The algebra $A_{\hbar,\eta}(\hat{g})$
and Infinite Hopf family of algebras

Abstract
New deformed affine algebras $A_{\hbar,\eta}(\hat{g})$ are defined for any simply-laced classical Lie algebra $g$, which are generalizations of the algebra $A_{\hbar,\eta}(\hat{sl}_2)$ recently proposed by Khoroshkin, Lebedev and Pakuliak (KLP). Unlike the work of KLP, we associate to the new algebras the structure of an infinite Hopf family of algebras in contrast to the one containing only finite number of algebras introduced by KLP. Bosonic representation for $A_{\hbar,\eta}(\hat{g})$ at level 1 is obtained, and it is shown that, by repeated application of Drinfeld-like comultiplications, a realization of $A_{\hbar,\eta}(\hat{g})$ at any positive integer level can be obtained. For the special case of $g = \hat{sl}_{r+1}$, $(r+1)$-dimensional evaluation representation is given. The corresponding intertwining operators are defined and the intertwining relations are also derived explicitly.
1 Introduction

Since Drinfeld [9, 10, 11] proposed the quantum groups and Yangian algebras as deformations of the universal enveloping algebras of the classical Lie algebras, Hopf algebras with nontrivial coalgebra structure, especially $q$-affine algebras [32] and Yangian doubles [22, 23], have become one of the major subjects of pure and applied algebra studies. Recent progress in the study of Hopf algebras and applications include the free boson representations of $q$-affine algebras and Yangian doubles at higher level [1, 18, 25] and the possibility of describing the dynamical symmetries and solving the correlation functions of certain solvable lattice statistic models and integrable quantum field theories within a pure algebraic framework [1, 3, 18, 26, 27, 30, 35]. The latter problem is, if not the sole force, among the driving forces which lead to the studies of deformed algebras beyond Hopf algebras. Examples of such deformed algebras are $q$-[2, 3, 12, 16, 29, 30, 31, 33, 34] and $\hbar$-[7, 17] deformed Virasoro and $W$ algebras, the elliptic algebra $A_{q,p}(\hat{sl}_2)$ [14, 15] and its scaling limit $A_{\hbar,\eta}(\hat{sl}_2)$ [24], and the algebra of screening operators of the $q$-deformed $W$-algebras [13] and so on.

In this paper we extend the recent work of S.Khoroshkin, D.Lebedev and S.Pakuliak [24] on the scaling algebra $A_{h,\eta}(\hat{sl}_2)$ of the elliptic algebra $A_{q,p}(\hat{sl}_2)$ to the general case, $A_{h,\eta}(\hat{g})$, where $g$ can be any classical simply-laced Lie algebra of any admissible rank. The algebra $A_{h,\eta}(\hat{sl}_2)$ introduced in [24] is a formal algebra with generators carrying continuous indices. One of the principal motivations of [24] was to establish a better understanding of the algebra $A_{q,p}(\hat{sl}_2)$ from the representation theoretic point of view because the representation theory of $A_{q,p}(\hat{sl}_2)$ has been rather obscure since its birth [14, 15]. For this the authors of [24] considered the scaling limit, $A_{h,\eta}(\hat{sl}_2)$, instead of $A_{q,p}(\hat{sl}_2)$ itself, with generating functions being analytic along some strip—which plays the role of fundamental parallelogram for the elliptic algebra $A_{q,p}(\hat{sl}_2)$—in the complex plane. The algebra $A_{h,\eta}(\hat{sl}_2)$ turns out to be not a Hopf algebra but belongs to a Hopf family of algebras in which the comultiplication can be made associative but with the sacrifice of changing the periods of structure functions for different iterations of the comultiplication. Moreover the twisted intertwining operators appeared in the representation theory of the algebra $A_{h,\eta}(\hat{sl}_2)$ satisfy a familiar set of commutation relations which were used in the calculation of correlation functions for Sine-Gordon model.

We shall show that the algebra $A_{h,\eta}(\hat{sl}_2)$ actually belongs to (and constitutes the simplest example of) a new type of deformed affine algebras, $A_{h,\eta}(\hat{g})$. Just like their simplest representative, $A_{h,\eta}(\hat{sl}_2)$, these new deformed affine algebras are not Hopf algebras, because the second deformation parameter $\eta$ spoils the usual Hopf algebra structure. However, for two reasons we regard them as deformations of the usual Hopf algebras. First, as the second deformation parameter $\eta$ approaches zero, the currents for the algebra $A_{h,\eta}(\hat{g})$ obey the same commutation relations as that of the Yangian double with center $DY_{h}(g)$: Second, if we consider the level zero representation of $A_{h,\eta}(\hat{g})$, the algebraic relations become Hopf algebra again.

Due to the complication for the case of general $g$, we pertain ourselves only in the current
realization. In this form, it is not easy to write down the analog of comultiplication used by KLP [24]. We therefore use an analog of the well-known Drinfeld comultiplication to study some aspects in the structure of our algebra. It is, however, not known whether the finite Hopf family structure of KLP can be realized using this form of comultiplication. To overcome this drawback, we introduce an alternative notion, which we call the infinite Hopf family of algebras, to write down the interactions of comultiplications in a convenient form. It turns out that this new notion leads to an astonishing simple realization of our algebra at any positive integer level.

Besides the pure algebraic elegance, our algebras are also expected to have relevant applications in such fields as to develop an algebraic formulation of quantum symmetry and the calculation of correlation functions for affine Toda field theories.

2 The algebras $A_{\hbar,\eta}(\hat{g})$ and infinite Hopf families

2.1 The algebra $A_{\hbar,\eta}(\hat{g})$

We begin our study by introducing the formal current algebra (denoted also by the symbol $A_{\hbar,\eta}(\hat{g})$) associated with $A_{\hbar,\eta}(\hat{g})$. The special case of $g = sl_2$ can be inferred from [24]. For other simply-laced classical Lie algebras $g$, the following definition is, to our knowledge, not introduced anywhere else.

**Definition 1** The current algebra $A_{\hbar,\eta}(\hat{g})$ associated with the classical simply-laced Lie algebra $g$ of rank $r$ (as an associative algebra with unit over the field $\mathbb{C}$) is generated by the $3r$ currents \{\(H_i^+(u)\), \(E_i(u)\), \(F_i(u)\)|\(i = 1, \ldots, r\)\}, the central element $c$ and 1 with the following generating relations [\([25]\)]:

\[
H_i^+(u)H_j^-(v) = \frac{\sh\eta(u - v - i\hbar(B_{ij} + c/2))\sh\eta(u - v + i\hbar(B_{ij} - c/2))}{\sh\eta(u - v + i\hbar(B_{ij} + c/2))\sh\eta(u - v - i\hbar(B_{ij} - c/2))}H_j^-(v)H_i^+(u),
\]

(1)

\[
H_i^\pm(u)H_j^\pm(v) = \frac{\sh\eta(u - v - i\hbar B_{ij})\sh\eta(u + v + i\hbar B_{ij})}{\sh\eta(u - v + i\hbar B_{ij})\sh\eta(u - v - i\hbar B_{ij})}H_j^\pm(v)H_i^\pm(u),
\]

(2)

\[
H_i^\pm(u)E_j(v) = \frac{\sh\eta(u - v - i\hbar(B_{ij} \pm c/4))}{\sh\eta(u - v + i\hbar(B_{ij} \pm c/4))}E_j(v)H_i^\pm(u),
\]

(3)

\[
H_i^\pm(u)F_j(v) = \frac{\sh\eta(u - v - i\hbar(B_{ij} \mp c/4))}{\sh\eta(u - v + i\hbar(B_{ij} \pm c/4))}F_j(v)H_i^\pm(u),
\]

(4)

\[\]

\[1\]Throughout this paper, the suffixes $i$ of the current operators take integer values, which indicate different root directions of the underlying Lie algebra $g$, whilst the symbol $i$ preceding the $\hbar$'s in the structure functions are square root of $-1$. 

