Abstract

In accordance with Article 6 of Regulation (EC) No 396/2005, the applicant Bayer Hellas AG submitted a request to the competent national authority in Greece to modify the existing maximum residue level (MRL) for the active substance fluopyram in broccoli. The data submitted in support of the request were found to be sufficient to derive MRL proposals for broccoli. Adequate analytical methods for enforcement are available to control the residues of fluopyram on the commodity under consideration at the validated limit of quantification (LOQ) of 0.01 mg/kg. Based on the risk assessment results, EFSA concluded that the short-term and long-term intake of residues resulting from the use of fluopyram according to the reported agricultural practice for broccoli will not result in consumer exposure exceeding the toxicological reference values and therefore are unlikely to present a risk to consumer health.

Summary

In accordance with Article 6 of Regulation (EC) No 396/2005, Bayer Hellas AG submitted an application to the competent national authority in Greece (evaluating Member State, EMS) to modify the existing maximum residue level (MRL) for the active substance fluopyram in broccoli. The EMS drafted an evaluation report in accordance with Article 8 of Regulation (EC) No 396/2005, which was submitted to the European Commission and forwarded to the European Food Safety Authority (EFSA) on 11 July 2018. To accommodate for the intended use of fluopyram, the EMS proposed to raise the existing MRL from the existing MRL 0.3 to 0.4 mg/kg.

EFSA assessed the application and the evaluation report as required by Article 10 of the MRL regulation. EFSA identified points which needed further clarification, which were requested from the EMS. In response to the request, the EMS submitted a revised evaluation report on 25 October 2018 which replaced the previously submitted evaluation report.

Based on the conclusions derived by EFSA in the framework of Directive 91/414/EEC, the data evaluated under previous MRL assessment and the additional data provided by the EMS in the framework of this application, the following conclusions are derived.

The metabolism of fluopyram in primary crops was investigated in the fruit (grapes, peppers), root (potatoes) and pulses/oilseeds (beans) crop groups and the residue definition was proposed as 'fluopyram' for enforcement and as 'sum of fluopyram and fluopyram-benzamide (M25) expressed as fluopyram' for risk assessment purposes. The metabolism of fluopyram in rotational crops and the effect of processing on the nature of the residue were assessed in the framework of the peer review and it was concluded that the residue definitions set on primary crops are applicable to rotational crops and processing commodities.

For the use supported in this MRL application, EFSA concludes that the metabolism of fluopyram is sufficiently addressed and that the derived residue definitions are applicable.

Sufficiently validated analytical methods are available to quantify residues in the crops assessed in this application according to the enforcement residue definition. The methods enable quantification of residues at or above 0.01 mg/kg in the crops assessed (limit of quantification (LOQ)).

The available residue trials are sufficient to derive a MRL proposal of 0.4 mg/kg for broccoli.

Specific studies investigating the magnitude of fluopyram residues in processed commodities were not submitted and they are not required.

The occurrence of fluopyram residues in rotational crops was investigated in the framework of the European Union (EU) pesticides peer review. Based on the available information on the nature and magnitude of residues, it was concluded that significant residue levels are unlikely to occur in rotational crops, provided that the active substance is used according to the proposed good agricultural practice (GAP).

Residues of fluopyram in commodities of animal origin were not assessed since the crop under consideration in this MRL application is normally not fed to livestock.

The toxicological profile of fluopyram was assessed in the framework of the EU pesticides peer review under Directive 91/414/EEC and the data were sufficient to derive an acceptable daily intake (ADI) of 0.012 mg/kg body weight (bw) per day and an acute reference dose (ARfD) of 0.5 mg/kg bw. The metabolites included in the residue definition are of similar toxicity as the parent active substance.

The consumer risk assessment was performed with revision 2 of the EFSA Pesticide Residues Intake Model (PRIMo). A long-term consumer intake concern was not identified for any of the European diets incorporated in the EFSA PRIMo. The maximum calculated chronic intake accounted for 96% of the ADI (NL child). The contribution of residues in the crop under consideration to the total consumer exposure was low, accounting for less than 0.1% of the ADI. The highest acute consumer exposure for broccoli was calculated to be 3% of the ARfD in child and 2.2% of the ARfD in adult.

