Abstract

We consider two laminar incompressible flows coupled by the continuous law at a fixed interface $\Gamma_I$. We approach the system by one that satisfies a friction Navier law at $\Gamma_I$, and we show that when the friction coefficient goes to $\infty$, the solutions converge to a solution of the initial system. We then write a numerical Schwarz-like coupling algorithm and run 2D-simulations, that yields same convergence result.

MCS Classification: 76D07, 35J20, 65N30

Key-words: Stokes equations, coupled problems, variational formulation, numerical simulations.

1 Introduction

We consider the two coupled fluids problem with a rigid lid assumption, given by two 3D stokes equations,

\begin{align}
-\nu_i \Delta u_i + \nabla p_i &= f_i, \quad \nabla \cdot u_i = 0, \\
u_{1,h}|\Gamma_I = u_{2,h}|\Gamma_I, \quad w_i|\Gamma_I = u_i \cdot n_i|\Gamma_I = 0, \\
u_1|\Gamma_1 = u_2|\Gamma_2 = 0,
\end{align}

for $i = 1, 2$, where the velocities $(u_1, u_2) = (u_1(x_h, z_1), u_2(x_h, z_2))$ are decomposed as $u_i = (u_{i,h}, w)$, $u_{i,h} = (u_{i,x}, u_{i,y})$. Moreover, $x_h \in T_2$, where $T_2$ is the two dimensional torus, which means that we consider horizontal periodic boundary conditions. The interface $\Gamma_I$ is given by $\Gamma_I = \{(x_h, 0), x_h \in T_2\}$, the boundaries $\Gamma_i$ are given by $\Gamma_1 = \{(x_h, z_1^+), x_h \in T_2\}$, $\Gamma_2 = \{(x_h, z_2^-), x_h \in T_2\}$, $z_1 \in J_1 = [0, z_1^+]$, $z_2 \in J_2 = [z_2^-, 0]$, where $z_1^+ > 0$ and $z_2^- < 0$. The coefficient $\nu_i > 0$ is the viscosity of the fluid $i$, $p_i$ its pressure.

The main characteristic of this problem is the continuity boundary condition (1.2), which is natural and physical [2], and usually considered for free interfaces [6]. Notice that the rigid lid assumption we consider is reasonable for laminar coupled flows, as well as for large scales. In this paper we adress the question of the existence and uniqueness of a weak solution to Problem (1.1)-(1.2)-(1.3), given as the limit of ”frictional solutions”, for

*Corresponding author
which we can write a numerical Schwarz-like algorithm. More specifically, we approach this problem by the following problem

\begin{align}
(1.4) \quad -\nu_1 \Delta u_i + \nabla p_i &= f_i, \quad \nabla \cdot u_i = 0, \\
(1.5) \quad \nu_1 \frac{\partial u_{i,h}}{\partial n_i} |_{\Gamma_I} &= -\alpha (u_{i,h} - u_{j,h}), \quad w_i |_{\Gamma_I} = u_i \cdot n_i |_{\Gamma_I} = 0, \\
(1.6) \quad u_i |_{\Gamma_i} &= 0,
\end{align}

\[ i, j = 1, 2, \text{ in which the continuity condition (1.2) is replaced by the Navier law (1.5) where } i \neq j. \]

Similar problems have been already studied before, see [3, 4, 5, 8], and the existence and uniqueness of a weak solution is guaranteed. We aim to investigate how Problem (1.4)-(1.5)-(1.6) approaches Problem (1.1)-(1.2)-(1.3) when the friction coefficient \( \alpha \) goes to infinity. Such question has already been addressed in [1] for a single fluid, where it is proved that the corresponding solution strongly converges to a solution to the corresponding Stokes (Navier-Stokes) equations with a no slip boundary condition when \( \alpha \to \infty \). We show in this paper the convergence in \( H^1 \) space type of the solution of (1.4)-(1.5)-(1.6) to a solution of (1.1)-(1.2)-(1.3) (see Theorem 2.1).

As we shall see, numerical simulations are easily carried out by (1.4)-(1.5)-(1.6) thanks to a Schwarz-like coupling algorithm, that does not work for (1.1)-(1.2)-(1.3). This method has already been successfully implemented for coupled problems, see for example [9].

The note is organized as follows. In the first part we set the functional framework and then we prove the convergence result, namely Theorem 2.1. In the second part, we describe our algorithm and show some numerical results in the 2D case. In particular we check the numerical convergence of the algorithm.