3
\[ E_i(u)E_j(v) = \frac{\sinh \eta (u - v - i \hbar B_{ij})}{\sinh \eta (u - v + i \hbar B_{ij})} E_j(v)E_i(u), \tag{5} \]
\[ F_i(u)F_j(v) = \frac{\sinh \eta' (u - v + i \hbar B_{ij})}{\sinh \eta (u - v - i \hbar B_{ij})} F_j(v)F_i(u), \tag{6} \]
\[ [E_i(u), F_j(v)] = \frac{2\pi i}{\hbar} \delta_{ij} \left( \delta(u - v - \frac{i \hbar}{2}) H^+(u - \frac{i \hbar}{4}) - \delta(u - v + \frac{i \hbar}{4}) H^-(v - \frac{i \hbar}{4}) \right). \tag{7} \]
\[ E_i(u_1)E_i(u_2)E_j(v) - 2 \cos(\eta \hbar) E_i(u_1)E_j(v)E_i(u_2) + E_j(v)E_i(u_1)E_i(u_2) + \delta(u_1 \leftrightarrow u_2) = 0, \text{ for } A_{ij} = -1, \tag{8} \]
\[ F_i(u_1)F_i(u_2)F_j(v) - 2 \cos(\eta' \hbar) F_i(u_1)F_j(v)F_i(u_2) + F_j(v)F_i(u_1)F_i(u_2) + \delta(u_1 \leftrightarrow u_2) = 0, \text{ for } A_{ij} = -1, \tag{9} \]
\[ [c, \text{everything}] = 0 = [1, \text{everything}], \tag{10} \]

where \( u, v \) etc. are spectral parameters, real \( \hbar, \eta \) are two deformation parameters, \( B_{ij} = A_{ij}/2 \), \( A_{ij} \) are matrix elements of the Cartan matrix for the Lie algebra \( g \), and \( \hbar \)

\[ \frac{1}{\eta'} - \frac{1}{\eta} = \hbar c. \]

**Remark 1** For \( g = sl_2 \), the above current algebra reduces to the current realization of \( A_{\hbar, \eta}(sl_2) \), where the Serre-like relations (8-9) are not present.

**Remark 2** In the limit \( \eta \to 0 \), the current algebra \( A_{\hbar, \eta}(\widehat{g}) \) would have the same form as that of the Yangian double \( DY_\hbar(g) \). But the limiting algebra \( A_{\hbar, 0}(\widehat{g}) \) should not be considered to be isomorphic with the Yangian double \( DY_\hbar(g) \) because the element of the algebra \( A_{\hbar, 0}(\widehat{g}) \) carries a continuous index whilst that of the Yangian double \( DY_\hbar(g) \) carries discrete one. For \( g = sl_2 \), see [24] for more information on this point.

To have a precise definition for the algebra \( A_{\hbar, \eta}(\widehat{g}) \) (and not its current realization form), we have to consider two different cases as did in ref. [24] for \( sl_2 \) case: 1) the case \( c \neq 0 \) and 2) the case \( c = 0 \). In the first case one should consider the currents \{ \( H^\pm_i(u), E_i(u), F_i(u) \} \) as the following Fourier transforms of the actual elements \( t_i(\lambda), e_i(\lambda) \) and \( f_i(\lambda) (\lambda \in \mathbb{R}) \) of the algebra \( A_{\hbar, \eta}(\widehat{g}) \),

\[ H^\pm_i(u) = -\frac{\hbar}{2} \int_{-\infty}^{\infty} d\lambda e^{i\lambda u} t_i(\lambda) e^{\mp \lambda/2\eta'}. \]
\[ E_i(u) = \int_{-\infty}^{\infty} d\lambda e^{i\lambda u} e_i(\lambda), \]
\[ F_i(u) = \int_{-\infty}^{\infty} d\lambda e^{i\lambda u} f_i(\lambda), \]

\[ ^2 \text{We assume throughout this paper that } \eta \text{ and } \hbar \text{ are generic, i.e. } \hbar \text{ is not a rational multiple of } \eta. \]
whereas in the second case, the currents $H_\pm^i(u)$ should be given another expression in terms of the actual elements $h_i(\lambda)$ of $A_{\hbar,\eta}(\hat{g})$ at $c = 0$,

$$H_\pm^i(u) = \mp \hbar \int_{-\infty}^{\infty} d\lambda \frac{h_i(\lambda)}{1 - e^{\mp \lambda/\eta}}.$$  

The difference between the cases for $c \neq 0$ and $c = 0$ can be summarized in a more compact relationship between the algebra generators $t_i(\lambda)$ and $h_i(\lambda)$. In fact, from the two expressions of $H_\pm^i(u)$, we can write down the following relation at $c = 0$,

$$h_i(\lambda) = t_i(\lambda) \text{sh}\left(\frac{\lambda}{2\eta}\right).$$

Therefore, in the limit $c \to 0$, $h_i(0)$ is well-defined but $t_i(0)$ tend to infinity. On the contrary, when $c \neq 0$, $t_i(0)$ is well-defined and $h_i(0)$ tends to zero.

Given the above Fourier transformations, one can in principle write down the generating relations for the algebra $A_{\hbar,\eta}(\hat{g})$ in terms of the continuous generators $t_i(\lambda)$, $h_i(\lambda)$, $e_i(\lambda)$, $f_i(\lambda)$. However, such relations are rather complicated and they are of no use in the rest of this paper. Therefore we shall omit such relations and consider only the current realization (1-10) of the algebra $A_{\hbar,\eta}(\hat{g})$.

Unlike the usual $q$-affine algebras and the Yangian doubles, the algebra under consideration is not a Hopf algebra. Recall that a Hopf algebra is an algebra endowed with five operations:

- the algebra multiplication $m : \mathcal{A} \times \mathcal{A} \rightarrow \mathcal{A}$, $m(a \otimes b) = ab$ for $\forall a, b \in \mathcal{A}$;
- the unit embedding $\iota : \mathbb{C} \rightarrow \mathcal{A}$, $\iota(c) = c1$, $c \in \mathbb{C}$, $1 \in \mathcal{A}$ is the unit element;
- comultiplication $\Delta : \mathcal{A} \rightarrow \mathcal{A} \times \mathcal{A}$, $\Delta(ab) = \Delta(a)\Delta(b)$ for $\forall a, b \in \mathcal{A}$;
- the antipode $S : \mathcal{A} \rightarrow \mathcal{A}$, $S(ab) = S(b)S(a)$ for $\forall a, b \in \mathcal{A}$;

and

- the counit $\epsilon : \mathcal{A} \rightarrow \mathbb{C}$, $\epsilon(a_i) = c_i$, for $\forall a_i \in \mathcal{A}$ and $c_i \in \mathbb{C}$.

To make the algebra $\mathcal{A}$ into a Hopf algebra, these structures have to obey the following axioms,

$$m \circ (m \otimes \text{id}) = m \circ (\text{id} \otimes m),$$  

(11)  

$$\Delta \otimes \text{id} \circ \Delta = (\text{id} \otimes \Delta) \circ \Delta,$$  

(12)  

$$\epsilon \otimes \text{id} \circ \Delta = \text{id} = (\text{id} \otimes \epsilon) \circ \Delta,$$  

(13)  

$$m \circ (S \otimes \text{id}) \circ \Delta = \epsilon = m \circ (\text{id} \otimes S) \circ \Delta.$$  

(14)
For our algebra $A_{h,\eta}(\hat{g})$, only the first of these axioms holds, which ensures the associativity of the algebra multiplication. The operations $\Delta$, $\epsilon$, $S$ cannot be defined on the algebra $A_{h,\eta}(\hat{g})$ alone. However, as first discovered in ref.[24], a well-defined coproduct can be defined over the so-called “Hopf family of algebras” containing a finite number of algebras of the kind $A_{h,\eta}(\hat{sl}_2)$ but with different parameters $\eta$. However, as stated in the introduction, the case for arbitrary $g$ is much more complicated and we can only make our analysis in the current realization. This difficulty prevented us from obtaining an analog structure of KLP’s Hopf family of algebras because the analogous comultiplication is not known. Therefore we proceed to introduce an alternative notion—the infinite Hopf family of algebras. It should be remarked that no relationship is implied here between our infinite Hopf family of algebras and the (finite) Hopf family of algebras introduced by KLP.