EFSA concluded that the proposed use of fluopyram on broccoli will not result in a consumer exposure exceeding the toxicological reference values and therefore is unlikely to pose a risk to consumers’ health.

EFSA proposes to amend the existing MRL as reported in the summary table below.

Full details of all end points and the consumer risk assessment can be found in Appendices B–D.
| Code<sup>(a)</sup> | Commodity | Existing EU MRL (mg/kg) | Proposed EU MRL (mg/kg) | Comment/justification |
|-----------------|-----------|------------------------|-------------------------|------------------------|
| 0241010         | Broccoli  | 0.3                    | 0.4                     | The submitted data are sufficient to derive a MRL proposal for the NEU/SEU use. Data sets for NEU and SEU are similar (U-test 5%), MRL is derived from merged data. Risk for consumers unlikely |

**Enforcement residue definition:** fluopyram

MRL: maximum residue level; NEU: northern Europe; SEU: southern Europe.

Assessment

The European Food Safety Authority (EFSA) received an application to modify the existing maximum residue level (MRL) for fluopyram in broccoli. The detailed description of the intended use of fluopyram in broccoli, which is the basis for the current MRL application, is reported in Appendix A.

Fluopyram is the ISO common name for N-[2-[3-chloro-5-(trifluoromethyl)-2-pyridyl] ethyl]-α,α,α-trifluoro-o-toluanil (IUPAC). The chemical structures of the active substance and its main metabolites are reported in Appendix E.

Fluopyram was evaluated in the framework of Directive 91/414/EEC1 with Germany designated as rapporteur Member State (RMS); the representative uses assessed were foliar applications on grapes, tomatoes and strawberries. The draft assessment report (DAR) prepared by the RMS has been peer reviewed by EFSA (2013). Fluopyram was approved2 for the use as a fungicide on 1 February 2014.

The European Union (EU) MRLs for fluopyram are established in Annex III of Regulation (EC) No 396/20053. The review of existing MRLs according to Article 12 of Regulation (EC) No 396/2005 (MRL review) is currently ongoing. EFSA has issued several reasoned opinions on the modification of MRLs for fluopyram (EFSA, 2011, 2014, 2016, 2017). The proposals from these reasoned opinions have been considered in the for EU MRL legislation.4 Certain Codex maximum residue limits (CXLs) have been taken over in the EU MRL legislation as well.

In accordance with Article 6 of Regulation (EC) No 396/2005, Bayer Hellas AG submitted an application to the competent national authority in Greece (evaluating Member State, EMS) to modify the existing MRL for the active substance fluopyram in broccoli. The EMS drafted an evaluation report in accordance with Article 8 of Regulation (EC) No 396/2005, which was submitted to the European Commission and forwarded to EFSA on 11 July 2018. To accommodate for the intended use of fluopyram, the EMS proposed to raise the existing MRL from the existing MRL 0.3 to 0.4 mg/kg.

EFSA assessed the application and the evaluation report as required by Article 10 of the MRL regulation.

EFSA based its assessment on the evaluation report submitted by the EMS (Greece, 2018), the DAR and its addendum prepared under Directive 91/414/EEC prepared under Directive 91/414/EEC (Germany, 2011, 2012), the European Commission review report on fluopyram (European Commission, 2013), the conclusion on the peer review of the pesticide risk assessment of the active substance fluopyram (EFSA, 2013), JMPR reports (FAO, 2013, 2015a,b, 2017) as well as the conclusions from previous EFSA opinions on fluopyram under Article 10 of EU Regulation 396/2005 (EFSA, 2011, 2014, 2016, 2017).

For this application, the data requirements established in Regulation (EU) No 544/20115 and the guidance documents applicable at the date of submission of the application to the EMS are applicable (European Commission, 1997a–g, 2000, 2010a,b, 2017; OECD, 2011, 2013). The assessment is performed in accordance with the legal provisions of the Uniform Principles for the Evaluation and the Authorisation of Plant Protection Products adopted by Commission Regulation (EU) No 546/20116.

