Two general series identities involving modified Bessel functions and a class of arithmetical functions

Bruce C. Berndt, Atul Dixit, Rajat Gupta, and Alexandru Zaharescu

Abstract. We consider two sequences \(a(n)\) and \(b(n)\), \(1 \leq n < \infty\), generated by Dirichlet series
\[
\sum_{n=1}^{\infty} a(n) \lambda_n^s \quad \text{and} \quad \sum_{n=1}^{\infty} b(n) \mu_n^s,
\]
satisfying a familiar functional equation involving the gamma function \(\Gamma(s)\). Two general identities are established. The first involves the modified Bessel function \(K_{\mu}(z)\), and can be thought of as a ‘modular’ or ‘theta’ relation wherein modified Bessel functions, instead of exponential functions, appear. Appearing in the second identity are \(K_{\mu}(z)\), the Bessel functions of imaginary argument \(I_{\mu}(z)\), and ordinary hypergeometric functions \(2F_1(a, b; c; z)\). Although certain special cases appear in the literature, the general identities are new. The arithmetical functions appearing in the identities include Ramanujan’s arithmetical function \(\tau(n)\), the number of representations of \(n\) as a sum of \(k\) squares \(r_k(n)\), and primitive Dirichlet characters \(\chi(n)\).

1 Introduction

Our goal is to establish two general identities involving arithmetical functions whose generating functions are Dirichlet series satisfying Hecke’s functional equation. For example, two of these arithmetical functions are \(r_k(n)\), the number of representations of \(n\) as a sum of \(k\) squares, and Ramanujan’s arithmetical function \(\tau(n)\). Our general theorems involve the Bessel function of imaginary argument \(I_{\nu}(z)\) and the modified Bessel function \(K_{\nu}(z)\), defined, respectively, in (2.1) and (2.2).

One of the identities is a modular or theta relation in which, roughly, the exponential functions are replaced by modified Bessel functions. The other is a transformation formula in which ordinary hypergeometric functions appear on one side. Certain special cases, which we cite in the sequel, of each of the two primary identities have appeared in the literature. However, the general theorems and the majority of the examples are new.
We consider the class of arithmetical functions studied by Chandrasekharan and Narasimhan [9]. Let \( a(n) \) and \( b(n) \), \( 1 \leq n < \infty \), be two sequences of complex numbers, not identically 0. Set

\[
\phi(s) := \sum_{n=1}^{\infty} \frac{a(n)}{\lambda_n^s}, \quad \sigma > \sigma_a; \quad \psi(s) := \sum_{n=1}^{\infty} \frac{b(n)}{\mu_n^s}, \quad \sigma > \sigma_a^*,
\]

where, throughout our paper, \( \sigma = \operatorname{Re}(s), \{\lambda_n\} \) and \( \{\mu_n\} \) are two sequences of positive numbers, each tending to \( \infty \), and \( \sigma_a \) and \( \sigma_a^* \) are the (finite) abscissae of absolute convergence for \( \phi(s) \) and \( \psi(s) \), respectively. Assume that \( \phi(s) \) and \( \psi(s) \) have analytic continuations into the entire complex plane \( \mathbb{C} \) and are analytic on \( \mathbb{C} \) except for a finite set \( S \) of poles. Suppose that for some \( \delta > 0 \), \( \phi(s) \) and \( \psi(s) \) satisfy a functional equation of the form

\[
\chi(s) := (2\pi)^{-s} \Gamma(s) \phi(s) = (2\pi)^{s-\delta} \Gamma(\delta - s) \psi(\delta - s).
\]

Chandrasekharan and Narasimhan proved that the functional equation (1.2) is equivalent to Theorems 1.1 and 1.2 [9, p. 6, Lemmas 4 and 5], the first of which is due to Bochner [8]. Hence, the validity of any one of (1.2) and Theorems 1.1 and 1.2 implies the truth of the other two identities.

**Theorem 1.1** The functional equation (1.2) is equivalent to the ‘modular’ relation

\[
\sum_{n=1}^{\infty} a(n) e^{-\lambda_n x} = \left( \frac{2\pi}{x} \right) \delta \sum_{n=1}^{\infty} b(n) e^{-4\pi^2 \mu_n/x} + P(x), \quad \operatorname{Re}(x) > 0,
\]

where

\[
P(x) := \frac{1}{2\pi i} \int_{C} (2\pi)^x \chi(z) x^{-z} dz,
\]

where \( C \) is a curve or curves encircling all of \( S \).

Recall that the ordinary Bessel function \( J_\nu(z) \) is defined by [26, p. 40]

\[
J_\nu(z) := \sum_{n=0}^{\infty} \frac{(-1)^n \left( \frac{1}{2} z \right)^{\nu + 2n}}{n! \Gamma(\nu + n + 1)}, \quad z \in \mathbb{C}.
\]

**Theorem 1.2** Let \( x > 0 \) and \( \rho > 2\sigma_a^* - \delta - \frac{1}{2} \). Then the functional equation (1.1) is equivalent to the Riesz sum identity

\[
\frac{1}{\Gamma(\rho + 1)} \sum_{\lambda_n \leq x} \left( \frac{\psi(x)}{\lambda_n^\rho} \right) + \frac{1}{\Gamma(\rho + 1)} \sum_{\mu_n \leq x} \left( \frac{\phi(x)}{\mu_n^\rho} \right) = \left( \frac{1}{2\pi} \right) \delta \sum_{n=1}^{\infty} b(n) \left( \frac{x}{\mu_n} \right)^{(\delta + \rho)/2} J_{\delta + \rho}(4\pi \sqrt{\mu_n x}) + Q_\rho(x),
\]

where the prime \( t \) on the summation sign on the left side indicates that if \( \rho = 0 \) and \( x \in \{\lambda_n\} \), then only \( \frac{1}{2} a(x) \) is counted. Furthermore, \( Q_\rho(x) \) is defined by

\[
Q_\rho(x) := \frac{1}{2\pi i} \int_{C} \frac{\chi(z)(2\pi)^x x^{z+\rho}}{\Gamma(\rho + 1 + z)} dz,
\]

where \( C \) is a curve or curves encircling \( S \).
Chandrasekharan and Narasimhan [9, p. 14, Theorem III] show that the restriction $\rho > 2a_\sigma^* - \delta - \frac{1}{2}$ can be replaced by $\rho > 2a_\sigma^* - \delta - \frac{3}{2}$ under certain conditions. Because we later use analytic continuation, this extension is not important here.

Theorem 1.1 is not explicitly used in the sequel. However, Theorem 1.2 is the key to our primary theorems, Theorems 3.1 and 10.1.

Our examples include the following arithmetical functions: $r_k(n)$, the number of representations of $n$ as a sum of $k$ squares; $\sigma_k(n)$, the sum of the $k$th powers of the divisors of $n$; Ramanujan's arithmetical function $\tau(n)$; both odd and even primitive characters $\chi(n)$; and $F(n)$, the number of integral ideals of norm $n$ in an imaginary quadratic number field.

### 2 Facts about Bessel functions

The Bessel function of imaginary argument $I_\nu(z)$ is defined by [26, p. 77]

\[
I_\nu(z) := \sum_{n=0}^{\infty} \frac{\left(\frac{1}{2}z\right)^{\nu+2n}}{n!\Gamma(\nu + n + 1)}, \quad z \in \mathbb{C},
\]

whereas the modified Bessel function $K_\nu(z)$ is defined by [26, p. 78]

\[
K_\nu(z) := \frac{\pi}{2} I_{-\nu}(z) - I_\nu(z), \quad z \in \mathbb{C}, \nu \notin \mathbb{Z},
\]

\[
K_n(z) := \lim_{\nu \to n} K_\nu(z), \quad n \in \mathbb{Z}.
\]

As special cases [26, p. 80],

\[
I_{1/2}(z) = \sqrt{\frac{2}{\pi z}} \sinh z,
\]

\[
K_{1/2}(z) = \sqrt{\frac{\pi}{2z}} e^{-z}.
\]

For $\nu \in \mathbb{C}$ [26, p. 79],

\[
K_\nu(z) = K_{-\nu}(z).
\]

For $\text{Re}(\nu) > 0$ [6, p. 329],

\[
\lim_{z \to 0} z^\nu K_\nu(z) = 2^{\nu-1}\Gamma(\nu).
\]

The three foregoing Bessel functions satisfy the differentiation formulas [26, pp. 66 and 79]

\[
\frac{d}{dz} \left( z^\nu I_\nu(z) \right) = z^\nu I_{\nu-1}(z),
\]

\[
\frac{d}{dz} \left( z^\nu I_\nu(z) \right) = z^\nu I_{\nu-1}(z),
\]

\[
\frac{d}{dz} \left( z^\nu K_\nu(z) \right) = -z^\nu K_{\nu-1}(z).
\]
We shall need their asymptotic formulas as $z \to \infty$, namely [26, pp. 199, 202, and 203],

\[ I_\nu(z) = \sqrt{\frac{2}{\pi z}} \left( \cos(z - \frac{1}{2} \nu \pi - \frac{1}{4} \pi) + O \left( \frac{1}{z} \right) \right), \]

\[ I_{-\nu}(z) = \sqrt{\frac{1}{2\pi z}} e^{-z} \left( 1 + O \left( \frac{1}{z} \right) \right), \]

\[ K_\nu(z) = \sqrt{\frac{\pi}{z}} e^{-z} \left( 1 + O \left( \frac{1}{z} \right) \right). \]

**Lemma 2.1** [26, p. 417] \hspace{1em} Let $a > 0$, $\text{Re}(\mu) > -1$, and $\nu \in \mathbb{C}$. Then,

\[ \int_0^\infty K_\nu \left( \frac{a\sqrt{t^2 + z^2}}{(t^2 + z^2)^{\nu/2}} \right) t^{2\mu+1} dt = \frac{2^\nu \Gamma(\mu + 1)}{a^{\nu+1} \pi^{\nu-1}} K_{\nu-1}(az). \]

**Lemma 2.2** [26, p. 416] \hspace{1em} For $a, b > 0$, $\text{Re}(z) > 0$, $\text{Re}(\mu) > -1$, and $\nu \in \mathbb{C}$,

\[ \int_0^\infty I_\mu(bx) K_\nu \left( \frac{a\sqrt{z^2 + x^2}}{z^2 \sqrt{x^2 + c^2}} \right) x^{\nu+1} dx = \frac{b\mu}{a^\nu} \left( \frac{\sqrt{a^2 + b^2}}{z} \right)^{\nu-1} K_{\nu-1}(z\sqrt{a^2 + b^2}). \]

### 3 The first primary theorem

**Theorem 3.1** \hspace{1em} Let $\text{Re}(\nu) > -1$, $\text{Re}(c)$, $\text{Re}(r) > 0$, and $\rho > -1$. Then,

\[ \frac{1}{\Gamma(\rho + 1)} \sum_{n=1}^\infty a(n) \int_0^\infty \frac{\lambda_n}{\lambda_n \lambda_n} (x - \lambda_n)^\rho (c^2 + x)^{-\nu/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right) dx \]

\[ = \frac{1}{(2\pi)^{\rho+1} \rho^\nu e^{\delta - \frac{1}{2}}} \sum_{n=1}^\infty \frac{b(n)}{(r^2 + \mu_n)^{\delta + \rho - \nu + 1}} K_{\delta + \rho + 1 - \nu} \left( 4\pi c \sqrt{r^2 + \mu_n} \right) \]

\[ + \int_0^\infty Q_p(x) (c^2 + x)^{-\nu/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right) dx, \]

where it is assumed that the integral $Q_p(x)$, defined by (1.5), converges absolutely.

**Proof** \hspace{1em} Assume that $\rho > 2a^*_c - \delta - \frac{1}{2}$. Multiply both sides of (1.4) by

\[ (c^2 + x)^{-\nu/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right), \quad c, r > 0, \]

and integrate over $0 \leq x < \infty$. Let $F_1(\delta, \rho, \nu)$ denote the left-hand side, and let $F_2(\delta, \rho, \nu)$ and $F_3(\delta, \rho, \nu)$ denote, in order, the two terms on the right-hand side that we so obtain.