**Definition 2** Let $\{A_n, n \in \mathbb{Z}\}$ be a family of associative algebras with unit defined over $\mathbb{C}$. If on each $A_n$ one can define the following operations

- the comultiplications $\Delta^+_n : A_n \rightarrow A_n \times A_{n+1}$, $\Delta^+_n(a_n) = a_n \otimes a_{n+1}$ and $\Delta^-_n : A_n \rightarrow A_{n-1} \times A_n$, $\Delta^-_n(a_n) = a_{n-1} \otimes a_n$, where $a_n \in A_n$ and $\Delta^\pm_n$ are algebra morphisms;
- the counits $\epsilon_n : A_n \rightarrow \mathbb{C}$;
- the antipodes $S^\pm_n : A_n \rightarrow A_{n\pm1}$, $S^\pm_n(a_n b_{n\pm1}) = S^\pm_n(b_{n\pm1}) S^\pm_n(a_{n\pm1})$, which are algebra anti-morphisms,

and if they satisfy the following constraints,

$$
(\epsilon_n \otimes id_{n+1}) \Delta^+_n = id_{n+1}, \quad (\epsilon_{n-1} \otimes id_n) \Delta^-_n = id_{n-1},
$$

(15)

$$
(id_{n+1} \otimes \epsilon_n) \Delta^+_n = id_{n+1}, \quad (id_{n-1} \otimes \epsilon_n) \Delta^-_n = id_{n-1},
$$

(16)

$$
m_{n+1} \circ (S^+_n \otimes id_{n+1}) \circ \Delta^+_n = \epsilon_{n+1},
$$

(17)

$$
m_{n-1} \circ (id_{n-1} \otimes S^-_n) \circ \Delta^-_n = \epsilon_{n-1},
$$

(18)

where $m_n$ is the algebra multiplication for the $n$-th component algebra $A_n$, then we call the family of algebras $\{A_n, n \in \mathbb{Z}\}$ an infinite Hopf family of algebras.

A trivial example for the infinite Hopf family of algebras is the family $\{A_n \equiv A, n \in \mathbb{Z}\}$ in which $A$ is a usual Hopf algebra. In this case, all our axioms (15-18) hold with the comultiplications $\Delta^\pm_n$, counits $\epsilon_n$ and the antipodes $S^\pm_n$ being identified with those corresponding structures for the usual Hopf algebra. Notice that in this trivial case, we have one more axiom, eq.(12), which represents the coassociativity of the comultiplication. For general cases no coassociativity is required. One may consider the lost of coassociativity in our infinite Hopf family of algebras a serious drawback compared to the (finite) Hopf family structure of [24]. However it will soon be clear in Proposition...
2 that this structure would bring about a great advantage in obtaining realizations of our algebra at integer levels $k > 1$.

Now we proceed to construct a nontrivial example for the infinite Hopf family of algebras containing our algebra $A_{\mathfrak{h}, n}(\mathfrak{g})$ as a member.

Let $\eta^{(0)} = \eta$. For all $n \in \mathbb{Z}$, let us define $\eta^{(n)}$ recursively such that

$$\frac{1}{\eta^{(n+1)}} = \frac{1}{\eta^{(n)}} + \hbar c_n,$$

where $c_n$ are a set of parameters and $c_0 \equiv c$, the center of our algebra $A_{\mathfrak{h}, n}(\mathfrak{g})$. Clearly, for $n = 0$, we have $\eta^{(1)} = \eta'$. The notations $A_{\mathfrak{h}, n^{(n)}(\mathfrak{g})c_n}$ have obvious meaning with the specification $A_{\mathfrak{h}, n^{(n)}(\mathfrak{g})c_n} = A_{\mathfrak{h}, n^{(n)}}(\mathfrak{g})$.

**Proposition 1** The family of algebras $\{A_n = A_{\mathfrak{h}, n^{(n)}(\mathfrak{g})c_n}, n \in \mathbb{Z}\}$ form an infinite Hopf family of algebras with the comultiplications $\Delta_n^\pm$, counits $\epsilon_n$ and antipodes $S_n^\pm$ defined as follows,

- the comultiplications $\Delta_n^\pm$:

  $$\Delta_n^+c_n = c_n + c_{n+1},$$

  $$\Delta_n^-c_n = c_{n-1} + c_n,$$

  $$\Delta_n^+H^+_i(u; \eta^{(n)}) = H^+_i(u + \frac{i\hbar c_{n+1}}{4}; \eta^{(n)}) \otimes H^+_i(u - \frac{i\hbar c_n}{4}; \eta^{(n+1)}),$$

  $$\Delta_n^-H^+_i(u; \eta^{(n)}) = H^+_i(u + \frac{i\hbar c_n}{4}; \eta^{(n-1)}) \otimes H^+_i(u - \frac{i\hbar c_{n+1}}{4}; \eta^{(n)}),$$

  $$\Delta_n^+H^-_i(u; \eta^{(n)}) = H^-_i(u - \frac{i\hbar c_n}{4}; \eta^{(n-1)}) \otimes H^-_i(u + \frac{i\hbar c_{n+1}}{4}; \eta^{(n+1)}),$$

  $$\Delta_n^-H^-_i(u; \eta^{(n)}) = H^-_i(u - \frac{i\hbar c_n}{4}; \eta^{(n+1)}) \otimes H^-_i(u + \frac{i\hbar c_{n+1}}{4}; \eta^{(n)}),$$

  $$\Delta_n^+E_i(u; \eta^{(n)}) = E_i(u; \eta^{(n)}) \otimes 1 + H^-_i(u + \frac{i\hbar c_n}{4}; \eta^{(n)}) \otimes E_i(u + \frac{i\hbar c_n}{4}; \eta^{(n+1)}),$$

  $$\Delta_n^-E_i(u; \eta^{(n)}) = E_i(u; \eta^{(n-1)}) \otimes 1 + H^-_i(u + \frac{i\hbar c_{n+1}}{4}; \eta^{(n-1)}) \otimes E_i(u + \frac{i\hbar c_n}{4}; \eta^{(n)}),$$

  $$\Delta_n^+F_i(u; \eta^{(n)}) = 1 \otimes F_i(u; \eta^{(n+1)}) + F_i(u + \frac{i\hbar c_{n+1}}{4}; \eta^{(n+1)}) \otimes H^+_i(u + \frac{i\hbar c_{n+1}}{4}; \eta^{(n+1)}),$$

  $$\Delta_n^-F_i(u; \eta^{(n)}) = 1 \otimes F_i(u; \eta^{(n)}) + F_i(u + \frac{i\hbar c_n}{4}; \eta^{(n-1)}) \otimes H^+_i(u + \frac{i\hbar c_n}{4}; \eta^{(n)});$$

- the counits $\epsilon_n$:

  $$\epsilon_n(c_n) = 0,$$

  $$\epsilon_n(1_n) = 1,$$

  $$\epsilon_n(H^+_i(u; \eta^{(n)})) = 1,$$

  $$\epsilon_n(E_i(u; \eta^{(n)})) = 0,$$

  $$\epsilon_n(F_i(u; \eta^{(n)})) = 0;$$
the antipodes $S_n^\pm$:

$$S_n^\pm(c_n) = -c_n^{\pm1},$$
$$S_n^\pm(H^\pm_i(u;\eta^{(n)})) = [H^\pm_i(u;\eta^{(n\pm1)})]^{-1},$$
$$S_n^\pm(E_i(u;\eta^{(n)})) = -H^+_i(u - \frac{i\hbar c_{n+1}^{\pm1}}{4};\eta^{(n\pm1)})^{-1}E_i(u - \frac{i\hbar c_{n+1}^{\pm1}}{2};\eta^{(n\pm1)}),$$
$$S_n^\pm(F_i(u;\eta^{(n)})) = -F_i(u - \frac{i\hbar c_{n+1}^{\pm1}}{2};\eta^{(n\pm1)})H^+_i(u - \frac{i\hbar c_{n+1}^{\pm1}}{4};\eta^{(n\pm1)})^{-1}.$$

where the second arguments in the current operators (the $\eta$'s) indicate to which algebra the currents belong.