## 2 Convergence analysis

### 2.1 Energy balance

This section is devoted to the derivation of the main a priori estimate, which is standard. Let \((u_1, u_2)\) be any enough smooth solution to Problem (1.4)-(1.5)-(1.6). Taking the scalar product of equation (1.4)_i by \(u_i\) in integrating over \(T_2 \times J_i\) over yields by (1.6)_i, because of the periodic boundary conditions in the \(x - y\) axes, the incompressibility condition and \(u_i \cdot n_i = 0\) at \(\Gamma_I\),

\[ \nu_i \int_{T_2 \times J_i} |\nabla u_i|^2 - \nu_i \int_{\Gamma_I} \frac{\partial u_{i,h}}{\partial n_i} = \int_{T_2 \times J_i} f_i \cdot u_i, \]

giving by (1.5), \(\nu_i \int_{T_2 \times J_i} |\nabla u_i|^2 + \alpha \int_{T_2 \times J_i} u_{i,h} \cdot (u_{i,h} - u_{j,h}) = \int_{T_2 \times J_i} f_i \cdot u_i. \) Summing up the two equalities yields the following energy balance,

\begin{equation}
(2.1) \quad \nu_1 \int_{T_2 \times J_1} |\nabla u_1|^2 + \nu_2 \int_{T_2 \times J_2} |\nabla u_2|^2 + \alpha \int_{T_2 \times J_i} |u_{1,h} - u_{2,h}|^2 = \int_{T_2 \times J_1} f_1 \cdot u_1 + \int_{T_2 \times J_2} f_2 \cdot u_2.
\end{equation}

### 2.2 Functions spaces, variational formulation

Let \(W_i = \{u \in C^\infty(T_2 \times J_i), \quad u |_{\Gamma_i} = 0, \quad u \cdot n_i |_{\Gamma_I} = 0, \quad \nabla \cdot u_i = 0\},\) equipped with \(\|u\|_{i,1} = \|\nabla u\|_{L^2(T_2 \times J_i)}\) which is indeed a norm due to the condition \(u_i |_{\Gamma_I} = 0.\) Let \(W_i\) denotes the completion of \(W_i\) with respect to this norm,

\begin{equation}
(2.2) \quad W = W_1 \times W_2, \quad W_0 = \{(u_1, u_2) \in W, \quad u_{1,h} |_{\Gamma_I} = u_{2,h} |_{\Gamma_I}, \ a.e. \ in \ \Gamma_I\}.
\end{equation}
We equip $W$ with the scalar product, for any $U = (u_1, u_2), V = (v_1, v_2) \in W$,

\[(2.3) \quad \Lambda(U, V) = \nu_1 \int_{T_2 \times J_1} \nabla u_1 \cdot \nabla v_1 + \nu_2 \int_{T_2 \times J_2} \nabla u_2 \cdot \nabla v_2.\]

The space $W_0$ is the kernel of the form $L : (u_1, u_2) \mapsto u_1|_{\Gamma_I} - u_2|_{\Gamma_I}$, which is continuous by the trace theorem. Therefore $W_0$ is a closed hyperplane of $W$. Let $P$ denotes the orthogonal projection over $W_0$, and $\Phi = (\phi_1, \phi_2)$ a unit orthogonal vector to $W_0$, so that $W_0^\perp = \text{vect } \Phi$.

**Definition 2.1.** (weak solution) A couple $U = (u_1, u_2) \in W$ is a weak solution to Problem (1.4)-(1.5)-(1.6) when $\forall V = (v_1, v_2) \in W$,

\[(2.4) \quad \Lambda(U, V) + \alpha \int_{\Gamma_J} (u_{1, h} - u_{2, h}) \cdot (v_{1, h} - v_{2, h}) = \int_{T_2 \times J_1} f_1 \cdot v_1 + \int_{T_2 \times J_2} f_2 \cdot v_2 = (F, V).\]

Throughout the rest of the paper, we assume that $f_i \in L^2(T_2 \times J_i), i = 1, 2$. The existence and the uniqueness of a weak solution to Problem (1.4)-(1.5)-(1.6) that satisfies the energy balance (2.1) is straightforward by the Lax-Milgram Theorem for any given $\alpha > 0$. Notice that work remains to be done about the pressures, by a suitable adaptation of a De Rham like theorem in this framework, which is an open problem.

### 2.3 Convergence

Let $U_\alpha = (u_{1, \alpha}, u_{2, \alpha}) \in W$ be the solution of (1.4)-(1.5)-(1.6). We study in this section the convergence of the family $(U_\alpha)_{\alpha > 0}$ when $\alpha \to \infty$, proving the following result.

