Citation: Tang L, L-Z, Cao G-H (2011) On Chinese species of Dianous group I (Coleoptera, Staphylinidae, Steninae). ZooKeys 111: 67–85. doi: 10.3897/zookeys.111.1431

Abstract
Chinese species of Dianous group I are studied and three new species are described: D. fengtingae sp. n. from Hainan Province, D. zhujianqingi sp. n. from Jiangxi and Guizhou Province, and D. huanghaoi sp. n. from Yunnan Province. Dianous shan Rougemont and D. viridicupreus Rougemont are discovered from China for the first time. Their diagnostic characters are illustrated and a key to Chinese species of Dianous group I is provided.

Keywords
Coleoptera, Staphylinidae, Dianous Group I, China

Introduction
The members of Dianous group I have large eyes and simple tarsi, and therefore were regarded as Stenus by earlier entomologists. In 1981 Puthz made a systematic comparison between these two genera and revealed that this group without protrudable labium
surely belonged to *Dianous*. To distinguished it from other members of *Dianous*, the following characters can be used: eyes large, usually without temples; tarsi simple, without tarsal shoes; frons with median portion not elevated.

Up to the present, 59 species of *Dianous* group I have been described, which account for nearly 30 percent of the genus. All of the species are distributed in the Oriental region and seem to be rare. In Chinese fauna, only four species were previously reported by Puthz (2000): *D. yao* Rougemont, 1981 from Guizhou and *D. tonkinensis* (Puthz), 1968 from Yunnan, Puthz (2001): *D. limitaneus* Puthz, 2001 from Yunnan, Shi and Zhou (2010): *D. viriditinctus* (Champion), 1920 from Xizang. In this paper, we complement the list with several new records and new species based on material from South China.

**Material and methods**

Specimens examined in this paper were all collected near streams through forests and killed with ethyl acetate. For examination of male genitalia, the last three abdominal segments were detached from the body after softening in hot water. The aedeagus together with other dissected pieces were mounted in Euparal (Chroma Gesellschaft Schmidt, Koengen, Germany) on plastic slides. Photos of sexual characters were taken with Cannon G7 attached to Olympus SZX 16 stereoscope; habitus photos were taken with a Cannon macro photo lens MP-E 65mm attached to Cannon EOS40D camera.

The type specimens treated in this study are deposited in the following public and private collections:

- **SHNU** Department of Biology, Shanghai Normal University, P. R. China
- **cPut** private collection of V. Puthz, Schlitz, Germany
- **cRou** private collection of G.-M. de Rougemont, London, England

The measurements of proportions are abbreviated as follows:

- **BL** body length, measured from the anterior margin of the clypeus to the posterior margin of 10th abdominal tergite
- **FL** forebody length, measured from the anterior margin of the clypeus to the apex of the elytra (apicocentral angle)
- **HW** width of head including eyes
- **PW** width of pronotum
- **EW** width of elytra
- **PL** length of pronotum
- **EL** length of elytra, measured from humeral angle
Results

Key to Chinese species of *Dianous* group I

1 Pronotum bicolorous with golden bands along the anterior and posterior margins

2 Pronotum unicolorous

3 Head distinctly broader than elytra; femora bicolorous. Habitus (Figs 13, 14), aedeagus (Fig. 3 in Rougemont 1985), female sexual characters (Figs 63–65). BL: 4.8–5.0 mm. *D. viridicupreus* Rougemont China (Xizang), Nepal

4 Head narrower than elytra; femora unicolorous. Habitus (Figs 17), sexual characters (Figs 6–10 in Shi & Zhou 2010). BL: 4.3–5.3 mm. *D. viriditinctus* (Champion) China (Xizang), India, Nepal, Bhutan

5 Elytra relatively narrow, head about as broad as elytra; punctures on head and pronotum moderate in size and distinctly separated, interstices can be as broad as half the diameter of a puncture. Habitus (Figs 5, 6), sexual characters (Figs 36–44). BL: 4.5 mm. *D. shan* Rougemont China (Yunnan), Myanmar, Thailand

