ABSTRACT

This paper proposes a novel camera vision based cursor control system, using hand gestures captured from a webcam through a color detection technique. The system will allow the user to navigate the computer cursor using their hand bearing color caps or tapes and left click and dragging will be performed using different hand gestures. And also it performs file transfer between two systems in a single same network. The proposed system uses nothing more than a low resolution webcam that acts as a sensor and it is able to track the users hand bearing color caps in two dimensions. The system will be implemented using python and OpenCV. The hand gesture is the most effortless and natural way of communication. The output of the camera will be displayed on the monitor. Shape and position information about the gesture will be gathered using detection of color. The file transferring scheme is implemented by using the python server programming.

Key Words: Virtual Mouse, Hand Gestures, Image capture, Processing, Masking

1. INTRODUCTION

The most efficient and expressive way of human communication is through hand gestures, which is a universally accepted language. It is pretty much expressive such that the dumb and deaf people could understand it. In this work, a real-time hand gesture system is proposed. Experimental setup of the system uses fixed position low-cost web camera high definition recording feature mounted on the top of the monitor of the computer or a fixed camera on a laptop, which captures a snapshot using Red Green Blue [RGB] color space from fixed distance. This work is divided into four stages such as image preprocessing, region extraction, feature extraction, feature matching. Recognition and the interpretation of sign language is one of the major issues for communication with dumb and deaf people.

In this project an effective hand gesture segmentation technique has been proposed based on the pre-processing, background subtraction and edge detection techniques [1]. Pre-processing is defined as the procedure of formulating data for another process. The main
Objective of the pre-processing process is to transform the data into a form that can be more effectively and effortlessly processed. In the proposed work, the pre-processing techniques are created on the basis of different types of combinations from the subsequent hand gesture image processing operations such as capturing image, removing noise, background subtraction, and edge detection and these image processing methods are discussed as follows. Initially, the hand gesture images are captured from the vision based camera. The hand gestures can be observed with the different kind of interfaces like “data gloves” that accurately records every abduction angles and digit’s and position sensors for wrists and optical orientation or electromagnetic, requiring the user to wear trackers or gloves. Habitually, the glove-based interfaces even need the user to be hitched to the computer, all minimizing time to user comfort and interface, conversely, vision-based interfaces offer unencumbered interaction with humans.

By this paper we are aiming in creating a cost free hand recognition software for laptops and PCs with a web-cam support. The project covers as a hand recognition tool which could be used to move the mouse pointer, perform simple operations like clicking and other hand gesture operations like moving file from computer to computer through delicate socket programming and performing simple but fascinating operations that could be covered with the hand recognition.

2. EXISTING SYSTEM

The existing system consists of the generic mouse and trackpad system of monitor controlling and the non-availability of a hand gesture system. The remote accessing of monitor screen using the hand gesture is unavailable. Even though it is largely trying to implement the scope is simply restricted in the field of virtual mouse. The existing virtual mouse control system consists of the simple operations using the hand recognition system, where we could perform the basic mouse operation like mouse pointer control, left click, right click, drag etc. The further use of the hand recognition is not been made use of. Even-though there are a number of systems which are used for hand recognition, the system they made used is the static hand recognition which is simply recognition of the shape made by hand and by defining an action for each shape made, which is limited to a number of defined actions and a large amount of confusion.

3. PROPOSED SYSTEM

Using the current system even-though there are a number of quick access methods available for the hand and mouse gesture for the laptops, using our project we could make use of the laptop or web-cam and by recognizing the hand gesture we could control mouse and perform basic operations like mouse pointer controlling, select and deselect using left click, and a quick access feature for file transfer between the systems connected via network LAN cable. The project is a “Zero Cost” hand recognition system for laptops, which uses simple algorithms to determine the hand, hand movements and by assigning an action for each movement. But we have mainly concentrated on the mouse pointing and clicking actions along with an action for the file transfer between connected systems by hand action and the movements. The system we are implementing which has been written in python code is much more responsive and is easily implemented since python is a simple language and is platform independent with a flexibility and is portable which is desirable in creating a program which is focused in such an aim for creating a Virtual Mouse and Hand Recognition system. The system is much more extendable by defining actions for the hand movement for doing a specific action. It could be further modified to any further extent by implementing such actions for the set of hand gestures, the scope is restricted by your imagination.
4. USE OF PROPOSED SYSTEM

This Virtual Mouse Hand Recognition application uses a simple color cap on the finger without the additional requirement of the hardware for the controlling of the cursor using simple gestures and hand control. This is done using vision based hand gesture recognition with inputs from a webcam.

5. METHODS

In the Methodology, the method used in each component of the system will be explained separately. They are following subsections:

5.1 Camera Settings

The runtime operations are managed by the webcam of the connected laptop or desktop. To capture a video, we need to create a Video Capture object. Its argument can be either the device index or the name of a video file. Device index is just the number to specify which camera. Since we only use a single camera we pass it as ‘0’. We can add additional cameras to the system and pass it as 1, 2 and so on. After that, you can capture it frame-by-frame. But at the end, don’t forget to release the capture. We could also apply color detection techniques to any image by doing simple modifications in the code.

5.2 Capturing frames

The infinite loop is used so that the web camera captures the frames in every instance and is open during the entire course of the program. We capture the live feed stream, frame by frame. Then we process each captured frame which is in RGB(default) color space to HSV color space. There are more than 150 color-space conversion methods available in OpenCV. But we will look into only two which are the most widely used ones, BGR to Gray and BGR to HSV.