As the review of the existing MRLs under Article 12 of Regulation 396/2005 is not yet finalised, the conclusions reported in this reasoned opinion may need to be reconsidered in the light of the outcome of the MRL review.

A selected list of end points of the studies assessed by EFSA in the framework of this MRL application including the end points of relevant studies assessed previously, submitted in support of the current MRL application, are presented in Appendix B.

6 Commission Regulation (EU) No 546/2011 of 10 June 2011 implementing Regulation (EC) No 1107/2009 of the European Parliament and of the Council as regards uniform principles for evaluation and authorisation of plant protection products. OJ L 155, 11.6.2011, p. 127–175.
The evaluation report submitted by the EMS (Greece, 2018) and the exposure calculations using the EFSA Pesticide Residues Intake Model (PRIMo revision 2) are considered as supporting documents to this reasoned opinion and, thus, are made publicly available as background documents to this reasoned opinion.

1. Residues in plants

1.1. Nature of residues and methods of analysis in plants

1.1.1. Nature of residues in primary crops

The metabolism of fluopyram has been investigated in the framework of EU pesticides peer review in primary crops in three crop groups, i.e. fruit, root and pulses/oilseeds crops using the radiolabelled active substance (labelled on the phenyl or the pyridyl moiety) (EFSA, 2013). The metabolism of fluopyram was regarded as qualitatively similar in all plant groups investigated in the framework of EU peer review. While parent fluopyram accounted for a major proportion of the residues in most of the crop parts analysed, metabolite fluopyram-benzamide (M25) resulting from the cleavage of the parent molecule, was observed in significant proportions and levels in the metabolism study in beans (pulses/oilseed crop group) accounting for up to 64% total radioactive residue (TRR) and to less extent in grapes, potatoes and peppers.

For broccoli, the available metabolism studies are considered sufficient to elucidate the metabolic behaviour.

1.1.2. Nature of residues in rotational crops

Since broccoli can grow in crop rotation with other crops and due to the high persistence of fluopyram in soils (DT$_{50}$ > 300 days, DT$_{90}$ > 1,000 days) (EFSA, 2013), the possible occurrence of residues in rotational crops had to be investigated. The metabolism of fluopyram in rotational crops (root, leafy and cereals crops categories) was assessed in the framework of the EU peer review process. The metabolism in rotational crops was shown to be similar to primary crop metabolism (EFSA, 2013).

1.1.3. Nature of residues in processed commodities

The effect of processing on the nature of fluopyram was investigated in the framework of the EU pesticides peer review. Fluopyram and fluopyram-benzamide (metabolite M25) were found to be stable under standard hydrolysis conditions (EFSA, 2013). It was therefore concluded that the residue definitions proposed from primary crops are also applicable to processed commodities.

1.1.4. Methods of analysis in plants

Analytical methods for the determination of fluopyram residues in plant commodities were assessed during the peer review under Directive 91/414/EEC (EFSA, 2013). An analytical method using gas chromatography with mass spectrometry (GC–MS) detection was concluded to be sufficiently validated for the determination of fluopyram residues in high acid (orange), high oil (oilseed rape), high water (lettuce), dry/protein (pea) and dry/starch (wheat) commodities at the validated limit of quantification (LOQ) of 0.01 mg/kg.

1.1.5. Stability of residues in plants

The stability of fluopyram and its benzamide metabolite (metabolite M25) in plant matrices under storage conditions prior to analysis was assessed during the peer review under Directive 91/414/EEC (EFSA, 2013) and additional studies were assessed in the previous EFSA reasoned opinions (EFSA, 2014, 2016). Based on the available data, it was concluded that residues of fluopyram and its metabolite M25 are stable for at least 3 years in high water (lettuce, cabbage), high starch (wheat), high protein (dry pea), high oil (rapeseeds) and in high acid matrices (orange), when stored at –18°C (EFSA, 2014).