6 Elytra relatively broad, head distinctly narrower than elytra; punctures on head and pronotum very coarse and very dense, interstices narrow and sharp

5 Frons between eyes sharply inclined inward forming a deep and broad concavity; punctures on elytra mostly distinctly delimited; paratergites of abdominal tergite 4 broad, slightly declivous. Habitus (Figs 15), aedeagus (Figs 2 in Rougemont, 1981a). BL: 4.0–5.2 mm. *D. yao* Rougemont China (Guizhou), Myanmar, Thailand

7 Frons between eyes gently inclined inward forming a shallow and broad concavity, traces of two lateral longitudinal furrows can be recognized at posterior portion of the concavity; punctures on elytra mostly transversely or diagonally confluent; paratergites of abdominal tergite 4 narrow, slightly reflexed. Habitus (Figs 16), male unknown. BL: 4.5–5.2 mm. *D. limitaneus* Puthz China (Yunnan)

8 Forebody distinctly metallic blue; femora bicolorous

7 Forebody black with plumbeous lustre, sometimes elytra with brassy reflection; femora unicolor

8 Punctures on frons deep and dense; posterior half of elytra with vorticose sculpture. Habitus (Figs 11, 12), sexual characters (Figs 54–62). BL: 4.6–5.0 mm. *D. huanghaoi* sp. n. China (Yunnan)
punctures on frons shallow and sparse; posterior half of elytra with transverse sculpture. Habitus (Figs 7–10), sexual characters (Figs 45–53). BL: 3.7–4.4 mm.................................................................D. zhujianqingi sp. n. China (Jiangxi, Guizhou)

8 Punctuation of pronotum and elytra coarser and less confluent; posteromedian part of 7th male sternite (Fig. 29) flattened, without keels. Habitus (Figs 3, 4), sexual characters (Figs 27–35). BL: 4.5–4.9 mm......D. fengtingae sp. n. China (Hainan)

– Punctuation of pronotum and elytra smaller and confluent; posteromedian part of 7th male sternite (Fig. 20) with an impression limited by raised keels laterally, and two acute backward projections at its posterior margin. Habitus (Figs 1, 2), sexual characters (Figs 18–26). BL: 4.4–5.9 mm ..................................................D. tonkinensis (Puthz)

China (Yunnan, Hunan), Vietnam, Thailand, Borneo, Indonesia

On Chinese species of Dianous group I (Coleoptera, Staphylinidae, Steninae)

Figures 1–6. Adult habitus of Dianous. 1, 2 D. tonkinensis 3, 4 D. fengtingae 5, 6 D. shan. Scales = 1 mm.

alt. 450–650m, 13.IV.2010, Zhu Jian-Qing leg. (female in cPut, female in cRou, rest in SHNU).

Description. Body entirely black, head, pronotum, elytra and basal abdominal tergites with a blue metallic lustre. Antennae blackish brown, with club segments lighter. First two segments of maxillary palpi brownish yellow, last segment brown. Legs blackish with tibiae and tarsi slightly lighter, femora yellowish in basal third.

BL: 4.5–4.9mm; FL: 2.5–2.6 mm.

Proportions of holotype: HW: 63.5, PW: 47, PL: 53, EW: 61, EL: 67.
Head 1.04 times as wide as elytra; interocular area gently inclined inward forming a shallow and broad concavity; punctures round, distinctly delimited, slightly larger on median area than near dorsal margins of eyes, diameter of large punctures about as wide as widest cross section of 2nd antennal segment, interstices smooth, mostly smaller than half diameter of punctures. Antennae when reflexed exceeding posterior margin of pronotum; length of segments from base to apex: 10.0: 7.0: 17.5: 11.0: 9.0: 8.0: 8.0: 7.0: 7.0: 8.0: 10.0.

Pronotum 1.28 times as long as wide, widest slightly before middle and constricted at base; punctures round, partially slightly confluent, distinctly larger than those on frons, interstices smooth, mostly smaller than half diameter of punctures.

