{-N_{i+n-1}(x)}
\end{pmatrix}. \quad (27)
\]

To extend these results to 2d continuum space, it is sufficient to summon on all the sites of 2d lattice

\[
C_{ijrs}^{\pm\pm} = \sum_{x \in \Omega} C_{ijrs}^{\pm\pm}(x) \quad (28)
\]

\[
H = \sum_{x \in \Omega} H(x). \quad (29)
\]

In the result (26), we remark that the hermetian operator \(H(x)\) looks like a deformed supersymmetry Hamiltonian operator describing a peculiar particles constructed from \(k_i\)-fermions and defined on 2d space. The deformation, in this case, looks be normal since the basis of our construction is deformed system \((k_i\)-fermionic one\) which generalizes the bosonic and fermionic ones and also the presence of special topological effects of 2d space in which anyons live.
6 Irreducible Representations of anyonic algebras and supralgebra

To construct the representations of anyonic algebras treated above, we will consider a Fock space. In first of all, let us give a local irreducible representation on a Fock space of \( k_i \)-fermionic algebra. We introduce this space of this algebra by the set

\[
F_{i_x} = \{ |n_{i_x} \rangle, n_{i_x} = 0, 1, ..., k_i - 1 \}
\]

(29)

where the notation \( i_x \) means that this Fock space is introduced in each site \( x \) of the lattice \( \Omega \).

The action of \( k_i \)-fermionic operators \( f_i^-(x) \) and \( f_i^+(x) \) on \( F_{i_x} \) is expressed by the following equalities

\[
f_i^+(x)|n_{i_x}\rangle = |n_{i_x} + 1\rangle, \quad f_i^+(x)|k_i - 1\rangle = 0, \\
f_i^-(x)|n_{i_x}\rangle = [n_{i_x}]_{q_i}|n_{i_x} - 1\rangle, \quad f_i^-(x)|0\rangle = 0.
\]

(30)

Then, the operator \( f_i^+(x) \) is called a creation \( k_i \)-fermionic operator on the site \( x \) and \( f_i^-(x) \) is an annihilation one. These generators also satisfy the following nilpotency condition which is coherent with the above equalities. So, we have

\[
(f_i^-(x))^{k_i} = (f_i^+(x))^{k_i} = 0
\]

(31)

which generalizes the Pauli exclusion principle; i.e. we can not find in one state more than \( k_i - 1 \) particles of the \( i^{th} \) kind.

Owing to the definition of anyonic operator given by Eq.(8) the irreducible representation space is the same one of \( k_i \)-fermionic system; \( F_{i_x} \). Thus, we can prove that the algebraic relations of Eq.(11) are coherent with the action of anyonic operators \( a_{ij}^{\pm}(x_{\pm}) \) on the Fock space \( F_{i_x} \). We get

\[
a_{ij}^{\pm}(x_{\pm})|n_{i_x}\rangle = e^{\pm i \sum_{y \neq x} \Theta_{\pm_{ij}}(x,y)} |n_{i_x} + 1\rangle \\
[a_{ij}^{\pm}(x_{\pm})|n_{i_x}\rangle = [n_{i_x}]_{q_i} e^{-i \sum_{y \neq x} \Theta_{\pm_{ij}}(x,y)} |n_{i_x} - 1\rangle \\
a_{ij}^{\pm}(x_{\pm})|k_i - 1\rangle = 0 \\
a_{ij}^{\pm}(x_{\pm})|0\rangle = 0.
\]

(32)

According to these relations, we see the operators \( a_{ij}^+(x_{\pm}) \) and \( a_{ij}^-(x_{\pm}) \) as a creation and annihilation anyonic operators respectively.

Let us now define the Fock-like space of combined anyonic system as a direct sum of Fock spaces \( F_{i_x} \) defined in the equality (29). We write

\[
F_x = \bigoplus_{i=0}^{n-1} F_{i_x}.
\]