First,

\[ F_1(\delta, \rho, \nu) = \frac{1}{\Gamma(\rho + 1)} \int_0^\infty \sum_{\lambda_n \leq x} a(n) (x - \lambda_n)^\rho (c^2 + x)^{-\nu/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right) dx \]

\[ = \frac{1}{\Gamma(\rho + 1)} \sum_{n=1}^\infty a(n) \int_{\lambda_n}^\infty (x - \lambda_n)^\rho (c^2 + x)^{-\nu/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right) dx. \]
Second, after we invert the order of summation and integration by absolute convergence on the right-hand side, we are led to the integral

\[ I(\delta, \rho, v) := \int_0^\infty x^{(\delta + \rho)/2} (c^2 + x)^{-v/2} J_{\delta + \rho}(4\pi \sqrt{\mu_n} x) K_v \left( 4\pi r \sqrt{c^2 + x} \right) \, dx \]

(3.3) 

\[ = 2 \int_0^\infty u^{\delta + \rho + 1} J_{\delta + \rho}(4\pi u \sqrt{\mu_n}) K_v \left( 4\pi r \sqrt{c^2 + u^2} \right) \frac{u^v}{(c^2 + u^2)^{v/2}} \, du. \]

Apply Lemma 2.2 with

\[ \mu = \delta + \rho, \quad a = 4\pi r, \quad \text{and} \quad b = 4\pi \sqrt{\mu_n}. \]

Hence, from (3.3), for \( \delta + \rho > -1 \),

\[ I(\delta, \rho, v) = 2 \left( \frac{4\pi \sqrt{\mu_n}}{4\pi r} \right)^{\delta + \rho} \left( \frac{\sqrt{(4\pi r)^2 + (4\pi \sqrt{\mu_n})^2}}{c} \right)^{v - \delta - \rho - 1} \]

\[ \times K_{v - \delta - \rho - 1} \left( c \sqrt{(4\pi r)^2 + (4\pi \sqrt{\mu_n})^2} \right) \]

(3.4)

\[ = \frac{b^{(\delta + \rho)/2}}{2\pi r^\nu c^{-\delta - 1}} (r^2 + \mu_n)^{(v - \delta - \rho - 1)/2} K_{v - \delta - \rho - 1} \left( 4\pi c \sqrt{r^2 + \mu_n} \right). \]

In summary, with the use of (2.5) and (3.4), we have

\[ F_2(\delta, \rho, v) = \frac{1}{(2\pi)^{\rho + 1} r^\nu c^{\delta - \rho - 1}} \sum_{n=1}^{\infty} \frac{b(n)}{(r^2 + \mu_n)^{(\delta + \rho - 1)/2}} K_{v - \delta - \rho - 1} \left( 4\pi c \sqrt{r^2 + \mu_n} \right) \]

(3.5)

\[ = \frac{1}{(2\pi)^{\rho + 1} r^\nu c^{\delta - 1}} \sum_{n=1}^{\infty} \frac{b(n)}{(r^2 + \mu_n)^{(\delta + \rho - 1)/2}} K_{\delta + \rho + 1/v} \left( 4\pi c \sqrt{r^2 + \mu_n} \right). \]

Third,

\[ F_3(\delta, \rho, v) = \int_0^\infty Q_\nu(x)(c^2 + x)^{-v/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right) \, dx. \]

(3.6)

We now gather together (3.2), (3.5), and (3.6) to conclude (3.1), which we have proved for \( v, r, c > 0 \). However, in view of (2.12), we see that by analytic continuation, (3.1) holds for \( \text{Re}(v) > -1 \), and \( \text{Re}(c), \text{Re}(r) > 0 \). The conditions \( \rho > 2\sigma_a^* - \delta - \frac{1}{2} \) and \( \delta + \rho > -1 \) can be discarded by analytic continuation in \( \rho \).

4 The special case \( \rho = 0 \)

We consider Theorem 3.1 in the special case \( \rho = 0 \).

**Theorem 4.1** Let \( \text{Re}(v) > -1 \) and \( \text{Re}(c), \text{Re}(r) > 0 \). Assume that the integral below converges absolutely. Then,

\[ \frac{1}{2\pi r^\nu c^{\delta - 1}} \sum_{n=1}^{\infty} \frac{b(n)}{(r^2 + \mu_n)^{(\delta + \rho - 1)/2}} K_{\delta + \rho + 1/v} \left( 4\pi c \sqrt{r^2 + \mu_n} \right) \]

\[ + \int_0^\infty Q_0(x)(c^2 + x)^{-v/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right) \, dx. \]
Proof First, set 

\[ u = 4\pi r \sqrt{c^2 + x} \quad \Rightarrow \quad dx = \frac{u}{8\pi^2 r^2} \, du. \]

Hence, in turn, using (2.5) and (2.9), we find that

\[
\int_{\lambda_n}^{\infty} (c^2 + x)^{-v/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right) \, dx = \int_{4\pi r \sqrt{c^2 + \lambda_n}}^{\infty} \left( \frac{u}{4\pi r} \right)^{-v} \left( \frac{u}{8\pi^2 r^2} \right) K_v(u) \, du \\
= \frac{2}{(4\pi r)^{2-v}} \int_{4\pi r \sqrt{c^2 + \lambda_n}}^{\infty} u^{-v+1} K_v(u) \, du \\
= 2(4\pi r)^{v-2} \int_{4\pi r \sqrt{c^2 + \lambda_n}}^{\infty} u^{-v+1} K_{-v}(u) \, du \\
= -2(4\pi r)^{v-2} \int_{4\pi r \sqrt{c^2 + \lambda_n}}^{\infty} \frac{d}{du} \left( u^{-v+1} K_{-v+1}(u) \right) \, du \\
= 2(4\pi r)^{v-2} (4\pi r \sqrt{c^2 + \lambda_n})^{-v+1} K_{-v+1}(4\pi r \sqrt{c^2 + \lambda_n}) \\
= \frac{1}{2\pi r} (c^2 + \lambda_n)^{-(v-1)/2} K_{v-1}(4\pi r \sqrt{c^2 + \lambda_n}).
\]

Thus, the sum on the left-hand side of (3.1) reduces to

\[
\frac{1}{2\pi r} \sum_{n=1}^{\infty} \frac{a(n)}{(c^2 + \lambda_n)^{(v-1)/2}} K_{v-1}(4\pi r \sqrt{c^2 + \lambda_n}).
\]

The remaining part of the proof is immediate after setting \( \rho = 0 \) in Theorem 3.1. ■

Before giving examples in illustration of Theorem 4.1, we offer remarks on previous work. Theorem 3.1 is new. The first author’s paper [3, p. 342] contains the first statement and proof of Theorem 4.1 [3, pp. 342–344]. Our proof here is completely different from that in [3]. Theorem 4.1 was also established via the Voronoi summation formula in [4, p. 154]. The special case, \( \delta = 1 \), of Theorem 4.1 was first established by Oberhettinger and Soni [22, p. 24] in 1972.

To illuminate the equivalence of the functional equation (1.2), the modular relation (1.3), and the Riesz sum identity (1.4), Chandrasekharan and Narasimhan [9] examine the three identities with particular arithmetical functions. For more details about the functional equations associated with these arithmetical functions, and for calculations of \( Q_0(x) \), see their paper [9].

In the examples below, we refer to calculations made by Chandrasekharan and Narasimhan [9] to illustrate Theorem 1.2. In particular, we use a few of their determinations of \( Q_0(x) \).

5 Example: \( r_k(n) \)

Let \( r_k(n) \) denote the number of representations of the positive integer \( n \) as a sum of \( k \) squares, where \( k \geq 2 \). Then,

\[
\zeta_k(s) := \sum_{n=1}^{\infty} \frac{r_k(n)}{n^s}, \quad \sigma > k/2,
\]
satisfies the functional equation

\[ \pi^{-s} \Gamma(s) \zeta_k(s) = \pi^{s-k/2} \Gamma(k/2-s) \zeta_k(k/2-s). \]

Thus, in the notation of (1.2),

\[ \varphi(s) = \psi(s) = 2^s \zeta_k(s), \quad a(n) = b(n) = r_k(n), \quad \delta = \frac{k}{2}, \quad \text{and} \quad \lambda_n = \mu_n = \frac{n}{2}. \]

From the functional equation (5.1), \( \zeta_k(0) = -1 \), and furthermore \( \zeta_k(s) \) has a simple pole at \( s = k/2 \) with residue \( \pi^{k/2} / \Gamma(k/2) \). It readily follows from (1.5) that

\[ Q_{\rho}(x) = \frac{x^\rho}{\Gamma(\rho + 1)} + \frac{(2\pi x)^{k/2} x^\rho}{\Gamma(\rho + 1 + k/2)}. \]

Applying Theorem 3.1, we find that for \( \Re(v) > -1, \Re(c), \Re(r) > 0, \) and \( \rho > -1, \)

\[ \frac{1}{\Gamma(\rho + 1)} \sum_{n=1}^{\infty} r_k(n) \int_{n/2}^{\infty} (x - n/2)^{\rho} (c^2 + x)^{-v/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right) dx \]

\[ = \frac{1}{(2\pi)^{\rho+1} r^v c^{v-k/2-\rho-1}} \sum_{n=1}^{\infty} \frac{r_k(n)}{(r^2 + n/2)^{(k/2+\rho-v+1)/2}} K_{k/2+\rho+1-v} \left( 4\pi c \sqrt{r^2 + n/2} \right) \]

\[ + \int_0^\infty \left( -\frac{x^\rho}{\Gamma(\rho + 1)} + \frac{(2\pi x)^{k/2} x^\rho}{\Gamma(\rho + 1 + k/2)} \right) (c^2 + x)^{-v/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right) dx. \]

First, making the trivial change of variable \( x = t^2 \), and applying Lemma 2.1 with \( a = 4\pi r, \ z = c, \) and \( \mu = \rho, \) we find that

\[ \int_0^\infty \frac{x^\rho}{\Gamma(\rho + 1)} (c^2 + x)^{-v/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right) dx = -\frac{2^\rho+1}{(4\pi r)^{\rho+1} c^{v-\rho-1}} K_{v-\rho-1} \left( 4\pi r c \right). \]

Second, again making the trivial change of variable \( x = t^2 \), and applying Lemma 2.1 with \( a = 4\pi r, \ z = c, \) and \( \mu = \rho + \frac{1}{2} k, \) we find that

\[ \int_0^\infty \frac{x^{\rho+k/2}}{\Gamma(\rho + 1 + k/2)} (c^2 + x)^{-v/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right) dx \]

\[ = \frac{2^{\rho+k/2+1}}{(4\pi r)^{\rho+k/2+1} c^{v-\rho-k/2-1}} K_{v-\rho-k/2-1} \left( 4\pi r c \right). \]

Now, put (5.4) and (5.5) into (5.3) to deduce that

\[ \frac{1}{\Gamma(\rho + 1)} \sum_{n=1}^{\infty} r_k(n) \int_{n/2}^{\infty} (x - n/2)^{\rho} (c^2 + x)^{-v/2} K_v \left( 4\pi r \sqrt{c^2 + x} \right) dx \]

\[ = \frac{1}{(2\pi)^{\rho+1} r^v c^{v-k/2-\rho-1}} \sum_{n=1}^{\infty} \frac{r_k(n)}{(r^2 + n/2)^{(k/2+\rho-v+1)/2}} K_{k/2+\rho+1-v} \left( 4\pi c \sqrt{r^2 + n/2} \right) \]

\[ - \frac{2^\rho+1}{(4\pi r)^{\rho+1} c^{v-\rho-1}} K_{v-\rho-1} \left( 4\pi r c \right) + \frac{(2\pi)^{k/2} 2^{\rho+k/2+1}}{(4\pi r)^{\rho+k/2+1} c^{v-\rho-k/2-1}} K_{v-\rho-k/2-1} \left( 4\pi r c \right). \]
Next, appealing to Theorem 4.1 and (5.2) in the case \( \rho = 0 \), we deduce that

\[
\frac{1}{2\pi r} \sum_{n=1}^{\infty} \frac{r_k(n)}{(c^2 + n/2)^{(\nu-1)/2}} K_{\nu-1}(4\pi r \sqrt{c^2 + n/2}) = \frac{1}{2\pi r^\nu c^{\nu-k/2-1}} \sum_{n=1}^{\infty} \frac{r_k(n)}{(r^2 + n/2)^{(k/2-\nu+1)/2}} K_{k/2+1-\nu}(4\pi c \sqrt{r^2 + n/2}) + \int_0^\infty \left( -1 + \frac{(2\pi x)^{k/2}}{\Gamma(1 + k/2)} \right) (c^2 + x)^{-\nu/2} K_{\nu}(4\pi r \sqrt{c^2 + x}) \, dx.
\]

(5.6)

Now, use (5.4) and (5.5) in the case \( \rho = 0 \). If we define \( r_k(0) = 1 \) and use (2.6), we see that (5.4) in the case \( \rho = 0 \) can be written as the term for \( n = 0 \) in the series on the left-hand side of (5.6), whereas (5.5) in the case \( \rho = 0 \) can be considered as the term for \( n = 0 \) in the series on the right-hand side. Multiplying both sides of the resulting identity by \( 2\pi r \), and replacing \( \nu \) by \( \nu + 1 \), we conclude that

\[
\sum_{n=0}^{\infty} \frac{r_k(n)}{(c^2 + n/2)^{\nu/2}} K_\nu(4\pi r \sqrt{c^2 + n/2}) = \frac{1}{r^\nu c^{\nu-k/2}} \sum_{n=0}^{\infty} \frac{r_k(n)}{(r^2 + n/2)^{(k/2-\nu)/2}} K_{k/2+1-\nu}(4\pi c \sqrt{r^2 + n/2}).
\]

(5.7)

The identity (5.7) was also established by the first author, Lee, and Sohn [7, p. 39, equation (5.5)]. For \( k = 2 \), (5.7) was first proved by Dixon and Ferrar [12, p. 53, equation (4.13)] in 1934. A different proof for \( k = 2 \) was given by Oberhettinger and Soni [22, p. 24].