Elytra nearly rectangular; punctation on average slightly coarser than that of pronotum, punctures on humeral area mostly distinctly delimited, and those on inner 2/3 portion of elytra (especially those on posterior half) obliquely confluent, interstices similar to those on pronotum.

Length of metatarsi from base to apex: 11.5: 8.5: 5.5: 3.5: 10.5.

Abdomen subcylindrical; 3rd to 6th segments with broad and densely punctate paratergites, paratergites of tergite 4 narrower than greatest width of hind tibia; 7th tergite with an apical membranous fringe; punctures on 3rd tergite as large as one eye facet, interstices smooth.

Male. Seventh sternite (Fig. 29) with a distinct posteriomedian emargination, 8th sternite (Fig. 30) with a broad triangular emargination posteromedially; 9th sternite (Fig. 31) with the apicolateral portion serrate, posterior margin slightly emarginate; 10th tergite (Fig. 32) with the posterior margin broadly rounded. Median lobe of aedeagus (Fig. 18) with an acutely pointed and setose apex (Fig. 19), parameres extending far beyond the apex of median lobe.

Female. Sternite 8 (Fig. 33) pointed posteromedially; valvifer (Fig. 34) with the posterior margin serrate; 10th tergite (Fig. 35) with the posterior margin truncate.

**Distribution.** China (Hainan).

**Diagnosis.** The new species is similar to *D. tonkinensis* (Puthz, 1968) from South Asia and *D. lividus* (L. Benick, 1929) from Philippines and Indonesia. It may be distinguished from both by the coarser and less confluent punctation on pronotum and especially on elytra.

*Dianous shan* Rougemont, 1981, new to China

urn:lsid:zoobank.org:act:03F6F311-0FA5-4860-A53B-1F53A74F970A
http://species-id.net/wiki/Dianous_zhujianqingi
Figs 7–10, 45–53

Type material. Holotype. China: Jiangxi: male, glued on a card with labels as follows: “China: Jiangxi Prov., Yushan County, Mt. Sanqingshan, alt. 1000–1200m, 16.X.2010, Peng, Zhai & Zhu leg.” “Holotype / Dianous zhujianqingi / Tang & Li” [red handwritten label] (SHNU). Paratypes. 14 males and 19 females, same data as for the holotype (1 pair in cPut, 1 pair in cRou, rest in SHNU); male and female, Sanqingshan, alt. 700–1000m, 4.V.2005, Hu Jia-Yao & Tang Liang leg. (SHNU); Guizhou: male and 2 females, Mt. Fanjing, 23.VII.2003, Li Li-Zhen, Hu Jia-Yao & Tang Liang leg. (SHNU)

Description. Body entirely black with a faint plumbeous lustre, elytra sometimes with brassy reflection. Antennae blackish brown. Maxillary palpi with first segment yellowish, second segment light brown and last segment brown. Legs black with a brownish tint, tibiae and tarsi slightly lighter.

BL: 3.7–4.4 mm; FL: 2.1–2.3 mm.

Proportions of holotype: HW: 58.0, PW: 44.5, PL: 49.0, EW: 59.0, EL: 63.5.

Head about as wide as elytra; lateral portions of front slightly rising, medial portion concave; punctures round, distinctly delimited, slightly larger on median area than near dorsal margins of eyes, diameter of large punctures about as wide as apical cross section of 3rd antennal segment, interstices smooth, smaller than or as broad as half diameter of punctures. Antennae when reflexed extending to the posterior margin of pronotum; Length of segments from base to apex: 9.0: 6.5: 9.0: 8.0: 8.0: 5.5: 8.0: 6.0: 7.0: 6.5: 9.0.

Pronotum 1.10 times as long as wide, widest slightly before middle and constricted at base; punctures partially confluent, diameter of large punctures about as wide as apical cross section of 2nd antennal segment, interstices smooth, mostly smaller than or about as broad as half diameter of punctures.

Elytra nearly rectangular; punctation similar to that of the pronotum, punctures on humeral area mostly distinctly delimited, those on medial two thirds obliquely confluent, interstices similar to those on pronotum.