(33)
In this space, the vacuum state and \( n \)-particles state are described on each \( x \) on the lattice \( \Omega \), and denoted, respectively, by

\[
|0\rangle_i = \begin{pmatrix}
|0\rangle_{i+1} \\
|0\rangle_{i+2} \\
... \\
|0\rangle_{i+n-1}
\end{pmatrix},
|n\rangle_i = \begin{pmatrix}
|n\rangle_{i+1} \\
|n\rangle_{i+2} \\
... \\
|n\rangle_{i+n-1}
\end{pmatrix}
\]

with index \( i = 0, 1, ..., n-1 \) of components in cyclic order. We remark, owing to equation (32), that the action of \( A_{ij}(x) \) and \( A^\dagger_{ij}(x) \), defined in equations (13) on \( F_x \) will be given by

\[
A_{ij}(x_\pm)(|0\rangle_i) = 0, \quad A^\dagger_{ij}(x_\pm)(|k_i - 1\rangle_i) = 0
\]

\[
A_{ij}(x_\pm)(|n\rangle_i) = A(|n - 1\rangle_i), \quad A^\dagger_{ij}(x_\pm)(|n\rangle_i) = B(|n + 1\rangle_i)
\]

with

\[
A = \begin{pmatrix}
[n]_{q_i} e^{-i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y)} & [n]_{q_{i+1}} e^{-i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y)} & \cdots & [n]_{q_{i+n-1}} e^{-i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y)} \\
[n]_{q_i} e^{-i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y)} & [n]_{q_{i+1}} e^{-i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y)} & \cdots & [n]_{q_{i+n-1}} e^{-i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y)} \\
\vdots & \vdots & \ddots & \vdots \\
[n]_{q_i} e^{-i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y)} & [n]_{q_{i+1}} e^{-i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y)} & \cdots & [n]_{q_{i+n-1}} e^{-i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y)} 
\end{pmatrix}
\]

\[
B = \begin{pmatrix}
i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y) & i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y) & \cdots & i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y) \\
i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y) & i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y) & \cdots & i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y) \\
i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y) & i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y) & \cdots & i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y) \\
i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y) & i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y) & \cdots & i\nu_j \sum_{y \neq x} \Theta_{\pm r_y}(x,y)
\end{pmatrix}
\]

Then, the relations of Eq.(35) are compatible with the nilpotency condition Eq.(15), and we can call \( A_{ij}(x_\pm) \) annihilation operator and \( A^\dagger_{ij}(x_\pm) \) creation one.

Now, let us give the representation of the supersymmetry constructed on 2d lattice. The action of the supercharges \( C_{ijrs}(x) \) on the associated Fock-like space that we define as

\[
F = \bigoplus_{i,r=0}^{n-1} (F_{x_i} \otimes F_{r_x})
\]

is given by the equalities

\[
C_{ijrs}^+(x)(|0\rangle_i \otimes |0\rangle_r) = 0
\]

\[
C_{ijrs}^+(x)(|n\rangle_i \otimes |n\rangle_r) = C(|n - 1\rangle_i \otimes |n + 1\rangle_r)
\]

\[
C_{ijrs}^-(x)(|n\rangle_i \otimes |n\rangle_r) = D(|n + 1\rangle_i \otimes |n - 1\rangle_r)
\]

\[
C_{ijrs}^-(x)(|k_i - 1\rangle_i \otimes |k_i - 1\rangle_r) = 0
\]
and their hermitian conjugate $C_{ijrs}^{\pm}(x)$ act on the Fock like-space

$$F^\prime = \bigoplus_{r = 0}^{n \choose -1} (F_{r_x} \otimes F_{i_x})$$

as follows

$$C_{ijrs}^{\pm}(x)(|0\rangle)_r \otimes (|0\rangle)_i = 0$$

$$C_{ijrs}^{\pm}(x)(|n\rangle)_r \otimes (|n\rangle)_i = E(|n - 1\rangle)_r \otimes (|n + 1\rangle)_i$$

$$C_{ijrs}^{\pm}(x)(|n\rangle)_r \otimes (|n\rangle)_i = F(|n + 1\rangle)_r \otimes (|n - 1\rangle)_i$$

$$C_{ijrs}^{\pm}(x)(|k_i - 1\rangle)_r \otimes (|k_i - 1\rangle)_i = 0$$

where

$$C = \begin{pmatrix}
[n]_{q_r} e^{\frac{i}{2} \sum_{y \neq x} (\nu_{r_s} \Theta_{+ \Gamma_x}(x,y) - \nu_{r_j} \Theta_{- \Gamma_x}(x,y))}

& \cdots

& \cdots

& \cdots

& [n]_{q_{r+1 - 1}} e^{\frac{i}{2} \sum_{y \neq x} (\nu_{r_{-n + 1 - s}} \Theta_{+ \Gamma_x}(x,y) - \nu_{r_{-n + 1 - j}} \Theta_{- \Gamma_x}(x,y))}
\end{pmatrix}$$

$$D = \begin{pmatrix}
[n]_{q_r} e^{\frac{i}{2} \sum_{y \neq x} (\nu_{r_j} \Theta_{- \Gamma_x}(x,y) - \nu_{r_s} \Theta_{+ \Gamma_x}(x,y))}