6 Example: \( \sigma_k(n) \)

Let \( \sigma_k(n) \) denote the sum of the \( k \)th powers of the divisors of \( n \), where it is assumed that \( k \) is an odd positive integer. The generating function for \( \sigma_k(n) \) is given by

\[
\zeta_k(s) := \zeta(s) \zeta(s-k) = \sum_{n=1}^{\infty} \frac{\sigma_k(n)}{n^s}, \quad \sigma > k + 1,
\]

and it satisfies the functional equation

\[
(2\pi)^{-s} \Gamma(s) \zeta_k(s) = (-1)^{(k+1)/2} (2\pi)^{-(k+1-s)} \Gamma(k+1-s) \zeta_k(k+1-s).
\]

(6.1)

In the notation of the Dirichlet series and functional equation in (1.1) and (1.2), respectively,

\[
a(n) = \sigma_k(n), \quad b(n) = (-1)^{(k+1)/2} \sigma_k(n), \quad \lambda_n = \mu_n = n, \quad \delta = k + 1.
\]

Now, \( Q_0(s) \) is the sum of the residues of

\[
R(z) := \frac{\Gamma(z) \zeta(z) \zeta(z-k) x^z}{\Gamma(z+1)}.
\]
In each instance below, we initially make the change of variable where

\[ \zeta(2n) = (-1)^{n-1} \frac{(2\pi)^{2n} B_{2n}}{2(2n)!}, \quad n \geq 1, \]

where \( n \) is a positive integer and \( B_n \) denotes the \( n \)th Bernoulli number, we readily find that

\[ Q_0(x) = \frac{B_{k+1}}{2(k+1)} - \frac{\delta_{1,k} x}{2} + \frac{(2\pi)^{k+1}(-1)^{(k-1)/2} B_{k+1} x^{k+1}}{2(k+1) \Gamma(k+2)}, \]

where

\[ \delta_{1,k} = \begin{cases} 1, & \text{if } k = 1, \\ 0, & \text{otherwise}. \end{cases} \]

Applying Theorem 4.1 and employing (6.2), we find that

\[
\frac{1}{2\pi r} \sum_{n=1}^{\infty} \frac{\sigma_k(n)}{(c^2 + n)^{(v-1)/2}} K_{v-1} \left( 4\pi r \sqrt{c^2 + n} \right) \\
= \frac{1}{2\pi r v c^{v-k-2}} \sum_{n=1}^{\infty} \frac{(-1)^{(k+1)/2} \sigma_k(n)}{(r^2 + n)^{(k+2-v)/2}} K_{k+2-v} \left( 4\pi c \sqrt{r^2 + n} \right) \\
+ \int_{0}^{\infty} \left( \frac{B_{k+1}}{2(k+1)} - \frac{\delta_{1,k} x}{2} + \frac{(2\pi)^{k+1}(-1)^{(k-1)/2} B_{k+1} x^{k+1}}{2(k+1) \Gamma(k+2)} \right) \\
\times (c^2 + x)^{-v/2} K_{v} \left( 4\pi r \sqrt{c^2 + x} \right) dx.
\]

Let \( I_1, I_2, \) and \( I_3 \) denote, respectively, the three integrals on the right side of (6.3). In each instance below, we initially make the change of variable \( x = t^2 \). First, by Lemma 2.1,

\[ I_1 = \frac{B_{k+1}}{2(k+1)} \int_{0}^{\infty} (c^2 + x)^{-v/2} K_{v} \left( 4\pi r \sqrt{c^2 + x} \right) dx = \frac{B_{k+1}}{k+1} \frac{1}{4\pi r c^{v-1}} K_{v-1}(4\pi r c). \]

Second, apply Lemma 2.1 with \( a = 4\pi r, z = c, \) and \( \mu = 1 \). Hence,

\[ I_2 = -\frac{\delta_{1,k}}{2} \int_{0}^{\infty} (c^2 + x)^{-v/2} K_{v} \left( 4\pi r \sqrt{c^2 + x} \right) x \ dx = -\frac{\delta_{1,k}}{4\pi r^2 c^{v-2}} K_{v-2}(4\pi r c). \]

Third, we apply Lemma 2.1 with \( a = 2\pi r, z = c, \) and \( \mu = k + 1 \). Therefore,

\[ I_3 = \frac{(2\pi)^{k+1}(-1)^{(k-1)/2} B_{k+1}}{2(k+1) \Gamma(k+2)} \int_{0}^{\infty} (c^2 + x)^{-v/2} K_{v} \left( 4\pi r \sqrt{c^2 + x} \right) x^{k+1} \ dx \\
= \frac{(-1)^{(k-1)/2} B_{k+1}}{4\pi(k+1) r^{k+2} c^{v-k-2}} K_{v-k-2}(4\pi r c). \]
In summary, putting (6.4)–(6.6) into (6.3), we deduce that

\[
\frac{1}{2\pi r} \sum_{n=0}^{\infty} \frac{\sigma_k(n)}{(c^2 + n)^{(v-1)/2}} K_{\nu-1} \left(4\pi r \sqrt{c^2 + n}\right)
\]

\[
= \frac{1}{2\pi r^v e^{v-2}} \sum_{n=0}^{\infty} \frac{(-1)^{(k+1)/2} \sigma_k(n)}{(r^2 + n)^{(k+2-v)/2}} K_{k+2-v} \left(4\pi c \sqrt{r^2 + n}\right)
\]

\[
+ \frac{B_{k+1}}{k+1} \frac{1}{4\pi r c^{v-1}} K_{\nu-1} \left(4\pi rc\right)
\]

(6.7) \quad \delta_{1,k} \frac{2}{(4\pi r)^2 e^{v-2}} K_{v-2} \left(4\pi rc\right) + \frac{(-1)^{(k-1)/2} B_{k+1}}{4\pi (k+1) r^{k+2} e^{v-k-2}} K_{v-k-2} \left(4\pi rc\right).

We now put (6.7) in a more palatable form. From (6.1),

\[
\zeta_k(0) = \zeta(0) \zeta(-k) = \frac{1}{2} \cdot -\frac{B_{k+1}}{k+1} = -\frac{B_{k+1}}{2(k+1)},
\]

by [13]. Define

(6.8) \quad \sigma_k(0) = -\zeta_k(0) = \frac{B_{k+1}}{2(k+1)}.

Thus, by (6.8), the first expression after the series on the right-hand side of (6.7) can be expressed as the term for \(n = 0\) in the series on the left-hand side. Similarly, the last expression on the right-hand side of (6.7) can be represented as the term for \(n = 0\) in the series on the right-hand side of (6.7). Thus, we can write (6.7) in the simplified form

\[
\frac{1}{2\pi r} \sum_{n=0}^{\infty} \frac{\sigma_k(n)}{(c^2 + n)^{(v-1)/2}} K_{\nu-1} \left(4\pi r \sqrt{c^2 + n}\right)
\]

\[
= \frac{1}{2\pi r^v e^{v-2}} \sum_{n=0}^{\infty} \frac{(-1)^{(k+1)/2} \sigma_k(n)}{(r^2 + n)^{(k+2-v)/2}} K_{k+2-v} \left(4\pi c \sqrt{r^2 + n}\right)
\]

\[
- \delta_{1,k} \frac{2}{(4\pi r)^2 e^{v-2}} K_{v-2} \left(4\pi rc\right).
\]

Multiplying both sides of (6.9) by \(2\pi r\), and replacing \(\nu\) by \(\nu + 1\), we deduce that

\[
\sum_{n=0}^{\infty} \frac{\sigma_k(n)}{(c^2 + n)^{v/2}} K_{\nu} \left(4\pi r \sqrt{c^2 + n}\right)
\]

\[
= - \frac{\delta_{1,k}}{4\pi r e^{v-1}} K_{\nu-1} \left(4\pi rc\right) + \frac{1}{r^v c^{v-1}} \sum_{n=0}^{\infty} \frac{(-1)^{(k+1)/2} \sigma_k(n)}{(r^2 + n)^{(k+1-v)/2}} K_{k+1-v} \left(4\pi c \sqrt{r^2 + n}\right).
\]

(6.10)

This identity appears to be new. If we let \(c \to 0\) in this identity, employ the limit evaluation [6, p. 329]

\[
\lim_{c \to 0} c^{-v/2} K_{\nu} \left(2\pi \sqrt{c^2}\right) = \frac{1}{2} \Gamma(-\nu) \pi^\nu \beta^{v/2},
\]

and replace \(\nu\) by \(-\nu - 1\), then we obtain the first equation on page 4794 of [5] for \(-1 < \text{Re}(\nu) < 1\). The restriction \(\text{Re}(\nu) < 1\) can then be removed by analytic continuation.
In a three-page fragment published with his lost notebook [24, p. 253], [2, p. 95], Ramanujan offered a kindred formula to (6.10). If \( \alpha \) and \( \beta \) are positive numbers such that \( \alpha \beta = \pi^2 \), and if \( s \) is any complex number, then

\[
\sqrt{\alpha} \sum_{n=1}^{\infty} \sigma_{-s}(n) n^{s/2} K_{s/2}(2n\alpha) + \sqrt{\beta} \sum_{n=1}^{\infty} \sigma_{-s}(n) n^{s/2} K_{s/2}(2n\beta)
\]

(6.11)

\[
= \frac{1}{4} \Gamma \left( \frac{s}{2} \right) \zeta(s) \left\{ \beta^{(1-s)/2} - \alpha^{(1-s)/2} \right\} + \frac{1}{4} \Gamma \left( -\frac{s}{2} \right) \zeta(-s) \left\{ \beta^{(1+s)/2} - \alpha^{(1+s)/2} \right\}.
\]

Note that (6.11) is not a special case of (6.10), and also note that (6.11) is valid for all complex \( s \), whereas \( k \) in (6.10) is a positive odd integer. The beautiful symmetry involving the modified Bessel functions is apparent in both (6.10) and (6.11). However, in (6.10), there is symmetry in the binomial powers, whereas in (6.11), the symmetry is in the powers of the summation index.

Unaware that (6.11) was first established by Ramanujan [24, p. 253], Guinand [17] gave the first proof in print in 1955. The identity (6.11) is now known as Guinand’s formula or the Ramanujan–Guinand formula. See also [7, pp. 25–27] for a proof.

Letting \( s = 0 \) in (6.11), we obtain a well-known formula of Koshliakov [7]. The identities (6.11) and (6.10) are reminiscent of the Fourier expansions of real analytic Eisenstein series, which are defined on the modular group \( SL_2(\mathbb{Z}) \). For \( \text{Re}(s) > 1 \) and \( z = x + iy \in \mathbb{H} \), define

\[
E(s, z) = \frac{1}{2} \sum_{\substack{-\infty < c, d < \infty \\
(c, d) = 1}} \frac{y^s}{|cz + d|^{2s}}.
\]

The Eisenstein series \( E(s, z) \) has a Fourier expansion that is given in terms of series involving modified Bessel function \( K_{\nu}(z) \), namely [21],

\[
E(s, z) = y^s + \frac{\psi(2s-1)}{\psi(2s)} y^{1-s} + \frac{4\sqrt{y}}{\psi(2s)} \sum_{m=1}^{\infty} m^{s-1/2} \sigma_{1-2s}(m) K_{s-1/2}(2\pi my) \cos(2\pi mx),
\]

where

\[
\psi(s) = \pi^{-s/2} \Gamma \left( \frac{s}{2} \right) \zeta(s).
\]

7 Example: \( \tau(n) \)

Recall that the Dirichlet series for Ramanujan’s arithmetical function \( \tau(n) \)

\[
f(s) := \sum_{n=1}^{\infty} \frac{\tau(n)}{n^s}, \quad \sigma > \frac{13}{2},
\]

satisfies the functional equation

\[
\chi(s) := (2\pi)^{-s} \Gamma(s) f(s) = (2\pi)^{-(12-s)} \Gamma(12-s) f(12-s).
\]
In the notation of (1.1) and (1.2), the function $\chi(s)$ is an entire function, and so $Q_0(x) \equiv 0$. Clearly,

$$\lambda_n = \mu_n = n, \quad \delta = 12.$$  

(7.3) 

First, apply Theorem 3.1. For $\Re(v) > -1$, $\Re(c)$, $\Re(r) > 0$, and $\rho > -1$, we have

$$\frac{1}{\Gamma(\rho + 1)} \sum_{n=1}^{\infty} \tau(n) \int_{n}^{\infty} (x-n)^{\rho}(c^2 + x)^{-v/2}K_v\left(4\pi r\sqrt{c^2 + x}\right) dx = \frac{1}{(2\pi)^{\rho + 1}\nu c^{\nu - 1 - \rho}} \sum_{n=1}^{\infty} \frac{\tau(n)}{(r^2 + n)^{(13 + \rho - v)/2}} K_{13 + \rho - v}\left(4\pi c\sqrt{r^2 + n}\right).$$

Second, applying Theorem 4.1 and replacing $\nu$ by $\nu + 1$, we deduce that, for $\Re(\nu)$, $\Re(c)$, $\Re(r) > 0$,

$$\sum_{n=1}^{\infty} \frac{\tau(n)}{(c^2 + n)^{v/2}} K_v\left(4\pi r\sqrt{c^2 + n}\right) = \frac{1}{r^{\nu} c^{\nu - 12}} \sum_{n=1}^{\infty} \frac{\tau(n)}{(r^2 + n)^{(12 - v)/2}} K_{12 - v}\left(4\pi c\sqrt{r^2 + n}\right).$$

(7.4) 

The identity (7.4) was first established by the first author, Lee, and Sohn [7, p. 40, equation (5.7)].