Length of metatarsi from base to apex as 18.5: 8.0: 5.5: 4.0: 11.5.

Abdomen subcylindrical; 3rd to 6th segments with broad and densely punctate paratergites, paratergites of 4th tergite as broad as greatest width of hind tibia; 7th tergite with an apical membranous fringe; punctures on 3rd tergite slightly smaller than one eye facet, interstices with very indistinct microsculpture.

Male. Seventh sternite (Fig. 47) with a very shallow emargination posteromedially, 8th sternite (Fig. 48) with a triangular emargination posteromedially; 9th sternite (Fig. 49) with distinct apicolateral projections, posterior margin slightly serrate and almost straight; 10th tergite (Fig. 50) with posterior margin broadly round. Median lobe of aedeagus (Fig. 45) with a triangularly pointed and setose apex (Fig. 46), a pair of distinct expulsion hooks, parameres extending far beyond the apex of median lobe.
Female. Eighth sternite (Fig. 51) pointed posteromedially; valvifer (Fig. 52) with posterior margin finely serrate; 10th tergite (Fig. 53) with the posterior margin broadly pointed.

**Distribution.** China (Jiangxi, Guizhou)

**Variability.** In a few specimens the punctation of pronotum and elytra is strongly confluent as in Fig. 9. Two specimens show more a distinct brassy reflection on elytra and blue metallic reflection on basal tergites (Fig. 10).

**Diagnosis.** The new species slightly resembles *D. cyaneovirens* (Cameron, 1930) from India, Nepal, Bhutan and *D. bracteatus* (Champion, 1920) from India, and Nepal. From both it may be easily distinguished by the faint metallic coloration (*D. cyaneovirens* and *D. bracteatus*: strongly metallic green), and from *D. bracteatus* also by darker legs.

**Figures 7–12.** Adult habitus of *Dianous*. 7–10 *D. zhujianqingi* 11, 12 *D. huanghaoi*. Scales = 1 mm.

**Type material.** Holotype. China: Yunnan: male, glued on a card with labels as follows: "Zhonghutiao, Hutiaoxia Coun., Yunnan Prov., 24.IV.2005, Huang Hao leg."  
"Holotype / Dianous Huanghaoi / Tang & Li" [red handwritten label] (SHNU).  
Paratypes. 2 males and 5 females, same data as for the holotype. (1 pair in cPut; rest in SHNU); 2 females, Yushuizhai, Lijiang, alt. 2600m, 14.IV.2003, stream moss, G. de Rougemont leg. (cRou)

**Description.** Body entirely black with a faint plumbeous lustre. Antennae blackish brown, antennal club slightly lighter than preceding segments. Maxillary palpi brownish. Legs black with a brownish tint, tibiae and tarsi slightly lighter.  
BL: 4.6–5.0mm; FL: 2.6–2.7mm.  
Proportions of holotype: HW: 59.5, PW: 44.0, PL: 50.5, EW: 66.0, EL: 69.5.  
Head 0.9 times as wide as elytra; lateral portions of frons slightly raised, median portion concave; punctures round to elliptic, distinctly delimited, slightly larger on median area than near dorsal margins of eyes, diameter of largest punctures about as wide as basal cross section of 2nd antennal segment, interstices smooth, smaller than or as broad as half diameter of punctures. Antennae when reflexed extending to the posterior margin of pronotum; Length of segments from base to apex as 9.5: 6.5: 14.5: 8.5: 7.5: 6.5: 7.0: 5.5: 6.0: 5.5: 8.0.  
Pronotum 1.15 times as long as wide, widest slightly before middle and constricted at base; punctures partially confluent, similar in size to those on head, interstices similar to those on frons.  
Elytra nearly rectangular; punctation similar to that of the pronotum, punctures on humeral area mostly distinctly delimited, those on posterior half of elytra strongly confluent, forming a narrowly vorticose sculpture.  
Relative length of segments of hind legs from base to apex as 15.0: 8.5: 5.5: 3.5: 14.5.  
Abdomen subcylindrical; 3rd to 6th segments with broad and densely punctate paratergites, paratergites on 4th segment as broad as largest width of hind tibia; 7th tergite with an apical membranous fringe; punctures on 3rd tergite distinctly smaller than eye facet, interstices smooth.  
Male. Seventh sternite (Fig. 56) with a very shallow emargination posteromedially; 8th sternite (Fig. 57) with a broad emargination posteromedially; 9th sternite (Fig. 58) with distinct apicolateral projections, posterior margin finely serrate and almost straight; 10th tergite (Fig. 59) with a shallow emargination at middle of posterior margin. Median lobe of aedeagus (Fig. 54) with a triangularly pointed and setose apex (Fig. 55), parameres extending far beyond the apex of median lobe.  
Female. Eighth sternite (Fig. 60) with posterior margin hardly pointed at middle; valvifer (Fig. 61) with posterior margin serrate; 10th tergite (Fig. 62) with the posterior margin rounded.
**Distribution.** China (Yunnan).