**Theorem 2.1.** The family $(U_\alpha)_{\alpha > 0}$ strongly converges in $W$ to a weak solution $U = (u_1, u_2) \in W_0$ of Problem (1.1)-(1.2)-(1.3) when $\alpha \to \infty$, in the sense:

\[(2.5) \quad \forall V = (v_1, v_2) \in W_0, \quad \Lambda(U, V) = (F, V).\]

Moreover, the solution of (2.5) is unique.

**Proof.** Let $U^\alpha = (u_{1, \alpha}, u_{2, \alpha}) \in W = W_1 \times W_2$ be the solution of $(S_1, S_2)$. We first show that the family $(U^\alpha)_{\alpha > 0}$ is bounded in $W$. We have, by (2.1),

\[(2.6) \quad \|U^\alpha\|^2_W + \alpha \int_{\Gamma_J} |u_{1, \alpha} - u_{2, \alpha}|^2 = \int_{T_2 \times J_1} f_1 \cdot u_{1, \alpha}^2 + \int_{T_2 \times J_2} f_2 \cdot u_{2, \alpha}^2,\]

which yields

\[(2.7) \quad \|U^\alpha\|^2_W \leq \int_{T_2 \times J_1} f_1 \cdot u_{1, \alpha}^2 + \int_{T_2 \times J_2} f_2 \cdot u_{2, \alpha}^2.\]

We deduce from Poincaré and Cauchy-Schwarz inequalities that $(U^\alpha)_{\alpha > 0}$ is indeed bounded in $W$. Therefore, we can extract a subsequence $(U^{\alpha_n})_{n \in \mathbb{N}} (\alpha_n \to \infty$ as $n \to \infty$ which converges weakly in $W$ to some $U \in W$. Moreover, by the trace theorem and usual Sobolev compactness results, the corresponding traces are strongly convergent in $L^2(\Gamma_J)$. As by (2.6) $\lim_{n \to \infty} \|u_{1, \alpha_n} - u_{2, \alpha_n}\| = 0$ in $L^2(\Gamma_J)$, then $U \in W_0$. Finally, take $V \in W_0$ in (2.4) as test, so that the boundary term vanishes. By passing to the limit in this case when $\alpha \to \infty$, we obtain that $U$ is a weak solution to (1.1)-(1.2)-(1.3). Uniqueness is straightforward, which in addition garanties that the entire family does converge to $U$. 

3
It remains to show the strong convergence. Let $\lambda_\alpha \in \mathbb{R}$, be such that $U^\alpha = P U^\alpha + \lambda_\alpha \Phi$ ($\Phi$ being given in section 2.2). We first show the strong convergence of $(P U^\alpha)_{\alpha>0}$ to $U$ by taking $P U^\alpha$ as a test in (2.4) which gives, by using the orthogonal decomposition of $U^\alpha$,

\begin{equation}
\Lambda(U^\alpha, PU^\alpha) = \|PU^\alpha\|_W^2 = (F, PU^\alpha),
\end{equation}

since the boundary term on $\Gamma_I$ equals to zero by orthogonality. Therefore $(PU^\alpha)_{\alpha>0}$ converges weakly to a limit $W$, strongly in $L^2((T_2 \times J_1) \times (T_2 \times J_2))$. Taking $V \in W_0$ in (2.4) as test, noting that in this case $\Lambda(U^\alpha, V) = \Lambda(PU^\alpha, V)$, and passing to the limit when $\alpha \to \infty$, we see that $W$ is solution of the problem (1.1)-(1.2)-(1.3), hence $W = U$ by uniqueness, and the entire sequence converges. Therefore, passing to the limit in (2.8) yields

$$\lim_{\alpha \to \infty} \|PU^\alpha\|_W^2 = (F, U) = \Lambda(U, U) = \|U\|_W^2,$$

which, together with the weak convergence, ensures the strong convergence as claimed. To conclude, it remains to prove that $\lim_{\alpha \to \infty} \lambda_\alpha = 0$. By the energy balance (2.6), we have

\begin{equation}
\limsup_{\alpha \to \infty} \|U^\alpha\|_W^2 + \limsup_{\alpha \to \infty} \int_{\Gamma_I} |u^\alpha_{1,h} - u^\alpha_{2,h}|^2 = (F, U).
\end{equation}

However, we have

$$\int_{\Gamma_I} |u^\alpha_{1,h} - u^\alpha_{2,h}|^2 = \lambda_\alpha^2 \int_{\Gamma_1} |\phi_{1,h} - \phi_{1,h}|^2.$$

Therefore, since $(\|U\|_W^2)_{\alpha>0}$ is bounded, by (2.9) we have $(\lambda_\alpha^2)_{\alpha>0}$ is bounded, which can happen only if $\lambda_\alpha \to 0$ as $\alpha \to \infty$, concluding the proof.  

