Abstract
The Concise Guide to PHARMACOLOGY 2015/16 provides concise overviews of the key properties of over 1750 human drug targets with their pharmacology, plus links to an open access knowledgebase of drug targets and their ligands (www.guidetopharmacology.org), which provides more detailed views of target and ligand properties. The full contents can be found at http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full. G protein-coupled receptors are one of the eight major pharmacological targets into which the Guide is divided, with the others being: G protein-coupled receptors, ligand-gated ion channels, voltage-gated ion channels, other ion channels, nuclear hormone receptors, catalytic receptors and transporters. These are presented with nomenclature guidance and summary information on the best available pharmacological tools, alongside key references and suggestions for further reading. The Concise Guide is published in landscape format in order to facilitate comparison of related targets. It is a condensed version of material contemporary to late 2015, which is presented in greater detail and constantly updated on the website www.guidetopharmacology.org, superseding data presented in the previous Guides to Receptors & Channels and the Concise Guide to PHARMACOLOGY 2013/14. It is produced in conjunction with NC-IUPHAR and provides the official IUPHAR classification and nomenclature for human drug targets, where appropriate. It consolidates information previously curated and displayed separately in IUPHAR-DB and GRAC and provides a permanent, citable, point-in-time record that will survive database updates.

Conflict of interest
The authors state that there are no conflicts of interest to declare.

Overview: The majority of biological solutes are charged organic or inorganic molecules. Cellular membranes are hydrophobic and, therefore, effective barriers to separate them allowing the formation of gradients, which can be exploited, for example, in the generation of energy. Membrane transporters carry solutes across cell membranes, which would otherwise be impermeable to them. The energy required for active transport processes is obtained from ATP turnover or by exploiting ion gradients.

ATP-driven transporters can be divided into three major classes: P-type ATPases; F-type or V-type ATPases and ATP-binding cassette transporters. The first of these, P-type ATPases, are multimeric proteins, which transport (primarily) inorganic cations. The second, F-type or V-type ATPases, are proton-coupled motors, which can function either as transporters or as motors. Last, are ATP-binding cassette transporters, heavily involved in drug disposition as well as transporting endogenous solutes.

The second largest family of membrane proteins in the human genome, after the G protein-coupled receptors, are the SLC solute carrier family. Within the solute carrier family, there are not only a great variety of solutes transported, from simple inorganic ions to amino acids and sugars to relatively complex organic molecules like haem. The solute carrier family includes 52 families of almost 400 members. Many of these overlap in terms of the solutes that they carry. For example, amino acids accumulation is mediated by members of the SLC1, SLC3/7, SLC6, SLC15, SLC16, SLC17, SLC32, SLC36, SLC38 and SLC43 families. Further members of the SLC superfamily regulate ion fluxes at the plasma membrane, or solute transport into and out of cellular organelles. Some SLC family members remain orphann transporters, in as much as a physiological function has yet to be determined. Within the SLC superfamily, there is an abundance in diversity of structure. Two families (SLC3 and SLC7) only generate functional transporters as heteromeric partners, where one partner is a single TM domain protein. Membrane topology

Transnitors 6110
predictions for other families suggest 3,4,6,7,8,9,10,11,12,13 or 14 TM domains. The SLC transporters include members which function as antiports, where solute movement in one direction is balanced by a solute moving in the reverse direction. Symports allow concentration gradients of one solute to allow movement of a second solute across a membrane. A third, relatively small group are equilibrative transporters, which allow solutes to travel across membranes down their concentration gradients. A more complex family of transporters, the SLC27 fatty acid transporters also express enzymatic function. Many of the transporters also express electrogenic properties of ion channels.

**Family structure**

This is a complete listing of transporter families included in the online IUPHAR/BPS Guide to PHARMACOLOGY database. Summary information is provided here for a subset of transporters where these are of significant pharmacological interest; further transporters are listed in the database.

| SLC family | Parental transporter family | Subfamily | Description |
|------------|-----------------------------|-----------|-------------|
| SLC26      | ATP-binding cassette        |           | Monoamine transporter subfamily |
| SLC26      | ABCA subfamily              |           | GABA transporter subfamily |
| SLC26      | ABCB subfamily              |           | Glycine transporter subfamily |
| SLC26      | ABCC subfamily              |           | Neutral amino acid transporter subfamily |
| SLC26      | ABCD subfamily of peroxisomal ABC transporters | | SLC8 family of sodium/calcium exchangers |
| SLC26      | ABCG subfamily              |           | SLC9 family of sodium/hydrogen exchangers |
| SLC26      | F-type and V-type ATPases   |           | SLC10 family of sodium-bile acid co-transporters |
| SLC26      | F-type ATPase               |           | SLC11 family of proton-coupled metal ion transporters |
| SLC26      | V-type ATPase               |           | SLC12 family of cation-coupled chloride transporters |
| SLC26      | Na+/K+ ATPases              |           | SLC13 family of sodium-dependent sulphate/carboxylate transporters |
| SLC26      | Ca2+-ATPases                |           | SLC14 family of facilitative urea transporters |
| SLC26      | H+/K+ ATPases               |           | SLC15 family of peptide transporters |
| SLC26      | Cu+-ATPases                 |           | SLC16 family of monocationate transporters |
| SLC26      | SLC2 superfamily of solute carriers | | SLC17 family of phosphate and organic anion transporter |
| SLC26      | SLC1 family of amino acid transporters | | Type I sodium-phosphate co-transporters |
| SLC26      | Glutamate transporter subfamily | | Sialic acid transporter |
| SLC26      | Alanine-serine/cysteine transporter subfamily | | Vesicular glutamate transporters (VGLUTs) |
| SLC26      | SLC2 family of hexose and sugar alcohol | | Vesicular nucleotide transporter |
| SLC26      | Class I transporters        |           | SLC18 family of vesicular amine transporters |
| SLC26      | Class II transporters       |           | SLC19 family of vitamin transporters |
| SLC26      | Proton-coupled inositol transporter | | SLC20 family of sodium-dependent phosphate transporters |
| SLC26      | SLC3 and SLC7 families of heteromeric amino acid transporters (HATs) | | SLC22 family of organic cation and anion transporters |
| SLC26      | SLC3 family                 |           | SLC23 family of organic anion and anion transporters |
| SLC26      | SLC7 family                 |           | SLC24 family of sodium/potassium/calcium exchangers |
| SLC26      | SLC4 family of bicarbonate transporters | | SLC25 family of mitochondrial transporters |
| SLC26      | Anion exchangers            |           | Mitochondrial di- and tri-carboxylic acid transporter subfamily |
| SLC26      | Sodium-dependent HCO3- transporters | | Mitochondrial amino acid transporter subfamily |
| SLC26      | SLC5 family of sodium-dependent glucose transporters | | Mitochondrial phosphate transporters |
| SLC26      | Hexose transporter family   |           | Mitochondrial nucleotide transporter subfamily |
| SLC26      | Choline transporter         |           | Mitochondrial uncoupling proteins |
| SLC26      | Sodium iodide symporter, sodium-dependent multivitamin transporter and sodium-coupled monocarboxylate transporters | | Miscellaneous SLC25 mitochondrial transporters |
| SLC26      | Sodium myo-inositol cotransporter transporters | | SLC26 family of anion exchangers |
| SLC26      | SLC6 neurotransmitter transporter family | | Selective sulphate transporters |
| SLC26      | SLC8 family of neutral amino acid transporters | | Chloride/bicarbonate exchangers |
| SLC26      | SLC9 family of sodium-dependent phosphate transporters | | Anion channels |
| SLC26      | SLC10 family of sodium-bile acid co-transporters | | Other SLC26 anion exchangers |
| SLC26      | SLC11 family of proton-coupled metal ion transporters | | SLC27 family of fatty acid transporters |
| SLC26      | SLC12 family of cation-coupled chloride transporters | | SLC28 and SLC29 families of nucleoside transporters |
| SLC26      | SLC13 family of sodium-dependent sulphate/carboxylate transporters | | SLC28 family |
| SLC26      | SLC14 family of facilitative urea transporters | | SLC29 family |
| SLC26      | SLC15 family of peptide transporters | | SLC30 family of zinc transporter |
| SLC26      | SLC16 family of monocationate transporters | | SLC31 family of copper transporters |
| SLC26      | SLC17 family of phosphate and organic anion transporter family | | SLC12 vesicular inhibitory amino acid transporter |
| SLC26      | Type I sodium-phosphate co-transporters | | SLC32 family of acetyl-CoA transporter |
| SLC26      | Sialic acid transporter | | SLC34 family of sodium phosphate co-transporters |
| SLC26      | Vesicular glutamate transporters (VGLUTs) | | SLC35 family of nucleotide sugar transporters |
| SLC26      | Vesicular nucleotide transporter | | SLC36 family of proton-coupled amino acid transporters |
| SLC26      | SLC18 family of vesicular amine transporters | | SLC37 family of phosphosugar/phosphate exchangers |
| SLC26      | SLC19 family of vitamin transporters | | SLC38 family of sodium-dependent neutral amino acid transporters |
| SLC26      | SLC20 family of sodium-dependent phosphate transporters | | System A-like transporters |
| SLC26      | SLC22 family of organic cation and anion transporters | | System N-like transporters |
| SLC26      | SLC23 family of organic anion and anion transporters | | Orphan SLC38 transporters |
| SLC26      | SLC24 family of sodium/potassium/calcium exchangers | | SLC39 family of metal ion transporters |
| SLC26      | SLC25 family of mitochondrial transporters | | SLC40 family of iron transporter |
| SLC26      | Mitochondrial di- and tri-carboxylic acid transporter subfamily | | SLC41 family of divalent cation transporters |
| SLC26      | Terminal transporters | | SLC42 family of Rhesus glycoprotein ammonium transporters |
| SLC26      | SLC23 family of ascorbic acid transporters | | SLC43 family of large neutral amino acid transporters |
| SLC26      | SLC24 family of sodium/potassium/calcium exchangers | | SLC44 family of choline transporter-like family |
| SLC26      | SLC25 family of mitochondrial transporters | | SLC45 family of putative sugar transporters |
| SLC26      | Mitochondrial di- and tri-carboxylic acid transporter subfamily | | SLC46 family of folate transporters |
| SLC26      | Mitochondrial amino acid transporter subfamily | | SLC47 family of multidrug and toxin extrusion transporters |
|   | SLC48 heme transporter | SLC49 family of FLVCR-related heme transporters | SLC50 sugar transporter | SLC51 family of steroid-derived molecule transporters | SLC52 family of riboflavin transporters | SLCO family of organic anion transporting polypeptides |

| 6194 |                       |                                                 |                         |                                                     |                                        |                                                  |
ATP-binding cassette transporter family

Overview: ATP-binding cassette transporters are ubiquitous membrane proteins characterized by active ATP-dependent movement of a range of substrates, including ions, lipids, peptides, steroids. Individual subunits are typically made up of two groups of 6TM-spanning domains, with two nucleotide-binding domains (NBD). The majority of eukaryotic ABC transporters are ‘full’ transporters incorporating both TM and NBD entities. Some ABCs, notably the ABCD and ABCG families are half-transporters with only a single membrane spanning domain and one NBD, and are only functional as homo- or heterodimers. Eukaryotic ABC transporters convey substrates from the cytoplasm, either out of the cell or into intracellular organelles. Their role in the efflux of exogenous compounds, notably chemotherapeutic agents, has led to considerable interest.

Comments: A further group of ABC transporter-like proteins have been identified to lack membrane spanning regions and are not believed to be functional transporters, but appear to have a role in protein translation [88, 380]: ABCE1 (P61221, also known as OABP or 2'-5' oligoadenylate-binding protein); ABCF1 (Q8NE71, also known as ABC50 or TNF-α-stimulated ABC protein); ABCF2 (Q9UG63, also known as iron-inhibited ABC transporter 2) and ABCF3 (Q9NUQ8).

ABCA subfamily

Transporters → ATP-binding cassette transporter family → ABCA subfamily

| Nomenclature | ABCA1 | ABCA3 | ABCA4 | ABCA5 |
|--------------|-------|-------|-------|-------|
| Common abreviation | ABC1, CERP | ABC3, ABCC | ABCR | – |
| HGNC, UniProt | ABCA1, O95477 | ABCA3, Q99758 | ABCA4, P78363 | ABCA5, Q8WWZ7 |
| Selective inhibitors | probucol [156, 520] | – | – | – |

| Nomenclature | ABCA1 | ABCA3 | ABCA4 | ABCA5 |
|-------------|-------|-------|-------|-------|
| Comments    | Loss-of-function mutations are associated with Tangier disease, in which plasma HDL cholesterol levels are greatly reduced. ABCA1 is a key player in cholesterol efflux from macrophages to lipid-free apo-A1 in a process known as reverse cholesterol transport, a role that is important in atherosclerosis. ABCA1 also controls apoE lipidation, and has a role in Alzheimer’s disease, including an impact on amyloid β (APP, P05067) deposition and clearance. ABCA1 is transcriptionally regulated by Liver X Receptors (LXR) and Retinoic X Receptor (RXR), which are being explored as therapeutic targets for development of agonists for treatment of metabolic and neurodegenerative disorders [286]. | Loss-of-function mutations are associated with pulmonary surfactant deficiency | Retinal-specific transporter of N-retinylPE; loss-of-function mutations are associated with childhood-onset Stargardt disease, a juvenile onset macular degenerative disease. The earlier onset disease is often associated with the more severe and deleterious ABCA4 variants [173]. ABCA4 facilitates the clearance of all-trans-retinal from photoreceptor disc membranes following photoexcitation. ABCA4 can also transport N-11-cis-retinylidene-phosphatidylethanolamine, the Schiff-base adduct of 11-cis-retinal; loss of function mutation cause a buildup of lipofuscin, atrophy of the central retina, and severe progressive loss in vision [394]. | ABCA5 is a lysosomal protein whose loss of function compromises integrity of lysosomes and leads to intra-endolysosomal accumulation of cholesterol. It has recently been associated with Congenital Generalized Hypertrichosis Terminalis (CGHT), a hair overgrowth syndrome, in a patient with a mutation in ABCA5 that significantly decreased its expression [113]. |

| Nomenclature | ABCA6 | ABCA7 | ABCA12 |
|-------------|-------|-------|--------|
| HGNC, UniProt | ABCA6, QBN139 | ABCA7, Q8IZY2 | ABCA12, Q86U20 |
| Comments    | A recent genome wide association study identified an ABCA6 variant associated with cholesterol levels [557]. | Genome wide association studies identify ABCA7 variants as associated with Alzheimer’s Disease [232]. | Reported to play a role in skin ceramide formation [555]. A recent study shows that ABCA12 expression also impacts cholesterol efflux from macrophages. ABCA12 is postulated to associate with ABCA1 and LXR beta, and stabilize expression of ABCA1. ABCA12 deficiency causes decreased expression of Abca1, Abcg1 and Ntr1h2 [171]. |

**Comments:** A number of structural analogues are not found in man: Abca14 (ENSMUSG00000062017); Abca15 (ENSMUSG00000054746); Abca16 (ENSMUSG00000051900) and Abca17 (ENSMUSG0000035435).

Full Contents of ConciseGuide: [http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full](http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full)
### ABCD subfamily of peroxisomal ABC transporters

Transports → ATP-binding cassette transporter family → ABCD subfamily of peroxisomal ABC transporters

**Overview:** This family of ‘half-transporters’ act as homo- or heterodimers to accumulate fatty acid-CoA esters into peroxisomes for oxidative metabolism [273].

| Nomenclature | ABCD1 | ABCD2 | ABCD3 |
|--------------|-------|-------|-------|
| Common abbreviation | ALDP | ALDR | PMP70 |
| HGNC, UniProt | ABCD1, P33897 | ABCD2, Q9UBJ2 | ABCD3, P28288 |
| Comments | Transports coenzyme A esters of very long chain fatty acids [558, 559]; loss-of-function mutations in \( \text{ABCD1} \) are associated with adrenoleukodystrophy (OMIM: 3001002). | Coenzyme A esters of very long chain unsaturated fatty acids [558] | – |

**Comments:** ABCC7 (also known as CFTR, a 12TM ABC transporter-type protein, is a cAMP-regulated epithelial cell membrane CT channel involved in normal fluid transport across various epithelia and can be viewed in the Choride channels section of the Guide. ABCC8 (ENSG00000006071, also known as SUR1, sulfonylurea receptor 1) and ABCC9 (ENSG00000069431, also known as SUR2, sulfonylurea receptor 2) are unusual in that they lack transport capacity but regulate the activity of particular \( \text{K^+} \) channels (Kir6.1-6.2), conferring nucleotide sensitivity to these channels to generate the canonical \( \text{K_{ATP}} \) channels. ABCC13 (ENSG00000155288) is a possible pseudogene.
**Comments:** ABCD4 (ENSG00000119688, also known as PMP69, PXMP1-L or P70R) appears to be located on the endoplasmic reticulum \[271\], with an unclear function. Loss-of-function mutations in the gene encoding ALDP underlie the metabolic storage disorder X-linked adrenoleukodystrophy.