The proof for this proposition is straightforward. Notice that in this example the comultiplications $\Delta_n^\pm$ are not all independent. A simple observation would show that

$$\Delta_n A_n = \Delta_{n-1}^+ A_{n-1}.$$

Two more remarks are in due course.

**Remark 3** In the case of $c_n = 0$ for all $n \in \mathbb{Z}$, the infinite Hopf family of algebras become trivial again because there are no differences between the algebras $A_{h,\eta^{(n)}}(\bar{g})_0$ and $A_{h,\eta^{(m)}}(\bar{g})_0$ for any pair of $n, m \in \mathbb{Z}$.

**Remark 4** Under the cases of remarks 2 and 3, the above structures for the infinite Hopf family of algebras reduce to the original Hopf algebra structure. In particular, under the case of remark 2, the comultiplications would have the same form with the so-called Drinfeld comultiplication for the Yangian double.

The comultiplications introduced above are useful not only in clarifying the structure of the infinite Hopf family of algebras but also in the representation theory of the representative algebra $A_{h,\eta}(\bar{g})$. Before going into detailed structure of representations, we state the following proposition, which can be directly verified.

**Proposition 2** The comultiplication $\Delta_n^\pm$ defined in eqs. (14, 23) induce algebra homomorphism from $A_{h,\eta^{(n)}}(\bar{g})_{c_n} \otimes A_{h,\eta^{(n+1)}}(\bar{g})_{c_{n+1}}$ to $A_{h,\eta^{(n)}}(\bar{g})_{c_n+c_{n+1}}$, $\Delta_n^\pm$ induce homomorphism from $A_{h,\eta^{(n-1)}}(\bar{g})_{c_{n-1}} \otimes A_{h,\eta^{(n)}}(\bar{g})_{c_n}$ to $A_{h,\eta^{(n-1)}}(\bar{g})_{c_{n-1}+c_n}$.

Actually, the above proposition states that the images of the generating currents $E_i(u;\eta^{(n)})$, $F_i(u;\eta^{(n)})$ and $H^\pm_i(u;\eta^{(n)})$ of $A_{h,\eta^{(n)}}(\bar{g})_{c_n}$ under $\Delta_n^\pm$ satisfy the defining relations for $A_{h,\eta^{(n)}}(\bar{g})_{c_n+c_{n+1}}$ and $A_{h,\eta^{(n-1)}}(\bar{g})_{c_{n-1}+c_n}$ respectively. This result is quite astonishing at on hand, and will be quite useful for constructing a higher level realization out of level 1 representations on the other. Therefore we proceed to consider the level 1 representation of our algebra.
3 Representation theory

3.1 Free boson realization of $\mathcal{A}_{\hbar,\eta}(\hat{g})$ at level $c = 1$

First we would like to consider the free boson realization of the generating relations (1-10) for the algebra $\mathcal{A}_{\hbar,\eta}(\hat{g})$. For this we introduce the set of deformed free bosons $a_i(\lambda)$ with continuous parameter $\lambda \neq 0$ and discrete $i = 1, ..., r$, which constitute the following deformed Heisenberg algebra $\mathcal{H}(\eta)$:

$$[a_i(\lambda), a_j(\mu)] = \alpha_{ij}(\lambda) \delta(\lambda + \mu).$$  \hspace{1cm} (29)

We also use the notations $a'_i(\lambda) = a_i(\lambda) \frac{\text{sh}\frac{\lambda}{2\eta} \text{sh}(\hbar B_{ij} \lambda)}{\text{sh} \frac{\lambda}{2\eta}}$, which satisfy the relations

$$[a'_i(\lambda), a'_j(\mu)] = \alpha_{ij}(\lambda) \delta(\lambda + \mu).$$

The normal ordering for the exponential expressions of the above free bosons are defined in the following way [24],

$$\exp \int_{-\infty}^{\infty} d\lambda g_1(\lambda)a_i(\lambda) \cdot \exp \int_{-\infty}^{\infty} d\mu g_2(\mu)a_j(\mu) : = \exp \left( \int_{C} \frac{d\lambda \ln(-\lambda)}{2\pi i} \alpha_{ij}(\lambda)g_1(\lambda)g_2(-\lambda) \right) : \exp \left( \int_{-\infty}^{\infty} d\lambda g_1(\lambda)a_i(\lambda) + \int_{-\infty}^{\infty} d\mu g_2(\mu)a_j(\mu) \right) :,$$

where $\alpha_{ij}(\lambda)$ is a function given by

$$[a_i(\lambda), a_j(\mu)] = \alpha_{ij}(\lambda) \delta(\lambda + \mu),$$ \hspace{1cm} (31)

$C$ is a contour on the complex $\lambda$-plane depicted in Figure 1. Moreover, we introduce the following zero mode operators,

$$[P_i, Q_j] = B_{ij}.$$ 

Proposition 3 The following bosonic expressions realize the generating relations (1-10) of the algebra $\mathcal{A}_{\hbar,\eta}(\hat{g})$ with $c = 1$, 

$$9$$
\[ E_j(u) = e^\gamma \exp(2\pi iQ_j) \exp(P_j) : \exp\left(\frac{1}{2}\phi'_j(u)\right) :, \quad (32) \]
\[ F_j(u) = e^\gamma \exp(-2\pi iQ_j) \exp(-P_j) : \exp\left(-\frac{1}{2}\phi_j(u)\right) :, \quad (33) \]
\[ H_j^\pm(u) = e^{-2\gamma} : E_i(u \pm i\hbar/4) F_j(u \mp i\hbar/4) : \quad (34) \]
\[ = : \exp \left( \mp \int_{-\infty}^{\infty} d\lambda \frac{e^{i\lambda u} e^{\mp \hbar \lambda/4}}{1 - e^{\pm \lambda/\eta} a_j(\lambda)} \right) :, \quad (35) \]

where

\[ \phi_j(u) = \int_{-\infty}^{+\infty} d\lambda \frac{e^{i\lambda u} a_j(\lambda)}{\text{sh} \frac{\lambda}{2}}, \quad (36) \]
\[ \phi'_j(u) = \int_{-\infty}^{+\infty} d\lambda e^{i\lambda u} \frac{a'_j(\lambda)}{\text{sh} \frac{\lambda}{2}}. \quad (37) \]

The proof of this proposition is also by straightforward but tedious calculations. The normal ordering rule (30) and the following formula which can be found in ref. [24] are very useful for the calculations,

\[ \int_C \frac{d\lambda \ln(-\lambda)}{\eta \pi^2} \frac{e^{-x\lambda}}{1 - e^{-\lambda/\eta}} = \ln \Gamma(\eta x) + (\eta x - \frac{1}{2})(\gamma - \ln \eta) - \frac{1}{2} \ln(2\pi), \]

where \( \Gamma(x) \) is the usual Gamma function which satisfy the following formula,

\[ \Gamma(x)\Gamma(1 - x) = \frac{\pi}{\sin \pi x}. \]

![Figure 1: The integration contour C](image)

It is interesting to mention that the bosonization formulas for the currents \( E_i(u) \) and \( F_i(u) \) are quite similar to that of the screening currents of the quantum \( (\hbar, \xi) \)-deformed \( W \)-algebras [17].
3.2 Representations at other integer levels

The bosonic expressions (32-37) only give a bosonic realization of $\mathcal{A}_{\hbar,\eta}(\hat{g})$ at level $c = 1$. However, as mentioned in the last section, it is possible to obtain realizations of $\mathcal{A}_{\hbar,\eta}(\hat{g})$ at other integer levels using the knowledge gathered so far. The key point is to make use of Proposition 2 repeatedly, first in the case of $c = c_0 = c_1 = 1$ (which lead to a realization at level $c = 2$), then in the case of $c = c_0 = 2, c_1 = 1$, and so on.