1.1.6. Proposed residue definitions

Based on the metabolic pattern identified in metabolism studies on primary and rotational crops, the results of hydrolysis studies, the toxicological significance of metabolites and/or degradation
products, the capabilities of enforcement analytical methods, the following general residue definitions were proposed:

- Residue definition for enforcement: fluopyram;
- Residue definition for risk assessment: sum of fluopyram and fluopyram-benzamide (M25), expressed as fluopyram.

The residue definition for enforcement set in Regulation (EC) No 396/2005 is identical with the above mentioned residue definition as well as the residue definitions proposed by JMPR.

Based on the available information, EFSA concluded that these residue definitions are appropriate and applicable for the intended use in broccoli. Since broccoli belong to the high water content commodities category, EFSA concludes that sufficiently validated analytical methods are available to monitor fluopyram residues in the commodity under assessment with an LOQ of 0.01 mg/kg.

1.2. Magnitude of residues in plants

1.2.1. Magnitude of residues in primary crops

To support the intended use of fluopyram in broccoli (application rate 2 × 125 g a.s./ha, preharvest interval (PHI) 14 days), 12 residue trials (6 northern EU and 6 southern EU) were submitted within the MRL application. The trials were conducted in different locations over two seasons and their independence has been confirmed.

The samples were analysed for the parent compound fluopyram and the metabolite fluopyram-benzamide (M25) achieving an LOQ of 0.01 mg/kg per analyte. According to the assessment of the EMS, the methods used were sufficiently validated and fit for purpose. Samples in the residue studies were stored deep-frozen within 24 h after sampling for 36 months; therefore, it is concluded that the residue data are valid with regard to storage stability.

Data sets for northern EU and southern EU are similar (U-test 5%), and therefore, a MRL proposal was derived from the merged data sets.

1.2.2. Magnitude of residues in rotational crops

The confined rotational crop study previously evaluated (EFSA, 2013) has shown that residues of fluopyram cannot be excluded in rotational crops. Therefore, rotational field studies were required.

In these rotational field studies conducted in spinach at the exaggerated dose rate of 500 g/ha (2N compared to the annual application rate for the intended good agricultural practice (GAP) on broccoli), residues of up to 0.09 mg/kg were found at a plant-back interval (PBI) of 28–36 days. It was proposed to set a MRL for leafy crops at the level of 0.2 mg/kg, unless a specific use in the leafy crops requires a higher MRL (EFSA, 2014).

For the time being, EFSA does not see the need to amend existing MRLs for crops grown in crop rotation, considering that the existing MRLs for most of these crops are set at a higher level than residue level expected in rotational crops. However, it is recommended that in the framework of the MRL review a detailed assessment of the residue situation in rotational crops should be performed.

1.2.3. Magnitude of residues in processed commodities

Fluopyram and fluopyram-benzamide were stable under standard hydrolysis conditions simulating pasteurisation, boiling/baking and sterilisation (see Section 1.1.3).

A processing study in cooking tomato was submitted in previous assessment (EFSA, 2013) and a processing factor (PF) was proposed. New processing studies were not submitted under the current MRL application.

Considering the low contribution of broccoli to the total exposure, no further information is required. If processing factors were to be required by risk managers, in particular for enforcement purposes (e.g. for blanched frozen broccoli), additional processing studies should be requested.

1.2.4. Proposed MRLs

The available data are considered sufficient to derive an MRL proposal as well as risk assessment values for broccoli (see Appendix B.1.2.1). In Section 3, EFSA assessed whether the expected residues on broccoli resulting from the intended use are likely to pose a consumer health risk.
2. **Residues in livestock**

   Residues of fluopyram in commodities of animal origin were not assessed since the crop under consideration in this MRL application is normally not fed to livestock.

3. **Consumer risk assessment**

   The toxicological reference values for fluopyram used in the risk assessment (i.e. acceptable daily intake (ADI) and acute reference dose (ARfD) values) were derived in the framework of the EU pesticides peer review (EFSA, 2013). The metabolites (M02, M03 and M25) included in the risk assessment residue definitions for plant and animal commodities are considered to be of similar toxicity/not more toxic than the parent compound.

   The consumer risk assessment was performed with revision 2 of the EFSA PRIMo. The PRIMo model contains the relevant European food consumption data for different subgroups of the EU population (EFSA, 2007).