5.3 Masking technique

The mask is basically creating some specific region of the image following certain rules. Here we are creating a mask that comprises an object in red color. After that we perform a bitwise AND operation on the Input image and the Threshold image, which result in only the red colored objects being highlighted. This result of the AND operation is stored in res. We then display the frame, res and mask on 3 separate windows using imshow() function.
5.4 Display the frame
The imshow() is a function of HighGui and it is required to call the waitKey regularly. The processing of the event loop of the imshow() function is done by calling waitKey. The function waitKey() waits for key event for a “delay” (here, 5 milliseconds). Windows events like redraw, resizing, input event etc. are processed by HighGui. So we call the waitKey function, even with a 1ms delay.

5.5 Mouse Movement
We have to first calculate the center of both detected red objects which we can easily do by taking the average of the bounding boxes maximum and minimum points. Now we got 2 co-ordinate from the center of the 2 objects. We will find the average of that and we will get the red point shown in the image. We are converting the detected coordinate from camera resolution to the actual screen resolution. After that we set the location as the mouse_position. but to move the mouse pointer it will take time. So we have to wait till the mouse pointer reaches that point. So we started a loop and we are not doing anything there, we are just waiting for the current mouse location to be the same as the assigned mouse location. That is for the open gesture.

5.6 Clicking
The next step is to implement the close gesture. The operation is performed by clicking the object and dragging it. It is similar to the open gesture, but the difference is we only have one object here so we only need to calculate the center of it. And that will be placed on the location where we will position our mouse pointer. Instead of a mouse release operation we will be performing a mouse press operation.

5.7 Drag
In order to implement the dragging we introduce a variable ‘pinch flag’. It will be set to 1 if it was clicked earlier. So after clicking whenever we find the open gesture we check if the pinch flag is set to 1. If it is set to one then Drag operation is performed otherwise the mouse move operation is performed.

5.8 DnD Frame
First we create the MyFileDropTarget class. Inside that we have one overridden method, OnDropFiles. This method accepts the x/y position of the mouse along with the file paths that are dropped.

5.9 File Transfer
Using the file path obtained from MyFileDropTarget class we send the file to the other system using the python socket module. And there it receives and creates the file.

6. RESULT AND EVALUATION
In this paper, we tried to focus on help patients who don’t have control of their limbs and also improvise the interaction between the machine and humans. Our motive was to create this technology in the cheapest possible way and also to create it under a standardized operating system.

The proposed system controls the functions of mouse pointer by detecting red, and perform the mouse functions such as left click, dragging, cursor movement, and the file transfer between two systems in a same network. This method detect the red colour objects for the mouse control. The user uses the red colour obects on their finger tip for the better performance. When the number of contours are two, then it perform the simple mouse movement action. Otherwise, when the number of contour is one then it perform the left click. This system also supports the simple file transfer between two or more systems in the same network connection. The left side of the computer’s screen act as a communication channel between the systems. i.e, the file which is to be copy should drag and drop on the left side of the computer’s screen. Then the dropped file will be copied to the destination or the receiver system.

This system is mainly aimed to reduce
the use of hardware components attached with the computer. Although the application can be run in an ordinary computer having a web camera. But ideally it requires having at least 2MP frontal camera with at least Pentium processor and at least 256 MB RAM. We can see these all operations on the following images:

![Fig 2: Moving the mouse pointer](image1)

![Fig 3: Performing mouse click](image2)

7. CONCLUSION

Gesture recognition gives the best interaction between human and machine. Gesture recognition is also important for developing alternative human computer interaction modalities. It enables humans to interface with machines in a more natural way. Gesture recognition can be used for many applications like sign language recognition for deaf and dumb people, robot control etc.

This technology has wide applications in the fields of augmented reality, computer graphics, computer gaming, prosthetics, and biomedical instrumentation. Digital Canvas is an extension of our system which is gaining popularity among artists, by which the artist could create 2D or 3D images using the Virtual Mouse technology using the hand as brush and a Virtual Reality kit or a monitor as a display set. This technology can be used to help patients who don’t have control of their limbs. In case of computer graphics and gaming this technology has been applied in modern gaming consoles to create interactive games where a person’s motions are tracked and interpreted as commands.

The major extension to this work can be done to make system able to work at much complex background and compatible with different light conditions. It can be made as an effective user interface and which can include all mouse functionalities. And also, it would be ideal to research into advanced mathematical materials for image processing and investigate on different hardware solutions that would result in more accurate hand detections. Not only did this project show the different gesture operations that could be done by the users but it also demonstrated the potential in simplifying user interactions with personal computers and hardware systems.

8. ACKNOWLEDGEMENT

It gives us nice pleasure in presenting this project report titled “Virtual mouse using hand gesture” and we have a tendency to want to precisce our huge feeling to the those who provided valuable information and support within the completion of this project. Their guidance and motivation has helped in creating this project a nice success. Thus, we specific deep sense of feeling and
satisfaction. We are indebted to our inspiring Project Guide, Prof. Shital raut, who has extended all valuable steerage, help and constant encouragement through numerous tough stages for the development of the project. Last but not the least we'd prefer to convey all direct and indirect identities of the college with whom we have a tendency to took the strides for this successful project.
