The Korean peninsula is located between China and Japan. After the Second World War, the Republic of Korea was established in the southern half of the Korean peninsula. South Korea has a total area of 98,480 km² and a population of 48,598,175 (July 2004 estimate). The per capita gross domestic product (GDP), in terms of purchasing power parity, is US$17,700 (2003 estimate) (Central Intelligence Agency, 2004). The illiteracy rate (among those aged over 15 years) is 1.9% (0.7% for males and 3% for females) (2003 estimate). Life expectancy at birth is 75.6 years (72.0 years for males and 79.5 years for females) and the infant mortality rate is 7.2 per 1000 births (2004 estimate). The unemployment rate is 3.4% (2003 estimate). The proportion of the population aged 65 and over is currently 8.7% (2004 estimate) (Korea National Statistics Office, 2003). Over 40% of the total Korean population (i.e. some 20 million) lives in Seoul and its vicinity. South Korea is highly urbanised and modernised. Besides central government, local government is based on seven metropolitan cities and nine provinces.

Mental health services

There is one hospital bed for every 148 citizens and one psychiatric bed for every 1446. There is one physician for 830 citizens and one psychiatrist for every 19,500 (2002 estimates).

The basic healthcare needs of the Korean population are covered by universal public health insurance, funded by premiums, not taxes. This is compulsory, and there is no private health insurance. None the less, the private sector accounts for approximately 90% of mental health services, as there are too few public facilities. However, the government is responsible for free nationwide healthcare funded by taxes for the poor and aged. Thanks to an active community mental health movement in the public and private sector of psychiatry, since 1995, 242 public health centres nationwide have registered to take care of people with mental illness, including elderly people with dementia or stroke. In 2002, there were 989 specialist mental health facilities in South Korea: 46 community mental health centres, 66 social rehabilitation facilities, 74 mental hospitals, 207 general hospitals with psychiatric out-patient departments, 541 psychiatric clinics and 55 nursing homes.

Table 1 shows the progress in the public mental health project run by the Korean government. Both community and institutional care programmes provide long-term care. Home help services and delivered meals, adult day care, short-stay and respite care and a visiting nursing programme are also available to people with mental illnesses, including elderly people with a mental disability. Table 1 shows that care capacity is being substantially increased. The proportion of the population in need of community care who could be catered for by the maximum community care capacity will increase from 4.7% in 2003 to 72.2% in 2011, and the equivalent

| Year | 2003 | 2005 | 2007 | 2009 | 2011 |
|------|------|------|------|------|------|
| Community care | | | | | |
| Number of home help centres | 120 | 470 | 1,020 | 1,770 | 2,769 |
| Number of day care centres | 166 | 416 | 866 | 1,516 | 2,561 |
| Number of short-term care centres | 32 | 131 | 356 | 681 | 1,079 |
| Total number of community care facilities | 318 | 1,017 | 2,242 | 3,967 | 6,409 |
| Maximum community care capacity, n | 15,200 | 52,700 | 114,700 | 200,700 | 319,930 |
| Number of patients who need community care | 320,974 | 353,080 | 387,528 | 416,319 | 442,925 |
| Community care capacity rate (%) | 4.7 | 14.9 | 29.6 | 48.2 | 72.2 |
| Institutional care | | | | | |
| Number of residential homes (capacity) | 161 (11,270) | 245 (17,150) | 325 (22,750) | 405 (28,350) | 488 (34,160) |
| Number of nursing homes (capacity) | 120 (8,400) | 192 (13,440) | 264 (18,480) | 355 (24,850) | 454 (31,780) |
| Number of dementia care hospitals (capacity) | 37 (3,852) | 51 (4,952) | 65 (6,052) | 79 (7,152) | 93 (8,252) |
| Total number of institutional care facilities | 318 | 488 | 654 | 839 | 1,035 |
| Maximum institutional care capacity | 23,522 | 35,542 | 47,282 | 60,352 | 74,192 |
| Number of patients who need institutional care | 77,836 | 84,838 | 92,347 | 98,624 | 104,423 |
| Institutional care capacity rate (%) | 30.2 | 41.9 | 51.2 | 61.2 | 71.0 |

would include some 3500–ment population of about 50 000 with mental illnesses. In general, each team has a catch-

A multidisciplinary community-oriented approach has been adopted and close working relationships have been maintained with various professionals caring for people with mental illnesses. In general, each team has a catchment population of about 50 000–200 000, which would include some 3500–14 000 people aged 65 and over. The staff usually comprise one consultant psychiatrist (generally part-time), one community psychiatric nurse, one social worker or psychologist and several volunteers. They draw on a variety of community resources in devising the most effective care pathway for people with mental illnesses and focus on enabling them to stay longer in their own homes. They have responsibility for registration, case management and education. Some of them run day care programmes for schizophrenia, alcohol dependence or dementia. The public sector has been more active in home-visiting outreach activities, while the private sector has been promoting day care rehabilitation. These movements in South Korea have been instrumental in developing infrastructure and providing mental health services.

**Psychiatric treatments**

The predominance of the private sector and the relatively generous reimbursement of public health insurance have made Korea a large and early market for novel drugs in psychiatry, although reimbursement for novel drugs has now become subject to much stricter regulation. Atypical antipsychotics and novel antidepressants are much more widely used in South Korea than are traditional antipsychotics and tricyclic antidepressants. Electroconvulsive therapy also has been frequently used; there is no special limitation on its use. Psychoanalysis, psychodynamic psychotherapy, cognitive–behavioural therapy, group therapy and even hypnosis are applied on in-patient wards and out-patient clinics in psychiatry.