**8 Example: primitive characters $\chi(n)$**

Let $\chi$ denote a primitive character modulo $q$. Because the functional equations for the Dirichlet $L$-series

$$L(s, \chi) = \sum_{n=1}^{\infty} \frac{\chi(n)}{n^s}, \quad \sigma > 0,$$

are different for $\chi$ even and $\chi$ odd, we separate the two cases.

Suppose first that $\chi$ is odd. Then, the functional equation for $L(s, \chi)$ is given by [11, p. 71]

$$\chi(s) := \left(\frac{\pi}{q}\right)^{-s} \Gamma(s)L(2s - 1, \chi) = -\frac{i\pi\tau(\chi)}{\sqrt{q}} \left(\frac{\pi}{q}\right)^{-\left(\frac{3}{2} - s\right)} \Gamma\left(\frac{3}{2} - s\right) L(2 - 2s, \overline{\chi}),$$

where $\overline{\chi(n)}$ denotes the complex conjugate of $\chi(n)$, and $\tau(\chi)$ denotes the Gauss sum

$$\tau(\chi) := \sum_{n=1}^{q} \chi(n)e^{2\pi in/q}.$$

(8.2) 

Hence, in the notation of (1.1) and (1.2),

$$a(n) = n\chi(n), \quad b(n) = -\frac{i\pi\tau(\chi)}{\sqrt{q}} \overline{n\chi(n)}, \quad \lambda_n = \mu_n = \frac{n^2}{2q}, \quad \delta = \frac{3}{2}.$$

(8.3)
Furthermore, $\chi(s)$ is an entire function, and consequently $Q_0(x) \equiv 0$. Applying Theorem 4.1, multiplying both sides of the resulting identity by $2\pi r$, and replacing $\nu$ by $\nu + 1$, we conclude that

$$
\sum_{n=0}^{\infty} \frac{n\chi(n)}{(c^2 + n^2/(2q))^{\nu/2}} K_\nu(4\pi r \sqrt{c^2 + n^2/(2q)}) = -\frac{i\tau(\chi)}{r^\nu c^{\nu-3/2}/q} \sum_{n=0}^{\infty} \frac{n\overline{\chi}(n)}{(r^2 + n^2/(2q))^{(3/2-\nu)/2}} K_{3/2-\nu}(4\pi c \sqrt{r^2 + n^2/(2q)}),
$$

which we believe to be new.

Second, let $\chi$ be even. Then, the functional equation of $L(s, \chi)$ is given by [11, p. 69]

$$
\chi(s) := \left(\frac{\pi}{q}\right)^{-s} \Gamma(s)L(2s, \chi) = \frac{\tau(\chi)}{\sqrt{q}} \left(\frac{\pi}{q}\right)^{-\left(\frac{1}{2} - s\right)} \Gamma\left(\frac{1}{2} - s\right)L(1-2s, \overline{\chi}).
$$

Hence, by (1.1) and (1.2),

$$
a(n) = \chi(n), \quad b(n) = \frac{\tau(\chi)}{\sqrt{q}} \overline{\chi}(n), \quad \lambda_n = \mu_n = \frac{n^2}{2q}, \quad \delta = \frac{1}{2}.
$$

Furthermore, $\chi(s)$ is an entire function, and consequently $Q_0(x) \equiv 0$. Appealing to Theorem 4.1, multiplying both sides of the identity so obtained by $2\pi r$, and replacing $\nu$ by $\nu + 1$, we conclude that

$$
\sum_{n=0}^{\infty} \frac{\chi(n)}{(c^2 + n^2/(2q))^{\nu/2}} K_\nu(4\pi r \sqrt{c^2 + n^2/(2q)}) = -\frac{i\tau(\chi)}{r^\nu c^{\nu-1/2}/q} \sum_{n=0}^{\infty} \frac{\overline{\chi}(n)}{(r^2 + n^2/(2q))^{(1/2-\nu)/2}} K_{1/2-\nu}(4\pi c \sqrt{r^2 + n^2/(2q)}),
$$

which we also believe to be a new identity.

**9 Example: ideal functions $F(n)$ of imaginary quadratic number fields**

Let $F(n)$ denote the number of integral ideals of norm $n$ in an imaginary quadratic number field $K = \mathbb{Q}(\sqrt{-D})$, where $D$ is the discriminant of $K$. Then, the Dedekind zeta function

$$
\zeta_K(s) := \sum_{n=1}^{\infty} \frac{F(n)}{n^s}, \quad \sigma > 1,
$$

satisfies the functional equation [10, p. 211]

$$
\left(\frac{2\pi}{\sqrt{|D|}}\right)^{-s} \Gamma(s)\zeta_K(s) = \left(\frac{2\pi}{\sqrt{|D|}}\right)^{s-1} \Gamma(1-s)\zeta_K(1-s).
$$

We note from (1.1) and (1.2) that

$$
a(n) = b(n) = F(n), \quad \lambda_n = \mu_n = n/\sqrt{|D|}, \quad \delta = 1.
$$
The function $\zeta_K(s)$ has an analytic continuation into the entire complex plane where it is analytic except for a simple pole at $s = 1$. From [10, p. 212],

\begin{equation}
\lim_{s \to 1} (s - 1) \zeta_K(s) = \frac{2\pi h(K) R(K)}{w(K) \sqrt{D}},
\end{equation}

where $h(K)$, $R(K)$, and $w(K)$ denote, respectively, the class number of $K$, the regulator of $K$, and the number of roots of unity in $K$. Furthermore, from (9.1) and (9.2),

\begin{equation}
\zeta_K(0) = \lim_{s \to 0} \frac{\sqrt{D}}{2\pi} \cdot \frac{1}{s \Gamma(s)} \cdot s \zeta_K(1 - s) = \frac{\sqrt{D}}{2\pi} \cdot \frac{2\pi h(K) R(K)}{w(K) \sqrt{D}} = -\frac{h(K) R(K)}{w(K)}.
\end{equation}

For simplicity, set $d = \sqrt{D}$, $h = h(K)$, $R = R(K)$, and $w = w(K)$. From (9.3) and (9.2),

\begin{equation}
Q_0(x) = \frac{1}{2\pi i} \int c \frac{\Gamma(z)}{\Gamma(z + 1)} \frac{d^2 \zeta_K(z)}{dz^2} x^z \, dz = -\frac{hR}{w} + \frac{2\pi hRx}{w}.
\end{equation}

By Theorem 4.1 and (9.4),

\begin{equation}
\frac{1}{2\pi r} \sum_{n=1}^{\infty} \frac{F(n)}{(c^2 + n/d)^{(v-1)/2}} K_{v-1} \left(4\pi r \sqrt{c^2 + n/d}\right)
= \frac{1}{2\pi r^v c^{v-2}} \sum_{n=1}^{\infty} \frac{F(n)}{(r^2 + n/d)^{(2-v)/2}} K_{2-v} \left(4\pi c \sqrt{r^2 + n/d}\right)
\end{equation}

\begin{equation}
(9.5)
+ \int_0^{\infty} \left(-\frac{hR}{w} + \frac{2\pi hRx}{w}\right) \left(c^2 + x\right)^{-v/2} K_v \left(4\pi r \sqrt{c^2 + x}\right) \, dx.
\end{equation}

Separate the integral on the right-hand side of (9.5) into two integrals, denoted by $I_1$ and $I_2$, respectively. First, by Lemma 2.1, as we did in our calculation in (6.4),

\begin{equation}
I_1 = -\frac{hR}{w} \int_0^{\infty} \left(c^2 + x\right)^{-v/2} K_v \left(4\pi r \sqrt{c^2 + x}\right) \, dx = -\frac{hR}{w} \frac{1}{2\pi r^{v-1} K_{v-1}(4\pi r)}.
\end{equation}

Second, by Lemma 2.1 with the same calculation as in (6.5),

\begin{equation}
I_2 = \frac{2\pi hR}{w} \int_0^{\infty} x \left(c^2 + x\right)^{-v/2} K_v \left(4\pi r \sqrt{c^2 + x}\right) \, dx = \frac{hR}{2w \pi r^2 c^{v-2}} K_{v-2}(4\pi r).
\end{equation}

Suppose that we define (perhaps for the first time in the literature)

\begin{equation}
F(0) = \frac{hR}{w}.
\end{equation}
Then, substituting (9.6) and (9.7) into (9.5) and employing the definition (9.8) to identify (9.6) and (9.7) as the terms for $n = 0$ on the left- and right-hand sides below, we find that

\[
\frac{1}{2\pi i} \sum_{n=0}^{\infty} \frac{F(n)}{(c^2 + n/d)^{(v-1)/2}} K_{v-1} \left( 4\pi r \sqrt{c^2 + n/d} \right)
\]

(9.9)

\[
= \frac{1}{2\pi r^v c^{v-2}} \sum_{n=0}^{\infty} \frac{F(n)}{(r^2 + n/d)^{(2-v)/2}} K_{2-v} \left( 4\pi c \sqrt{r^2 + n/d} \right). 
\]

Lastly, multiplying both sides of (9.9) by $2\pi r$ and replacing $v$ by $v + 1$, we conclude with the identity

\[
\sum_{n=0}^{\infty} \frac{F(n)}{c^2 + n/d} v_2 K_v \left( 4\pi r \sqrt{c^2 + n/d} \right)
\]

(9.10)

\[
= \frac{1}{r^v c^{v-1}} \sum_{n=0}^{\infty} \frac{F(n)}{(r^2 + n/d)^{(1-v)/2}} K_{1-v} \left( 4\pi c \sqrt{r^2 + n/d} \right). 
\]

The identity (9.10) was first proved in 1934 by Koshliakov [19, p. 555, equation (15)], who used the Abel–Planas summation formula.

10 The second primary theorem

**Theorem 10.1** For $\Re(v) > -1$, $\rho > -1$, $\delta + \rho + \Re(v) + 1 > \delta^* > 0$, and $\Re(\sqrt{\alpha}) > \Re(\sqrt{\beta}) > 0$,

\[
\frac{1}{\Gamma(\rho + 1)} \sum_{n=1}^{\infty} a(n) \int_{\lambda_n}^{\infty} (t - \lambda_n)^{\rho} \frac{d}{dt} H(\alpha, \beta; t) dt
\]

\[
= -\frac{2}{(2\pi)^{\delta+2\rho}} \Gamma(v + 2) \sum_{n=1}^{\infty} b(n) \\sqrt{4\mu_n + \alpha} \sqrt{4\mu_n + \beta}^{v+1} \left( \frac{1}{\sqrt{4\mu_n + \alpha} + \sqrt{4\mu_n + \beta}} + \frac{1}{\sqrt{4\mu_n + \alpha} + \sqrt{4\mu_n + \beta}} \right)^{2\delta+2\rho-2} 
\]

\[
\times 2F1 \left( \begin{array}{cc} \nu - \delta - \rho + 2, 1 - \delta - \rho; \nu + 2; \frac{\sqrt{4\mu_n + \alpha} - \sqrt{4\mu_n + \beta}}{\sqrt{4\mu_n + \alpha} + \sqrt{4\mu_n + \beta}} \\
\end{array} \right)^2 
\]

(10.1)

\[
- \frac{Q_\rho(0)}{2(v + 1)} \left( \frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}} \right)^{v+1} - \int_0^{\infty} Q'_\rho(t) H(\alpha, \beta; t) dt, 
\]

where

(10.2) $H(\alpha, \beta; t) := I_{1+1} \left( \frac{\pi \sqrt{t} \left( \sqrt{\alpha} - \sqrt{\beta} \right)}{\sqrt{\alpha} + \sqrt{\beta}} \right) K_{1+1} \left( \frac{\pi \sqrt{t} \left( \sqrt{\alpha} + \sqrt{\beta} \right)}{\sqrt{\alpha} + \sqrt{\beta}} \right)$, 

where it is assumed that $Q_\rho(0)$ exists, and where $2\, F_1(a; b; c; z)$ denotes the ordinary hypergeometric function.
**Proof** Replace $x$ by $t$ in (1.4), multiply both sides of (1.4) by

$$
\frac{d}{dt} H(\alpha, \beta; t),
$$

where $H(\alpha, \beta; t)$ is defined by (10.2), and finally integrate with respect to $t$ over $(0, \infty)$. We see that the left-hand side becomes

\begin{equation}
\frac{1}{\Gamma(\rho + 1)} \sum_{n=1}^{\infty} a(n) \int_{\lambda_n}^{\infty} (t - \lambda_n)^\rho \frac{d}{dt} H(\alpha, \beta; t) dt = \frac{1}{(2\pi)^\rho} F_1(\alpha, \beta, \rho) + F_2(\alpha, \beta, \rho),
\end{equation}

where

\begin{equation}
F_1(\alpha, \beta, \rho) := \sum_{n=1}^{\infty} b(n) \int_{0}^{\infty} \left( \frac{t}{\mu_n} \right)^{(\delta+\rho)/2} I_{\delta+\rho} \left( 4\pi \sqrt{\mu_n t} \right) H(\alpha, \beta; t) dt
\end{equation}

and

\begin{equation}
F_2(\alpha, \beta, \rho) := \int_{0}^{\infty} Q_\rho(t) H(\alpha, \beta; t) dt.
\end{equation}

