Supplemental Figure S5. Systemic Cic inactivation.

(A) Western blot analysis of Cic expression in the indicated tissues obtained from a representative Cic<sup>lox/lox</sup>;hUBC-CreERT<sup>2+/T</sup> mouse subjected to Tmx diet for 3 months. Two different exposures for Cic are shown. Akt expression levels served as a loading control.

(B) Relative expression levels of Etv4 mRNA in the indicated tissues obtained from a representative Cic<sup>lox/lox</sup>;hUBC-CreERT<sup>2+/T</sup> mouse subjected to Tmx diet for 3 months. β-Actin expression levels were used for normalization. Data represent mean ± SD.