& \cdots

& \cdots

& \cdots

& [n]_{q_{r+1 - 1}} e^{\frac{i}{2} \sum_{y \neq x} (\nu_{r_{-n + 1 - j}} \Theta_{- \Gamma_x}(x,y) - \nu_{r_{-n + 1 - s}} \Theta_{+ \Gamma_x}(x,y))}
\end{pmatrix}$$

$$E = \begin{pmatrix}
[n]_{q_r} e^{\frac{i}{2} \sum_{y \neq x} (\nu_{r_j} \Theta_{- \Gamma_x}(x,y) - \nu_{r_s} \Theta_{+ \Gamma_x}(x,y))}

& \cdots

& \cdots

& \cdots

& [n]_{q_{r+1 - 1}} e^{\frac{i}{2} \sum_{y \neq x} (\nu_{r_{-n + 1 - j}} \Theta_{- \Gamma_x}(x,y) - \nu_{r_{-n + 1 - s}} \Theta_{+ \Gamma_x}(x,y))}
\end{pmatrix}$$

$$F = \begin{pmatrix}
[n]_{q_r} e^{-\frac{i}{2} \sum_{y \neq x} (\nu_{r_j} \Theta_{+ \Gamma_x}(x,y) - \nu_{r_s} \Theta_{- \Gamma_x}(x,y))}

& \cdots

& \cdots

& \cdots

& [n]_{q_{r+1 - 1}} e^{-\frac{i}{2} \sum_{y \neq x} (\nu_{r_{-n + 1 - j}} \Theta_{+ \Gamma_x}(x,y) - \nu_{r_{-n + 1 - s}} \Theta_{- \Gamma_x}(x,y))}
\end{pmatrix}$$

Owing to these results the irreducible representations of anyonic algebras were considered and it was shown that they are related to generalized Pauli exclusion principle. Furthermore, we could see the supersymmetry of our combined system has deformation properties plus "fractional" properties coming from the basis particles ($k_i$-fermions) and the nature of anyons respectively.
Concluding remarks

To summarize, exotic statistics were introduced in physics as an exotic extension of bosonic and fermionic statistics, and the both statistics could be unified by SUSY. Recently, the existence of intimate relation between exotic statistics and SUSY was established by observation of hidden SUSY structure in purely parabosonic and purely parafermionics systems. So, the SUSY and exotic statistics can be unified in the form of paraSUSY for parafermions, and also in the form of so-called fractional SUSY for $q$-bosons where $q$ is a root of unity and nonlinear SUSY for bosonization of supersymmetric quantum mechanics. These studies were formulated on four dimensional spacetime.

For lower dimensions, we have discussed in this work what we could call fractional SUSY in a general case for $k_i$-fermionic anyons. As generalization, our work was for unification of different exotic statistics on 2d space. These kinds of statistics describe quasi-particles which we defined as deformed particles constructed from bosons or fermions. To generalize this construction we have considered $k_i$-fermions as basis to build our generalized anyons, those we call $k_i$-fermionic anyons. From our present construction, it is easy to remark that in the limit cases $k_i = 2$ we re-find the anyonic oscillators defined in the reference [20] by Lerda and Sciuto, and for $k_i \to \infty$ our anyons go to bosonic anyons.

These results are compatible with the fact that anyonic particles having different fractional charge and spin can not live peacefully, such that the commutation relations for anyonic operators show the generalization of exclusion principle and the interchange of two anyons can not be defined consistently for them. These analyses are very interesting for various fields as condensed matter in which the experimental advances related to the fractional quantum Hall effect have proved that quasi-particles discovered appear to exhibit anyonic behavior. Also, the field of quantum computation which can be constructed from the abstract study of anyonic systems, such that the braiding and fusion of anyonic excitations in quantum Hall electron liquids and 2D magnets are modeled by modular functors opening a new possibility for the realization of quantum computers [25, 26].

Acknowledgments

The author would like to thank the Abdus Salam ICTP, particularly the associate-ship Sckeme for its warm hospitality, and the Max-Planck-Institut für Physik Komplexer Systeme for link hospitality during the stage in which one part of this paper was done.