**Training**

Basic undergraduate training in psychiatry forms part of the curriculum in medical school. Postgraduate training comprises a 4-year residency in psychiatry, in which both the theoretical and the clinical aspects of psychiatry are covered. This leads to the psychiatric board examination. Training programmes are accredited under the auspices of the Korean Neuropsychiatric Association, which is also the medical body that deals with all academic issues.

**Epidemiological issues**

There have been several community-based epidemiological studies on the prevalence of mental disorder in South Korea (Cho et al., 1998; Suh et al., 1999a; 2003; Suh & Shah, 2001). Epidemiological data on the prevalence of mental health problems help to determine the need for care. Dementia and depression are the most common mental disorders and the most severe public health problem, especially in the older population. Korean reports have been comparable to those of Western studies. Suh et al. (2003) interviewed 1037 people aged 65 and over, and found a prevalence of dementia of 6.6% (Alzheimer’s disease 4.2%, vascular dementia 2.4%). A nationwide survey examined the prevalence of depressive symptoms in the Korean population. The prevalence rates using a cut-off score of 16/17 on the CES-D (Center for the Epidemiologic Study of Depression) scale were 23.1% of male adults, 27.4% of female adults and 24.3% of the elderly population (Cho et al., 1998; Suh et al., 1999a). A community-based survey reported a prevalence of ‘the wish to die’ within last 2 weeks among elderly respondents of 14.6% (Suh et al., 1999b).

A total of 788 000 persons, equivalent to 21% of the South Korean elderly population, were in need of long-term care in 2001. Of these, at least 74 000 needed institutional care, while the remainder required community care. The number of patients with dementia and disturbed instrumental activities of daily living has been estimated at 186 000, and this group will require institutional care at some point (Sunwoo, 2001).

**Problems in mental healthcare in South Korea**

There are several problems in mental healthcare in South Korea. First, medical, psychiatric and social welfare services are separate, which means that integrated care is not available. This separation originated from an artificial distinction between ‘treatment’ and ‘care’. Second, subacute care facilities are too scanty: there are generally only acute care and chronic care facilities. Differentiation of function in facilities is necessary, for example ‘hostel’ for mild cases and ‘nursing home’ for severe cases. Third, public care facilities are too few (less than 10% of the overall mental healthcare provision). Most facilities are private and this leads to frequent conflict between consumers, government and suppliers. However, the Korean government has substantially increased its expenditure on healthcare and social welfare to meet the unmet need. It is also actively considering the adoption of a long-term care insurance system, similar to those that have been adopted in Germany and Japan.

**Conclusion**

The private sector provides approximately 90% of mental health services in South Korea. These services are in short supply for the population, despite the relatively high number of psychiatrists. Thanks to an active community mental health movement in the public and private sectors of psychiatry and the long-term care plan being implemented by the Ministry of Health and Welfare, better care provision is expected. Although services have
actively been trying to move away from institutionalisation to community-based care, the inadequate number of fully qualified community mental health professionals, prejudice towards mental illnesses among the general population and less active participation of board-certified psychiatrists make this move difficult. However, a large investment in infrastructure, the development of programmes for community care, upgraded training and active research will lead to a more modern, community-based, multidisciplinary approach to healthcare in South Korea.

Psychiatry and geriatric psychiatry in Romania

Nicoleta Tataru

Senior Consultant Psychiatrist, Oradea, Romania, email: nicoleta_tataru@hotmail.com; President of the Romanian Association of Geriatric Psychiatry, Member of the Honorary Board of the Romanian Association of Psychiatry, and Member of the Board of the International Psychogeriatric Association and of the Association of European Psychiatrists

Romania is now in a period of transition from communism to democracy. Geographically, Romania, like other Eastern European countries, is on the border between the Western world and the Middle East and Asia; until December 1989 it was behind the ‘Iron Curtain’.

It covers 237 500 km², divided into 42 districts. In 2002 it had a population estimated to be 21 795 000. The unemployment rate was 10.5%. Fourteen per cent of the general population were over the age of 65. The infant death rate was 17.3 per 1000 and life expectancy at birth was 67.6 years for males and 71.1 years for females. The gross domestic product per capita (GDP) expressed in purchasing power parity (PPP) is US$6041, and total health expenditure is 2.60% of GDP. The proportion of the national budget spent on the health system is 4%, and around 29% of the total health budget is for mental health. There are 189 physicians per 100 000 population.

Mental health services

Nationally, there are 908 psychiatrists (4.16 per 100 000 population), of whom 260 are child psychiatrists (1.19 per 100 000 population). They all work in the public health sector, although some also work in private ambulatory clinics. There are also psychologists and social workers in the mental healthcare system.

Most psychiatric services are provided by hospitals and out-patient clinics attached to the Ministry of Health. There are 38 psychiatric hospitals and many psychiatric departments in the general hospitals (a total of 17 079 beds) as well as day hospitals (1222 beds) to care for patients with both acute and chronic mental illnesses; in addition there are 166 beds for patients with drug dependency. There are also 65 mental health centres for adults and children with mental illness. There are no private psychiatric hospitals.

The special needs of people with mental illness have not always been recognised and respected by the generic health services. However, a mental health law was passed in Romania only in August 2002 (Monitorul oficial al Romaniei, XIV, 589). This was the first step towards reform of the mental health services and care system. In chapter 4 of the law, the forms of specific mental health services existing in Romania are listed, along with care standards for people with mental disorders. Only recently has Romania tried to add community mental healthcare services to the traditional system of active psychiatric hospital care. This started by radically reducing the number of beds, but unfortunately without ensuring adequate community care programmes and services.

Many long-stay psychiatric wards were transferred to the COUNTRY PROFILE