First, examine $F_1(\alpha, \beta, \rho)$. Integrating by parts while using (2.7) in the form

$$
\frac{d}{dt} \left( t^{(\delta+\rho)/2} J_{\delta+\rho} \left( a\sqrt{t} \right) \right) = \frac{a}{2} t^{(\delta+\rho-1)/2} J_{\delta+\rho-1} \left( a\sqrt{t} \right),
$$

we find that

\begin{equation}
F_1(\alpha, \beta, \rho) = \sum_{n=1}^{\infty} \frac{b(n)}{\mu_n^{(\delta+\rho)/2}} \int_{0}^{\infty} t^{(\delta+\rho)/2} J_{\delta+\rho} \left( 4\pi \sqrt{\mu_n t} \right) \frac{d}{dt} H(\alpha, \beta; t)
\end{equation}

\begin{equation}
= - \sum_{n=1}^{\infty} \frac{b(n)}{\mu_n^{(\delta+\rho)/2}} \int_{0}^{\infty} \frac{d}{dt} \left( t^{(\delta+\rho)/2} J_{\delta+\rho} \left( 4\pi \sqrt{\mu_n t} \right) \right) H(\alpha, \beta; t) dt
\end{equation}

\begin{equation}
= - 2\pi \sum_{n=1}^{\infty} \frac{b(n)}{\mu_n^{(\delta+\rho-1)/2}} \int_{0}^{\infty} t^{(\delta+\rho-1)/2} J_{\delta+\rho-1} \left( 4\pi \sqrt{\mu_n t} \right) H(\alpha, \beta; t) dt,
\end{equation}

where we have used the asymptotic formulas (2.10)–(2.12), the hypothesis $\delta + \rho > 0$, and the existence of

$$
\lim_{t \to 0} I_{\nu+1} \left( \pi \sqrt{t} \left( \sqrt{\alpha} - \sqrt{\beta} \right) \right) K_{\nu+1} \left( \pi \sqrt{t} \left( \sqrt{\alpha} + \sqrt{\beta} \right) \right),
$$

which is explicitly calculated in (10.8).
We next employ an integral evaluation from [6, p. 315]. For \( \text{Re}(\mu) > -1 \), \( \text{Re}(\mu + \nu) > -1 \), and \( \text{Re}(\pi(z + w)) > |\text{Re}(\pi(z - w))| + |\text{Im}(\xi)| \),

\[
\int_0^\infty x^{\mu+1} J_\mu(\xi x) I_\nu(\pi(z - w)x) K_\nu(\pi(z + w)x) \, dx = \\
\frac{\Gamma(\mu + \nu + 1)}{\Gamma(\nu + 1)} \left( \frac{\xi/2}{\sqrt{\xi^2 + 4\pi^2 z^2}} \right)^\nu \times \\
\frac{\sqrt{\xi^2 + 4\pi^2 z^2}}{\sqrt{\xi^2 + 4\pi^2 w^2}} \left( \frac{\sqrt{\xi^2 + 4\pi^2 z^2} - \sqrt{\xi^2 + 4\pi^2 w^2}}{\sqrt{\xi^2 + 4\pi^2 z^2} + \sqrt{\xi^2 + 4\pi^2 w^2}} \right)^{2\mu}
\]

(10.6) \( \times _2 F_1 \left( v - \mu, -\mu; v + 1; \frac{\sqrt{\xi^2 + 4\pi^2 z^2} - \sqrt{\xi^2 + 4\pi^2 w^2}}{\sqrt{\xi^2 + 4\pi^2 z^2} + \sqrt{\xi^2 + 4\pi^2 w^2}} \right)^2 \).

The Hankel inversion of the formula given above with the same kernel, that is, \( J_\mu \), was given by Koshliakov [20, equation (1)] and is a generalization of an integral evaluation by Fock and Bursian [15, pp. 361–363], arising in their study on electromagnetism (see also [14, equations (31) and (33)]).

In the integral on the extreme right-hand side of (10.5), make the change of variable \( t = x^2 \) and then apply (10.6) with \( \xi = 4\pi\sqrt{\mu_n}, \mu = \delta + \rho - 1, z = \sqrt{\alpha}, w = \sqrt{\beta}, \) and \( v \) replaced by \( v + 1 \). Thus, for \( \text{Re}(\nu + \delta + \rho) > -1 \) and \( \delta + \rho > 0 \), we find that

\[
F_1(\alpha, \beta, \rho) = -2\pi \sum_{n=1}^\infty \frac{b(n)}{\mu_n^{(\delta + \rho - 1)/2}} \left\{ \frac{2\Gamma(\nu + \delta + \rho + 1)}{\Gamma(\nu + 2)} \right\} \sqrt{16\pi^2 \mu_n + 4\pi^2 \alpha} \sqrt{16\pi^2 \mu_n + 4\pi^2 \beta} \times \\
\left( \frac{\sqrt{4\mu_n + \alpha} - \sqrt{4\mu_n + \beta}}{\sqrt{4\mu_n + \alpha} + \sqrt{4\mu_n + \beta}} \right)^{\nu+1} \left( \frac{1}{\sqrt{16\pi^2 \mu_n + 4\pi^2 \alpha}} + \frac{1}{\sqrt{16\pi^2 \mu_n + 4\pi^2 \beta}} \right)^{2\delta + 2\rho - 2} \times \\
\left( \frac{\sqrt{4\mu_n + \alpha} - \sqrt{4\mu_n + \beta}}{\sqrt{4\mu_n + \alpha} + \sqrt{4\mu_n + \beta}} \right)^{\nu+1} \left( \frac{1}{\sqrt{4\mu_n + \alpha}} + \frac{1}{\sqrt{4\mu_n + \beta}} \right)^{2\delta + 2\rho - 2} \times _2 F_1 \left( v - \delta - \rho + 2, -\delta - \rho + 1, v + 1, \nu + 2, \frac{\sqrt{4\mu_n + \alpha} - \sqrt{4\mu_n + \beta}}{\sqrt{4\mu_n + \alpha} + \sqrt{4\mu_n + \beta}} \right)^2 \right\}
\]

(10.7) \( \times _2 F_1 \left( v - \delta - \rho + 2, -\delta - \rho + 1, v + 2, \frac{\sqrt{4\mu_n + \alpha} - \sqrt{4\mu_n + \beta}}{\sqrt{4\mu_n + \alpha} + \sqrt{4\mu_n + \beta}} \right)^2 \).

Second, by the definitions of \( I_\nu \) and \( K_\nu \) in (2.1) and (2.2), respectively, and by the use of the functional equation and reflection formula for \( \Gamma(z) \), we find that
Utilizing (2.11), (2.12), and (10.8) in performing an integration by parts in (10.4), we deduce that, for \( \text{Re}(\nu) > -1 \),

\[
F_2(\alpha, \beta, \rho) = -\frac{1}{2(v+1)} \left( \frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}} \right)^{v+1} Q_\rho(0)
\]

(10.9)

\[- \int_0^\infty Q'_\rho(t) I_{v+1} \left( \pi \sqrt{t} \left( \sqrt{\alpha} - \sqrt{\beta} \right) \right) K_{v+1} \left( \pi \sqrt{t} \left( \sqrt{\alpha} + \sqrt{\beta} \right) \right) dt,
\]

where, for \( \text{Re}(\sqrt{\alpha}) > \text{Re}(\sqrt{\beta}) \), the boundary term at \( \infty \) vanishes, since by (2.11) and (2.12), respectively, as \( t \to \infty \),

\[
I_v(\pi(\sqrt{t}\alpha - \sqrt{t}\beta)) \sim \frac{e^{\pi(\sqrt{t}\alpha - \sqrt{t}\beta)}}{\pi \sqrt{2(\sqrt{t}\alpha - \sqrt{t}\beta)}}
\]

(10.10)

and

\[
K_v(\pi(\sqrt{t}\alpha + \sqrt{t}\beta)) \sim \frac{e^{-\pi(\sqrt{t}\alpha + \sqrt{t}\beta)}}{\sqrt{2(\sqrt{t}\alpha + \sqrt{t}\beta)}}.
\]

(10.11)

Finally, from (10.3), (10.7), and (10.9), we deduce that

\[
\frac{1}{\Gamma(\rho + 1)} \sum_{n=1}^\infty a(n) \int_{\lambda_n}^\infty (t - \lambda_n)^\rho \frac{d}{dt} H(\alpha, \beta; t) dt
\]

\[-\frac{1}{2(v+1)} \left( \frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}} \right)^{v+1} Q_\rho(0)
\]

\[- \frac{2}{(2\pi)^{\delta + 2\rho}} \frac{\Gamma(v + \delta + \rho + 1)}{\Gamma(v + 2)} \sum_{n=1}^\infty b(n) \left( \frac{\sqrt{4\mu_n + \alpha} - \sqrt{4\mu_n + \beta}}{\sqrt{4\mu_n + \alpha} + \sqrt{4\mu_n + \beta}} \right)^{v+1}
\]

\[\times \left( \frac{1}{\sqrt{4\mu_n + \alpha}} + \frac{1}{\sqrt{4\mu_n + \beta}} \right)^{2\delta + 2\rho - 2}
\]
\[\times \ _2F_1\left(v - \delta - \rho + 2, 1 - \delta - \rho; v + 2; \left(\frac{\sqrt{4\mu_n + \alpha} - \sqrt{4\mu_n + \beta}}{\sqrt{4\mu_n + \alpha} + \sqrt{4\mu_n + \beta}}\right)^2\right)\]

\[-\int_0^{\infty} Q'_\nu(t) H(\alpha, \beta; t) dt.\]

The proof of Theorem 10.1 is now complete. \[\blacksquare\]

11 The special case: \(\rho = 0\)

When \(\rho = 0\) in Theorem 10.1, by (10.10) and (10.11), the left-hand side of (10.1) reduces to

\[\sum_{n=1}^{\infty} a(n) \int_{\lambda_n}^{\infty} \frac{d}{dt} H(\alpha, \beta; t) dt = -\sum_{n=1}^{\infty} a(n) H(\alpha, \beta; \lambda_n).\]

Hence, we have our second main theorem.

**Theorem 11.1** Assume that \(\text{Re}(\nu) > -1\) and \(\text{Re}(\sqrt{\alpha}) > \text{Re}(\sqrt{\beta}) > 0\). Also assume that \(\delta + \text{Re}(\nu) + 1 > \sigma^*_n > 0\). Suppose that the integral on the right side below converges absolutely and that \(Q_0(0)\) exists. Then,

\[\sum_{n=1}^{\infty} a(n) H(\alpha, \beta; \lambda_n) = \frac{2(2\pi)^{-\delta} \Gamma(v + 1)}{\Gamma(v + 2)} \times \sum_{n=1}^{\infty} b(n) \frac{\sqrt{4\mu_n + \alpha} - \sqrt{4\mu_n + \beta}}{\sqrt{4\mu_n + \alpha} + \sqrt{4\mu_n + \beta}}^{v+1} \times \left(\frac{1}{\sqrt{4\mu_n + \alpha}} + \frac{1}{\sqrt{4\mu_n + \beta}}\right)^{2\delta-2} \times _2F_1\left(v - \delta + 2, 1 - \delta; v + 2; \left(\frac{\sqrt{4\mu_n + \alpha} - \sqrt{4\mu_n + \beta}}{\sqrt{4\mu_n + \alpha} + \sqrt{4\mu_n + \beta}}\right)^2\right) \]

\[+ \frac{Q_0(0)}{2(v + 1)} \left(\frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}}\right)^{v+1} + \int_0^{\infty} Q'_\nu(x) H(\alpha, \beta; x) dx,\]

(11.1)

where \(H(\alpha, \beta; t)\) is defined by (10.2).