## ABCG subfamily

**Transmitters → ATP-binding cassette transporter family → ABCG subfamily**

**Overview:** This family of ‘half-transporters’ act as homo- or heterodimers; particularly ABCG5 and ABCG8 are thought to be obligate heterodimers. They are associated with cellular export of sterols and phospholipids, as well as exogenous drugs (ABCG2).

| Nomenclature | ABCG1 | ABCG2 | ABCG4 | ABCG5 | ABCG8 |
|--------------|-------|-------|-------|-------|-------|
| Common abreviation | ABC8 | ABCP | – | ABCG4, Q9H172 | ABCG8, Q9H221 |
| HGNC, UniProt | ABCG1, P45844 | ABCG2, Q9UNQ0 | – | ABCG5, Q9H222 | ABCG8, Q9H221 |
| Comments | Transports sterols and choline phospholipids \[275\] | Exhibits a broad substrate specificity, including urate and haem, as well as multiple synthetic compounds \[275\]. The functional transporter is likely to be a homodimer, although higher oligomeric states have also been proposed. | Putative functional dependence on ABCG1 | Transports phytosterols and cholesterol; forms an obligate heterodimer with ABCG8. Loss-of-function mutations in ABCG5 are associated with sitosterolemia (OMIM: 210250). | Transports phytosterols and cholesterol; forms an obligate heterodimer with ABCG5. Loss-of-function mutations in ABCG8 are associated with sitosterolemia (OMIM: 210250). |

F-type and V-type ATPases

Overview: The F-type (ATP synthase) and the V-type (vacuolar or vesicular proton pump) ATPases, although having distinct subcellular locations and roles, exhibit marked similarities in subunit structure and mechanism. They are both composed of a ‘soluble’ complex (termed F₁ or V₁) and a membrane complex (F₀ or V₀). Within each ATPase complex, the two individual sectors appear to function as connected opposing rotary motors, coupling catalysis of ATP synthesis or hydrolysis to proton transport. Both the F-type and V-type ATPases have been assigned enzyme commission number E.C. 3.6.3.14.

F-type ATPase

Overview: The F-type ATPase, also known as ATP synthase or ATP phosphohydrolase (H⁺-transporting), is a mitochondrial membrane-associated multimeric complex consisting of two domains, an F₀ channel domain in the membrane and an F₁ domain extending into the lumen. Proton transport across the inner mitochondrial membrane is used to drive the synthesis of ATP, although it is also possible for the enzyme to function as an ATPase. The ATP5O subunit (oligomycin sensitivity-conferring protein, OSCP, [P48047]), acts as a connector between F₁ and F₀ motors. The F₁ motor, responsible for ATP turnover, has the subunit composition α₃β₃γ₁ε.

The F₀ motor, responsible for ion translocation, is complex in mammals, with probably nine subunits centring on A, B, and C subunits in the membrane, together with D, E, F2, F6, G2 and 8 subunits. Multiple pseudogenes for the F₀ motor proteins have been defined in the human genome.

V-type ATPase

Transports → F-type and V-type ATPases → V-type ATPase

**Overview:** The V-type ATPase is most prominently associated with lysosomes in mammals, but also appears to be expressed on the plasma membrane and neuronal synaptic vesicles. The V₁ motor, responsible for ATP turnover, has eight subunits with a composition of A-H. The V₀ motor, responsible for ion translocation, has six subunits (a-e).

P-type ATPases

Transports → P-type ATPases

**Overview:** Phosphorylation-type ATPases (EC 3.6.3.-) are associated with membranes and the transport of ions or phospholipids. Characteristics of the family are the transient phosphorylation of the transporters at an aspartate residue and the interconversion between E1 and E2 conformations in the activity cycle of the transporters, taken to represent ‘half-channels’ facing the cytoplasm and extracellular/luminal side of the membrane, respectively. Sequence analysis across multiple species allows the definition of five subfamilies, P1-PS. The P1 subfamily includes heavy metal pumps, such as the copper ATPases. The P2 subfamily includes calcium, sodium/potassium and proton/potassium pumps. The P4 and P5 subfamilies include putative phospholipid flipases.

P-type ATPases 6120
**Na^+*/K^+*-ATPases**

**Overview:** The cell-surface Na^+*/K^+*-ATPase is an integral membrane protein which regulates the membrane potential of the cell by maintaining gradients of Na^+ and K^+ ions across the plasma membrane, also making a small, direct contribution to membrane potential, particularly in cardiac cells. For every molecule of ATP hydrolysed, the Na^+*/K^+*-ATPase extrudes three Na^+ ions and imports two K^+ ions. The active transporter is a heteromultimer with incompletely defined stoichiometry, possibly as tetramers of heterodimers, each consisting of one of four large, ten TM domain catalytic α subunits and one of three smaller, single TM domain glycoprotein β subunits (see table). Additional protein partners known as FXYD proteins (e.g. FXYD2, P54710) appear to associate with and regulate the activity of the pump.

**Comments:** Na^+*/K^+*-ATPases are inhibited by ouabain and cardiac glycosides, such as digoxin, as well as potentially endogenous cardiotonic steroids [23].

**Ca^{2+}-ATPases**

**Overview:** The sarcoplasmic/endoplasmic reticulum Ca^{2+}-ATPase (SERCA) is an intracellular membrane-associated pump for sequestering calcium from the cytosol into intracellular organelles, usually associated with the recovery phase following excitation of muscle and nerves. The plasma membrane Ca^{2+}-ATPase (PMCA) is a cell-surface pump for extruding calcium from the cytosol, usually associated with the recovery phase following excitation of cells. The active pump is a homodimer, each subunit of which is made up of ten TM segments, with cytosolic C- and N-termini and two large intracellular loops. Secretory pathway Ca^{2+}-ATPases (SPCA) allow accumulation of calcium and manganese in the Golgi apparatus.

**Comments:** The fungal toxin ochratoxin A has been described to activate SERCA in kidney microsomes [91]. Cyclopiazonic acid [440], thapsigargin [324] and BHQ are widely employed to block SERCA. Thapsigargin has also been described to block the TRPV1 vanilloid receptor [485]. The stoichiometry of flux through the PMCA differs from SERCA, with the PMCA transporting 1 Ca^{2+} while SERCA transports 2 Ca^{2+}. Loss-of-function mutations in SPCA1 appear to underlie Hailey-Hailey disease [234].

Full Contents of ConciseGuide: [http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full](http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full)
H⁺/K⁺-ATPases

Overview: The H⁺/K⁺ ATPase is a heterodimeric protein, made up of α and β subunits. The α subunit has 10 TM domains and exhibits catalytic and pore functions, while the β subunit has a single TM domain, which appears to be required for intracellular trafficking and stabilising the α subunit. The ATP4A and ATP4B subunits are expressed together, while the ATP12A subunit is suggested to be expressed with the β1 (ATP1B1) subunit of the Na⁺/K⁺-ATPase [383].

Comments: The gastric H⁺/K⁺-ATPase is inhibited by proton pump inhibitors used for treating excessive gastric acid secretion, including (R)-lansoprazole and a metabolite of esomeprazole.

Cu⁺-ATPases

Overview: Copper-transporting ATPases convey copper ions across cell-surface and intracellular membranes. They consist of eight TM domains and associate with multiple copper chaperone proteins (e.g. ATOX1, O00244).

Phospholipid-transporting ATPases

Overview: These transporters are thought to translocate the aminophospholipids phosphatidylserine and phosphatidylethanolamine from one side of the phospholipid bilayer to the other to generate asymmetric membranes. They are also proposed to be involved in the generation of vesicles from intracellular and cell-surface membranes.

Comments: Loss-of-function mutations in ATP8B1 are associated with type I familial intrahepatic cholestasis. A further series of structurally-related proteins have been identified in the human genome, with as yet undefined function, including ATP13A1 (Q9HD20), ATP13A2 (Q9NQ11), ATP13A3 (Q9H7F0), ATP13A4 (Q4VNC1) and ATP13A5 (Q4VNC0).

SLC superfamily of solute carriers

Transports → SLC superfamily of solute carriers

**Overview:** The SLC superfamily of solute carriers is the second largest family of membrane proteins after G protein-coupled receptors, but with a great deal fewer therapeutic drugs that exploit them. As with the ABC transporters, however, they play a major role in drug disposition and so can be hugely influential in determining the clinical efficacy of particular drugs. 48 families are identified on the basis of sequence similarities, but many of them overlap in terms of the solutes that they carry. For example, amino acid accumulation is mediated by members of the SLC1, SLC3/7, SLC6, SLC15, SLC16, SLC17, SLC32, SLC36, SLC38 and SLC43. Further members of the SLC superfamily regulate ion fluxes at the plasma membrane, or solute transport into and out of cellular organelles. Within the SLC superfamily, there is an abundance in diversity of structure. Two families (SLC3 and SLC7) only generate functional transporters as heteromeric partners, where one partner is a single TM domain protein. Membrane topology predictions for other families suggest 3, 4, 6, 7, 8, 9, 10, 11, 12, 13, or 14 TM domains. Functionally, members may be divided into those dependent on gradients of ions (particularly sodium, chloride or protons), exchange of solutes or simple equilibrative gating. For many members, the stoichiometry of transport is not yet established. Furthermore, one family of transporters also possess enzymatic activity (SLC27), while many members function as ion channels (e.g. SLC1A7/EAAT5), which increases the complexity of function of the SLC superfamily.

SLC1 family of amino acid transporters

Overview: The SLC1 family of sodium dependent transporters includes the plasma membrane located glutamate transporters and the neutral amino acid transporters ASCT1 and ASCT2 [7, 32, 264, 265, 378].

Glutamate transporter subfamily

Overview: Glutamate transporters present the unusual structural motif of 8TM segments and 2 re-entrant loops [208]. The crystal structure of a glutamate transporter homologue (GltPh) from *Pyrococcus horikoshii* supports this topology and indicates that the transporter assembles as a trimer, where each monomer is a functional unit capable of substrate permeation [53, 406, 533] reviewed by [254]). This structural data is in agreement with the proposed quaternary structure for EAAT2 [185] and several functional studies that propose the monomer is the functional unit [205, 284, 302, 418]. Recent evidence suggests that EAAT3 and EAAT4 may assemble as heterotrimers [362]. The activity of glutamate transporters located upon both neurons (predominantly EAAT3, 4 and 5) and glia (predominantly EAAT 1 and 2) serves, dependent upon their location, to regulate excitatory neurotransmission, maintain low ambient extracellular concentrations of glutamate (protecting against excitotoxicity) and provide glutamate for metabolism including the glutamate-glutamine cycle. The Na+/K+-ATPase that maintains the ion gradients that drive transport has been demonstrated to co-assemble with EAAT1 and EAAT2 [412]. Recent evidence supports altered glutamate transport and novel roles in brain for splice variants of EAAT1 and EAAT2 [184, 303]. Three patients with dicarboxylic aminoaciduria (DA) were recently found to have loss-of-function mutations in EAAT3 [24]. DA is characterized by excessive excretion of the acidic amino acids glutamate and aspartate and EAAT3 is the predominant glutamate/aspartate transporter in the kidney. Enhanced expression of EAAT2 resulting from administration of β-lactam antibiotics (e.g. *ceftriaxone*) is neuroprotective and occurs through NF-κB-mediated EAAT2 promoter activation [181, 306, 414] reviewed by [277]). PPARγ activation (e.g. by rosiglitazone) also leads to enhanced expression of EAAT though promoter activation [411]. In addition, several translational activators of EAAT2 have recently been described [98] along with treatments that increase the surface expression of EAAT2 (e.g. [301, 554]), or prevent its down-regulation (e.g. [199]). A thermodynamically uncoupled Cl⁻ flux, activated by Na⁺ and glutamate [207, 265, 327] (Na⁺ and aspartate in the case of GltPh [417]), is sufficiently large, in the instances of EAAT4 and EAAT5, to influence neuronal excitability [476, 498]. Indeed, it has recently been suggested that the primary function of EAAT5 is as a slow anion channel gated by glutamate, rather than a glutamate transporter [176].

| Nomenclature | Excitatory amino acid transporter 1 | Excitatory amino acid transporter 2 | Excitatory amino acid transporter 3 | Excitatory amino acid transporter 4 | Excitatory amino acid transporter 5 |
|--------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|-----------------------------------|
| Systematic nomenclature | SLC1A3 | SLC1A2 | SLC1A1 | SLC1A6 | SLC1A7 |
| Common abbreviation | EAAT1 | EAAT2 | EAAT3 | EAAT4 | EAAT5 |
| HGNC, UniProt | SLC1A3, P43003 | SLC1A2, P43004 | SLC1A1, P43005 | SLC1A6, P48664 | SLC1A7, O00341 |
Excitatory amino acids bind with high affinity to all (p[3H]ETB-TBOA), demonstrating low affinity to L-trans-2,4-pyrolidine dicarboxylate. L-trans-2,4-pyrolidine dicarboxylate, D-aspartic acid, and L-trans-2,4-pyrolidine dicarboxylate are non-selective inhibitors with a preference for EAAT2 over EAAT3.

Endogenous substrates include L-aspartic acid, L-glutamic acid, and L-glutamine. The Stoichiometry of transport is probably 3 Na⁺: 1 H⁺: 1 glutamate (in): 1 K⁺ (out).

Inhibitors such as UCPH-101, WAY-213613, and NBI-59159 demonstrate competitive substrate-like currents at L-glutamic acid, L-aspartic acid, and L-lactate. WAY-213613 is a selective inhibitor of EAAT2 (5-fold) over EAAT1 and EAAT3.

Labelled ligands include [3H]JETB-TBOA (-binding) (pKᵦ 7.8) [445] - Rat, [3H]JETB-TBOA (binding) (pKᵦ 6.5) [445] - Rat, and [3H]JETB-TBOA (binding) (pKᵦ 6.5) [445] - Rat. Threo-3-methylglutamate induces substrate-like currents at EAAT4, but does not elicit reverse exchange of [3H]-aspartate in synaptosomal preparations, inconsistent with the behaviour of a substrate inhibitor [141]. Parawixin 1, a compound isolated from the venom of the spider Parawixia bistriata, is a selective enhancer of the glutamate uptake through EAAT2 but not through EAAT1 or EAAT3 [165, 166]. In addition to the agents listed in the table, DL-threo-β-hydroxyaspartate and L-trans-2,4-pyrolidine dicarboxylate act as non-selective competitive substrate inhibitors of all EAATs. Zn²⁺ and arachidonic acid are putative endogenous modulators of EAATs with actions that differ across transporter subtypes (reviewed by [491]).

Comments: The Kᵦ (or Kᵢ) values reported, unless indicated otherwise, are derived from transporter currents mediated by EAATs expressed in voltage-clamped Xenopus laevis oocytes [141, 443, 444, 449]. Kᵦ (or Kᵢ) values derived in uptake assays are generally higher (e.g. [444]). In addition to acting as a poorly selective inhibitor of EAAT2, (2S,4R)-4-methylglutamate is a competitive non-substrate inhibitor that preferentially blocks EAAT3 versus EAAT1, or EAAT2 [150]. [3H](2S,4R)-4-methylglutamate demonstrates low affinity binding (Kᵦ ≈ 6.0 μM) to EAAT1 and EAAT2 in rat brain homogenates [15] and EAAT1 in murine astrocyte membranes [13], whereas [3H]JETB-TBOA binds with high affinity to all EAATs, with a preference for EAAT3 [445]. The novel isoxazole derivative (-)-HIP-A may interact at the same site as TBOA and preferentially inhibit reverse transport of glutamate [97]. Threo-3-methylglutamate induces substrate-like currents at EAAT4, but does not elicit reverse exchange of [3H]-aspartate in synaptosomal preparations, inconsistent with the behaviour of a substrate inhibitor [141]. Parawixin 1, a compound isolated from the venom of the spider Parawixia bistriata, is a selective enhancer of the glutamate uptake through EAAT2 but not through EAAT1 or EAAT3 [165, 166]. In addition to the agents listed in the table, DL-threo-β-hydroxyaspartate and L-trans-2,4-pyrolidine dicarboxylate act as non-selective competitive substrate inhibitors of all EAATs. Zn²⁺ and arachidonic acid are putative endogenous modulators of EAATs with actions that differ across transporter subtypes (reviewed by [491]).
Alanine/serine/cysteine transporter subfamily

Transporters → SLC superfamily of solute carriers → SLC1 family of amino acid transporters → Alanine/serine/cysteine transporter subfamily

**Overview:** ASC transporters mediate Na⁺-dependent exchange of small neutral amino acids such as Ala, Ser, Cys and Thr and their structure is predicted to be similar to that of the glutamate transporters \[16, 489\]. ASCT1 and ASCT2 also exhibit thermodynamically uncoupled chloride channel activity associated with substrate transport \[63, 541\]. Whereas EAATs counter-transport K⁺ (see above) ASCTs do not and their function is independent of the intracellular concentration of K⁺ \[541\].

| Nomenclature | Alanine/serine/cysteine transporter 1 | Alanine/serine/cysteine transporter 2 |
|--------------|--------------------------------------|--------------------------------------|
| Systematic nomenclature | SLC1A4 | SLC1A5 |
| Common abbreviation | ASCT1 | ASCT2 |
| HGNC, UniProt | SLC1A4, P43007 | SLC1A5, Q15758 |
| Endogenous substrates | L-cysteine > L-alanine = L-serine > L-threonine | L-alanine = L-serine = L-cysteine (low Vmax) = L-threonine = L-glutamine = L-asparagine ➞ L-methionine = glycine = L-leucine > L-valine > L-glutamic acid (enhanced at low pH) |
| Stoichiometry | 1 Na⁺: 1 amino acid (in): 1 Na⁺: 1 amino acid (out); (homo-, or hetero-exchange; \[542\]) | 1 Na⁺: 1 amino acid (in): 1 Na⁺: 1 amino acid (out); (homo-, or hetero-exchange; \[61\]) |
| Inhibitors | – | p-nitrophenyl glutamyl anilide (pKᵢ 4.3) \[151\] – Rat, benzylcysteine (pKᵢ 3.1) \[206\], benzylserine (pKᵢ 3) \[206\] |

**Comments:** The substrate specificity of ASCT1 may extend to L-proline and trans-4-hydroxy-proline \[386\]. At low pH (5.5) both ASCT1 and ASCT2 are able to exchange acidic amino acids such as L-cysteate and glutamate \[466, 489\]. In addition to the inhibitors tabulated above, HgCl₂, methylmercury and mersalyl, at low micromolar concentrations, non-competitively inhibit ASCT2 by covalent modification of cysteine residues \[372\].