We give the following proposition

**Proposition 4** The level $c = k$ ($k \in \mathbb{Z}^+$) bosonic realization for the algebra $\mathcal{A}_{\hbar,\eta}(\hat{g})$ can be obtained using $k$ copies of the Heisenberg algebra $\{\mathcal{H}((\eta)^{(l)}), l = 0, 1, \ldots, k-1\}$ (each of which realizes the level 1 representation for the algebras $\mathcal{A}_{\hbar,\eta(l)}(\hat{g})$ with $l = 0, 1, \ldots, k-1$) and the repeated use of Proposition 2 (the comultiplication $\Delta^+_0$).

Actually, the above proposition provides a way to understand the meaning of the infinite Hopf family of algebras—instead of getting higher level representations of any distinguished member of this family, one can study the level 1 representations for several members simultaneously.

To obtain bosonic realizations of negative integer level, one may use the antipodes $S_{\pm n}$. However, such realizations are of less interests to us.

3.3 The structure of Fock spaces

The bosonic realizations of the algebra $\mathcal{A}_{\hbar,\eta}(\hat{g})$ can be viewed as representations on the Fock space of the bosonic Heisenberg algebras. Therefore, for completeness, we have to pay some words on the structure of Fock spaces.

First we specify the Fock space for the level 1 representation. Consider the abbreviated form (31) of the bosonic Heisenberg algebra $\mathcal{H}(\eta)$. The structure functions $\alpha_{ij}(\lambda)$ have the properties

$$\alpha_{ij}(\lambda) = -\alpha_{ij}(-\lambda),$$
$$\alpha_{ij}(\lambda) = \alpha_{ji}(\lambda).$$

(38)

Let $|\text{vac}\rangle$ be a right “vacuum state”. The right Fock space $\mathcal{F}(\eta)$ is generated from $|\text{vac}\rangle$ as follows,

$$\int_{-\infty}^{0} d\lambda_n \ f_n(\lambda_n) a_{i_n}(\lambda_n) ... \int_{-\infty}^{0} d\lambda_1 \ f_1(\lambda_1) a_{i_1}(\lambda_1) \ |\text{vac}\rangle, \ i_i = 1, 2, ..., r, \ l = 1, 2, ..., n,$$

where $f_l(\lambda)$ are functions which are analytic in a neighborhood of $\mathbb{R}_+$ except $\lambda = 0$, where a simple pole may appear. For each concrete $\alpha_{ij}(\lambda)$, proper asymptotic behaviors for $f_l(\lambda)$ as $\lambda \rightarrow +\infty$
are required. However, we do not specify them in detail (for the special case of \( g = \mathfrak{sl}_2 \), such asymptotics were given explicitly in ref.\[24\]).

Similarly, let \( \langle \text{vac} | \) be a left “vacuum state”. The left Fock space \( \mathcal{F}^*(\eta) \) is generated from as follows,

\[
\langle \text{vac} | \int_0^{+\infty} d\lambda_1 \, g_1(\lambda_1) a_{i_1}(\lambda_1) \ldots \int_0^{+\infty} d\lambda_n \, g_n(\lambda_n) a_{i_n}(\lambda_n), \ i_i = 1, \ 2, \ \ldots, \ r, \ l = 1, \ 2, \ \ldots, \ n,
\]

where \( g_l(\lambda) \) are functions which are analytic in a neighborhood of \( \mathbb{R}^- \) except \( \lambda = 0 \), where a simple pole may appear. As in the case of \( f_l(\lambda) \), proper asymptotic behaviors for \( g_l(\lambda) \) as \( \lambda \to -\infty \) are also required.

Like in the case of \( g = \mathfrak{sl}_2 \), the pairing \( (\ , \ ) : \mathcal{F}^*(\eta) \times \mathcal{F}(\eta) \to \mathbb{C} \) between the left and right Fock spaces can be uniquely defined by the following prescriptions,

- \((\langle \text{vac} |, |\text{vac}\rangle) = 1,
- \((\langle \text{vac} | \int_0^{+\infty} d\lambda \, g(\lambda) a_i(\lambda), \int_{-\infty}^0 d\mu \, f(\mu) a_j(\mu) |\text{vac}\rangle) = \int_C \frac{d\lambda \ln(-\lambda)}{2\pi i} g(\lambda) f(-\lambda) \alpha_{ij}(\lambda),
- \) the Wick theorem.

Now let the vacuum states \( |\text{vac}\rangle \) and \( \langle \text{vac} | \) be such that

\[
\begin{align*}
    a_i(\lambda) \ |\text{vac}\rangle &= 0, \ \lambda > 0, \ P_l \ |\text{vac}\rangle = 0, \\
    \langle \text{vac} | a_i(\lambda) &= 0, \ \lambda < 0, \ \langle \text{vac} | Q_i = 0.
\end{align*}
\]

Let \( f(\lambda) \) be analytic in some neighborhood of the real \( \lambda \)-line, satisfying proper analytic behaviors as \( \lambda \to \pm\infty \), and may have simple poles at \( \lambda = 0 \). Then the action of the expressions like

\[
F = : \exp \left( \int_{-\infty}^{+\infty} d\lambda \ f(\lambda) a_i(\lambda) \right) :
\]
on \( \mathcal{F}(\eta) \) and \( \mathcal{F}^*(\eta) \) are given respectively by the decompositions \( F = F_- F_+ \) and \( F = \tilde{F}_- \tilde{F}_+ \), where

\[
\begin{align*}
    F_- &= \exp \left( \int_{-\infty}^0 d\lambda \ f(\lambda) a_i(\lambda) \right), \\
    F_+ &= \lim_{\epsilon \to 0^+} e^{\text{Im} f(\epsilon) a_i(\epsilon)} \exp \left( \int_{\epsilon}^{+\infty} d\lambda \ f(\lambda) a_i(\lambda) \right), \\
    \tilde{F}_- &= \lim_{\epsilon \to 0^+} e^{\text{Im} f(-\epsilon) a_i(-\epsilon)} \exp \left( \int_{-\infty}^{-\epsilon} d\lambda \ f(\lambda) a_i(\lambda) \right), \\
    \tilde{F}_+ &= \exp \left( \int_0^{+\infty} d\lambda \ f(\lambda) a_i(\lambda) \right).
\end{align*}
\]
Moreover, these two actions are adjoint to each other, and the product of normal ordered operators like \( F \) satisfy our normal ordering rule \( (30) \). This complete the description of Fock spaces at level 1.

The Fock spaces for level \( k \) bosonic representation of \( A_{\hbar, \eta}(\hat{g}) \) is nothing but the direct product of \( k \) copies of the level 1 Fock spaces, namely, \( \mathcal{F}^{(k)}(\eta^{(0)}, \ldots, \eta^{(k-1)}) = \mathcal{F}(\eta^{(0)}) \otimes \ldots \otimes \mathcal{F}(\eta^{(k-1)}) \). The left Fock space for level \( k \) bosonic representation has a similar structure, \( \mathcal{F}^\ast(k)(\eta^{(0)}, \ldots, \eta^{(k-1)}) = \mathcal{F}^\ast(\eta^{(0)}) \otimes \ldots \otimes \mathcal{F}^\ast(\eta^{(k-1)}) \).