Next, we show that Theorem 4.1 from [5] can be obtained as a special case of Theorem 11.1. To that end, divide both sides of (11.1) by \((\sqrt{\alpha} - \sqrt{\beta})^{v+1}\), and let \(\alpha \to \beta\). In the course of doing so, we need the limit

\[\lim_{\alpha \to \beta} \frac{I_{v+1}\left(\pi \sqrt{\lambda_n} (\sqrt{\alpha} - \sqrt{\beta})\right) K_{v+1}\left(\pi \sqrt{\lambda_n} (\sqrt{\alpha} + \sqrt{\beta})\right)}{(\sqrt{\alpha} - \sqrt{\beta})^{v+1}} = \left(\frac{\pi}{2}\right)^{v+1} \lambda^{(v+1)/2}_n \frac{K_{v+1}(2\pi \sqrt{\lambda_n} \beta)}{\Gamma(v + 2)},\]

(11.2)
where the definitions of $I_v$ and $K_v$ in (2.1) and (2.2), respectively, were used. On the left side of (11.1), by (2.8) and (2.9), the series converges absolutely and uniformly with respect to $\alpha$ for $0 \leq \sqrt{\alpha} < \varepsilon$, for each fixed $\varepsilon > 0$. Thus, we can interchange summation and the limit as $\alpha \to \beta$ on the left-hand side of (11.1) to find that

$$
\lim_{\alpha \to \beta} \sum_{n=1}^{\infty} a(n) I_{\nu+1} \left( \pi \sqrt{\lambda_n} \left( \sqrt{\alpha} - \sqrt{\beta} \right) \right) K_{\nu+1} \left( \pi \sqrt{\lambda_n} \left( \sqrt{\alpha} + \sqrt{\beta} \right) \right) = \frac{(\pi)^{\nu+1}}{\Gamma(\nu + 2)} \sum_{n=1}^{\infty} a(n) \lambda_n^{(\nu+1)/2} K_{\nu+1}(2\pi \sqrt{\lambda_n} \beta).
$$

(11.3)

We also take the limit as $\alpha \to \beta$ inside the integral on the far right side of (11.1) by using a similar argument with $\lambda_n$ replaced by $x$ in (11.2). Hence,

$$
\lim_{\alpha \to \beta} \int_{0}^{\infty} Q'_{\nu}(x) I_{\nu+1} \left( \pi \sqrt{x} \left( \sqrt{\alpha} - \sqrt{\beta} \right) \right) K_{\nu+1} \left( \pi \sqrt{x} \left( \sqrt{\alpha} + \sqrt{\beta} \right) \right) dx = \frac{(\pi)^{\nu+1}}{\Gamma(\nu + 2)} \int_{0}^{\infty} Q'_{\nu}(x) x^{(\nu+1)/2} K_{\nu+1}(2\pi \sqrt{x} \beta) dx.
$$

(11.4)

Next, recall that $\;_{2}F_{1}(a, b; c; 0) = 1$. Thus, it remains to evaluate the limit

$$
\lim_{\alpha \to \beta} \frac{\left( \sqrt{4\mu_n + \alpha + \sqrt{4\mu_n + \beta}} \right)^{-\nu-1}}{\sqrt{4\mu_n + \alpha \sqrt{4\mu_n + \beta}}} \times \left( \frac{\sqrt{4\mu_n + \alpha - \sqrt{4\mu_n + \beta}}}{\sqrt{\alpha - \sqrt{\beta}}} \right)^{\nu+1} \left( \frac{1}{\sqrt{4\mu_n + \alpha}} + \frac{1}{\sqrt{4\mu_n + \beta}} \right)^{2\delta-2}
$$

$$
= \lim_{\alpha \to \beta} \frac{\left( \sqrt{4\mu_n + \alpha + \sqrt{4\mu_n + \beta}} \right)^{-2\nu-2}}{\sqrt{4\mu_n + \alpha \sqrt{4\mu_n + \beta}}} \times \left( \sqrt{\alpha} + \sqrt{\beta} \right)^{\nu+1} \left( \frac{1}{\sqrt{4\mu_n + \alpha}} + \frac{1}{\sqrt{4\mu_n + \beta}} \right)^{2\delta-2}
$$

$$
= \frac{2^{2\delta-2}}{(4\mu_n + \beta)^{\delta}} \left( \frac{\sqrt{\beta}}{2(4\mu_n + \beta)} \right)^{\nu+1}.
$$

(11.5)

Bringing together (11.3)–(11.5), we conclude that

$$
\frac{(\pi)^{\nu+1}}{\Gamma(\nu + 2)} \sum_{n=1}^{\infty} a(n) \lambda_n^{(\nu+1)/2} K_{\nu+1}(2\pi \sqrt{\lambda_n} \beta)
$$

$$
= \frac{2^{\delta-\nu-2} \pi^{\delta} \beta^{(\nu+1)/2} \Gamma(\nu + \delta + 1)}{\Gamma(\nu + 2)} \sum_{n=1}^{\infty} b(n) \left( \frac{4\mu_n + \beta}{4\mu_n + \beta} \right)^{\delta v+1}
$$

$$
+ \frac{(\pi)^{\nu+1}}{\Gamma(\nu + 2)} \int_{0}^{\infty} Q'_{\nu}(x) x^{(\nu+1)/2} K_{\nu+1}(2\pi \sqrt{\beta} x) dx.
$$

(11.6)
Let $s = 2\pi\sqrt{\beta}$. Multiplying both sides of (11.6) by $2/s$ and by $(\frac{n}{s})^{-\nu-1} \Gamma(\nu + 2)$ and then integrating by parts with the aid of (2.9) and (2.12), we conclude that

$$
2 \sum_{n=1}^{\infty} a(n) \lambda_n^{(v+1)/2} K_{v+1}(s \sqrt{\lambda_n}) = 2^{3\delta + v + 1} \pi^v \Gamma(\nu + \delta + 1) \sum_{n=1}^{\infty} \frac{b(n)}{(16\pi^2 \mu_n + s^2)^{\delta + v + 1}}
$$

$$
+ \int_0^{\infty} Q_0(x)x^{v/2} K_v(s \sqrt{x}) dx
$$

We hence obtain Theorem 4.1 from [5] as a corollary of Theorem 11.1.

**Corollary 11.2**  For Re($\nu$) > -1, $\delta + \Re(\nu) + 1 > \sigma_n^*$, and Re($s$) > 0,

$$
2 \sum_{n=1}^{\infty} a(n) \lambda_n^{(v+1)/2} K_{v+1}(s \sqrt{\lambda_n}) = 2^{3\delta + v + 1} \pi^v \Gamma(\nu + \delta + 1) \sum_{n=1}^{\infty} \frac{b(n)}{(16\pi^2 \mu_n + s^2)^{\delta + v + 1}}
$$

$$
+ \int_0^{\infty} Q_0(x)x^{v/2} K_v(s \sqrt{x}) dx,
$$

where it is assumed that the integral converges absolutely.

Corollary 11.2 was also established in [5, Theorem 4.1].

### 12 Example: $r_k(n)$

Recall (5.1) and (5.2). Applying Theorem 11.1 with $\alpha$ and $\beta$ replaced by $2\alpha$ and $2\beta$, respectively, and $\nu$ replaced by $\nu - 1$, for Re($\nu$) > 0, we find that

$$
\sum_{n=1}^{\infty} r_k(n) I_\nu \left( \pi \sqrt{n} \left( \sqrt{\alpha} - \sqrt{\beta} \right) \right) K_\nu \left( \pi \sqrt{n} \left( \sqrt{\alpha} + \sqrt{\beta} \right) \right) =
$$

$$
= \frac{\Gamma(k/2 + v)}{\pi^{k/2} 2^{k-1} \Gamma(v + 1)} \sum_{n=1}^{\infty} \frac{b(n)}{\sqrt{n + \alpha} \sqrt{n + \beta}} \left( \frac{\sqrt{n + \alpha} - \sqrt{n + \beta}}{\sqrt{n + \alpha} + \sqrt{n + \beta}} \right)^v
$$

$$
\times \left( \frac{1}{\sqrt{n + \alpha}} + \frac{1}{\sqrt{n + \beta}} \right)^{k-2}
$$

$$
\times _2 F_1 \left( v - k/2 + 1, 1 - k/2; v + 1; \frac{\sqrt{n + \alpha} - \sqrt{n + \beta}}{\sqrt{n + \alpha} + \sqrt{n + \beta}} \right)
$$

$$
- \frac{1}{2^v} \frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}}^v + \int_0^{\infty} Q_0(x) I_\nu \left( \pi \sqrt{2x} \left( \sqrt{\alpha} - \sqrt{\beta} \right) \right)
$$

$$
\times K_\nu \left( \pi \sqrt{2x} \left( \sqrt{\alpha} + \sqrt{\beta} \right) \right) dx.
$$

(12.1)
To evaluate the integral in (12.1), we use an integral in [16, p. 717, equation 6.576, no. 5], namely, for $a > b$, $\text{Re}(2\nu) > \lambda - 1$, and $\text{Re}(\lambda) < 1$,

$$
\int_0^\infty x^{-\lambda} K_\nu(ax) I_\nu(bx) \, dx = \frac{b^\nu \Gamma \left( \frac{1-\lambda+2\nu}{2} \right) \Gamma \left( \frac{1-\lambda}{2} \right)}{2^{\lambda+1} \Gamma(\nu+1) a^{1-\lambda+\nu}} \, _2F_1 \left( \frac{1-\lambda+2\nu}{2}, -\frac{\lambda}{2}; \nu+1; \frac{b^2}{a^2} \right).
$$

Using (5.2) and (12.2), wherein we make the change of variable $t = \sqrt{2x}$ and note that $\lambda = 1 - k$, $a = \pi(\sqrt{a} + \sqrt{b})$, and $b = \pi(\sqrt{a} - \sqrt{b})$, we deduce that

$$
\int_0^\infty Q_0(x) I_\nu \left( \pi \sqrt{2x} \left( \sqrt{a} - \sqrt{b} \right) \right) K_\nu \left( \pi \sqrt{2x} \left( \sqrt{a} + \sqrt{b} \right) \right) \, dx
$$

$$
= \frac{k(2\pi)^{k/2}}{2\Gamma(1 + k/2)} \int_0^\infty x^{k/2-1} I_\nu \left( \pi \sqrt{2x} \left( \sqrt{a} - \sqrt{b} \right) \right) K_\nu \left( \pi \sqrt{2x} \left( \sqrt{a} + \sqrt{b} \right) \right) \, dx
$$

$$
= \frac{k2^{k/2-1} \pi^{k/2}}{2^{k/2-1} \Gamma(1 + k/2)} \int_0^\infty t^{k-1} I_\nu \left( \pi t \left( \sqrt{a} - \sqrt{b} \right) \right) K_\nu \left( \pi t \left( \sqrt{a} + \sqrt{b} \right) \right) \, dt
$$

$$
= \frac{k\pi^{k/2}}{\Gamma(1 + k/2)} \left( \pi \left( \sqrt{a} - \sqrt{b} \right) \right) \nu \Gamma \left( \nu \left( \frac{k}{2} + v \right) \right) \Gamma \left( \nu \left( \frac{k}{2} \right) \right) \cdot _2F_1 \left( \frac{k}{2} + v, \frac{k}{2}; v + 1; \frac{\sqrt{a} - \sqrt{b}}{\sqrt{a} + \sqrt{b}} \right)^2
$$

(12.3)

$$
= \frac{2^{k-1} \Gamma \left( \frac{k}{2} + v \right)}{\pi^{k/2} \Gamma(\nu+1)} \left( \frac{\sqrt{a} - \sqrt{b}}{\sqrt{a} + \sqrt{b}} \right)^\nu \left( \frac{1}{\sqrt{\alpha + \beta}} \right)^k \ _2F_1 \left( \frac{k}{2} + v, \frac{k}{2}; v + 1; \frac{\sqrt{a} - \sqrt{b}}{\sqrt{a} + \sqrt{b}} \right)^2
$$

Invoking Euler’s formula [1, p. 68, Theorem 2.2.5]

$$
_2F_1 \left( a, b; c; x \right) = (1 - x)^{-a-b} _2F_1 \left( c - a, c - b; c; x \right)
$$

in (12.3), we find that

$$
\int_0^\infty Q_0(x) I_\nu \left( \pi \sqrt{2x} \left( \sqrt{a} - \sqrt{b} \right) \right) K_\nu \left( \pi \sqrt{2x} \left( \sqrt{a} + \sqrt{b} \right) \right) \, dx
$$

$$
= \frac{2^{k-1} \Gamma \left( \frac{k}{2} + v \right)}{\pi^{k/2} \Gamma(\nu+1)} \left( \frac{\sqrt{a} - \sqrt{b}}{\sqrt{a} + \sqrt{b}} \right)^\nu \left( \frac{1}{\sqrt{\alpha + \beta}} \right)^k \ _2F_1 \left( \frac{k}{2} + v, \frac{k}{2}; v + 1; \frac{\sqrt{a} - \sqrt{b}}{\sqrt{a} + \sqrt{b}} \right)^2
$$

$$
= \frac{2^{1-k} \Gamma \left( \frac{k}{2} + v \right)}{\pi^{k/2} \Gamma(\nu+1)} \left( \frac{\sqrt{a} - \sqrt{b}}{\sqrt{a} + \sqrt{b}} \right)^\nu \left( \frac{1}{\sqrt{\alpha + \beta}} \right)^{2-k} \ _2F_1 \left( 1 - \frac{k}{2} + v, 1 - \frac{k}{2}; v + 1; \frac{\sqrt{a} - \sqrt{b}}{\sqrt{a} + \sqrt{b}} \right)^2
$$

$$
= \frac{\Gamma \left( \frac{k}{2} + v \right)}{\pi^{k/2} 2^{k-1} \Gamma(\nu+1)} \left( \frac{\sqrt{a} - \sqrt{b}}{\sqrt{a} + \sqrt{b}} \right)^\nu \left( \frac{1}{\sqrt{\alpha + \beta}} \right)^{k-2} \ _2F_1 \left( 1 - \frac{k}{2} + v, 1 - \frac{k}{2}; v + 1; \frac{\sqrt{a} - \sqrt{b}}{\sqrt{a} + \sqrt{b}} \right)^2.
$$