SLC2 family of hexose and sugar alcohol transporters

**Overview:** The SLC2 family transports D-glucose, D-fructose, inositol (e.g. myo-inositol) and related hexoses. Three classes of glucose transporter can be identified, separating GLUT1-4 and 14, GLUT6, 8, 10 and 12; and GLUTS, 7, 9 and 11. Modelling suggests a 12 TM membrane topology, with intracellular termini, with functional transporters acting as homodimers or homotramers.

### Class I transporters

**Overview:** Class I transporters are able to transport D-glucose, but not D-fructose, in the direction of the concentration gradient and may be inhibited non-selectively by phloretin and cytochalasin B. GLUT1 is the major glucose transporter in brain, placenta and erythrocytes, GLUT2 is found in the pancreas, liver and kidneys, GLUT3 is neuronal and placental, while GLUT4 is the insulin-responsive transporter found in skeletal muscle, heart and adipose tissue. GLUT14 appears to result from gene duplication of GLUT3 and is expressed in the testes [521].

| Nomenclature | Glucose transporter 1 | Glucose transporter 2 | Glucose transporter 3 | Glucose transporter 4 | Glucose transporter 14 |
|--------------|-----------------------|-----------------------|-----------------------|-----------------------|-----------------------|
| Systematic nomenclature | SLC2A1 | SLC2A2 | SLC2A3 | SLC2A4 | SLC2A14 |
| Common abbreviation | GLUT1 | GLUT2 | GLUT3 | GLUT4 | GLUT14 |
| HGNC, UniProt | SLC2A1, P11166 | SLC2A2, P11168 | SLC2A3, P11169 | SLC2A4, P14672 | SLC2A14, Q8TDB8 |
| Substrates | D-glucosamine (D-glucose = D-glucosamine) [487], dehydroascorbic acid [39], D-glucose (D-glucose = D-glucosamine) [487] | D-glucosamine (D-glucose = D-glucosamine) [487], D-glucose [487] | D-glucose [487] | D-glucosamine (D-glucose = D-glucosamine) [487], D-glucose [487] | – |
| Labelled ligands | [3H]2-deoxyglucose | [3H]2-deoxyglucose | [3H]2-deoxyglucose | [3H]2-deoxyglucose | – |
Class II transporters

Overview: Class II transporters transport D-fructose and appear to be insensitive to cytochalasin B. Class II transporters appear to be predominantly intracellularly located.

| Nomenclature | Glucose transporter 5 | Glucose transporter 7 | Glucose transporter 9 | Glucose transporter 11 |
|--------------|-----------------------|-----------------------|-----------------------|-----------------------|
| Systematic nomenclature | SLC2A5 | SLC2A7 | SLC2A9 | SLC2A11 |

SLC3 family

Overview: SLC3 family members are single TM proteins with extensive glycosylation of the exterior C-terminus, which heterodimerize with SLC7 family members in the endoplasmic reticulum and assist in the plasma membrane localization of the transporter.

SLC7 family

Overview: SLC7 family members may be divided into two major groups: cationic amino acid transporters (CATs) and glycoprotein-associated amino acid transporters (gpaATs). Cationic amino acid transporters are 14 TM proteins, which mediate pH- and sodium-independent transport of cationic amino acids (system y⁺), apparently as an exchange mechanism. These transporters are sensitive to inhibition by N-ethylmaleimide.

| Nomenclature | High affinity cationic amino acid transporter 1 | Low affinity cationic amino acid transporter 2 | Cationic amino acid transporter 3 | L-type amino acid transporter 1 |

**Nomenclature**

| Asc-type amino acid transporter 1 | Cystine/glutamate transporter | AGT1 |
|-----------------------------------|------------------------------|------|
| SLC7A10                           | SLC7A11                      | SLC7A13 |
| Common abbreviation Asc-1         | xCT                         | –    |
| HGNC, UniProt                     | SLC7A11, Q9NS82              | SLC7A13, Q8TCU3 |

**Comments:** CAT4 appears to be non-functional in heterologous expression \([516]\), while SLC7C14 has yet to be characterized. Glycoprotein-associated amino acid transporters are 12 TM proteins, which heterodimerize with members of the SLC3 family to act as cell-surface amino acid exchangers. Heterodimers between 4F2hc and LAT1 or LAT2 generate sodium-independent system L transporters. LAT1 transports large neutral amino acids including branched-chain and aromatic amino acids as well as miglustat, whereas LAT2 transports most of the neutral amino acids.

Heterodimers between 4F2hc and y^+LAT1 or y^+LAT2 generate transporters similar to the system y^+, which transport cationic (L-arginine, L-lysine, L-ornithine) amino acids independent of sodium and neutral (L-leucine, L-isoleucine, L-methionine, L-glutamine) amino acids in a partially sodium-dependent manner. These transporters are N-ethylmaleimide-insensitive. Heterodimers between rBAT and b^0,+AT appear to mediate sodium-independent system b^0,+ transport of most of the neutral amino acids and cationic amino acids (L-arginine, L-lysine and L-ornithine).

Asc-1 appears to heterodimerize with 4F2hc to allow the transport of small neutral amino acids (such as L-alanine, L-serine, L-threonine, L-glutamine and glycine), as well as D-serine, in a sodium-independent manner. xCT generates a heterodimer with 4F2hc for a system \(X_{\text{e-C}}\) transporter that mediates the sodium-independent exchange of L-cystine and L-glutamic acid. AGT has been conjugated with SLC3 members as fusion proteins to generate functional transporters, but the identity of a native heterodimer has yet to be ascertained.

**SLC4 family of bicarbonate transporters**

**Overview:** Together with the SLC26 family, the SLC4 family of transporters subserve anion exchange, principally of chloride and bicarbonate (HCO_3^-), but also carbonate and hydrogen sulphate (HSO_4^-). SLC4 family members regulate bicarbonate fluxes as part of carbon dioxide movement, chyme neutralization and reabsorption in the kidney.

Within the family, subgroups of transporters are identifiable: the electroneutral sodium-independent Cl^-/HCO_3^- transporters (AE1, AE2 and AE3), the electrogenic sodium-dependent HCO_3^- transporters (NBCe1 and NBCe2) and the electroneutral HCO_3^- transporters (NBCn1 and NBCn2). Topographical information derives mainly from study of AE1, abundant in erythrocytes, which suggests a dimeric or tetrameric arrangement, with subunits made up of 13 TM domains and re-entrant loops at TM9/10 and TM11/12. The N terminus exhibits sites for interaction with multiple proteins, including glycolytic enzymes, haemoglobin and cytoskeletal elements.

**SLC5 family of sodium-dependent glucose transporters**

**Overview:** The SLC5 family of sodium-dependent glucose transporters includes, in mammals, the Na$^+$/substrate co-transporters for glucose (e.g. choline), D-glucose, monocarboxylates, myo-inositol and I$^-$ [159, 179, 518, 519]. Members of the SLC5 and SLC6 families, along with other unrelated Na$^+$ cotransporters (i.e. Mhp1 and BetP), share a common structural core that contains an inverted repeat of STM $\alpha$-helical domains [2].
Hexose transporter family

Transports → SLC superfamily of solute carriers → SLC5 family of sodium-dependent glucose transporters → Hexose transporter family

**Overview:** Detailed characterisation of members of the hexose transporter family is limited to SGLT1, 2 and 3, which are all inhibited in a competitive manner by phlorizin, a natural dihydrocholine glucoside, that exhibits modest selectivity towards SGLT2 (see [518] for an extensive review). SGLT1 is predominantly expressed in the small intestine, mediating the absorption of glucose (e.g. D-glucose), but also occurs in the brain, heart and in the late proximal straight tubule of the kidney. The expression of SGLT2 is almost exclusively restricted to the early proximal convoluted tubule of the kidney, where it is largely responsible for the renal reabsorption of glucose. SGLT3 is not a transporter but instead acts as a glucosensor generating an inwardly directed flux of Na⁺ that causes membrane depolarization [120].

| Nomenclature | Sodium/glucose cotransporter 1 | Sodium/glucose cotransporter 2 | Low affinity sodium-glucose cotransporter | Sodium/glucose cotransporter 4 | Sodium/glucose cotransporter 5 |
|--------------|-------------------------------|-------------------------------|------------------------------------------|-------------------------------|-------------------------------|
| Systematic nomenclature | SLC5A1 | SLC5A2 | SLC5A9 | SLC5A10 |
| Common abbreviation | SGLT1 | SGLT2 | SGLT3 | SGLT4 |
| HGNC, UniProt Substrates | D-galactose [501], α-MDG [501], D-glucose [501] | α-MDG, D-glucose | | |
| Stoichiometry | 2 Na⁺ : 1 glucose [266] | 1 Na⁺ : 1 glucose [236] | – | – |
| Inhibitors | sotagliflozin (pIC₅₀ 7.4) [538], dapagliflozin (pIC₅₀ 6.4) [313], canagliflozin (pIC₅₀ 6.2) [316], remogliflozin (pKᵢ 5.3) [172], empagliflozin (pIC₅₀ 5.1) [204], sergliflozin (pKᵢ 5.1) [272] | empagliflozin (pIC₅₀ 8.5) [204], canagliflozin (pIC₅₀ 8.4) [316], remogliflozin (pKᵢ 7.9) [172], sergliflozin (pKᵢ 6.8) [272] | – | – |
| Selective inhibitors | – | dapagliflozin (pIC₅₀ 9.3) [269] | – | – |
| Comments | – | – | ‘sodium/glucose cotransporter 3’ is a misnomer since SGLT3 is a glucosensor. | – | – |
**Comments**: Recognition and transport of substrate by SGLTs requires that the sugar is a pyranose. De-oxylucose derivatives have reduced affinity for SGLT1, but the replacement of the sugar equatorial hydroxyl group by fluorine at some positions, excepting C2 and C3, is tolerated (see [518] for a detailed quantification). Although SGLT1 and SGLT2 have been described as high- and low-affinity sodium glucose co-transporters, respectively, recent work suggests that they have a similar affinity for glucose under physiological conditions [236]. Selective blockers of SGLT2, and thus blocking 50% of renal glucose reabsorption, are in development for the treatment of diabetes (e.g. [80]).

**Choline transporter**

**Overview**: The high affinity, hemicholinium-3-sensitive, choline transporter (CHT) is expressed mainly in cholinergic neurones on nerve cell terminals and synaptic vesicles (keratinocytes being an additional location). In autonomic neurones, expression of CHT requires an activity-dependent retrograde signal from postsynaptic neurones [291]. Through recapture of choline generated by the hydrolysis of ACh by acetylcholinesterase, CHT serves to maintain acetylcholine synthesis within the presynaptic terminal [159]. Homozygous mice engineered to lack CHT die within one hour of birth as a result of hypoxia arising from failure of transmission at the neuromuscular junction of the skeletal muscles that support respiration [158]. A low affinity choline uptake mechanism that remains to be identified at the molecular level may involve multiple transporters. In addition, a family of choline transporter-like (CTL) proteins, (which are members of the SLC44 family) with weak Na+ dependence have been described [477].

| Nomenclature | CHT |
|--------------|-----|
| Systematic nomenclature | SLC5A7 |
| HGNC, UniProt | SLC5A7, Q9G2V3 |
| Substrates | triethylcholine |
| Endogenous substrates | choline |
| Stoichiometry | Na⁺ : choline (variable stoichimetry); modulated by extracellular Cl⁻ [251] |
| Selective inhibitors | hemicholinium-3 (pKᵢ 7–8) [370] |
| Labelled ligands | [³H]hemicholinium-3 (pKᵦ 8.2–8.4) |

**Comments**: Kᵢ and Kᵦ values for hemicholinium-3 listed in the table are for human CHT expressed in *Xenopus laevis* oocytes [371], or COS-7 cells [12]. Hemicholinium mustard is a substrate for CHT that causes covalent modification and irreversible inactivation of the transporter. Several exogenous substances (e.g. triethylcholine) that are substrates for CHT act as precursors to cholinergic false transmitters.
Sodium iodide symporter, sodium-dependent multivitamin transporter and sodium-coupled monocarboxylate transporters

Transporters → SLC superfamily of solute carriers → SLC5 family of sodium-dependent glucose transporters → Sodium iodide symporter, sodium-dependent multivitamin transporter and sodium-coupled monocarboxylate transporters

Overview: The sodium-iodide symporter (NIS) is an iodide transporter found principally in the thyroid gland where it mediates the accumulation of I⁻ within thyrocytes. Transport of I⁻ by NIS from the blood across the basolateral membrane followed by apical efflux into the colloidal lumen, mediated at least in part by pendrin (SLC22A4), and most likely not SMCT1 (SLC5A8) as once thought, provides the I⁻ required for the synthesis of the thyroid hormones triiodothyronine (triiodothyronine) and thyroxine (T₄). NIS is also expressed in the salivary glands, gastric mucosa, intestinal enterocytes and lactating breast. NIS mediates I⁻ absorption in the intestine and I⁻ secretion into the milk. SMVT is expressed on the apical membrane of intestinal enterocytes and colonocytes and is the main system responsible for biotin (vitamin H) and pantothenic acid (vitamin B₅) uptake in humans. SMVT located in kidney proximal tubule epithelial cells mediates the reabsorption of biotin and pantothenic acid. SMCT1 (SLC5A8), which transports a wide range of monocarboxylates, is expressed in the apical membrane of epithelia of the small intestine, colon, kidney, brain neurons and the retinal pigment epithelium. SMCT2 (SLC5A12) also localises to the apical membrane of kidney, intestine, and colon, but in the brain and retina is restricted to astrocytes and Müller cells, respectively. SMCT1 is a high-affinity transporter whereas SMCT2 is a low-affinity transporter. The physiological substrates for SMCT1 and SMCT2 are lactate (L-lactic acid and D-lactic acid), pyruvic acid, propanoic acid, and nicotinic acid in non-colonic tissues such as the kidney. SMCT1 is also likely to be the principal transporter for the absorption of nicotinic acid (vitamin B₃) in the intestine and kidney. In the small intestine and colon, the physiological substrates for these transporters are nicotinic acid and the short-chain fatty acids acetic acid, propanoic acid, and butyric acid that are produced by bacterial fermentation of dietary fiber. SMCT2 is responsible for the bulk absorption of lactate because of its low-affinity/high-capacity nature. Absence of both transporters in the kidney leads to massive excretion of lactate in urine and consequently drastic decrease in the circulating levels of lactate in blood. SMCT1 also functions as a tumour suppressor in the colon as well as in various other non-colonic tissues. The tumour-suppressive function of SMCT1 is based on its ability to transport pyruvic acid, an inhibitor of histone deacetylases, into cells in non-colonic tissues. In the colon, the ability of SMCT1 to transport butyric acid and propanoic acid, also inhibitors of histone deacetylases, underlies the tumour-suppressive function of this transporter. The ability of SMCT1 to promote histone acetylase inhibition through accumulation of butyric acid and propanoic acid in immune cells is also responsible for suppression of dendritic cell development in the colon.

| Nomenclature | NIS | SMVT | SMCT1 | SMCT2 |
|---------------|-----|------|-------|-------|
| Systematic nomenclature | SLC5A5 | SLC5A6 | SLC5A8 | SLC5A12 |
| HGNC, UniProt | SLC5A5, Q92911 | SLC5A6, Q9Y289 | SLC5A8, Q8N695 | SLC5A12, Q1EHB4 |
| Substrates | ClO₄⁻, SCN⁻, I⁻, NO₃⁻, pertechnetate | lipoic acid [556], pantothenic acid [556], I⁻ [556], biotin [556] | propanoic acid, 3-bromopyruvate, pyroglutamic acid, nicotinic acid, D-lactic acid, β-D-hydroxybutyric acid, L-lactic acid, salicylic acid, dichloroacetate, butyric acid, α-ketoisocaproate, pyruvic acid, acetoacetic acid, benzozate, γ-hydroxybutyric acid, 2-oxothiazolidine-4-carboxylate, acetic acid, β-L-hydroxybutyric acid, S-aminosalicylate | pyruvic acid, L-lactic acid, nicotinic acid |
| Stoichiometry | 2Na⁺ : 1 I⁻ [149]; 1Na⁺ : 1 ClO₄⁻ [123] | 2Na⁺ : 1 biotin (or pantothenic acid) [390] | 2Na⁺ : 1 monocarboxylate [94] | – |
| Inhibitors | – | – | fenoprofen (pIC₅₀ 4.6) [248], ibuprofen (pIC₅₀ 4.2) [248], ketoprofen (pIC₅₀ 3.9) [248] | – |
**Comments**: F-, ClO₄⁻, thiocyanate and NO₃⁻ are competitive substrate inhibitors of NIS [123]. Lipoic acid appears to act as a competitive substrate inhibitor of SMVT [505] and the anticonvulsant drugs primidone and carbamazepine competitively block the transport of biotin by brush border vesicles prepared from human intestine [423].