### 3.4 The case of \( c = 0 \): evaluation representation

As mentioned earlier, the structure of the algebra \( A_{\hbar, \eta}(\hat{g}) \) changes drastically from \( c \neq 0 \) to \( c = 0 \). This change is not only reflected in the different asymptotic behaviors for the generating currents, but also in the trivialization of the structure of the infinite Hopf family (see Remark 3), and it also affects the representation theory at \( c = 0 \).

Just like the usual affine Lie algebras and the affine Hopf algebras, among the class of level 0 representations for the algebra \( A_{\hbar, \eta}(\hat{g}) \), there is a special subclass which is finite dimensional. We adopt the terminology from the representation theory of affine and affine Hopf algebras and call the finite dimensional level 0 representations of \( A_{\hbar, \eta}(\hat{g}) \) the evaluation representations.

Recall that there is no differences between the algebras \( A_{\hbar, \eta}(\hat{g})_0 \) and \( A_{\hbar, \eta}(\hat{g})_0 \) for different \( n \) and \( m \). Recall also that the evaluation representations for the usual affine Hopf algebras are best written in terms of “half currents” rather than the total currents which we have been using for \( A_{\hbar, \eta}(\hat{g}) \) so far. Therefore it seem that the first step to give an evaluation representation for the algebra \( A_{\hbar, \eta}(\hat{g}) \) is to split the total currents \( E_i(u) \) and \( F_i(u) \) into half currents. This task can be fulfilled in a completely analogous way as in the \( sl_2 \) case.

We define (for generic \( c \)) the half currents \( e_i^\pm(u) \) and \( f_i^\pm(u) \) as follows,

\[
e_i^\pm(u) = \pi \eta \int_{C_1} dv \frac{E_i(v)}{2\pi i \sinh \eta (u - v \pm \ic/4)}
\]

\[
f_i^\pm(u) = \pi \eta' \int_{C_2} dv \frac{F_i(v)}{2\pi i \sinh \eta' (u - v \mp \ic/4)}
\]

where the contours \( C_1 \) and \( C_2 \) run from \(-\infty\) to \( \infty \), with the points \( u + \ic/4 - ik/\eta (k \geq 0) \) above \( C_1 \), \( u + \ic/4 + ik/\eta \) (\( k \geq 0 \)) below \( C_1 \), \( u + \ic/4 + ik/\eta' \) (\( k \geq 0 \)) above \( C_2 \), \( u - \ic/4 + ik/\eta' \) (\( k \geq 0 \)) below \( C_2 \).

The remarkable point for these half currents is that they satisfy the following Ding-Frenkel like relations,
\( e_i^+(u - \frac{i\hbar}{4}) - e_i^-(u + \frac{i\hbar}{4}) = E_i(u), \)
\( f_i^+(u + \frac{i\hbar}{4}) - f_i^-(u - \frac{i\hbar}{4}) = F_i(u), \)

however these relations should be understood in some proper analytic continuation sense in contrast to the direct decompositions of formal power series \([20, 22]\). To be explicit, we give the domains of analyticity for the half currents:

\( e_i^+(u), f_i^+(u), H_i^+(u) : \) analytic in \( \Pi_+ = \left\{ \frac{1}{\eta} - \frac{\hbar c}{4} < \text{Im} u < -\frac{\hbar c}{4} \right\} \)
\( e_i^-(u), f_i^-(u), H_i^-(u) : \) analytic in \( \Pi_- = \left\{ \frac{\hbar c}{4} < \text{Im} u < \frac{\hbar c}{4} + \frac{1}{\eta} \right\} \).

Moreover, we have

\( e_i^-(u) = -e_i^+(u - i/\eta''), \)
\( f_i^-(u) = -f_i^+(u - i/\eta'') \)

and

\( H_i^-(u) = H_i^+(u - i/\eta''), \)

where \( u \in \Pi_- \).

The following proposition gives a simplest evaluation representation for \( A_{h,\eta}(\hat{g}) \) with \( g = sl_{r+1} \).

**Proposition 5** Let \( V \) be an \((r+1)\)-dimensional vector space with orthogonal basis \( \{ v_0, v_1, ..., v_r \} \). The \((r+1)\)-dimensional evaluation representation of \( A_{h,\eta}(\hat{g}) \) with \( g = sl_{r+1} \) on \( V_z(\eta) = V \otimes \mathbb{C}[[e^{\pi \eta z}]] \) is given by the following actions \((u \in \Pi_+)\),

\[
\begin{align*}
e_i^+(u)v_{j,z} &= \delta_{ij} - \text{sh} \pi \eta \hbar \left( \frac{u - z - \frac{r-l}{2}i\hbar}{\text{sh} \pi \eta (u - z - \frac{r-l}{2}i\hbar)} \right) v_{j-1,z}, \\
f_i^+(u)v_{j-1,z} &= \delta_{ij} - \text{sh} \pi \eta \hbar \left( \frac{u - z - \frac{r-l}{2}i\hbar}{\text{sh} \pi \eta (u - z - \frac{r-l}{2}i\hbar)} \right) v_{j,z}, \\
H_i^+(u)v_{j,z} &= \delta_{ij} \theta(l) \left( \frac{u - z - \frac{r-l+2}{2}i\hbar}{\text{sh} \pi \eta (u - z - \frac{r-l+2}{2}i\hbar)} \right) v_{j,z} \\
&\quad + \delta_{i-1,j} \theta(2l) \left( \frac{u - z - \frac{r-l+2}{2}i\hbar}{\text{sh} \pi \eta (u - z - \frac{r-l+2}{2}i\hbar)} \right) v_{j,z} \\
&\quad + (1 - \delta_{ij} - \delta_{i-1,j})v_{j,z}.
\end{align*}
\]
The relations for the “negative” half currents are given by the same formulas but with \( u \in \Pi_- \).

Notice that for \( r = 1 \), the above evaluation representation reduces to the one presented in ref. [24] for \( A_{\hbar, \eta}(\widehat{sl}_2) \); for \( \eta \to 0 \), it reduces to the \((r + 1)\)-dimensional evaluation representation for \( DY_{\hbar}(sl_{r+1}) \) [20].

### 3.5 The intertwining relations and vertex operators

One of the important ingredients in the representation theory of affine algebras is the intertwining operators which intertwine the infinite-dimensional representation and its tensor product with evaluation representation. For the infinite Hopf family of algebras, we can define analogous objects, also called intertwining operators, however acting on the space of tensor product of the infinite dimensional representation of one member of the family and the evaluation representation of the subsequent member of the same family, or on the space of tensor product of the evaluation representation and some infinite dimensional representation of a fixed member of the family.

Taking as the infinite dimensional representation the level 1 bosonic representation, as the evaluation representation the \((r + 1)\)-dimensional representation obtained above for \( g = sl_{r+1} \), we now proceed to give the definition of a particular set of intertwining operators.

**Definition 3** The intertwining operators (vertex operators) (here \( \eta' = 1/(\hbar + \frac{1}{\eta}) \))

\[
\Phi(z) : \mathcal{F}(\eta) \to \mathcal{F}(\eta) \otimes V_z(\eta'), \\
\Phi^*(z) : \mathcal{F}(\eta) \otimes V_z(\eta') \to \mathcal{F}(\eta), \\
\Psi^*(z) : V_z \otimes \mathcal{F}(\eta) \to \mathcal{F}(\eta), \\
\Psi(z) : \mathcal{F}(\eta) \to V_z \otimes \mathcal{F}(\eta)
\]

are those commute with the action of \( A_{\hbar, \eta}(\widehat{g}) \)

\[
\Phi(z)x = \Delta(x)\Phi(z) \\
\Phi^*(z)\Delta(x) = x\Phi^*(z) \\
\Psi^*(z)\Delta(x) = x\Psi^*(z) \\
\Psi(z)x = \Delta(x)\Psi(z)
\]

where \( x \in A_{\hbar, \eta}(\widehat{g}) \).