(12.4)
Now put (12.4) in (12.1). To obtain the final equality below, we define \( r_k(0) = 1 \). To that end,

\[
\sum_{n=1}^{\infty} r_k(n) I_\nu \left( \pi \sqrt{n} \left( \sqrt{\alpha} - \sqrt{\beta} \right) \right) K_\nu \left( \pi \sqrt{n} \left( \sqrt{\alpha} + \sqrt{\beta} \right) \right) = \frac{\Gamma(k/2 + \nu)}{\pi^{k/2} 2^{k-1} \Gamma(\nu+1)} \sum_{n=1}^{\infty} \frac{r_k(n)}{\sqrt{n + \alpha} \sqrt{n + \beta}} \left( \frac{\sqrt{n + \alpha} - \sqrt{n + \beta}}{\sqrt{n + \alpha} + \sqrt{n + \beta}} \right)^\nu \\
\times \left( \frac{1}{\sqrt{n + \alpha}} + \frac{1}{\sqrt{n + \beta}} \right)^{k-2}
\times \mathbf{2F1} \left( \nu - k/2 + 1, 1 - k/2; \nu + 1; \left( \frac{\sqrt{n + \alpha} - \sqrt{n + \beta}}{\sqrt{n + \alpha} + \sqrt{n + \beta}} \right)^2 \right)
\times \frac{1}{2\nu} \left( \frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}} \right)^\nu + \frac{\Gamma(k/2 + \nu)}{\pi^{k/2} 2^{k-1} \Gamma(\nu+1)} \left( \frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}} \right)^\nu \left( \frac{1}{\sqrt{\alpha}} + \frac{1}{\beta} \right)^{k-2} \frac{1}{\sqrt{\alpha \beta}}
\times \mathbf{2F1} \left( 1 - \frac{k}{2} + \nu, 1 - \frac{k}{2}; \nu + 1; \left( \frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}} \right)^2 \right).
\]

Thus, with simplification,

\[
\sum_{n=1}^{\infty} r_k(n) I_\nu \left( \pi \sqrt{n} \left( \sqrt{\alpha} - \sqrt{\beta} \right) \right) K_\nu \left( \pi \sqrt{n} \left( \sqrt{\alpha} + \sqrt{\beta} \right) \right) = -\frac{1}{2\nu} \left( \frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}} \right)^\nu + \frac{\Gamma(k/2 + \nu)}{\pi^{k/2} 2^{k-1} \Gamma(\nu+1)} \left( \frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}} \right)^\nu \left( \frac{1}{\sqrt{\alpha}} + \frac{1}{\beta} \right)^{k-2} \frac{1}{\sqrt{\alpha \beta}}
\times \mathbf{2F1} \left( 1 - \frac{k}{2} + \nu, 1 - \frac{k}{2}; \nu + 1; \left( \frac{\sqrt{n + \alpha} - \sqrt{n + \beta}}{\sqrt{n + \alpha} + \sqrt{n + \beta}} \right)^2 \right).
\]

(12.5)

By a different method, the identity (12.5) was also established in [6, Theorem 1.6]. Letting \( \nu = 1/2 \) in (12.5) yields [6, Corollary 4.4]

\[
\sum_{n=1}^{\infty} \frac{r_k(n)}{\sqrt{n}} e^{-\pi \sqrt{n} (\sqrt{\alpha} + \sqrt{\beta})} \sinh(\pi \sqrt{n} (\sqrt{\alpha} - \sqrt{\beta})) = -\pi (\sqrt{\alpha} - \sqrt{\beta}) - \frac{1}{2\pi (k-1/2)} \Gamma \left( \frac{k-1}{2} \right) \sum_{n=0}^{\infty} r_k(n) \left( (n + \alpha)^{(1-k)/2} - (n + \beta)^{(1-k)/2} \right),
\]
whereas dividing both sides of (12.5) by \((\alpha - \beta)^v\) and then letting \(\alpha \to \beta\) gives

\[
(12.6) \quad \sum_{n=0}^{\infty} r_k(n) n^k K_v(2\pi \sqrt{n\beta}) = \frac{\beta^{3/2} \Gamma \left( v + \frac{k}{2} \right)}{2\pi^{v+k/2}} \sum_{n=0}^{\infty} \frac{r_k(n)}{(n + \beta)^{v+k/2}}.
\]

The special case \(k = 2\) and \(v = 1/2\) of (12.6) was employed by Hardy [18, equation (2.12)] to prove his famous result while investigating the Gauss circle problem, namely, as \(x \to \infty\),

\[
\sum_{n \leq x} r_2(n) - \pi x = \Omega(x^{1/4}).
\]

### 13 Example: Ramanujan’s tau-function \(\tau(n)\)

Let \(\tau(n)\) denote Ramanujan’s famous arithmetical tau-function. Recall the associated facts and parameters given in (7.1)–(7.3). Then, from Theorem 11.1, for \(\text{Re}(\nu) > -13/2\),

\[
\sum_{n=1}^{\infty} \tau(n) I_{\nu+1} \left( \pi \sqrt{n} \left( \sqrt{\alpha} - \sqrt{\beta} \right) \right) K_{\nu+1} \left( \pi \sqrt{n} \left( \sqrt{\alpha} + \sqrt{\beta} \right) \right)
\]

\[
= \frac{2(2\pi)^{-12} \Gamma(13 + \nu)}{\Gamma(\nu + 2)} \sum_{n=1}^{\infty} \frac{\tau(n)}{\sqrt{4n + \alpha} \sqrt{4n + \beta}} \left( \frac{\sqrt{4n + \alpha} - \sqrt{4n + \beta}}{\sqrt{4n + \alpha} + \sqrt{4n + \beta}} \right)^v \frac{2\sqrt{22}}{2F1} \left( v - 10, -11; v + 2; \left( \frac{\sqrt{4n + \alpha} - \sqrt{4n + \beta}}{\sqrt{4n + \alpha} + \sqrt{4n + \beta}} \right)^2 \right).
\]

Letting \(\nu = -\frac{1}{2}\) in (13.1) and using (2.3) and (2.4), we are led to

\[
\sum_{n=1}^{\infty} \tau(n) e^{-\pi \sqrt{n}(\sqrt{\alpha} + \sqrt{\beta})} \sinh(\pi \sqrt{n}(\sqrt{\alpha} - \sqrt{\beta}))
\]

\[
= \frac{2(2\pi)^{-12} \Gamma(25/2)}{\Gamma(3/2)} \sum_{n=1}^{\infty} \frac{\tau(n)}{\sqrt{4n + \alpha} \sqrt{4n + \beta}} \left( \frac{\sqrt{4n + \alpha} - \sqrt{4n + \beta}}{\sqrt{4n + \alpha} + \sqrt{4n + \beta}} \right)^{1/2} \frac{2\sqrt{22}}{2F1} \left( -21/2, -11; 3/2; \left( \frac{\sqrt{4n + \alpha} - \sqrt{4n + \beta}}{\sqrt{4n + \alpha} + \sqrt{4n + \beta}} \right)^2 \right).
\]

Employing [23, p. 461, no. 107]

\[
2F1(a, a + 1/2; 3/2; z) = \frac{1}{2(2a - 1)\sqrt{z}} \left\{ (1-z)^{1-2a} - (1+\sqrt{z})^{1-2a} \right\},
\]

with \(a = -11\), we find that

\[
2F1(-21/2, -11; 3/2; z) = -\frac{1}{46\sqrt{z}} \left\{ (1-\sqrt{z})^{23} - (1+\sqrt{z})^{23} \right\}.
\]
With \((13.3)\) in \((13.2)\) and with considerable simplification, we deduce that
\[
\sum_{n=1}^{\infty} \frac{\tau(n)}{\sqrt{n}} e^{-\pi \sqrt{\alpha + \sqrt{\beta}}} \sinh(\pi \sqrt{\alpha - \sqrt{\beta}}) = 2 \frac{3 \cdot 5 \cdots 21}{n^{11}} \sum_{n=1}^{\infty} \tau(n) \left( \frac{1}{(4n + \beta)^{3/2}} - \frac{1}{(4n + \alpha)^{3/2}} \right).
\]
\((13.4)\)

If we differentiate both sides of \((13.4)\) with respect to \(\alpha\) and simplify, we find that
\[
\sum_{n=1}^{\infty} \tau(n) e^{-2\pi \sqrt{\alpha}} = 2 \frac{3 \cdot 5 \cdots 21 \cdot 23}{n^{12}} \sum_{n=1}^{\infty} \sqrt{\alpha} \tau(n) \frac{1}{(4n + \alpha)^{25/2}}
\]
which, with \(\alpha = s^2/(4\pi^2)\), gives \([5, \text{equation (7.4)}]\)
\[
\sum_{n=1}^{\infty} \tau(n) e^{-\sqrt{s}} = 2^{36} \pi^{23/2} \Gamma \left( \frac{25}{2} \right) \sum_{n=1}^{\infty} \frac{s \tau(n)}{(s^2 + 16\pi^2n)^{25/2}}.
\]

### 14 Example: primitive Dirichlet characters

Let \(\chi\) denote a primitive character modulo \(q\). Depending on the parity of \(\chi\), we separate two cases. First, consider odd \(\chi\). Recall that the functional equation for the associated Dirichlet \(L\)-series is given in \((8.1)\), the Gauss sum \(\tau(\chi)\) is defined in \((8.2)\), and the relevant parameters are given in \((8.3)\). Consequently, by Theorem 11.1 and the fact that \(Q_0(x) \equiv 0\), for \(\Re(v) > -5/2\),
\[
\sum_{n=1}^{\infty} n \chi(n) I_{\nu+1} \left( \frac{\pi n}{\sqrt{2q}} \left( \sqrt{\alpha - \sqrt{\beta}} \right) \right) K_{\nu+1} \left( \frac{\pi n}{\sqrt{2q}} \left( \sqrt{\alpha + \sqrt{\beta}} \right) \right) = -i \pi^{-3/2} \Gamma(v + 5/2) \frac{\sqrt{2n^2/q}}{2q \Gamma(v + 2)} \tau(\chi) \sum_{n=1}^{\infty} \frac{n \chi(n)}{\sqrt{\left( \frac{2n^2}{q} + \alpha \right) \sqrt{\left( \frac{2n^2}{q} + \beta \right)}}} \left( \frac{\sqrt{\frac{2n^2}{q} + \alpha - \sqrt{\frac{2n^2}{q} + \beta}}}{\sqrt{\frac{2n^2}{q} + \alpha + \sqrt{\frac{2n^2}{q} + \beta}}} \right)^{v+1}
\]
\[
\times \left( \frac{1}{\sqrt{\left( \frac{2n^2}{q} + \alpha \right)}} + \frac{1}{\sqrt{\left( \frac{2n^2}{q} + \beta \right)}} \right)
\times _2 F_1 \left( v + 1/2, -1/2; v + 2; \left( \frac{\sqrt{\frac{2n^2}{q} + \alpha - \sqrt{\frac{2n^2}{q} + \beta}}}{\sqrt{\frac{2n^2}{q} + \alpha + \sqrt{\frac{2n^2}{q} + \beta}}} \right)^2 \right)
\]
\[
= -i \pi^{-3/2} \Gamma(v + 5/2) \frac{\sqrt{2n^2/q}}{2q \Gamma(v + 2)} \tau(\chi) \sum_{n=1}^{\infty} \frac{n \chi(n)}{\sqrt{\left( \frac{2n^2}{q} + \alpha \right) \left( \frac{2n^2}{q} + \beta \right)}} \left( \frac{\sqrt{\frac{2n^2}{q} + \alpha - \sqrt{\frac{2n^2}{q} + \beta}}}{\sqrt{\frac{2n^2}{q} + \alpha + \sqrt{\frac{2n^2}{q} + \beta}}} \right)^{v+1}
\]
\[
\times _2 F_1 \left( v + 1/2, -1/2; v + 2; \left( \frac{\sqrt{\frac{2n^2}{q} + \alpha - \sqrt{\frac{2n^2}{q} + \beta}}}{\sqrt{\frac{2n^2}{q} + \alpha + \sqrt{\frac{2n^2}{q} + \beta}}} \right)^2 \right).
\]
\((14.1)\)
Letting \( v = -1/2 \) in (14.1), using (2.3) and (2.4), appealing to the trivial fact that
\[
\text{2F}_1 (0, -1/2; 3/2; x) = 1,
\]
and multiplying both sides by \( \pi \sqrt{\alpha - \beta}/\sqrt{2q} \), we deduce that
\[
\sum_{n=1}^{\infty} \chi(n) e^{-\frac{\pi n}{\sqrt{2q}} (\sqrt{\alpha} + \sqrt{\beta})} \sinh \left( \frac{\pi n}{\sqrt{2q}} (\sqrt{\alpha} - \sqrt{\beta}) \right) = -i \pi^{-1/2} \Gamma(2) \sqrt{\alpha - \beta} \tau(\chi) \sum_{n=1}^{\infty} \frac{\bar{\chi}(n)}{n} \frac{n\bar{\chi}(n)}{2q \Gamma(3/2)} \frac{1}{(2n^2 + \alpha)(2n^2 + \beta)}
\]
\[
\times \left( \sqrt{\frac{2n^2}{q} + \alpha} - \sqrt{\frac{2n^2}{q} + \beta} \right)^{1/2} \times \left( \sqrt{\frac{2n^2}{q} + \alpha} + \sqrt{\frac{2n^2}{q} + \beta} \right)^{-1/2} = -i q \tau(\chi) (\alpha - \beta) \pi \sum_{n=1}^{\infty} \frac{n\bar{\chi}(n)}{2(2n^2 + \alpha q)(2n^2 + \beta q)}.
\]
(14.2)