**Sodium myo-inositol cotransporter transporters**

**Overview**: Three different mammalian myo-inositol transporters are currently known; two are the Na⁺-coupled SMIT1 and SMIT2 tabulated below and the third is proton-coupled HMIT (SLC2A13). SMIT1 and SMIT2 have a widespread and overlapping tissue location but in polarized cells, such as the Madin-Darby canine kidney cell line, they segregate to the basolateral and apical membranes, respectively [41]. In the nephron, SMIT1 mediates myo-inositol uptake as a ‘compatible osmolyte’ when inner medullary tubules are exposed to increases in extracellular osmolality, whilst SMIT2 mediates the reabsorption of myo-inositol from the filtrate. In some species (e.g. rat, but not rabbit) apically located SMIT2 is responsible for the uptake of myo-inositol from the intestinal lumen [11].

| Nomenclature        | SMIT1                      | SMIT2                      |
|---------------------|----------------------------|---------------------------|
| Systematic nomenclature | SLC5A3                    | SLC5A11                   |
| Common abbreviation  | SMIT1                      | SMIT2                     |
| HGNC, UniProt        | SLC5A3, P53794             | SLC5A11, Q8WWX8           |
| Substrates           | myo-inositol, scyllo-inositol > L-fucose > L-xylose > L-glucose, D-glucose, α-MDG > D-galactose, D-fucose > D-xylose [214] | myo-inositol = D-chiro-inositol> D-glucose > D-xylose > L-xylose [95] |
| Stoichiometry        | 2 Na⁺ :1 myo-inositol [214] | 2 Na⁺ :1 myo-inositol [55] |
| Inhibitors           | phlorizin [95]             | phlorizin (pKi 4.1) [95]  |

**Comments**: The data tabulated are those for dog SMIT1 and rabbit SMIT2. SMIT2 transports D-chiro-inositol, but SMIT1 does not. In addition, whereas SMIT1 transports both D-xylose and L-xylose and D-fucose and L-fucose, SMIT2 transports only the D-isomers of these sugars [95, 214]. Thus the substrate specificities of SMIT1 (for L-fucose) and SMIT2 (for D-chiro-inositol) allow discrimination between the two SMITs. Human SMIT2 appears not to transport glucose [318].

SLC6 neurotransmitter transporter family

Overview: Members of the solute carrier family 6 (SLC6) of sodium- and (sometimes chloride-) dependent neurotransmitter transporters [64, 83, 292] are primarily plasma membrane located and may be divided into four subfamilies that transport monoamines, GABA, glycine and neutral amino acids, plus the related bacterial NSS transporters [424]. The members of this superfamily share a structural motif of 10 TM segments that has been observed in crystal structures of the NSS bacterial homolog LeuT<sub>Ar</sub>, a Na<sup>+</sup>-dependent amino acid transporter from Aquiflex aeolicus [527] and in several other transporter families structurally related to LeuT [167].

Monoamine transporter subfamily

Overview: Monoamine neurotransmission is limited by perisynaptic transporters. Presynaptic monoamine transporters allow recycling of synaptically released noradrenaline, dopamine and 5-hydroxytryptamine.

**Overview:** The activity of GABA-transporters located predominantly upon neurones (GAT-1), glia (GAT-3) or both (GAT-2, BGT-1) serves to terminate phasic GABA-ergic transmission, maintain low ambient extracellular concentrations of GABA, and recycle GABA for reuse by neurones. Nonetheless, ambient concentrations of GABA are sufficient to sustain tonic inhibition mediated by high affinity GABA A receptors in certain neuronal populations [442]. GAT1 is the predominant GABA transporter in the brain and occurs primarily upon the terminals of presynaptic neurones and to a much lesser extent upon distal astrocytic processes that are in proximity to axons terminals. GAT3 resides predominantly on distal astrocytic terminals that are close to the GABAergic synapse. By contrast, BGT1 occupies an extrasynaptic location possibly along with GAT2 which has limited expression in the brain [329]. TauT is a high affinity taurine transporter involved in osmotic balance that occurs in the brain and non-neuronal tissues, such as the kidney, brush border membrane of the intestine and blood brain barrier [83, 219]. CT1, which transports creatine, has a ubiquitous expression pattern, often co-localizing with creatine kinase [83].
### Nomenclature

| GAT1 | GAT2 | GAT3 |
|------|------|------|
| GABA | β-alanine, GABA | β-alanine, GABA |

### Endogenous substrates

- GABA
- β-alanine
- GABA

### Stoichiometry

- GAT1: 2Na⁺: 1Cl⁻: 1GABA
- GAT2: 2Na⁺: 1Cl⁻: 1GABA
- GAT3: 2Na⁺: 2Cl⁻: 1GABA

### Selective inhibitors

- **NNC-711** (pIC₅₀ 7.4) [50], tiagabine (pIC₅₀ 7.2) [50], SKF89976A (pIC₅₀ 6.9) [117], CI-966 (pIC₅₀ 6.6) [50], (R/S) EF-1500 (pIC₅₀ 4.9–5.7), (R)-EF-1520 (pIC₅₀ 5.1–5.4), LU32-176B (pIC₅₀ 5.4) [512] – Mouse, (S)-EF-1520 (pIC₅₀ 3.6–3.9)

- **SNAP-5114** (pIC₅₀ 4.7) [49] – Rat

### Labelled ligands

- [³H]tiagabine (Inhibitor)

### Comments:

The IC₅₀ values for GAT1-4 reported in the table reflect the range reported in the literature from studies of both human and mouse transporters. There is a tendency towards lower IC₅₀ values for the human orthologue [295]. SNAP-5114 is only weakly selective for GAT2 and GAT3, with IC₅₀ values in the range 22 to ≥30 μM at GAT1 and BGT1, whereas NNC052090 has at least an order of magnitude selectivity for BGT1 [see [93, 438] for reviews]. Compound (R)-4d [PMID: 16766089] is a recently described compound that displays 20-fold selectivity for GAT3 over GAT1 [174]. In addition to the inhibitors listed, deramciclane is a moderately potent, though non-selective, inhibitor of all cloned GABA transporters (IC₅₀ = 26–46 μM; [116]). Diarylpyrimidine and diarylvinyl ether derivatives of nipecotic acid and guvacine that potently inhibit the uptake of [³H]GABA into rat synaptosomes have been described [282]. Several derivatives of exo-THPO (e.g. N-methyl-exo-THPO and N-acetyloxyethyl-exo-THPO) demonstrate selectivity as blockers of astroglial, versus neuronal, uptake of GABA [see [93, 437] for reviews]. GAT3 is inhibited by physiologically relevant concentrations of Zn²⁺ [96]. Taut transports GABA, but with low affinity, but CT1 does not, although it can be engineered to do so by mutagenesis guided by LeuT as a structural template [121]. Although inhibitors of creatine transport by CT1 (e.g. β-guanidinopropionic acid, cyclocreatine, guanidinoethane sulfonic acid) are known (e.g. [103]) they insufficiently characterized to be included in the table.
**Glycine transporter subfamily**

**Overview:** Two gene products, GlyT1 and GlyT2, are known that give rise to transporters that are predominantly located on glia and neurones, respectively. Five variants of GlyT1 (a,b,c,d & e) differing in their N- and C-termini are generated by alternative promoter usage and splicing, and three splice variants of GlyT2 (a,b & c) have also been identified (see [36, 152, 194, 459] for reviews). GlyT1 transporter isoforms expressed in glia surrounding glutamatergic synapses regulate synaptic glycine concentrations influencing NMDA receptor-mediated neurotransmission [35, 175], but also are important, in early neonatal life, for regulating glycine concentrations at inhibitory glycinergic synapses [195]. Homozygous mice engineered to totally lack GlyT1 exhibit severe respiratory and motor deficiencies due to hyperactive glycinergic signalling and die within the first postnatal day [195, 479]. Disruption of GlyT1 restricted to forebrain neurones is associated with enhancement of EPSCs mediated by NMDA receptors and behaviours that are suggestive of a promnesic action [532]. GlyT2 transporters localised on the axons and boutons of glycinergic neurones appear crucial for efficient transmitter loading of synaptic vesicles but may not be essential for the termination of inhibitory neurotransmission [196, 415]. Mice in which GlyT2 has been deleted develop a fatal hyperekplexia phenotype during the second postnatal week [196] and mutations in the human gene encoding GlyT2 (SLC6A5) have been identified in patients with hyperekplexia (reviewed by [221]). ATB0+ (SLC14A1) is a transporter for numerous dipolar and cationic amino acids and thus has a much broader substrate specificity than the glycine transporters alongside which it is grouped on the basis of structural similarity [83]. ATB0+ is expressed in various peripheral tissues [83]. By contrast PROT (SLC6A7), which is expressed only in brain in association with a subset of excitatory nerve terminals, shows specificity for the transport of L-proline.

| Nomenclature | GlyT1 | GlyT2 | ATB0+ | PROT |

## Neutral amino acid transporter subfamily

**Overview:** Certain members of neutral amino acid transport family are expressed upon the apical surface of epithelial cells and are important for the absorption of amino acids from the duodenum, jejunum and ileum and their reabsorption within the proximal tubule of the nephron (i.e. BªAT1 (SLC6A19), SLC6A17, SLC6A18, SLC6A20). Others may function as transporters for neurotransmitters or their precursors (i.e. BªAT2, SLC6A17) [65].

| Nomenclature | BªAT1 | BªAT2 | BªAT3 |
|--------------|-------|-------|-------|
| Systematic nomenclature | SLC6A19 | SLC6A17 | SLC6A18 |

**Searchable database:** [http://www.guidetopharmacology.org/index.jsp](http://www.guidetopharmacology.org/index.jsp)

**Full Contents of ConciseGuide:** [http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full](http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full)

---

**Comments:** sarcosine is a selective transportable inhibitor of GlyT1 and also a weak agonist at the glycine binding site of the NMDA receptor [544], but has no effect on GlyT2. This difference has been attributed to a single glycine residue in TM6 (serine residue in GlyT2) [493]. Inhibition of GLYT1 by the sarcosine derivatives NFPS, NPTS and Org 24598 is non-competitive [331, 341]. IC₅₀ values for Org 24598 reported in the literature vary, most likely due to differences in assay conditions [58, 331]. The tricyclic antidepressant amoxapine weakly inhibits GlyT2 (IC₅₀ 92 μM) with approximately 10-fold selectivity over GlyT1 [366]. The endogenous lipids arachidonic acid and anandamide exert opposing effects upon GlyT1a, inhibiting (IC₅₀ 2 μM) and potentiating (EC₅₀ 13 μM) transport currents, respectively [381]. N-arachidonoyl-glycine, N-arachidonoyl-γ-aminobutyric acid and N-arachidonoyl-D-alanine have been described as endogenous non-competitive inhibitors of GlyT2a, but not GlyT1b [136, 253, 513]. Protons [20] and Zn²⁺ [257] act as non-competitive inhibitors of GlyT1b, with IC₅₀ values of 100 nM and 10 μM respectively, but neither ion affects GlyT2 (reviewed by [491]). Glycine transport by GLYT1 is inhibited by Li⁺, whereas GLYT2 transport is stimulated (both in the presence of Na⁺) [392].

**SLC8 family of sodium/calcium exchangers**

**Overview:** The sodium/calcium exchangers (NCX) use the extracellular sodium concentration to facilitate the extrusion of calcium out of the cell. Alongside the plasma membrane Ca\(^{2+}\)-ATPase (PMCA) and sarcoplasmic/endoplasmic reticulum Ca\(^{2+}\)-ATPase (SERCA), as well as the sodium/potassium/calcium exchangers (NKX, SLC24 family), NCX allow recovery of intracellular calcium back to basal levels after cellular stimulation. When intracellular sodium ion levels rise, for example, following depolarisation, these transporters can operate in the reverse direction to allow calcium influx and sodium efflux, as an electrogenic mechanism. Structural modelling suggests the presence of 9 TM segments, with a large intracellular loop between the fifth and sixth TM segments.

**Nomenclature**

| Nomenclature | Sodium/calcium exchanger 1 | Sodium/calcium exchanger 2 | Sodium/calcium exchanger 3 |
|--------------|---------------------------|---------------------------|---------------------------|
| Systematic nomenclature | SLC8A1 | SLC8A2 | SLC8A3 |
| Common abbreviation | NCX1 | NCX2 | NCX3 |
| HGNC, UniProt | SLC8A1, P32418 | SLC8A2, Q9UPR5 | SLC8A3, P57103 |
| Stoichiometry | 3 Na\(^{+}\) (in) : 1 Ca\(^{2+}\) (out) or 4 Na\(^{+}\) (in) : 1 Ca\(^{2+}\) (out) \([124]\); Reverse mode 1 Ca\(^{2+}\) (in) : 1 Na\(^{+}\) (out) | – | – |

**Comments:** Although subtype-selective inhibitors of NCX function are not widely available, 3,4-dichlorobenzamil and CBDMB act as non-selective NCX inhibitors, while SEA0400, KB-R7943, SN6, and ORM-10103 \([256]\) act to inhibit NCX function with varying degrees of selectivity. BED is a selective NCX3 inhibitor \([439]\).

SLC9 family of sodium/hydrogen exchangers

Overview: Sodium/hydrogen exchangers or sodium/proton antiports are a family of transporters that maintain cellular pH by utilising the sodium gradient across the plasma membrane to extrude protons produced by metabolism, in a stoichiometry of 1 Na⁺ (in) : 1 H⁺ (out). Several isoforms, NHE6, NHE7, NHE8 and NHE9 appear to locate on intracellular membranes [351, 357, 365]. Li⁺ and NH₄⁺, but not K⁺, ions may also be transported by some isoforms. Modelling of the topology of these transporters indicates 12 TM regions with an extended intracellular C-terminus containing multiple regulatory sites.

NHE1 is considered to be a ubiquitously-expressed ‘housekeeping’ transporter. NHE3 is highly expressed in the intestine and kidneys and regulate sodium movements in those tissues. NHE10 is present in sperm [504] and osteoclasts [307]; gene disruption results in infertile male mice [504].

Comments: Analogues of the non-selective cation transport inhibitor amiloride appear to inhibit NHE function through competitive inhibition of the extracellular Na⁺ binding site. The more selective amiloride analogues MPA and ethylisopropylamiloride exhibit a rank order of affinity of inhibition of NHE1 > NHE2 > NHE3 [100, 480, 481].

SLC10 family of sodium-bile acid co-transporters

Overview: The SLC10 family transport bile acids, sulphated solutes, and other xenobiotics in a sodium-dependent manner. The founding members, SLC10A1 (NTCP) and SLC10A2 (ASBT) function, along with members of the ABC transporter family (MDR1/ABCB1, BSEP/ABCB11 and MRP2/ABCC2) and the organic solute transporter obligate heterodimer OSTα:OSTβ (SLC51), to maintain the enterohepatic circulation of bile acids [110, 281]. SLC10A6 (SOAT) functions as a sodium-dependent transporter of sulphated solutes included sulphated steroids and bile acids [187, 189]. Transport function has not yet been demonstrated for the 4 remaining members of the SLC10 family, SLC10A3 (P3), SLC10A4 (P4), SLC10A5 (P5), and SLC10A7 (P7), and the identity of their endogenous substrates remain unknown [160, 189, 193, 500]. Members of the SLC10 family are predicted to have seven transmembrane domains with an extracellular N-terminus and cytoplasmic C-terminus [29, 215].

SLC11 family of proton-coupled metal ion transporters

Overview: The family of proton-coupled metal ion transporters are responsible for movements of divalent cations, particularly ferrous and manganese ions, across the cell membrane (SLC11A2/DMT1) and across endosomal (SLC11A2/DMT1) or lysosomal/phagosomal membranes (SLC11A1/NRAMP1), dependent on proton transport. Both proteins appear to have 12 TM regions and cytoplasmic N- and C-termini. NRAMP1 is involved in antimicrobial action in macrophages, although its precise mechanism is undefined. Facilitated diffusion of divalent cations into phagosomes may increase intravesicular free radicals to damage the pathogen. Alternatively, export of divalent cations from the phagosome may deprive the pathogen of essential enzyme cofactors. SLC11A1/DMT1 is more widely expressed and appears to assist in divalent cation assimilation from the diet, as well as in phagocytic cells.

| Nomenclature | NRAMP1 | DMT1 |
|--------------|--------|------|
| Systematic nomenclature | SLC11A1 | SLC11A2 |
| HGNC, UniProt | SLC11A1, P49279 | SLC11A2, P49281 |
| Endogenous substrates | Fe²⁺, Mn²⁺ | Cu²⁺, Co²⁺, Cd²⁺, Fe²⁺, Mn²⁺ |
| Stoichiometry | 1 H⁺: 1 Fe²⁺ (out) or 1 Fe²⁺ (in): 1 H⁺ (out) | 1 H⁺: 1 Fe²⁺ (out) [212] |

Comments: Loss-of-function mutations in NRAMP1 are associated with increased susceptibility to microbial infection (OMIM: 607948). Loss-of-function mutations in DMT1 are associated with microcytic anemia (OMIM: 206100).