   The long-term exposure assessment was performed, taking into account the supervised trials median residue (STMR) value derived for broccoli; for the remaining commodities, the STMR values derived in previous assessments of EFSA (2011, 2013, 2014, 2016, 2017) were selected as input values. For crops for which the CXLs were taken over in the EU legislation, the related STMR values derived by JMPR have been used to estimate the dietary exposure. For the remaining commodities, the MRLs established in most recent MRL regulation were used. The complete list of input values is presented in Appendix D.1.

   The estimated long-term dietary intake accounted for up to 96% of the ADI for NL children. Broccoli accounted for up to 0.075% of the ADI. EFSA concludes that the long-term intake of residues of fluopyram resulting from the existing and the intended use is likely to present a risk to consumer health.

   The short-term exposure assessment was performed in accordance with the internationally agreed methodology. It was performed only with regard to the commodity under consideration assuming the consumption of a large portion of the food items as reported in the national food surveys containing residues at the highest residue (HR) level as observed in supervised field trials (Appendix B.1.2.1).

   The calculated maximum short-term (acute) exposure accounted for 3% in children and 2.2% in adults.

   Based on these calculations, EFSA concluded that the proposed use of fluopyram on the crop assessed is unlikely to pose a risk for the consumers.

   For further details on the exposure calculations, a screenshot of the Report sheet of the PRIMo is presented in Appendix C.

4. **Conclusion and Recommendations**

   The data submitted in support of this MRL application were found to be sufficient to derive an MRL proposal for broccoli.

   EFSA concluded that the proposed use of fluopyram on broccoli will not result in a consumer exposure exceeding the toxicological reference values and therefore is unlikely to pose a risk to consumers’ health.

   The MRL recommendations are summarised in Appendix B.4.

Appendix B – List of end points

B.1. Residues in plants

B.1.1. Nature of residues and methods of analysis in plants

B.1.1.1. Metabolism studies, methods of analysis and residue definitions in plants

| Primary crops (available studies) | Crop groups | Crop(s) | Application(s) | Sampling (DALA) |
|-----------------------------------|-------------|---------|----------------|-----------------|
| Fruit crops                       | Grapes      | Foliar, 1 × 100 + 2 × 200 g/ha | 18–19          |
|                                  | Peppers     | Drip irrigation, 5 and 20 mg/plant | 33–97        |
| Root crops                        | Potatoes    | Foliar, 3 × 167 g/ha | 51             |
| Pulses/oilseeds                   | Beans       | Foliar, 2 × 250 g/ha | 4–29           |

Radiolabelled active substance: phenyl-UL-14C
Reference: EFSA (2013)

| Rotational crops (available studies) | Crop groups | Crop(s) | Application(s) | PBI (DAT) |
|-------------------------------------|-------------|---------|----------------|-----------|
| Root                                | Turnips     | Bare soil, 1 × 534 g/ha | 30, 139, 280 |
| Leafy                              | Swiss chard | Bare soil, 1 × 534 g/ha | 30, 139, 280 |
| Cereal (small grain)               | Wheat       | Bare soil, 1 × 534 g/ha | 30, 139, 280 |

Comments: Phenyl-UL-14C and Pyridyl-2,6-14C
Reference: Germany (2011), EFSA (2013)

| Processed commodities (hydrolysis study) | Conditions | Investigated? |
|-----------------------------------------|------------|---------------|
|                                        | Pasteurisation (20 min, 90°C, pH 4) | Yes |
|                                        | Baking, brewing and boiling (60 min, 100°C, pH 5) | Yes |
|                                        | Sterilisation (20 min, 120°C, pH 6) | Yes |

Reference: EFSA (2013)

Can a general residue definition be proposed for primary crops? Yes
Rotational crop and primary crop metabolism similar? Yes
Residue pattern in processed commodities similar to residue pattern in raw commodities? Yes
Plant residue definition for monitoring (RD-Mo) Fluopyram
Plant residue definition for risk assessment (RD-RA) Sum of fluopyram and fluopyram-benzamide (M25), expressed as fluopyram
Methods of analysis for monitoring of residues (analytical technique, crop groups, LOQs)
Matrices with high water content, high oil content, high acid content and dry matrices: HPLC–MS/MS, GC–MS, LOQ 0.01 mg/kg (EFSA, 2013; EFSA, 2016; Greece, 2018).