The components of these vertex operators are defined as follows,

\footnote{In ref. [24], a twisted version of the vertex operators was defined so that the commutation relations of the twisted vertex operators yield the two-body S-matrix for Sine-Gordon model. In our case, we do not have such motivations to define twisted vertex operators. Moreover, remember that the comultiplications of ref. [24] is different from the one we are using.}

15
\[
\Phi(z)v = \sum_{j=0}^{r} \Phi_j(z)v \otimes v_j, \\
\Phi^*(z)(v \otimes v_j) = \Phi^*_j(z)v, \\
\Psi^*(z)(v_j \otimes v) = \Psi^*_j(z)v, \\
\Psi(z)v = \sum_{j=0}^{r} v_j \otimes \Psi_j(z)v,
\]

where \( v \in \mathcal{F}(\eta) \) and \( v_j \in V \).

Using the explicit form of the evaluation representation given in the last subsection and the comultiplication formulas (19-28), we are ready to obtain the following intertwining relations (the commutation relations between vertex operators and the generating currents for \( \mathcal{A}_{\hbar,\eta}(\hat{g}) \)),

- Relations for \( \Phi(z) \):

\[
\begin{align*}
\Phi_j(z)H^+_j(u) &= \frac{\sinh \eta' \left( u - z - \frac{r-j}{2} i \hbar - \frac{1}{4} i \hbar \right)}{\sinh \eta' \left( u - z - \frac{r-j}{2} i \hbar \right)} H^+_j(u) \Phi_j(z), \\
\Phi_{j-1}(z)H^+_j(u) &= \frac{\sinh \eta' \left( u - z - \frac{r+j+2}{2} i \hbar - \frac{3}{4} i \hbar \right)}{\sinh \eta' \left( u - z - \frac{r+j}{2} i \hbar - \frac{1}{4} i \hbar \right)} H^+_j(u) \Phi_{j-1}(z), \\
\Phi_l(z)H^+_j(u) &= H^+_j(u) \Phi_l(z), \text{ otherwise}
\end{align*}
\]

\[
\begin{align*}
\Phi_j(z)H^-_j(u) &= \frac{\sinh \eta' \left( u - z - \frac{r-j-2}{2} i \hbar - \frac{1}{4} i \hbar \right)}{\sinh \eta' \left( u - z - \frac{r-j}{2} i \hbar - \frac{1}{4} i \hbar \right)} H^-_j(u) \Phi_j(z), \\
\Phi_{j-1}(z)H^-_j(u) &= \frac{\sinh \eta' \left( u - z - \frac{r+j+2}{2} i \hbar - \frac{3}{4} i \hbar \right)}{\sinh \eta' \left( u - z - \frac{r+j}{2} i \hbar - \frac{1}{4} i \hbar \right)} H^-_j(u) \Phi_{j-1}(z), \\
\Phi_l(z)H^-_j(u) &= H^-_j(u) \Phi_l(z), \text{ otherwise}
\end{align*}
\]

\[
[\Phi_j(z), E_i(u)] = \frac{\sinh \eta \hbar}{\eta' \pi} \delta_{j,l-1} \delta(u - z - \frac{r-l}{2} i \hbar) H^-_j(u + \frac{i \hbar}{4}) \Phi_l(z),
\]

\[
\begin{align*}
\Phi_j(z)F_j(u) &= \frac{\sinh \eta' \left( u - z - \frac{r-j-2}{2} i \hbar - \frac{1}{4} i \hbar \right)}{\sinh \eta' \left( u - z - \frac{r-j}{2} i \hbar - \frac{1}{4} i \hbar \right)} F_j(u) \Phi_j(z) \\
+ \frac{\sinh \eta' \hbar}{\pi \eta'} \delta(u - z - \frac{r-l}{2} i \hbar - \frac{3}{2} i \hbar) \Phi_{j-1}(z), \\
\Phi_{j-1}(z)F_j(u) &= \frac{\sinh \eta' \left( u - z - \frac{r+j+2}{2} i \hbar - \frac{3}{4} i \hbar \right)}{\sinh \eta' \left( u - z - \frac{r+j}{2} i \hbar - \frac{1}{4} i \hbar \right)} F_j(u) \Phi_{j-1}(z), \\
\Phi_l(z)F_j(u) &= F_j(u) \Phi_l(z), \text{ otherwise}
\end{align*}
\]

- Relations for \( \Phi^*(z) \):
\[
\begin{align*}
    H_j^+ (u) \Phi_j^* (z) &= \frac{\text{sh} \pi \eta' (u - z - \frac{r-2j}{2} \text{i}h - \frac{3}{4} \text{i}h)}{\text{sh} \pi \eta' (u - z - \frac{r-j}{2} \text{i}h - \frac{1}{4} \text{i}h)} \Phi_j^* (z) H_j^+ (u), \\
    H_j^+ (u) \Phi_j^{-1} (z) &= \frac{\text{sh} \pi \eta' (u - z - \frac{r-2j}{2} \text{i}h - \frac{3}{4} \text{i}h)}{\text{sh} \pi \eta' (u - z - \frac{r-j}{2} \text{i}h - \frac{1}{4} \text{i}h)} \Phi_j^{-1} (z) H_j^+ (u), \\
    H_j^+ (u) \Phi_j^* (z) &= \Phi_j^* (z) H_j^+ (u), \text{ otherwise} \\
    H_j^- (u) \Phi_j^* (z) &= \frac{\text{sh} \pi \eta' (u - z - \frac{r-2j}{2} \text{i}h - \frac{1}{4} \text{i}h)}{\text{sh} \pi \eta' (u - z - \frac{r-j}{2} \text{i}h - \frac{1}{4} \text{i}h)} \Phi_j^* (z) H_j^- (u), \\
    H_j^- (u) \Phi_j^{-1} (z) &= \frac{\text{sh} \pi \eta' (u - z - \frac{r-2j}{2} \text{i}h - \frac{1}{4} \text{i}h)}{\text{sh} \pi \eta' (u - z - \frac{r-j}{2} \text{i}h - \frac{1}{4} \text{i}h)} \Phi_j^{-1} (z) H_j^- (u), \\
    H_j^- (u) \Phi_j^* (z) &= \Phi_j^* (z) H_j^- (u), \text{ otherwise} \\
\end{align*}
\]

\[
\begin{align*}
    [E_l (u), \Phi_j^* (z)] &= \frac{\text{sh} \pi \eta' \delta (u - z - \frac{r-l}{2} \text{i}h) \Phi_{j-1}^* (z) H_l^- (u + \frac{i}{4} \text{i}h),} \pi \eta' \\
    F_j (u) \Phi_j^* (z) &= \frac{\text{sh} \pi \eta' (u - z - \frac{r-2j}{2} \text{i}h - \frac{1}{4} \text{i}h)}{\text{sh} \pi \eta' (u - z - \frac{r-j}{2} \text{i}h - \frac{1}{4} \text{i}h)}, \Phi_j^* (z) F_j (u), \\
    F_j (u) \Phi_j^{-1} (z) &= \frac{\text{sh} \pi \eta' (u - z - \frac{r-2j}{2} \text{i}h - \frac{1}{4} \text{i}h)}{\text{sh} \pi \eta' (u - z - \frac{r-j}{2} \text{i}h - \frac{1}{4} \text{i}h)}, \Phi_j^{-1} (z) F_j (u), \\
    + \frac{\text{sh} \pi \eta' \delta (u - z - \frac{r-l}{2} \text{i}h - \frac{1}{4} \text{i}h) \Phi_j^* (z),} \pi \eta' \\
    F_j (u) \Phi_l^* (z) &= \Phi_l^* (z) F_j (u), \text{ otherwise};
\end{align*}
\]