SLC12 family of cation-coupled chloride transporters

Overview: The SLC12 family of chloride transporters contribute to ion fluxes across a variety of tissues, particularly in the kidney and choroid plexus of the brain. Within this family, further subfamilies are identifiable: NKCC1, NKCC2 and NCC constitute a group of therapeutically-relevant transporters, targets for loop and thiazide diuretics. These 12 TM proteins exhibit cytoplasmic termini and an extended extracellular loop at TM7/8 and are kidney-specific (NKCC2 and NCC) or show a more widespread distribution (NKCC1). A second family, the K-Cl co-transporters are also 12 TM domain proteins with cytoplasmic termini, but with an extended extracellular loop at TM 5/6. CCC6 exhibits structural similarities with the K-Cl co-transporters, while CCC9 is divergent, with 11 TM domains and a cytoplasmic N-terminus and extracellular C-terminus.

SLC13 family of sodium-dependent sulphate/carboxylate transporters

Transporters → SLC superfamily of solute carriers → SLC13 family of sodium-dependent sulphate/carboxylate transporters

Overview: Within the SLC13 family, two groups of transporters may be differentiated on the basis of the substrates transported: NaS1 and NaS2 convey sulphate, while NaC1-3 transport carboxylates. NaS1 and NaS2 transporters are made up of 13 TM domains, with an intracellular N terminus and are electrogenic with physiological roles in the intestine, kidney and placenta. NaC1, NaC2 and NaC3 are made up of 11 TM domains with an intracellular N terminus and are electrogenic, with physiological roles in the kidney and liver.

| Nomenclature | Na⁺/sulfate cotransporter | Na⁺/dicarboxylate cotransporter 1 | Na⁺/dicarboxylate cotransporter 3 | Na⁺/sulfate cotransporter | Na⁺/citrate cotransporter |
|--------------|---------------------------|----------------------------------|-------------------------------|---------------------------|--------------------------|

SLC14 family of facilitative urea transporters

Overview: As a product of protein catabolism, urea is moved around the body and through the kidneys for excretion. Although there is experimental evidence for concentrative urea transporters, these have not been defined at the molecular level. The SLC14 family are facilitative transporters, allowing urea movement down its concentration gradient. Multiple splice variants of these transporters have been identified; for UT-A transporters, in particular, there is evidence for cell-specific expression of these variants with functional impact [455]. Topographical modelling suggests that the majority of the variants of SLC14 transporters have 10 TM domains, with a glycosylated extracellular loop at TMs5/6, and intracellular C- and N-termini. The UT-A1 splice variant, exceptionally, has 20 TM domains, equivalent to a combination of the UT-A2 and UT-A3 splice variants.

| Nomenclature | Erythrocyte urea transporter | Kidney urea transporter |
|--------------|-----------------------------|------------------------|
| Systematic nomenclature | SLC14A1 | SLC14A2 |
| Common abreviation | UT-B | UT-A |
| HGNC, UniProt | SLC14A1, Q13336 | SLC14A2, Q15849 |
| Substrates | acetamide [546], acrylamide [546], methylurea [546] | urea [328] |
| Endogenous substrates | ammonium carbonate [546], urea [546], formamide [546] | Equilibrative |
| Stoichiometry | Equilibrative | Equilibrative |

Stewart G. (2011) The emerging physiological roles of the SLC14A family of urea transporters. Br. J. Pharmacol. 164: 1780-92 [PMID:21449978]
Overview: The SLC15 family of peptide transporters may be divided on the basis of structural and functional differences into two subfamilies: SLC15A1 (PepT1) and SLC15A2 (PepT2) transport di- and tripeptides, but not amino acids, whereas SLC15A3 (PHT2) and SLC15A4 (PHT1) transport L-histidine and some di- and tripeptides [105]. The transporters are 12 TM proteins with intracellular termini and an extended extracellular loop at TM 9/10. The crystal structure of PepTSo (a prokaryote homologue of PepT1 and PepT2 from Shewanella oneidensis) confirms many of the predicted structural features of mammalian PepT1 and PepT2 [360]. PHT1 has been suggested to be intracellular [410], while PHT2 protein is located on lysosomes in transfected cells [52, 230, 426]. PHT1 is hypothesised to mediate efflux of bacterial-derived peptides into the cytosol perhaps in the colon where SLC15A4 mRNA expression is increased in inflammatory bowel disease [305]. Transport via PHT1 may be important in immune responses as both Toll-like receptor- and NOD1-mediated responses are reduced in PHT1 knockout mice or mouse strains expressing mutations in PHT1 [45, 430].

| Nomenclature | Peptide transporter 1 | Peptide transporter 2 | Peptide transporter 3 | Peptide transporter 4 |
|--------------|----------------------|----------------------|----------------------|----------------------|
| Systematic nomenclature | SLC15A1 | SLC15A2 | SLC15A3 | SLC15A4 |
| Common abbreviation | PepT1 | PepT2 | PHT2 | PHT1 |

Comments: The PepT1 and PepT2 transporters are particularly promiscuous in the transport of dipeptides and tripeptides from the endogenous amino acids, as well as some D-amino acid containing peptides. PepT1 has also been exploited to allow delivery of therapeutic pro-drugs, such as those for zidovudine (zidovudine) [218], sulpiride [508] and cytarabine [457]. D-Ala-Lys-AMCA has been used as a fluorescent probe to identify transport via both PepT1 and PepT2 [416].

SLC16 family of monocarboxylate transporters

**Overview**: Members of the SLC16 family may be divided into subfamilies on the basis of substrate selectivities, particularly lactate (e.g. L-lactic acid), pyruvic acid and ketone bodies, as well as aromatic amino acids. Topology modelling suggests 12 TM domains, with intracellular termini and an extended loop at TM 6/7.

The proton-coupled monocarboxylate transporters (monocarboxylate transporters 1, 4, 2 and 3) allow transport of the products of cellular metabolism, principally lactate (e.g. L-lactic acid) and pyruvic acid.

| Nomenclature | Monocarboxylate transporter 1 | Monocarboxylate transporter 2 | Monocarboxylate transporter 3 | Monocarboxylate transporter 4 |
|--------------|------------------------------|------------------------------|------------------------------|------------------------------|
| Systematic nomenclature | SLC16A1 | SLC16A7 | SLC16A8 | SLC16A3 |
| Common abbreviation | MCT1 | MCT2 | MCT3 | MCT4 |
| HGNC, UniProt | SLC16A1, P53985 | SLC16A7, Q60669 | SLC16A8, Q95907 | SLC16A3, O15427 |
| Substrates | γ-hydroxybutyric acid | pyruvic acid, L-lactic acid, β-D-hydroxybutyric acid | pyruvic acid, L-lactic acid | pyruvic acid, L-lactic acid |
| Endogenous substrates | – | – | – | – |
| Stoichiometry | 1 H+ : 1 monocarboxylate− (out) | 1 H+ : 1 monocarboxylate− (out) | 1 H+ : 1 monocarboxylate− (out) | 1 H+ : 1 monocarboxylate− (out) |

| Nomenclature | Monocarboxylate transporter 6 | Monocarboxylate transporter 8 | Monocarboxylate transporter 10 |
|--------------|------------------------------|------------------------------|------------------------------|
| Systematic nomenclature | SLC16A5 | SLC16A2 | SLC16A10 |
| Common abbreviation | MCT6 | MCT8 | TAT1 |
| HGNC, UniProt | SLC16A5, O15375 | SLC16A2, P36021 | SLC16A10, Q8TF71 |
| Endogenous substrates | – | triiodothyronine [169], T4 [169] | L-tryptophan, L-phenylalanine, levodopa, L-tyrosine |

Searchable database: [http://www.guidetopharmacology.org/index.jsp](http://www.guidetopharmacology.org/index.jsp)
Full Contents of ConciseGuide: [http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full](http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full)
Nomenclature | Monocarboxylate transporter 6 | Monocarboxylate transporter 8 | Monocarboxylate transporter 10
--- | --- | --- | ---
Stoichiometry | Unknown | Unknown | Unknown
Comments | MCT6 has been reported to transport bumetanide, but not short chain fatty acids [353]. | – | –

**Comments**: MCT1 and MCT2, but not MCT3 and MCT4, are inhibited by CHC, which also inhibits members of the mitochondrial transporter family, SLC25. MCT5-MCT7, MCT9 and MCT11-14 are regarded as orphan transporters.

SLC17 phosphate and organic anion transporter family

Overview: The SLC17 family are sometimes referred to as Type I sodium-phosphate co-transporters, alongside Type II (SLC34 family) and Type III (SLC20 family) transporters. Within the SLC17 family, however, further subgroups of organic anion transporters may be defined, allowing the accumulation of sialic acid in the endoplasmic reticulum and glutamate (e.g. L-glutamic acid) or nucleotides in synaptic and secretory vesicles. Topology modelling suggests 12 TM domains.

Type I sodium-phosphate co-transporters

Overview: Type I sodium-phosphate co-transporters are expressed in the kidney and intestine.

| Nomenclature          | Sodium/phosphate cotransporter 1 | Sodium/phosphate cotransporter 3 | Sodium/phosphate cotransporter 4 | Sodium/phosphate cotransporter homolog |
|-----------------------|----------------------------------|----------------------------------|----------------------------------|----------------------------------------|
| Systematic nomenclature| SLC17A1                          | SLC17A2                          | SLC17A3                          | SLC17A4                                 |
| Common abbreviation   | NPT1                             | NPT3                             | NPT4                             | –                                      |

Sialic acid transporter

Overview: The sialic acid transporter is expressed on both lysosomes and synaptic vesicles, where it appears to allow export of sialic acid and accumulation of acidic amino acids, respectively [349], driven by proton gradients. In lysosomes, degradation of glycoproteins generates amino acids and sugar residues, which are metabolized further following export from the lysosome.

| Nomenclature                  | Sialin                  |
|------------------------------|-------------------------|
| Systematic nomenclature      | SLC17A5                 |
| Common abbreviation          | AST                     |
| HGNC, UniProt                | SLC17A5, Q9NRA2         |
| Endogenous substrates        | L-lactic acid, gluconate (out), L-glutamic acid (in) [349], glucuronic acid, L-aspartic acid [349], sialic acid |
| Stoichiometry                | 1 H⁺ : 1 sialic acid (out) |

Comments: Loss-of-function mutations in sialin are associated with Salla disease (OMIM: 604369), an autosomal recessive neurodegenerative disorder associated with sialic acid storage disease [497].

Vesicular glutamate transporters (VGLUTs)

Overview: Vesicular glutamate transporters (VGLUTs) allow accumulation of glutamate into synaptic vesicles, as well as secretory vesicles in endocrine tissues. The roles of VGLUTs in kidney and liver are unclear. These transporters appear to utilize the proton gradient and also express a chloride conductance [33].

| Nomenclature                  | Vesicular glutamate transporter 1 | Vesicular glutamate transporter 2 | Vesicular glutamate transporter 3 |
|------------------------------|----------------------------------|----------------------------------|----------------------------------|
| Systematic nomenclature      | SLC17A7                          | SLC17A6                          | SLC17A8                          |
| Common abbreviation          | VGLUT1                           | VGLUT2                           | VGLUT3                           |
| HGNC, UniProt                | SLC17A7, Q9P2U7                  | SLC17A6, Q9P2U8                  | SLC17A8, Q8NDX2                  |
| Endogenous substrates        | L-glutamic acid > D-glutamic acid | L-glutamic acid > D-glutamic acid | L-glutamic acid > D-glutamic acid |
| Stoichiometry                | Unknown                          | Unknown                          | Unknown                          |

Comments: Endogenous ketoacids produced during fasting have been proposed to regulate VGLUT function through blocking chloride ion-mediated allosteric enhancement of transporter function [258].

Vesicular nucleotide transporter

Overview: The vesicular nucleotide transporter is the most recent member of the SLC17 family to have an assigned function. Uptake of ATP was independent of pH, but dependent on chloride ions and membrane potential [431].

| Nomenclature          | Vesicular nucleotide transporter |
|-----------------------|----------------------------------|
| Systematic nomenclature | SLC17A9                         |
| Common abbreviation   | VVUT                             |
| HGNC, UniProt         | SLC17A9, Q98YT1                  |
| Endogenous substrates | guanosine 5′-diphosphate [431], guanosine-5′-triphosphate [431], ATP [431] |
| Stoichiometry         | Unknown                          |

Comments: VGLUTs and VNUT can be inhibited by DIDS and Evans blue dye.

SLC18 family of vesicular amine transporters

Overview: The vesicular amine transporters (VATs) are putative 12 TM domain proteins that function to transport singly positively charged amine neurotransmitters and hormones from the cytoplasm and concentrate them within secretory vesicles. They function as amine/proton antiporers driven by secondary active transport utilizing the proton gradient established by a multi-subunit vacuolar ATPase that acidifies secretory vesicles (reviewed by [139]). The vesicular acetylcholine transporter (VACht; [148]) localizes to cholinergic neurons, but non-neuronal expression has also been claimed [434]. Vesicular monoamine transporter 1 (VMAT1, [146]) is mainly expressed in peripheral neuroendocrine cells, but most likely not in the CNS, whereas VMAT2 [147] distributes between both central and peripheral sympathetic monoaminergic neurones [140].

### Vesicular monoamine transporters

| Nomenclature | Vesicular monoamine transporter 1 | Vesicular monoamine transporter 2 | Vesicular acetylcholine transporter | Solute carrier family 18, subfamily B, member 1 |
|--------------|-----------------------------------|-----------------------------------|-------------------------------------|-----------------------------------------------|
| Systematic nomenclature | SLC18A1 | SLC18A2 | SLC18A3 | SLC18B1 |
| Common abbreviation | VMAT1 | VMAT2 | VAChT | – |
| HGNC, UniProt | SLC18A1, PS4219 | SLC18A2, Q05940 | SLC18A3, Q16572 | Q6NT16 |
| Substrates | dexamfetamine ($K_i$ 4.7×10⁻⁴ M) [147], β-phenylethylamine ($K_i$ 3.7×10⁻⁶ M) [147], fenfluramine ($K_i$ 3.1×10⁻⁸ M) [147], MPP⁺ ($K_i$ 6.9×10⁻⁶ M) [147], MDMA (Ki 1.9×10⁻⁸ M) [147] | β-phenylethylamine ($K_i$ 3.7×10⁻⁶ M) [147], dexamfetamine ($K_i$ 2.1×10⁻⁸ M) [147], fenfluramine ($K_i$ 5.1×10⁻⁸ M) [147], MPP⁺ ($K_i$ 8.9×10⁻⁶ M) [147], MDMA (Ki 6.9×10⁻⁶ M) [147] | acetylcholine ($K_i$ 7.9×10⁻⁴ M) [57, 276], choline (Ki 5×10⁻⁶ M) [57, 276] | – |
| Stoichiometry | 1 amine (in): 2H⁺ (out) | 1 amine (in): 2H⁺ (out) | 1 amine (in): 2H⁺ (out) | – |
| Inhibitors | reserpine (pKᵢ 7.5) [147], ketanserin (pKᵢ 5.8) [147], tetrabenazine (pKᵢ 4.7) [147] | reserpine (pKᵢ 7.9) [147], tetrabenazine (pKᵢ 7) [147], ketanserin (pKᵢ 6.3) [147] | aminobenzovesamicol (pKᵢ 10.9) [138], vesamicol (pKᵢ 8.7) [138] | – |
| Labelled ligands | – | $[^3]H$]TBZOH (Inhibitor) (pKᵢ 8.2) [495], $[^125]I$iodovinyl-TBZ (Inhibitor) (pKᵢ 8.1) [293], $[^11]C$]TBZ (Inhibitor), $[^125]I$]azido-8-iodoketanserin (Inhibitor) [449] | $[^3]H$]vesamicol (pKᵢ 8.4) [495], $[^125]I$iodobenzovesamicol | – |

**Comments:** pKᵢ values for endogenous and synthetic substrate inhibitors of human VMAT1 and VMAT2 are for inhibition of $[^3]H$]5-HT uptake in transfected and permeabilised CV-1 cells as detailed by [147]. In addition to the monoamines listed in the table, the trace amines tyramine and β-phenylethylamine are probable substrates for VMAT2 [140]. Probes listed in the table are those currently employed; additional agents have been synthesized (e.g. [551]).