3 Numerical simulations

3.1 Algorithm

We solve the problems (1.4)-(1.5)-(1.6) for large values of $\alpha$, with a coupling Schwarz like algorithm, using the software Freefem++, for solving 2D Stokes problems by the finite element method. Our algorithm is set as follows.

Step 1: We solve the problem on the upper part which gives a first value $u^0_{1,0}$.

\begin{align}
-\nu_1 \Delta u^0_{1,0} + \nabla P^0_1 &= f_1, \quad \nabla \cdot u^0_{1,0} = 0, \\
\frac{\partial u^0_{1,h}}{\partial n_1}|_{\Gamma_1} &= -\alpha u^0_{1,0}, \\
u_1 u^0_{1,h} |_{\Gamma_1} &= 0, \quad u^0_{1,h} \cdot n_1 = 0.
\end{align}

This velocity allows us to solve the problem on the lower part, and to calculate the velocities step by step, up and down.

Step 2: We calculate $u^{\alpha,n}_{2}$ and $u^{\alpha,n+1}_{1}$ by solving

\begin{align}
-\nu_2 \Delta u^{\alpha,n}_{2} + \nabla P^{(n)}_2 &= f_2, \quad \nabla \cdot u^{\alpha,n}_{2} = 0, \\
\frac{\partial u^{\alpha,n}_{2,h}}{\partial n_2}|_{\Gamma_2} &= -\alpha (u^{\alpha,n}_{2,h} - u^{\alpha,n}_{1,h}), \\
u_2 u^{\alpha,n}_{2,h} |_{\Gamma_2} &= 0, \quad u^{\alpha,n}_{2,h} \cdot n_2 = 0.
\end{align}
and

\begin{align}
    -\nu_1 \Delta u^{\alpha,n+1}_1 + \nabla P_1^{(n+1)} &= f_1, \quad \nabla \cdot u^{\alpha,n+1}_1 = 0, \\
    \nu_1 \frac{\partial u^{\alpha,n+1}_1}{\partial n_1}|_{\Gamma_I} &= -\alpha (u^{\alpha,n+1}_{1,h} - u^{\alpha,n+1}_{2,h}), \\
    u^{\alpha,n+1}_1|_{\Gamma_I} &= 0, \quad u^{\alpha,n+1}_1 \cdot n_1 = 0. 
\end{align}

(3.7) \quad (3.8) \quad (3.9)

Note that we are able to prove the stability of this algorithm, and numerical simulation confirm the convergence (see table below). Problem (1.1)-(1.2)-(1.3) cannot be solved in a similar way. Indeed, the interface conditions

\begin{equation}
    u^{(n)}_{2,h}|_{\Gamma_I} = u^{(n)}_{1,h}|_{\Gamma_I}, \quad u^{(n+1)}_{1,h}|_{\Gamma_I} = u^{(n)}_{2,h}|_{\Gamma_I}, \quad \quad (3.10)
\end{equation}

imply that the sequences \((u^{(n)}_{1,h})_n\) and \((u^{(n)}_{2,h})_n\) are constant on the interface \(\Gamma_I\) which doesn’t allow any iterations on the coupling algorithm.

### 3.2 Simulation results

We take \(z_1^+ = 50\), \(z_2^- = -5\), \(L = 100\), \(\nu_1 = \nu_2 = 1\) and the source \(F = \left(\begin{pmatrix} 1 \\ -1 \end{pmatrix}, \begin{pmatrix} 1 \\ -1 \end{pmatrix}\right)\) constant, for the simplicity.

![Figure 1: Domain and mesh](image)

![Figure 2: L2 norm of the errors and rate of convergence for n=100](image)
To check the numerical convergence of the method, we study the error term $\| U^{\alpha,n+1} - U^{\alpha,n} \|_{L^2}$. On the left, for a given $\alpha$, we have the first value of $n$ for which $\| U^{\alpha,n+1} - U^{\alpha,n} \|_{L^2} < 10^{-3}$. The method is always converging, and the convergence is almost instantaneous for large $\alpha (> 10^6)$.

![Figure 3: Velocities, $f_1 = (1, -1) = f_2$, $n = 9$, $\alpha = 10^9$](image)