DALA: days after last application; DAT: days after treatment; PBI: plant-back interval; HPLC–MS/MS: high performance liquid chromatography with tandem mass spectrometry; GC–MS: gas chromatography with mass spectrometry; LOQ: limit of quantification.
### Stability of residues in plants

| Plant products (available studies) | Category           | Commodity         | $T$ ($^\circ$C) | Stability (Months) |
|-----------------------------------|--------------------|-------------------|----------------|-------------------|
| Lettuce, cabbage                 | High water content | –18°C             | 36             |
| Rapeseed                         | High oil content   | –18°C             | 36             |
| Dry pea/wheat                    | Dry/High starch    | –18°C             | 36             |
| Orange                           | High acid content  | –18°C             | 36             |

B.1.2. Magnitude of residues in plants

B.1.2.1. Summary of residues data from the supervised residue trials

| Commodity   | Region/indoor<sup>(a)</sup> | Residue levels observed in the supervised residue trials (mg/kg) | Comments/Source                                                                 | Calculated MRL (mg/kg) | HR<sup>(b)</sup> (mg/kg) | STMR<sup>(c)</sup> (mg/kg) | CF<sup>(d)</sup> |
|-------------|----------------------------|---------------------------------------------------------------|---------------------------------------------------------------------------------|------------------------|--------------------------|-------------------------|--------------|
| Broccoli    | NEU                        | Mo: 0.01; 0.013; 0.056; 0.092; 0.096; 0.20                    | Residue trials on broccoli compliant with GAP. Data sets for NEU and SEU are similar (U-test 5%), MRL is derived from merged data sets | 0.4                    | Mo: 0.25                | RA: 0.26                | 1.2          |
|             | 2 × 125 g/ha PHI 14 days   | RA: 0.02; 0.023; 0.066; 0.1; 0.11; 0.21                      |                                                                                  |                        | RA: 0.09                |                         |              |
|             | SEU                        | Mo: 0.011; 0.012; 0.071; 0.084; 0.091; 0.25                  |                                                                                  |                        |                        | RA: 0.09                | 1.2          |
|             |                            | RA: 0.021; 0.022; 0.081; 0.094; 0.1; 0.26                  |                                                                                  |                        |                        |                         |              |

MRL: maximum residue level; GAP: Good Agricultural Practice; Mo: monitoring; RA: risk assessment.

<sup>(a)</sup>: NEU: Outdoor trials conducted in northern Europe, SEU: Outdoor trials conducted in southern Europe, Indoor: indoor EU trials or Country code: if non-EU trials.

<sup>(b)</sup>: Highest residue. The highest residue for risk assessment refers to the whole commodity and not to the edible portion.

<sup>(c)</sup>: Supervised trials median residue. The median residue for risk assessment refers to the whole commodity and not to the edible portion.

<sup>(d)</sup>: Conversion factor to recalculate residues according to the residue definition for monitoring to the residue definition for risk assessment.
B.1.2.2. Residues in rotational crops

Residues in rotational and succeeding crops expected based on confined rotational crop study?

Yes

Residues in rotational and succeeding crops expected based on field rotational crop study?

Yes; A default MRL of 0.1 mg/kg was recommended by the peer review (EFSA, 2013) for root and leafy crops and of 0.01 mg/kg for cereals, oilseed grown in rotation with crops treated with fluopyram. These proposals were derived from the field studies conducted at the exaggerated dose rate of 500 g/ha, representative for the predicted plateau concentration in soil (0.08 mg/kg soil, 20 cm depth) reached after 10 years of consecutive application (EFSA, 2013).

In addition, a default MRL of 0.2 mg/kg was proposed for spinach grown in rotation to crops treated with fluopyram (EFSA, 2014).

New rotational field studies were not submitted in the framework of the current application.