SLC20 family of sodium-dependent phosphate transporters

Overview: The SLC20 family is looked upon not only as ion transporters, but also as retroviral receptors. As ion transporters, they are sometimes referred to as Type III sodium-phosphate co-transporters, alongside Type I (SLC17 family) and Type II (SLC34 family). PiTs are cell-surface transporters, composed of ten TM domains with extracellular C- and N-termini. PiT1 is a focus for dietary phosphate and vitamin D regulation of parathyroid hormone secretion from the parathyroid gland. PiT2 appears to be involved in intestinal absorption of dietary phosphate.

| Nomenclature | Sodium-dependent phosphate transporter 1 | Sodium-dependent phosphate transporter 2 |
|--------------|----------------------------------------|----------------------------------------|
| Systematic nomenclature | SLC20A1 | SLC20A2 |
| Common abbreviation | PiT1 | PiT2 |
| HGNC, UniProt | SLC20A1, Q8WUM9 | SLC20A2, Q08357 |
| Substrates | AsO$_4^{3-}$ [400], phosphate [400] | phosphate [400] |
| Stoichiometry | $>$1 Na$^+$ : 1 HPO$_4^{2-}$ (in) | $>$1 Na$^+$ : 1 HPO$_4^{2-}$ (in) |

SLC22 family of organic cation and anion transporters

Overview: The SLC22 family of transporters is mostly composed of non-selective transporters, which are expressed highly in liver, kidney and intestine, playing a major role in drug disposition. The family may be divided into three subfamilies based on the nature of the substrate transported: organic cations (OCTs), organic anions (OATs) and organic zwitertions/cations (OCTN). Membrane topology is predicted to contain 12 TM domains with intracellular termini, and an extended extracellular loop at TM 1/2.

Organic zwitterions/cation transporters (OCTN)

Transports → SLC superfamily of solute carriers → SLC22 family of organic cation and anion transporters → Organic zwitterions/cation transporters (OCTN)

Overview: Organic zwitterions/cation transporters (OCTN) function as organic cation uniporters, organic cation/proton exchangers or sodium/L-carnitine co-transporters.

| Nomenclature                           | Organic cation/carnitine transporter 1 | Organic cation/carnitine transporter 2 | Carnitine transporter 2 |

# Organic anion transporters (OATs)

**Transports → SLC superfamily of solute carriers → SLC22 family of organic cation and anion transporters → Organic anion transporters (OATs)**

**Overview:** Organic anion transporters (OATs) are non-selective transporters prominent in the kidney and intestine

| Nomenclature | Organic anion transporter 1 | Organic anion transporter 2 | Organic anion transporter 3 |
|--------------|-----------------------------|-----------------------------|-----------------------------|
| Systematic nomenclature | SLC22A6 | SLC22A7 | SLC22A8 |
| Common abbreviation | OAT1 | OAT2 | OAT3 |
| HGNC, UniProt | SLC22A6, Q4U2R8 | SLC22A7, Q9Y694 | SLC22A8, Q8TCC7 |
| Substrates | aminohippuric acid, non-steroidal anti-inflammatory drugs | aminohippuric acid, PGE₂, non-steroidal anti-inflammatory drugs | estrone-3-sulphate [294], aminohippuric acid [294], cimetidine [294], ochratoxin A [294] |
| Stoichiometry | Unknown | Unknown | Unknown |
| Inhibitors | probenecid (Inhibition of urate transport by human SCL22A6.) (pIC₅₀ 4.9) [239] | – | – |

| Nomenclature | Organic anion transporter 4 | Organic anion transporter 5 |
|--------------|-----------------------------|-----------------------------|
| Systematic nomenclature | SLC22A9 | SLC22A10 |
| Common abbreviation | OAT4 | OAT5 |
| HGNC, UniProt | SLC22A9, Q8IVM8 | SLC22A10, Q63ZE4 |
| Substrates | – | ochratoxin A [534] |
| Stoichiometry | Unknown | Unknown |
| Inhibitors | – | dehydroepiandrosterone sulphate [77], estrone-3-sulphate [77], ochratoxin A [77] |

Searchable database: [http://www.guidetopharmacology.org/index.jsp](http://www.guidetopharmacology.org/index.jsp)
Full Contents of ConciseGuide: [http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full](http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full)
Urate transporter

Transporters → SLC superfamily of solute carriers → SLC22 family of organic cation and anion transporters → Urate transporter

| Nomenclature | Urate anion exchanger 1 |
|---------------|-------------------------|
| Systematic nomenclature | SLC22A12 |
| Common abbreviation | URAT1 |
| HGNC, UniProt | SLC22A12, Q96S37 |
| Endogenous substrates | uric acid [145], orotic acid [145] |
| Stoichiometry | Unknown |
| Selective inhibitors | sufinpyrazone (pIC50 4) [536] |

SLC23 family of ascorbic acid transporters

Transporters → SLC superfamily of solute carriers → SLC23 family of ascorbic acid transporters

**Overview:** Predicted to be 12 TM segment proteins, members of this family transport the reduced form of ascorbic acid (while the oxidized form may be handled by members of the SLC2 family (GLUT1/SLC2A1, GLUT3/SLC2A3 and GLUT4/SLC2A4)). Phloretin is considered a non-selective inhibitor of these transporters, with an affinity in the micromolar range.

| Nomenclature | Sodium-dependent vitamin C transporter 1 | Sodium-dependent vitamin C transporter 2 | Sodium-dependent vitamin C transporter 3 | Sodium-dependent nucleoside transporter |
|---------------|------------------------------------------|------------------------------------------|------------------------------------------|------------------------------------------|
| Systematic nomenclature | SLC23A1 | SLC23A2 | SLC23A3 | SLC23A4 |
| Common abbreviation | SVCT1 | SVCT2 | SVCT3 | SNBT1 |
| HGNC, UniProt | SLC23A1, Q9UH17 | SLC23A2, Q9UGH3 | SLC23A3, Q6PIS1 | SLC23A4P, – |
| Endogenous substrates | L-ascorbic acid -> D-ascorbic acid > dehydroascorbic acid [483] | L-ascorbic acid -> D-ascorbic acid > dehydroascorbic acid [483] | – | uracil -> thymine -> guanine, hypoxanthine -> xanthine, uridine [526] |
| Substrates | – | – | – | S-fluorouracil [526] |
| Stoichiometry | 2 Na+: 1 ascorbic acid (in) [483] | 2 Na+: 1 ascorbic acid (in) [483] | – | 1 Na+: 1 uracil (in) [526] |
| Inhibitors | phloretin (pK1 4.2) [483] | – | – | – |
Nomenclature | Sodium-dependent vitamin C transporter 1 | Sodium-dependent vitamin C transporter 2 | Sodium-dependent vitamin C transporter 3 | Sodium-dependent nucleobase transporter
Labelled ligands | $[^{14}C]$ascorbic acid (Binding) | $[^{14}C]$ascorbic acid | – | –
Comments | – | – | SLC23A3 does not transport ascorbic acid and remains an orphan transporter. | SLC23A4/SNBT1 is found in rodents and non-human primates, but the sequence is truncated in the human genome and named as a pseudogene, SLC23A4P

SLC24 family of sodium/potassium/calcium exchangers

Overview: The sodium/potassium/calcium exchange family of transporters utilize the extracellular sodium gradient to drive calcium and potassium co-transport out of the cell. As is the case for NCX transporters (SLC8A family), NKCX transporters are thought to be bidirectional, with the possibility of calcium influx following depolarization of the plasma membrane. Topological modeling suggests the presence of 10 TM domains, with a large intracellular loop between the fifth and sixth TM regions.

Nomenclature | Sodium/potassium/calcium exchanger 1 | Sodium/potassium/calcium exchanger 6
Systematic nomenclature | SLC24A1 | SLC24A6
Common abbreviation | NKX1 | NKX6
HGNC, UniProt | SLC24A1, O60721 | SLC24A6, Q6J4K2
Stoichiometry | 4Na$^+$(1Ca$^{2+}$ + 1K$^+$) | –

Comments: NKX6 has been proposed to be the sole member of a CAX Na$^+$/Ca$^{2+}$ exchanger family, which may be the mitochondrial transporter responsible for calcium accumulation from the cytosol [441].

SLC25 family of mitochondrial transporters

Transporters → SLC superfamily of solute carriers → SLC25 family of mitochondrial transporters

Overview: Mitochondrial transporters are nuclear-encoded proteins, which convey solutes across the inner mitochondrial membrane. Topological modelling suggests homodimeric transporters, each with six TM segments and termini in the cytosol.

Mitochondrial di- and tri-carboxylic acid transporter subfamily

Transporters → SLC superfamily of solute carriers → SLC25 family of mitochondrial transporters → Mitochondrial di- and tri-carboxylic acid transporter subfamily

Overview: Mitochondrial di- and tri-carboxylic acid transporters are grouped on the basis of commonality of substrates and include the citrate transporter which facilitates citric acid export from the mitochondria to allow the generation of oxalacetic acid and acetyl CoA through the action of ATP:citrate lyase.

| Nomenclature                  | Mitochondrial citrate transporter | Mitochondrial dicarboxylate carrier | Mitochondrial oxoglutarate carrier | Mitochondrial oxodicarboxylate carrier |
|-------------------------------|-----------------------------------|-------------------------------------|------------------------------------|---------------------------------------|

### Mitochondrial amino acid transporter subfamily

**Overview:** Mitochondrial amino acid transporters can be subdivided on the basis of their substrates. Mitochondrial ornithine transporters play a role in the urea cycle by exchanging cytosolic ornithine (L-ornithine and D-ornithine) for mitochondrial citrulline (L-citrulline and D-citrulline) in equimolar amounts. Further members of the family include transporters of S-adenosylmethionine and carnitine.

| Nomenclature       | AGC1                                                                 | AGC2                                                                 | Mitochondrial glutamate carrier 2 | Mitochondrial glutamate carrier 1 |
|--------------------|----------------------------------------------------------------------|----------------------------------------------------------------------|-----------------------------------|-----------------------------------|
| Systematic nomenclature | SLC25A12                                                                | SLC25A13                                                              | SLC25A18                          | SLC25A22                          |
| Common abbreviation | –                                                                     | –                                                                     | GC2                               | GC1                               |

| Substrates         | L-citrulline [161], L-arginine [161], L-lysine [161], D-lysine [161], D-arginine [161], D-citrulline [161], D-ornithine [161], L-ornithine [161], D-histidine [161], L-histidine [161] | L-lysine [161], L-ornithine [161], L-citrulline [161], L-arginine [161] | –                              |
| Stoichiometry      | 1 Ornithine (in) :1 citrulline : 1 H⁺ (out)                             | 1 Ornithine (in) :1 citrulline : 1 H⁺ (out)                            | –                              |
| Comments           | –                                                                       | –                                                                      | Exchanges cytosolic acylcarnitine for mitochondrial carnitine |
Comments: Both ornithine transporters are inhibited by the polyamine spermine [162]. Loss-of-function mutations in these genes are associated with hyperornithinemia-hyperammonemia-homocitrullinuria.

Mitochondrial phosphate transporters

Transporters → SLC superfamily of solute carriers → SLC25 family of mitochondrial transporters → Mitochondrial phosphate transporters

Overview: Mitochondrial phosphate transporters allow the import of inorganic phosphate for ATP production.

| Nomenclature       | Mitochondrial phosphate carrier |
|--------------------|--------------------------------|
| Systematic nomenclature | SLC25A3                      |
| Common abbreviation | PHC                           |
| HGNC, UniProt      | SLC25A3, Q00325               |
| Stoichiometry      | \( \text{PO}_3^{4-} \) (in) : \( \text{OH}^- \) (out) or \( \text{PO}_3^{4-} : \text{H}^+ \) (in) |

Mitochondrial nucleotide transporter subfamily

Transporters → SLC superfamily of solute carriers → SLC25 family of mitochondrial transporters → Mitochondrial nucleotide transporter subfamily

Overview: Mitochondrial nucleotide transporters, defined by structural similarities, include the adenine nucleotide translocator family (SLC25A4, SLC25A5, SLC25A6 and SLC25A31), which under conditions of aerobic metabolism, allow coupling between mitochondrial oxidative phosphorylation and cytosolic energy consumption by exchanging cytosolic adenosine diphosphate for mitochondrial ATP. Further members of the mitochondrial nucleotide transporter subfamily convey diverse substrates including CoA, although not all members have had substrates identified.

| Nomenclature       | Mitochondrial adenine nucleotide translocator 1 | Mitochondrial adenine nucleotide translocator 2 | Mitochondrial adenine nucleotide translocator 3 | Mitochondrial adenine nucleotide translocator 4 |
|--------------------|-----------------------------------------------|-----------------------------------------------|-----------------------------------------------|-----------------------------------------------|
| Systematic nomenclature | SLC25A4                                      | SLC25A5                                      | SLC25A6                                      | SLC25A31                                     |
| Common abbreviation | ANT1                                         | ANT2                                         | ANT3                                         | ANT4                                         |

SLC26 family of anion exchangers

Overview: Along with the SLC4 family, the SLC26 family acts to allow movement of monovalent and divalent anions across cell membranes. The predicted topology is of 10-14 TM domains with intracellular C- and N-termini, probably existing as dimers. Within the family, subgroups may be identified on the basis of functional differences, which appear to function as anion exchangers and anion channels (SLC26A7 and SLC26A9).

Overview: Fatty acid transporter proteins (FATPs) are a family (SLC27) of six transporters (FATP1-6). They have at least one, and possibly six [312, 432], transmembrane segments, and are predicted on the basis of structural similarities to form dimers. SLC27 members have several structural domains: integral membrane associated domain, peripheral membrane associated domain, FATP signature, intracellular AMP binding motif, dimerization domain, lipocalin motif, and an ER localization domain (identified in FATP4 only) [153, 346, 373]. These transporters are unusual in that they appear to express intrinsic very long-chain acyl-CoA synthetase (EC 6.2.1- , EC 6.2.1.7) enzyme activity. Within the cell, these transporters may associate with plasma and peroxisomal membranes. FATP1-4 and -6 transport long- and very long-chain fatty acids, while FATP5 transports long-chain fatty acids as well as bile acids [344, 432].

| Nomenclature | Fatty acid transport protein 1 | Fatty acid transport protein 2 | Fatty acid transport protein 3 |
|--------------|-------------------------------|-------------------------------|-------------------------------|
| Systematic nomenclature | SLC27A1 | SLC27A2 | SLC27A3 |
| Common abbreviation | FATP1 | FATP2 | FATP3 |

| Comments | FATP4 is genetically linked to restrictive dermopathy. | – | – |
**Comments:** Although the stoichiometry of fatty acid transport is unclear, it has been proposed to be facilitated by the coupling of fatty acid transport to conjugation with coenzyme A to form fatty acyl CoA esters. Small molecule inhibitors of FATP2 [314, 429] and FATP4 [43, 549], as well as bile acid inhibitors of FATP5 [549], have been described; analysis of the mechanism of action of some of these inhibitors suggests that transport may be selectively inhibited without altering enzymatic activity of the FATP. C1-BODIPY-C12 accumulation has been used as a non-selective index of fatty acid transporter activity. FATP2 has two variants: Variant 1 encodes the full-length protein, while Variant 2 encodes a shorter isoform missing an internal protein segment. FATP6 also has two variants: Variant 2 encodes the same protein as Variant 1 but has an additional segment in the 5’ UTR.

**SLC28 and SLC29 families of nucleoside transporters**

**Overview:** Nucleoside transporters are divided into two families, the sodium-dependent, concentrative solute carrier family 28 (SLC28) and the equilibrative, solute carrier family 29 (SLC29). The endogenous substrates are typically nucleosides, although some family members can also transport nucleobases and organic cations.

---

**SLC28 family**

**Overview:** SLC28 family members appear to have 13 TM segments with cytoplasmic N-termini and extracellular C-termini, and function as concentrative nucleoside transporters.

**Comments**: A further two Na\(^+\)-dependent (stoichiometry 1 Na\(^+\) : 1 nucleoside (in)) nucleoside transporters have been defined on the basis of substrate and inhibitor selectivity: CNT4 (N4/cit, which transports uridine, thymidine and guanosine) and CNT5 (N5/csg, which transports guanosine and adenosine, and may be inhibited by nitrobenzylmercaptopurine ribonucleoside).

## SLC29 family

**Overview**: SLC29 family members appear to be composed of 11 TM segments with cytoplasmic N-termini and extracellular C-termini. ENT1, ENT2 and ENT4 are cell-surface transporters, while ENT3 is intracellular, possibly lysosomal [27]. ENT1-3 are described as broad-spectrum equilibrative nucleoside transporters, while ENT4 is primarily a polyspecific organic cation transporter at neutral pH [231]. ENT4 transports adenosine only under acidic conditions [31].