**Diagnosis.** The new species is similar to *D. carinipennis* (Bernhauer, 1914) and *D. nilgiriensis* Puthz, 1995, both from India. It can be distinguished from the latter two species by the less confluent punctation on pronotum and with vorticose sculpture on posterior half of elytra.

Puthz V (2001) Dianous limitaneus sp. n. aus Yunnan (Coleoptera, Staphylinidae). Zeitschrift der Arbeitsgemeinschaft Österreichischer Entomologen 53: 7–10.

Shi K, Zhou H-Z (2010) Taxonomy of the genus Dianous (Coleoptera: Staphylinidae: Steninae) in China and zoogeographic patterns of its distribution. Insect Science 18(3): 1–16. doi:10.1111/j.1744-7917.2010.01365.x
Figures 18–26. *Dianous tonkinensis*. 18 aedeagus 19 apical portion of aedeagus 20 7th male sternite 21 8th male sternite 22 9th male sternite 23 9th and 10th male tergites 24 8th female sternite 25 valvifer 26 9th and 10th female tergites. Scales = 0.25 mm (18, 20–26), scales = 0.05 mm (19).
On Chinese species of Dianous group I (Coleoptera, Staphylinidae, Steninae)

Figures 27–35. *Dianous fengtingae*. 27 aedeagus 28 apical portion of aedeagus 29 7th male sternite 30 8th male sternite 31 9th male sternite 32 9th and 10th male tergites 33 8th female sternite 34 valvifer 35 9th and 10th female tergites. Scales = 0.25 mm (27, 29–35), scales = 0.05 mm (28).
Figures 36–44. *Dianous shan*. 36 aedeagus 37 apical portion of aedeagus 38 7th male sternite 39 8th male sternite 40 9th male sternite 41 9th and 10th male tergites 42 8th female sternite 43 valvifer 44 9th and 10th female tergites. Scales = 0.25 mm (36, 38–44), scales = 0.05 mm (37).
On Chinese species of Dianous group I (Coleoptera, Staphylinidae, Steninae)

Figures 45–53. *Dianous zhujianqingi*. 45 aedeagus 46 apical portion of aedeagus 47 7th male sternite 48 8th male sternite 49 9th male sternite 50 9th and 10th male tergites 51 8th female sternite 52 valvifer 53 9th and 10th female tergites. Scales = 0.25 mm (45, 47–53), scales = 0.05 mm (46).
Figures 54–62. *Dianous huanghaii*. 54 aedeagus 55 apical portion of aedeagus 56 7th male sternite 57 8th male sternite 58 9th male sternite 59 9th and 10th male tergites 60 8th female sternite 61 valvifer 62 9th and 10th female tergites. Scales = 0.25 mm (54, 56–62), scales = 0.05 mm (55).
Figures 63–65. *Dianous* viridicupreus. 63 8th female sternite 64 valvifer 65 9th and 10th female tergites. Scales = 0.25 mm.