MRL: maximum residue level.

B.1.2.3. Processing factors

No new processing studies were submitted in the framework of the present MRL application.

B.2. Residues in livestock

Not relevant.

B.3. Consumer risk assessment

ARfD

0.5 mg/kg bw (EFSA, 2013)

Highest IESTI, according to EFSA PRIMo

Broccoli: 3% of ARfD (child), 2.2% of ARfD (adult)

Assumptions made for the calculations

The calculation is based on the highest residue levels expected in raw agricultural commodities according to the residue definition for risk assessment

ADI

0.012 mg/kg bw per day (EFSA, 2013)

Highest IEDI, according to EFSA PRIMo

96% ADI (NL, child)

Contribution of crops assessed:

Broccoli: 0.075% of ADI

Assumptions made for the calculations

The chronic consumers’ exposure has been calculated by using the supervised trials median residue (STMR) derived for broccoli according to the risk assessment residue definition and the STMR values previously evaluated and implemented in the MRL Regulation or the STMR corresponding to the CXL implemented in the EU MRL legislation.

For the remaining crops, the existing MRL was used as input value.

ARfD: acute reference dose; bw: body weight; IESTI: international estimated short-term intake; PRIMo: (EFSA) Pesticide Residues Intake Model; ADI: acceptable daily intake; IEDI: international estimated daily intake; STMR: supervised trials median residue; MRL: maximum residue level; CXL: Codex maximum residue limit.
### B.4. Recommended MRLs

| Code<sup>(a)</sup> | Commodity | Existing EU MRL (mg/kg) | Proposed EU MRL (mg/kg) | Comment/justification |
|-------------------|-----------|------------------------|-------------------------|-----------------------|
| 0241010           | Broccoli  | 0.3                    | 0.4                     | The submitted data are sufficient to derive a MRL proposal for the NEU/SEU use. Data sets for NEU and SEU are similar (U-test 5%), MRL is derived from merged data. Risk for consumers unlikely |

**Enforcement residue definition:** fluopyram

MRL: maximum residue level; NEU: northern Europe; SEU: southern Europe.

(a): Commodity code number according to Annex I of Regulation (EC) No 396/2005

Conclusion:
The estimated Theoretical Maximum Daily Intakes (TMDI), based on pTMRLs were below the ADI. A long-term intake of residues of Fluopyram is unlikely to present a public health concern.

www.efsa.europa.eu/efsajournal 18  EFSA Journal 2019;17(3):5624
The acute risk assessment is based on the ARfD.

For each commodity, the calculation is based on the highest reported MS consumption per kg bw and the corresponding unit weight from the MS with the critical consumption. If no data on the unit weight was available from that MS, an average European unit weight was used for the IESTI calculation.

In the IESTI 1 calculation, the variability factors used were 10, 7 or 5 (according to JMPR manual 2002); for lettuce, a variability factor of 5 was used.

In the IESTI 2 calculations, the variability factors of 10 and 7 were replaced by 5. For lettuce, the calculation was performed with a variability factor of 3.

Threshold MRL is the calculated residue level which would lead to an exposure equivalent to 100% of the ARfD.

| Highest % of ARfD/ADI Commodities | pTMRL/Threshold MRL (mg/kg) | Highest % of ARfD/ADI Commodities | pTMRL/Threshold MRL (mg/kg) | Highest % of ARfD/ADI Commodities | pTMRL/Threshold MRL (mg/kg) | Highest % of ARfD/ADI Commodities | pTMRL/Threshold MRL (mg/kg) |

For processed commodities, no exceedance of the ARfD/ADI was identified.

Acute risk assessment/children – refined calculations

| No of commodities for which ARfD/ADI is exceeded (IESTI 1): | — |
| No of commodities for which ARfD/ADI is exceeded (IESTI 2): | — |

No exceedance of the ARfD/ADI was identified for any unprocessed commodity.

**Conclusion:**

For Fluopyram, IESTI 1 and IESTI 2 were calculated for food commodities for which pTMRLs were submitted and for which consumption data are available.

No exceedance of the ARfD/ADI was identified for any unprocessed commodity.