### Nomenclature

| Transporter 1 | Transporter 2 | Transporter 3 | Plasma membrane monoamine transporter |
|---------------|---------------|---------------|----------------------------------------|
| Equilibrative nucleoside transporter 1 | Equilibrative nucleoside transporter 2 | Equilibrative nucleoside transporter 3 | decynium 22 (pK<sub>i</sub> 7) [144], rhodamine123 (pK<sub>i</sub> 6) [144], dipyridamole (pK<sub>i</sub> 4.9) [503], verapamil (pK<sub>i</sub> 4.7) [144], fluoxetine (pK<sub>i</sub> 4.6) [144], quinidine (pK<sub>i</sub> 4.6) [144], quinine (pK<sub>i</sub> 4.6) [144], desipramine (pK<sub>i</sub> 4.5) [144], cimetidine (pK<sub>i</sub> 3.3) [144], decynium 22 (pK<sub>i</sub> 7) [144], rhodamine123 (pK<sub>i</sub> 6) [144], dipyridamole (pK<sub>i</sub> 4.9) [503], verapamil (pK<sub>i</sub> 4.7) [144], fluoxetine (pK<sub>i</sub> 4.6) [144], quinidine (pK<sub>i</sub> 4.6) [144], quinine (pK<sub>i</sub> 4.6) [144], desipramine (pK<sub>i</sub> 4.5) [144], cimetidine (pK<sub>i</sub> 3.3) [144] |

### Inhibitors

- nitrobenzylmercaptopurine ribonucleoside (pK<sub>i</sub> 9.7), drafazline (pK<sub>i</sub> 9.6) [216], KF24345 (pK<sub>i</sub> 9.4) [217], NBTGR (pK<sub>i</sub> 9.3), dilazep (pK<sub>i</sub> 9), dipyridamole (pK<sub>i</sub> 8.8) [217]
- rhodamine123 (pK<sub>i</sub> 6) [144], dipyridamole (pK<sub>i</sub> 5.9) [503], verapamil (pK<sub>i</sub> 4.7) [144], fluoxetine (pK<sub>i</sub> 4.6) [144], quinidine (pK<sub>i</sub> 4.6) [144], quinine (pK<sub>i</sub> 4.6) [144], desipramine (pK<sub>i</sub> 4.5) [144], cimetidine (pK<sub>i</sub> 3.3) [144]

### Labelled ligands

- [3H]nitrobenzylmercaptopurine ribonucleoside (pK<sub>d</sub> 9.3)

### Comments

- ENT1 has 100-1000-fold lower affinity for nucleobases as compared with nucleosides [529].
- The affinities of draflazine, dilazep, KF24345 and dipyridamole at ENT1 transporters are species dependent, exhibiting lower affinity at rat transporters than at human transporters [217, 458].
- The loss of ENT1 activity in ENT1-null mice has been associated with a hypermineralization disorder similar to human diffuse idiopathic skeletal hyperostosis [507]. Lack of ENT1 also results in the Augustine-null blood type [106].

SLC30 zinc transporter family

Transporters → SLC superfamily of solute carriers → SLC30 zinc transporter family

**Overview**: Along with the SLC39 family, SLC30 transporters regulate the movement of zinc ions around the cell. In particular, these transporters remove zinc ions from the cytosol, allowing accumulation into intracellular compartments or efflux through the plasma membrane. ZnT1 is thought to be placed on the plasma membrane extruding zinc, while ZnT3 is associated with synaptic vesicles and ZnT4 and ZnT5 are linked with secretory granules. Membrane topology predictions suggest a multimeric assembly, potentially heteromultimeric [461], with subunits having six TM domains, and both termini being cytoplasmic. Dityrosine covalent linking has been suggested as a mechanism for dimerisation, particularly for ZnT3 [427]. The mechanism for zinc transport is unknown.

**Comments**: ZnT8/SLC30A8 is described as a type 1 diabetes susceptibility gene. Zinc fluxes may be monitored through the use of radioisotopic Zn-65 or the fluorescent dye FluoZin 3.

SLC31 family of copper transporters

Transporters → SLC superfamily of solute carriers → SLC31 family of copper transporters

**Overview**: SLC31 family members, alongside the Cu-ATPases are involved in the regulation of cellular copper levels. The CTR1 transporter is a cell-surface transporter to allow monovalent copper accumulation into cells, while CTR2 appears to be a vacuolar/vesicular transporter [401]. Functional copper transporters appear to be trimeric with each subunit having three TM regions and an extracellular N-terminus. CTR1 is considered to be a higher affinity copper transporter compared to CTR2. The stoichiometry of copper accumulation is unclear, but appears to be energy-independent [304].

| Nomenclature               | Copper transporter 1 | Copper transporter 2 |
|----------------------------|---------------------|---------------------|
| Systematic nomenclature    | SLC31A1             | SLC31A2             |
| Common abbreviation        | CTR1                | CTR2                |

**Comments**

SLC32 vesicular inhibitory amino acid transporter

Overview: The vesicular inhibitory amino acid transporter, VIAAT (also termed the vesicular GABA transporter VGAT), which is the sole representative of the SLC32 family, transports GABA, or glycine, into synaptic vesicles [182, 183], and is a member of the structurally-defined amino acid-polyamine-organocation/APC clan composed of SLC32, SLC36 and SLC38 transporter families (see [435]). VIAAT was originally suggested to be composed of 10 TM segments with cytoplasmic N- and C-termini [335]. However, an alternative 9TM structure with the N terminus facing the cytoplasm and the C terminus residing in the synaptic vesicle lumen has subsequently been reported [333]. VIAAT acts as an antiporter for inhibitory amino acids and protons. The accumulation of GABA and glycine within vesicles is driven by both the chemical (ΔpH) and electrical (Δψ) components of the proton electrochemical gradient (ΔμH+) established by a vacuolar H+-ATPase [335]. However, one study, [259], presented evidence that VIAAT is instead a Cl-/GABA co-transporter. VIAAT co-exists with VGLUT1 (SLC17A7), or VGLUT2 (SLC17A6), in the synaptic vesicles of selected nerve terminals [155, 539]. VIAAT knock out mice die between embryonic day 18.5 and birth [515]. In cultures of spinal cord neurones established from earlier embryos, the co-release of GABA and glycine from synaptic vesicles is drastically reduced, providing direct evidence for the role of VIAAT in the sequestration of both transmitters [425, 515].

### Vesicular inhibitory amino acid transporter

**Nomenclature**

- **Systematic nomenclature**: SLC32A1
- **Common abbreviation**: VIAAT
- **HGNC, UniProt**: SLC32A1, Q9H598

**Endogenous substrates**

- β-alanine, γ-hydroxybutyric acid, GABA ($K_m$ 5×10⁻⁵M) [335], glycine

**Stoichiometry**

1 amino acid (in): 1 H⁺ (out) [182] or 1 amino acid: 2Cl⁻ (in) [259]

**Inhibitors**

- vigabatrin (pIC₅₀ 2.1) [335]

### SLC33 acetylCoA transporter

**Overview**: Acetylation of proteins is a post-translational modification mediated by specific acetyltransferases, using the donor acetyl CoA. SLC33A1/AT1 is a putative 11 TM transporter present on the endoplasmic reticulum, expressed in all tissues, but particularly abundant in the pancreas [267], which imports cytosolic acetyl CoA into these intracellular organelles.

**Nomenclature**

- **Systematic nomenclature**: SLC33A1
- **Common abbreviation**: ACATN1
- **HGNC, UniProt**: SLC33A1, Q00400
- **Endogenous substrates**: acetyl CoA
- **Stoichiometry**: Unknown
- **Labelled ligands**: [¹⁴C]acetylCoA (Binding)

---

**Searchable database**: [http://www.guidetopharmacology.org/index.jsp](http://www.guidetopharmacology.org/index.jsp)

**Full Contents of ConciseGuide**: [http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full](http://onlinelibrary.wiley.com/doi/10.1111/bph.13355/full)
**Comments**: In heterologous expression studies, acetyl CoA transport through AT1 was inhibited by coenzyme A, but not acetic acid, ATP or UDP-galactose [255]. A loss-of-function mutation in ACATN1/SLC33A1 has been associated with spastic paraplegia (SPG42, [317]), although this observation could not be replicated in a subsequent study [436].

### SLC34 family of sodium phosphate co-transporters

**Overview**: The SLC34 family are sometimes referred to as Type II sodium-phosphate co-transporters, alongside Type I (SLC17 family) and Type III (SLC20 family) transporters. Topological modelling suggests eight TM domains with C- and N- termini in the cytoplasm, and a re-entrant loop at TM7/8. SLC34 family members are expressed on the apical surfaces of epithelia in the intestine and kidneys to regulate body phosphate levels, principally NaPi-IIa and NaPi-IIb, respectively. NaPi-IIa and NaPi-IIb are electrogenic, while NaPiIic is electroneutral [10].

| Nomenclature | Sodium phosphate 1 | Sodium phosphate 2 | Sodium phosphate 3 |
|--------------|--------------------|--------------------|--------------------|
| Systematic nomenclature | SLC34A1 | SLC34A2 | SLC34A3 |
| Common abbreviation | NaPi-Iia | NaPi-Iib | NaPi-Iic |
| HGNC, UniProt | SLC34A1, Q06495 | SLC34A2, Q05436 | SLC34A3, Q8N130 |
| Stoichiometry | 3 Na⁺ : 1 HPO₄²⁻ (in) [168] | 3 Na⁺ : 1 HPO₄²⁻ (in) [10] | 2 Na⁺ : 1 HPO₄²⁻ (in) [10] |
| Antibodies | – | lifastuzumab vedotin (Binding) [115] | – |

**Comments**: These transporters can be inhibited by foscarnet, in contrast to type III sodium-phosphate cotransporters, the SLC20 family.

SLC35 family of nucleotide sugar transporters

Overview: Glycoprotein formation in the Golgi and endoplasmic reticulum relies on the accumulation of nucleotide-conjugated sugars via the SLC35 family of transporters. These transporters have a predicted topology of 10 TM domains, with cytoplasmic termini, and function as exchangers, swapping nucleoside monophosphates for the corresponding nucleoside diphosphate conjugated sugar. Five subfamilies of transporters have been identified on the basis of sequence similarity, namely SLC35A1, SLC35A2, SLC35A3, SLC35A4 and SLC35A5; SLC35B1, SLC35B2, SLC35B3 and SLC35B4; SLC35C1 and SLC35C2; SLC35D1, SLC35D2 and SLC35D3, and the subfamily of orphan SLC35 transporters, SLC35E1-4 and SLC35F1-5.

| Nomenclature | CMP-sialic acid transporter | UDP-galactose transporter | UDP-N-acetylglucosamine transporter | PAPS transporter 1 | PAPS transporter 2 |
|--------------|----------------------------|---------------------------|------------------------------------|--------------------|-------------------|
| Systematic nomenclature | SLC35A1 | SLC35A2 | SLC35A3 | SLC35B2 | SLC35B3 |
| HGNC, UniProt | SLC35A1, P78382 | SLC35A2, P78381 | SLC35A3, Q9Y2D2 | SLC35B2, Q8TB61 | SLC35B3, Q9H1N7 |
| Substrates | CMP-sialic acid [243] | UDP-galactose [245, 348], UDP N-acetyl-glucosamine [245, 348] | UDP-N-acetyl-glucosamine [246] |

| Nomenclature | YEA | GDP-Fucose transporter | UDP-glucuronic acid/UDP-N-acetylgalactosamine dual transporter | HFRC1 |
|--------------|-----|------------------------|---------------------------------------------------------------|------|
| Systematic nomenclature | SLC35B4 | SLC35C1 | SLC35D1 | SLC35D2 |

SLC36 family of proton-coupled amino acid transporters

**Overview:** The SLC36 family of proton-coupled amino acid transporters (or PAT) is highly expressed in the intestine and kidney, having roles in the disposition of amino acids [474]. PAT1 is found on the gut epithelia luminal surface accumulating dietary amino acids, and additionally in lysosomal membranes where it likely functions as an efflux mechanism for amino acids produced during intralysosomal proteolysis [4, 420]. PAT2 is found at the apical membrane of the kidney proximal tubule [66]. PAT1 and PAT2 are predicted to have 11 TM domains with intracellular N-termini [48, 420].

| Nomenclature | Proton-coupled Amino acid | Proton-coupled Amino acid | Proton-coupled Amino acid | Proton-coupled Amino acid |
|--------------|---------------------------|---------------------------|---------------------------|---------------------------|
| Systematic nomenclature | SLC36A1 | SLC36A2 | SLC36A3 | SLC36A4 |
| Common abbreviation | PAT1 | PAT2 | PAT3 | PAT4 |
| HGNC, UniProt | SLC36A1 | SLC36A2, Q495M3 | SLC36A3, Q495N2 | SLC36A4, Q6YBV0 |
| Substrates | MeAIB [86], betaine, vigabatrin [1], 5-aminolevulinic acid, β-guanidinopropionic acid, gaboxadol [299], L-azetidine-2-carboxylate [274], THPO [300] | MeAIB [87], L-azetidine-2-carboxylate [274] | – | – |
| Endogenous substrates | GABA, L-alanine, β-alanine, taurine, D-cysteine, D-serine, L-proline, D-proline, trans-4-hydroxy-proline [338], glycine [338], D-alanine, sarcosine | L-alanine, β-alanine, glycine, sarcosine, L-proline, trans-4-hydroxy-proline | – | L-tryptophan [384], L-proline [384] |
| Stoichiometry | 1 H⁺ : 1 amino acid (in) | 1 H⁺ : 1 amino acid (in) | Unknown | Unknown |
| Inhibitors | 5-hydroxy-L-tryptophan (pKᵢ 3) [339], L-tryptophan (pKᵢ 2.3) [339], indole-3-propionic acid (pKᵢ 2.3) [339], 5-hydroxytryptamine (pKᵢ 2.2) [339], 5-hydroxy-L-tryptophan (pIC₅₀ 2.8) [137], α-methyl-D,L-tryptophan (pIC₅₀ 2.5) [137] | – | – | – |
| Comments | [³H] or [¹⁴C] labelled substrates as listed above are used as probes | [³H] or [¹⁴C] labelled substrates as listed above are used as probes | – | – |

**Comments:** Both PAT1 and PAT2 can also function as an electroneutral transport system for H⁺ and fatty acids including acetic acid, propanoic acid and butyric acid [164]. Loss-of-function mutations in PAT2 lead to iminoglycinuria and hyperglycinuria in man [65].

SLC37 family of phosphosugar/phosphate exchangers

Overview: The family of sugar-phosphate exchangers pass particular phosphorylated sugars across intracellular membranes, exchanging for inorganic phosphate. Of the family of sugar phosphate transporters, most information is available on SPX4, the glucose-6-phosphate transporter. This is a 10 TM domain protein with cytoplasmic termini and is associated with the endoplasmic reticulum, with tissue-specific splice variation.

| Nomenclature | Glycerol-3-phosphate transporter | Sugar phosphate exchanger 2 | Glucose-6-phosphate transporter |
|--------------|----------------------------------|-----------------------------|---------------------------------|
| Systematic nomenclature | SLC37A1 | SLC37A2 | SLC37A4 |
| Common abbreviation | SPX1 | SPX2 | SPX4 |
| HGNC, UniProt | SLC37A1, P57057 | SLC37A2, Q8TED4 | SLC37A4, O43826 |
| Endogenous substrates | glycerol 3-phosphate, glucose 6-phosphate | glucose 6-phosphate | glucose 6-phosphate |
| Stoichiometry | Glucose 6-phosphate (in): phosphate (out) [379]. | Glucose 6-phosphate (in): phosphate (out) [379]. | Glucose 6-phosphate (in): phosphate (out) [84]. |
| Comments | – | – | Multiple polymorphisms have been described for the SLC37A4 gene, some of which associate with a glycogen storage disease [6]. |

SLC38 family of sodium-dependent neutral amino acid transporters

Overview: The SLC38 family of transporters appears to be responsible for the functionally-defined system A and system N mechanisms of amino acid transport and are mostly expressed in the CNS. Two distinct subfamilies are identifiable within the SLC38 transporters. SNAT1, SNAT2 and SNAT4 appear to resemble system A transporters in accumulating neutral amino acids under the influence of the sodium gradient. SNAT3 and SNAT5 appear to resemble system N transporters in utilizing proton co-transport to accumulate amino acids. The predicted membrane topology is of 11 TM domains with an extracellular C-terminus and intracellular N-terminus [435].

Nomenclature

Putative sodium-coupled neutral amino acid transporter 7

Systematic nomenclature
SLC38A7

Common abbreviation
SNAT7

HGNC, UniProt
SLC38A7, Q9NVC3

Comments
SNAT7/SLC38A7 has been described to be a system N-like transporter allowing preferential accumulation of glutamine (e.g. L-glutamine), histidine (e.g. L-histidine) and asparagine (e.g. L-asparagine) [237].

**SLC39 family of metal ion transporters**

**Overview:** Along with the SLC30 family, SLC39 family members regulate zinc movement in cells. SLC39 metal ion transporters accumulate zinc into the cytosol. Membrane topology modelling suggests the presence of eight TM regions with both termini extracellular or in the lumen of intracellular organelles. The mechanism for zinc transport for many members is unknown but appears to involve co-transport of bicarbonate ions \([191, 321]\).

| Nomenclature | Zinc transporter 8 | Zinc transporter 14 |
|--------------|--------------------|--------------------|
| Systematic nomenclature | SLC39A8 | SLC39A14 |
| Common abbreviation | ZIP8 | ZIP14 |
| HGNC, UniProt | SLC39A8, Q9C0K1 | SLC39A14, Q15043 |
| Substrates | Cd\(^{2+}\) \([104, 321]\) | Cd\(^{2+}\) \([191]\), Mn\(^{2+}\) \([191]\), Fe\(^{2+}\) \([322]\) |
| Stoichiometry | 1 Zn\(^{2+}\) (in) : 2 HCO\(_3\)^\(-\) (in) \([321]\) | – |

**Comments:** Zinc fluxes may be monitored through the use of radioisotopic Zn-65 or the fluorescent dye FluoZin 3. The bicarbonate transport inhibitor DIDS has been reported to inhibit cation accumulation through ZIP14 \([191]\).