- Relations for $\Psi^* (z)$:
• Relations for $\Psi(z)$:

\[
\begin{align*}
\Psi_j(z) H_j^+(u) &= \frac{\text{sh} \pi \eta(u - z - \frac{r-j-2}{2} i \hbar - \frac{1}{4} i \hbar)}{\text{sh} \pi \eta(u - z - \frac{r-j}{2} i \hbar - \frac{1}{4} i \hbar)} H_j^+(u) \Psi_j(z), \\
\Psi_j-1(z) H_j^+(u) &= \frac{\text{sh} \pi \eta(u - z - \frac{r-j+2}{2} i \hbar - \frac{1}{4} i \hbar)}{\text{sh} \pi \eta(u - z - \frac{r-j}{2} i \hbar - \frac{1}{4} i \hbar)} H_j^+(u) \Psi_{j-1}(z), \\
\Psi_1(z) H_j^+(u) &= H_j^+(u) \Psi_1(z), \text{ otherwise}
\end{align*}
\]

\[
\begin{align*}
\Psi_j(z) H_j^-(u) &= \frac{\text{sh} \pi \eta(u - z - \frac{r-j-2}{2} i \hbar - \frac{3}{4} i \hbar)}{\text{sh} \pi \eta(u - z - \frac{r-j}{2} i \hbar - \frac{3}{4} i \hbar)} H^-_j(u) \Psi_j(z), \\
\Psi_j-1(z) H_j^-(u) &= \frac{\text{sh} \pi \eta(u - z - \frac{r-j+2}{2} i \hbar - \frac{3}{4} i \hbar)}{\text{sh} \pi \eta(u - z - \frac{r-j}{2} i \hbar - \frac{3}{4} i \hbar)} H^-_j(u) \Psi_{j-1}(z), \\
\Psi_1(z) H_j^-(u) &= H_j^- (u) \Psi_1(z), \text{ otherwise}
\end{align*}
\]

\[
\begin{align*}
\Psi_j(z) E_j(u) &= \frac{\text{sh} \pi \eta(u - z - \frac{r-j-2}{2} i \hbar - \frac{i \hbar}{2})}{\text{sh} \pi \eta(u - z - \frac{r-j}{2} i \hbar - \frac{i \hbar}{2})} E_j(u) \Psi_j(z), \\
\Psi_j-1(z) E_j(u) &= \frac{\text{sh} \pi \eta(u - z - \frac{r-j+2}{2} i \hbar - \frac{i \hbar}{2})}{\text{sh} \pi \eta(u - z - \frac{r-j}{2} i \hbar - \frac{i \hbar}{2})} E_j(u) \Psi_{j-1}(z) \\
&\quad + \frac{\text{sh} \pi \eta}{\pi \eta} \delta(u - z - \frac{r-l}{2} i \hbar - \frac{i \hbar}{2}) \Psi_j(z), \\
\Psi_l(z) E_j(u) &= E_j(u) \Psi_l(z), \text{ otherwise}
\end{align*}
\]

\[
[\Psi_j(z), F_l(u)] = \frac{\text{sh} \pi \eta}{\pi \eta} \delta_{ij} \delta(u - z - \frac{r-l}{2} i \hbar) H_l^+(u + \frac{i \hbar}{4}) \Psi_{l-1}(z).
\]

Similar relations for $q$-affine algebras can be found in ref. [3].

**Remark 5** The intertwining relations are highly sensitive to the form of the comultiplication used in the definition of intertwining operators. The relations given above can be obtained only if we use the comultiplications defined in (14-23). For other form of the comultiplication such as the one used in [24] for $g = sl_2$, not all of the intertwining relations can be written explicitly.

Using the bosonic Heisenberg algebra $\mathcal{H}(\eta)$, one can in principle obtain bosonic realizations of these intertwining operators. Then the calculation for the commutation relations between these intertwining operators and the correlation functions of such operators will become possible. We leave such tasks to future studies.

### 4 Discussions

In closing this paper we give the conclusions and some discussions.

We defined the algebra $\mathcal{A}_{h, \eta}(\mathfrak{g})$ and its infinite Hopf family for all the simply-laced Lie algebras $g$. Using the deformed Heisenberg algebra $\mathcal{H}(\eta)$, we obtained the level 1 bosonic representation, and then by repeated use of the comultiplication we get the representations for all positive integer levels. For $g = sl_{r+1}$, we also gave the simplest $(r+1)$-dimensional evaluation representation and
the intertwining relations for the level 1 representation and the \((r + 1)\)-dimensional evaluation representation.

Clearly, many relevant problems are still left open and among which we mention several which we would like to solve in future works.

The first problem is: why not non-simply-laced Lie algebras \(g\)? Indeed, no reason can be stated \textit{a priori} that no analogous algebras exist for non-simply-laced Lie algebras \(g\). However, for self-consistence we intentionally excluded non-simply-laced \(g\) in our consideration. The reason is that, for such a \(g\), the Cartan matrix is \textit{not} symmetric, so that the Heisenberg algebra \(\mathcal{H}(\eta)\) is not well-defined (the condition (38) is violated). Probably the way around is to use the \textit{symmetrized} Cartan matrix instead of the Cartan matrix. Then we can give well-defined Heisenberg algebra \(\mathcal{H}(\eta)\), but the Serre-like relations (39) are still not enough to define the algebra \(A_{\hbar,\eta}(\hat{g})\), because there are cases for \(A_{ij} = -2, -3, \) etc.

The second problem is the other possible realizations of the algebra \(A_{\hbar,\eta}(\hat{g})\). For \(q\)-affine algebras, Yangian doubles and \(A_{\hbar,\eta}(\hat{sl}_2)\), three different realizations are known to exist, i.e. the current realization, Drinfeld generator realization and the Reshetkhn-Semenov-Tian-Shansky (RLL) realization. For our algebra, it seems important to find the third realization because this realization has direct connection with the Yang-Baxter relation and hence is more convenient while considering the possible application of the algebra in integrable quantum field theories.

As mentioned in the introduction, we postulate that our algebra might have important application in describing the quantum symmetries of affine Toda theory, however such applications can be made possible only if we have identified the \(R\)-matrix of our algebra with the quantum \(S\)-matrix of affine Toda theory. In this respect, the other form of the comultiplication which is compatible with RLL relations is also important because under such a comultiplication the commutation relations between the intertwining operators would become a set of Faddeev-Zamo\l o\-chikov like algebra which should be explained as the operator form of the quantum scattering of the corresponding integrable quantum field theory—the affine Toda theory as we postulate.

Various considerations on the different choices of domains for the deformation parameters \(\hbar\) and \(\eta\) are also important. On this point the authors of ref.\ref{[24]} have already listed many problems to whom we whole heartily agree. Besides the problems listed in there, we are also interested in the case of \(\hbar \to \infty\), which should correspond to the case of crystal base for \(q\)-affine algebras.

Last, we would like to mention the possible connections between our algebra and the quantum \((\hbar, \xi)\)-deformed Virasoro and \(W\)-algebras. The \(q\)- and \(\hbar\)-deformed Virasoro (and \(W\)) Poisson algebras were known to be closely connected to \(q\)-affine algebra and Yangian double at the critical level \ref{[4, 7]}. The quantum versions of these deformed algebras were also known to exist and nobody knows to which deformed affine algebras they correspond. The algebras given in this paper may be the right candidate to correspond to the quantum \((\hbar, \xi)\)-deformed Virasoro and \(W\)-algebras. We point out that algebras correspond to the \((q, \xi)\)-deformed quantum \(W\)-algebras also exist, which are generalizations of the elliptic algebra \(A_{q,p}(\hat{sl}_2)\) to other \(g\) with higher rank. We shall present
the bosonic representation for the current realization for such algebras (which we call $A_{q,p}(\hat{g})$, representative of yet another example of infinite Hopf family structure) in the next paper [19].