SLC40 iron transporter

Overview: Alongside the SLC11 family of proton-coupled metal transporters, ferroportin allows the accumulation of iron from the diet. Whilst SLC11A2 functions on the apical membrane, ferroportin acts on the basolateral side of the enterocyte, as well as regulating macrophage and placental iron levels. The predicted topology is of 12 TM domains, with intracellular termini \([407]\), with the functional transporter potentially a dimeric arrangement \([3, 111]\). Ferroportin is essential for iron homeostasis \([126]\). Ferroportin is expressed on the surface of cells that store and transport iron, such as duodenal enterocytes, hepatocytes, adipocytes and reticuloendothelial macrophages. Levels of ferroportin are regulated by its association with (binding to) hepcidin, a 25 amino acid hormone responsive to circulating iron levels (amongst other signals). Hepcidin binding targets ferroportin for internalisation and degradation, lowering the levels of iron export to the blood. Novel therapeutic agents which stabilise ferroportin or protect it from hepcidin-induced degradation are being developed as anti-anemia agents. Anti-ferroportin monoclonal antibodies are such an agent.

| Nomenclature     | Ferroportin     |
|------------------|-----------------|
| Systematic nomenclature | SLC40A1         |
| Common abreviation | IREG1           |
| HGNC, UniProt    | SLC40A1, Q9NP59 |
| Endogenous substrates | Fe^{2+}        |
| Stoichiometry    | Unknown         |
| Antibodies       | LY2928057 (Binding) \([310]\) |

Comments: Hepcidin \((HAMP, P81172)\), cleaved into hepcidin-25 \((HAMP, P81172)\) and hepcidin-20 \((HAMP, P81173)\), is a small protein that increases upon inflammation, binds to ferroportin to regulate its cellular distribution and degradation. Gene disruption in mice results in embryonic lethality \([126]\), while loss-of-function mutations in man are associated with haemochromatosis \([112]\).

SLC41 family of divalent cation transporters

Overview: By analogy with bacterial orthologues, this family is probably magnesium transporters. The prokaryote orthologue, MgtE, is responsible for uptake of divalent cations, while the heterologous expression studies of mammalian proteins suggest Mg\textsuperscript{2+} efflux [287], possibly as a result of co-expression of particular protein partners (see [421]). Topological modelling suggests 10 TM domains with cytoplasmic C- and N- termini.

SLC42 family of Rhesus glycoprotein ammonium transporters

Overview: Rhesus is commonly defined as a ‘factor’ that determines, in part, blood type, and whether neonates suffer from haemolytic disease of the newborn. These glycoprotein antigens derive from two genes, RHCE (P18577) and RHD (Q02161), expressed on the surface of erythrocytes. On these transporters derives from orthologues in yeast, plants and bacteria. More recent evidence points to family members being permeable to carbon dioxide, leading to the term gas channels.

SLC43 family of large neutral amino acid transporters

SLC43A1 and LAT4 (SLC43A2) are transporters with system L amino acid transporter activity, along with the structurally and functionally distinct transporters LAT1 and LAT2 that are members of the SLC7 family. LAT3 and LAT4 contain 12 putative TM domains with both N and C termini located intracellularly. They transport neutral amino acids in a manner independent of Na⁺ and Cl⁻ and with two kinetic components [22, 47]. LAT3/SLC43A1 is expressed in human tissues at high levels in the pancreas, liver, skeletal muscle and fetal liver [22] whereas LAT4/SLC43A2 is primarily expressed in the placenta, kidney and peripheral blood leukocytes [47]. SLC43A3 is expressed in vascular endothelial cells [502] but remains to be characterised.

**SLC44 choline transporter-like family**

**Overview:** Members of the choline transporter-like family are encoded by five genes (CTL1-CTL5) with further diversity occurring through alternative splicing of CTL1, 4 and 5 [47]. CTL family members are putative 10TM domain proteins with extracellular termini that mediate Na⁺-independent transport of choline with an affinity that is intermediate to that of the high affinity choline transporter CHT1 (SLC5A7) and the low affinity organic-cation transporters [OCT1 (SLC22A1) and OCT2 (SLC22A2)] [343]. CTL1 is expressed almost ubiquitously in human tissues [514] and mediates choline transport across the plasma and mitochondrial membranes [342]. Transport of choline by CTL2, which in rodents is expressed as two isoforms (CTL2P1 and CLT2P2; [288]) in lung, colon, inner ear and spleen and to a lesser extent in brain, tongue, liver, and kidney, has only recently been demonstrated [288, 358]. CTL3-5 remain to be characterized functionally.

| Nomenclature                | Choline transporter-like 1 |
|-----------------------------|----------------------------|
| Systematic nomenclature     | SLC44A1                    |
| Common abbreviation         | CTL1                       |

| Stoichiometry               | Unknown: uptake enhanced in the absence of extracellular Na⁺, reduced by membrane depolarization, extracellular acidification and collapse of plasma membrane H⁺ electrochemical gradient |
| Inhibitors                  | hemicholinium-3 (pKᵢ 3.5–4.5) |
Comments: Data tabulated are features observed for CLT1 endogenous to: rat astrocytes [242]; rat renal tubule epithelial cells [524]; human colon carcinoma cells [289]; human keratinocytes [486] and human neuroblastoma cells [525]. Choline uptake by CLT1 is inhibited by numerous organic cations (e.g. [242, 524, 525]). In the guinea-pig, CTL2 is a target for antibody-induced hearing loss [355] and in man, a polymorphism in CTL2 constitutes the human neutrophil alloantigen-3a (HNA-3a; [203]).

SLC45 family of putative sugar transporters

**Overview:** Members of the SLC45 family remain to be fully characterised. SLC45A1 was initially identified in the rat brain, particularly predominant in the hindbrain, as a proton-associated sugar transport, induced by hypercapnia [447]. The protein is predicted to have 12TM domains, with intracellular termini. The *SLC45A2* gene is thought to encode a transporter protein that mediates melanin synthesis. Mutations in *SLC45A2* are a cause of oculocutaneous albinism type 4 (e.g. [361]), and polymorphisms in this gene are associated with variations in skin and hair color (e.g. [202]).

| Nomenclature | Proton-associated sugar transporter A |
|--------------|-------------------------------------|
| Systematic nomenclature | SLC45A1 |
| HGNC, UniProt | SLC45A1, Q9Y2W3 |
| Substrates | L-glucose [447], Galactose [447] |
| Stoichiometry | Unknown; increased at acid pH [447] |

**Overview:** Based on the prototypical member of this family, PCFT, this family includes proton-driven transporters with 11 TM segments. SLC46A1 has been described to act as an intestinal proton-coupled high-affinity folic acid transporter [393], with lower affinity for heme. Folic acid accumulation is independent of Na⁺ or K⁺ ion concentrations, but driven by extracellular protons with an as yet undefined stoichiometry.

### Nomenclature
- Proton-coupled folate transporter
- Systematic nomenclature: SLC46A1
- Common abbreviation: PCFT
- HGNC, UniProt: SLC46A1, Q96NT5

### Substrates
- Folic acid (1.3 µM) > heme (≥100 µM) [356]
- Substrates: pemetrexed, N-formyltetrahydrofolate, methotrexate [393]
- Endogenous substrates: N5-methylenetetrafolate [393]

### Labelled ligands
- [3H]N⁵-methylfolate (Binding), [3H]folic acid, [3H]folinic acid (Binding), [3H]methotrexate, [3H]pemetrexed (Binding)

### Comments
- Loss-of-function mutations in PCFT (SLC46A1) are the molecular basis for hereditary folate maladsorption [428].

SLC48 heme transporter

Overview: HRG1 has been identified as a cell surface and lysosomal heme transporter [398]. In addition, evidence suggests this 4TM-containing protein associates with the V-ATPase in lysosomes [367]. Recent studies confirm its lysosomal location and demonstrate that it has an important physiological function in macrophages ingesting senescent red blood cells (erythrophagocytosis), recycling heme (released from the red cell hemoglobin) from the phagolysosome into the cytosol, where the heme is subsequently catabolized to recycle the iron [511].

SLC49 family of FLVCR-related heme transporters

Overview: FLVCR1 was initially identified as a cell-surface attachment site for feline leukemia virus subgroup C [464], and later identified as a cell surface accumulation which exports heme from the cytosol [395]. A recent study indicates that an isoform of FLVCR1 is located in the mitochondria, the site of the final steps of heme synthesis, and appears to transport heme into the cytosol [89]. FLVCR-mediated heme transport is essential for erythropoiesis. FLVCR1 gene mutations have been identified as the cause of PCARP (posterior column ataxia with retinitis pigmentosa) (PCARP) [397]. There are three paralogs of FLVCR1 in the human genome. FLVCR2, most similar to FLVCR1 [319], has been reported to function as a heme importer [129]. In addition, a congenital syndrome of proliferative vasculopathy and hydranencephaly, also known as Fowler’s syndrome, is associated with a loss-of-function mutation in FLVCR2 [340]. The functions of the other two members of the SLC49 family, MFSD7 and DIRC2, are unknown, although DIRC2 has been implicated in hereditary renal carcinomas [46].

Systematic nomenclature SLC49A1 SLC49A2
Common abbreviation FLVCR1 FLVCR2
HGNC, UniProt FLVCR1, Q9Y5Y0 FLVCR2, Q9UPI3
Substrates heme [395] heme [129]
Stoichiometry Unknown Unknown

Comments: Non-functional splice alternatives of FLVCR1 have been implicated as a cause of a congenital red cell aplasia, Diamond Blackfan anemia [405].

### SLC50 sugar transporter

**Overview:** A mouse stromal cell cDNA library was used to clone C2.3 [463], later termed Rag1-activating protein 1, with a sequence homology predictive of a 4TM topology. The plant orthologues, termed SWEETs, appear to be 7 TM proteins, with extracellular N-termini, and the capacity for bidirectional flux of D-glucose [82]. Expression of mouse SWEET in the mammary gland was suggestive of a role in Golgi lactose synthesis [82].

| Nomenclature | SLC50 sugar exporter |
|--------------|----------------------|
| Systematic nomenclature | SLC50A1 |
| Common abbreviation | RAG1AP1 |
| HGNC, UniProt | SLC50A1, Q9BRV3 |

SLC51 family of steroid-derived molecule transporters

**Overview:** The SLC51 organic solute transporter family of transporters is a pair of heterodimeric proteins which regulate bile salt movements in the bile duct, small intestine and kidney, and elsewhere, as part of the enterohepatic circulation [28, 109]. OSTα/OSTβ heterodimers have been shown to transport [3H]taurocholic acid, [3H]dehydroepiandrosterone sulphate, [3H]estrone-3-sulphate, [3H]pregnenolone sulphate and [3H]dehydroepiandrosterone sulphate [28, 109, 154]. OSTα is suggested to be a seven TM protein, while OSTβ is a single TM ‘ancillary’ protein, both of which are thought to have intracellular C-termini [315]. Bimolecular fluorescence complementation studies suggest the possibility of OSTα homo-oligomers, as well as OSTα/OSTβ hetero-oligomers [92, 315].

| Nomenclature                  | Organic solute transporter subunit α | Organic solute transporter subunit β |
|------------------------------|-------------------------------------|-------------------------------------|
| Systematic nomenclature      | SLC51A1                             | SLC51A1BP                           |
| Common abbreviation          | OSTα                                | OSTβ                                |
| HGNC, UniProt                | SLC51A, Q86UW1                      | SLC51B, Q86UW2                      |

SLC52 family of riboflavin transporters

**Overview:** riboflavin, also known as vitamin B2, is a precursor of the enzyme cofactors flavin mononucleotide (FMN) and flavin adenine dinucleotide (FAD). Riboflavin transporters are predicted to possess 10 or 11 TM segments.
**SLCO family of organic anion transporting polypeptides**

**Overview:** The SLCO superfamily is comprised of the organic anion transporting polypeptides (OATPs). The 11 human OATPs are divided into 6 families and ten subfamilies based on amino acid identity. These proteins are located on the plasma membrane of cells throughout the body. They have 12 TM domains and intracellular termini, with multiple putative glycosylation sites. OATPs mediate the sodium-independent uptake of a wide range of amphiphilic substrates, including many drugs and toxins. Due to the multispecificity of these proteins, this guide lists classes of substrates and inhibitors for each family member. More comprehensive lists of substrates, inhibitors, and their relative affinities may be found in the review articles listed below.

**Nomenclature**

| Solute carrier family | Solute carrier family | Solute carrier family |
|----------------------|----------------------|----------------------|
| SLC52A1              | SLC52A2              | SLC52A3              |
| RFVT1                | RFVT2                | RFVT3                |
| RFVT1, Q9NWF4        | SLC52A2, Q9HAB3      | SLC52A3, Q9NQ40      |
| unknown              | riboflavin (Km 1.3x10^{-3}M) [530] | riboflavin (Km 3.3x10^{-4}M) [530] |
| unknown              | unknown              | H^+-dependent |

**Comments:** Although expressed elsewhere, RFVT3 is found on the luminal surface of intestinal epithelium and is thought to mediate uptake of dietary riboflavin, while RFVT1 and RFVT2 are thought to allow movement from the epithelium into the blood.

| Nomenclature | OATP1A2 | OATP1B1 | OATP1B3 | OATP1C1 |
|--------------|---------|---------|---------|---------|
| Substrates   | fluoroquinolones, beta blockers, deltorphin II, rosuvastatin, fexofenadine, bromsulphthalein, anticancer drugs, antibiotics, HIV protease inhibitors, talinolol, ouabain, microcystin | statins, opioids, β-lactam antibiotics, bile acid derivatives and conjugates, bromsulphthalein, anticancer drugs, HIV protease inhibitors, fexofenadine, antifungals, ACE inhibitors, rifampicin, endothelin receptor antagonists, sartans | rifampicin, opioids, sartans, statins, digoxin, anticancer drugs, bromsulphthalein, bile acid derivatives and conjugates, β-lactam antibiotics, ouabain, amanitin, saquinavir, fexofenadine, erythromycin-A, phalloidin | statins, bromsulphthalein |
| Endogenous substrates | bile acids, thyroid hormones, steroid conjugates, bilirubin, PGE₂ | leukotrienes, steroid conjugates, thyroid hormones, bile acids, bilirubin | steroid conjugates, thyroid hormones, bile acids, CCK-8 (CCK, P06307), bilirubin, LTC₄ | thyroid hormones, steroid conjugates |
| Ligands | – | pravastatin (Binding) | – | – |
| Inhibitors | naringin [25], rifampicin, rifamycin SV | cyclosporin A, gemfibrozil [364], glycyrrhizin, indocyanine green, rifampicin, rifamycin SV, sildenafil | cyclosporin A (pIC₅₀ 6.1) [478], sildenafil (pIC₅₀ 6.1) [478], rifampicin (pIC₅₀ 5.8) [478], gemfibrozil, glycyrrhizin, rifamycin SV | DPDPE, probenecid, taurocholic acid |
| Labelled ligands | [³H]BSP, [³H]DPDPE, [³H]estrone-3-sulphate | [³H]estradiol-17β-glucuronide, [³H]estrone-3-sulphate | [³H]BSP, [³H]CCCK-8 (human, mouse, rat), [³H]estradiol-17β-glucuronide | [¹²⁵I]thyroxine, [³H]BSP, [³H]estrone-3-sulphate |
| Comments | Although rat and mouse OATP1A4 are considered the orthologs of human OATP1A2 we do not cross-link to gene or protein databases for these since in reality there are five genes in rodents that arose through gene duplication in this family and it is not clear which one of these is the "true" ortholog. | pravastatin is used as a probe | Other inhibitors include, fibrates, flavonoids, glitazones and macrolide antibiotics. pravastatin is used as a probe | Other inhibitors include, HIV protease inhibitors, glitazones and macrolide antibiotics |
### Nomenclature

| Substrates | OATP2A1 | OATP2B1 | OATP3A1 | OATP4A1 | OATP4C1 |
|------------|---------|---------|---------|---------|---------|
| Synthetic prostaglandin derivatives | amiodarone, bromsulphthalein, statins, glibenclamide, aliskiren, fexofenadine, talinolol, bosentan, telmisartan | – | – | penicillin G | dipeptidyl peptidase-4 inhibitors, anticancer drugs, cardiac glycosides |
| Endogenous substrates | prostaglandins, eicosanoids | estrone-3-sulphate, dehydroepiandrosterone sulphate, T4 | BQ123, vasopressin (AVP, P01185), thyroid hormones, prostaglandins | – | thyroid hormones, prostaglandins, bile acids, steroid conjugates |
| Inhibitors | bromocresol green (Inhibition of PGF2α uptake in PGT-expressing HeLa cells) (pKi 5.4) [263] – Rat, bromsulphthalein (Inhibition of PGF2α uptake in PGT-expressing HeLa cells) (pKi 5.2) [263] – Rat | gemfibrozil, glibenclamide, rifamycin SV | – | – | – |
| Labelled ligands | [3H]PGE2 (Binding) [78] | [3H]BSP, [3H]estrone-3-sulphate | [3H]PGE2, [3H]estrone-3-sulphate | [3H]estrone-3-sulphate | [3H]digoxin |
| Comments | Other inhibitors include NSAIDs | Other inhibitors include glitazones and citrus juices | – | – | – |

Patched family

Other protein targets → Patched family

Overview: NPC1L1 acts in the gut epithelium to allow the accumulation of dietary cholesterol through a clathrin-dependent mechanism. Ezetimibe is used to reduce cholesterol absorption through inhibition of NPC1L1.

| Nomenclature          | NPC1-like 1 |
|-----------------------|-------------|
| HGNC, UniProt         | NPC1L1, Q9UHC9 |
| Selective antagonists | ezetimibe (Inhibition) (pKd 6.7) [21] |