Next, let \( \chi \) be even. Recall that the functional equation and relevant parameters are given in (8.4) and (8.5), respectively. Therefore, by Theorem 11.1, for \( \text{Re}(\nu) > -3/2 \),
\[
\sum_{n=1}^{\infty} \chi(n) I_{\nu+1} \left( \frac{\pi n}{\sqrt{2q}} (\sqrt{\alpha} - \sqrt{\beta}) \right) K_{\nu+1} \left( \frac{\pi n}{\sqrt{2q}} (\sqrt{\alpha} + \sqrt{\beta}) \right) = 
\]
\[
= \sqrt{2} \Gamma(\nu+3/2)/\sqrt{\pi q} \Gamma(\nu+2) \tau(\chi) \sum_{n=1}^{\infty} \bar{\chi}(n) \left( \sqrt{\frac{2n^2}{q} + \alpha} - \sqrt{\frac{2n^2}{q} + \beta} \right)^{\nu+1} \left( \sqrt{\frac{2n^2}{q} + \alpha} + \sqrt{\frac{2n^2}{q} + \beta} \right)^{\nu+2}
\]
\[
\times \text{2F}_1 \left( \nu + 3/2, 1/2; \nu + 2; \left( \sqrt{\frac{2n^2}{q} + \alpha} - \sqrt{\frac{2n^2}{q} + \beta} \right)^2 \left( \sqrt{\frac{2n^2}{q} + \alpha} + \sqrt{\frac{2n^2}{q} + \beta} \right)^2 \right).
\]
(14.3)

Letting \( \nu = -1/2 \) in (14.3) and using the evaluation [16, p. 1067, Formula 9.121, no. 7]
\[
\text{2F}_1 (1, 1/2; 3/2; x) = \frac{1}{2\sqrt{x}} \log \left( \frac{1 + \sqrt{x}}{1 - \sqrt{x}} \right),
\]
we obtain, after considerable simplification,
\[
\sum_{n=1}^{\infty} \chi(n) e^{-\frac{\pi n}{n\sqrt{2q}} (\sqrt{\alpha} + \sqrt{\beta})} \sinh \left( \frac{\pi n}{\sqrt{2q}} (\sqrt{\alpha} - \sqrt{\beta}) \right) = \frac{\tau(\chi)}{2q} \sum_{n=1}^{\infty} \bar{\chi}(n) \log \left( \frac{2n^2 + \alpha q}{2n^2 + \beta q} \right).
\]
(14.4)

Equations (14.1)–(14.3) and (14.5) are new. If we differentiate both sides of (14.5) with respect to \( \alpha \) and simplify, we obtain
\[
\sum_{n=1}^{\infty} \chi(n) e^{-\frac{\pi n}{n\sqrt{2q}} (\sqrt{\alpha} + \sqrt{\beta})} = \frac{\sqrt{2} \alpha q}{\pi} \tau(\chi) \sum_{n=1}^{\infty} \bar{\chi}(n) \frac{\bar{\chi}(n)}{2n^2 + \alpha q},
\]
which can also be derived by letting \( v = -1/2 \) and \( r = \pi \sqrt{2\alpha/q} \) in [5, equation (9.6)].
Similarly, differentiating both sides of (14.2) with respect to $\alpha$ and simplifying, we arrive at

$$\sum_{n=1}^{\infty} n \chi(n) e^{\frac{-\pi \sqrt{2n}}{\sqrt{x}}} = -\frac{i(2q)^{\frac{1}{2}} \sqrt{\alpha} \tau(\chi)}{\pi^2} \sum_{n=1}^{\infty} \frac{n \chi(n)}{(2n^2 + \alpha q)^{\frac{1}{2}}},$$

which also follows upon letting $\nu = -1/2$ and $r = \pi \sqrt{2\alpha/q}$ in [5, equation (9.3)].

15 A generalization of a theorem of Watson

The functional equation of the Riemann zeta function is given by [13, p. 14]

$$\pi^{-s/2} \Gamma(s/2) \zeta(s) = \pi^{-(1-s)/2} \Gamma((1-s)/2) \zeta(1-s).$$

Hence, replacing $s$ by $2s$, we see that it can be transformed into the form (1.2) with $\delta = 1/2$, $a(n) = b(n) = 1$, and $\lambda_n = \mu_n = n^2/2$. Note that in (1.5),

$$Q_0(x) = -\frac{1}{2} + \sqrt{2x}.$$

Employing (12.2) with $x$ replaced by $\sqrt{x}$, and then with $\nu$ replaced by $\nu + 1$, and letting $\lambda = 0$, $a = \pi \left(\sqrt{\alpha} + \sqrt{\beta}\right)$, and $b = \pi \left(\sqrt{\alpha} - \sqrt{\beta}\right)$, we find that Theorem 11.1 yields, for $\text{Re}(\nu) > -1/2$,

$$\frac{1}{4(\nu + 1)} \left(\frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}}\right)^{\nu+1} + \sum_{n=1}^{\infty} I_{\nu+1}\left(\frac{n \pi}{\sqrt{2}} \left(\frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}}\right)\right) K_{\nu+1} \left(\frac{n \pi}{\sqrt{2}} \left(\frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}}\right)\right)
= \frac{\Gamma(\nu + 3/2)}{\sqrt{2\pi\Gamma(\nu + 2)}} \frac{\left(\frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}}\right)^{\nu+1}}{(\sqrt{\alpha} + \sqrt{\beta})^{\nu+2}} \cdot 2F_1 \left(\nu + 3/2, 1/2; \nu + 2; \left(\frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}}\right)^2\right)
+ \frac{\sqrt{2\Gamma(\nu + 3/2)}}{\sqrt{\pi\Gamma(\nu + 2)}} \sum_{n=1}^{\infty} \frac{\left(\frac{\sqrt{2n^2 + \alpha - \sqrt{2n^2 + \beta}}}{\sqrt{2n^2 + \alpha + \sqrt{2n^2 + \beta}}}\right)^{\nu+1}}{(\sqrt{2n^2 + \alpha} + \sqrt{2n^2 + \beta})^{\nu+2}} \cdot 2F_1 \left(\nu + 3/2, 1/2; \nu + 2; \left(\frac{\sqrt{2n^2 + \alpha - \sqrt{2n^2 + \beta}}}{\sqrt{2n^2 + \alpha + \sqrt{2n^2 + \beta}}}\right)^2\right).$$

Replacing $\alpha$ by $2\alpha$ and $\beta$ by $2\beta$, we find that

$$\frac{1}{4(\nu + 1)} \left(\frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}}\right)^{\nu+1} + \sum_{n=1}^{\infty} I_{\nu+1}\left(\frac{n \pi}{\sqrt{2}} \left(\frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}}\right)\right) K_{\nu+1} \left(\frac{n \pi}{\sqrt{2}} \left(\frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}}\right)\right)
= \frac{\Gamma(\nu + 3/2)}{2\sqrt{2\pi\Gamma(\nu + 2)}} \frac{\left(\frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}}\right)^{\nu+1}}{(\sqrt{\alpha} + \sqrt{\beta})^{\nu+2}} \cdot 2F_1 \left(\nu + 3/2, 1/2; \nu + 2; \left(\frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}}\right)^2\right)$$
Arithmetical identities

\[ + \frac{\Gamma(v + 3/2)}{\sqrt{\pi} \Gamma(v + 2)} \sum_{n=1}^{\infty} \frac{(\sqrt{n^2 + \alpha} - \sqrt{n^2 + \beta})^{v+1}}{n} \left( \sqrt{n^2 + \alpha} + \sqrt{n^2 + \beta} \right)^{v+2} \]

(15.1) \quad \times \binom{v + 3/2, 1/2; v + 2; \left( \frac{\sqrt{n^2 + \alpha} - \sqrt{n^2 + \beta}}{\sqrt{n^2 + \alpha} + \sqrt{n^2 + \beta}} \right)^2}{2F_1}\]

Dividing both sides by \((\sqrt{\alpha} - \sqrt{\beta})^{v+1}\), letting \(\alpha \to \beta\), multiplying both sides of the resulting identity by \(2(v + 1)\Gamma(v + 1)(2\sqrt{\beta})^{v+1}\), replacing \(v\) by \(v - 1\) and \(\beta\) by \(\frac{z^2}{4\pi^2}\), and rearranging, for \(\text{Re}(z) > 0\), we recover an important result of Watson [25, equation (4)]:

\[ \frac{1}{2} \Gamma(v) + 2 \sum_{n=1}^{\infty} \left( \frac{1}{2} \pi n \right)^v \epsilon_n(vz) = \Gamma \left( \frac{1}{2} \right) \Gamma \left( v + \frac{1}{2} \right) \times z^{2v} \left\{ \frac{1}{2} z^{2v+1} + 2 \sum_{n=1}^{\infty} \frac{1}{z^2 + 4n^2 \pi^2)^{v+1}} \right\}. \]

We now provide a generalization of yet another identity of Watson [25, equation (6)].

**Corollary 15.1** Let \(K(k)\) denote the complete elliptic integral of the first kind defined by

(15.2) \quad K(k) := \int_0^{\pi/2} \frac{d\theta}{\sqrt{1 - k^2 \sin^2(\theta)}}, \quad 0 \leq |k| < 1.

For \(\text{Re}(\sqrt{\alpha}) > \text{Re}(\sqrt{\beta}) > 0\),

\[ \sum_{n=1}^{\infty} I_0 \left( \pi n \left( \sqrt{\alpha} - \sqrt{\beta} \right) \right) K_0 \left( \pi n \left( \sqrt{\alpha} + \sqrt{\beta} \right) \right) = \frac{1}{\pi \left( \sqrt{\alpha} + \sqrt{\beta} \right)} K \left( \left( \frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}} \right)^2 \right) \times \frac{\gamma + \log \left( \sqrt{\alpha} + \sqrt{\beta} \right) - \log 4}{2} + \sum_{n=1}^{\infty} \left\{ \frac{2}{\pi \left( \sqrt{n^2 + \alpha} + \sqrt{n^2 + \beta} \right)} K \left( \left( \frac{\sqrt{n^2 + \alpha} - \sqrt{n^2 + \beta}}{\sqrt{n^2 + \alpha} + \sqrt{n^2 + \beta}} \right)^2 \right) - \frac{1}{2n} \right\}. \]

**Proof** Corollary 15.1 follows by analytically continuing (15.1) to the region \(\text{Re}(v) > -3/2\) and then letting \(v \to -1\). Since the argument is similar to that given in Section 5 of [6], we discuss it only briefly here.

Let \(g(n)\) denote the \(n\)th summand in the series on the right-hand side of (15.1). It is not difficult to show that, as \(n \to \infty\),

\[ g(n) \sim \frac{(\alpha - \beta)^{v+1}}{2n^{2v+3}}. \]
Therefore, for \( \text{Re}(\nu) > -1 \),

\[
\sum_{n=1}^{\infty} g(n) = \sum_{n=1}^{\infty} \left( g(n) - \frac{(\alpha - \beta)^{\nu+1}}{(2n)^{2\nu + 3}} \right) + \frac{(\alpha - \beta)^{\nu+1}}{2^{2\nu + 3}} \zeta(2\nu + 3).
\]

Substituting this in (15.1) and rearranging, we find that, for \( \text{Re}(\nu) > -1 \),

\[
\sum_{n=1}^{\infty} I_{\nu+1} \left( \pi n \left( \sqrt{\alpha} - \sqrt{\beta} \right) \right) K_{\nu+1} \left( \pi n \left( \sqrt{\alpha} + \sqrt{\beta} \right) \right) = \frac{\Gamma(\nu + 3/2)}{2\sqrt{2\pi} \Gamma(\nu + 2)} \left( \frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}} \right)^{\nu+1} \, _2F_1 \left( \nu + 3/2, 1/2; \nu + 2; \left( \frac{\sqrt{\alpha} - \sqrt{\beta}}{\sqrt{\alpha} + \sqrt{\beta}} \right)^2 \right) + \frac{\sqrt{2}\Gamma(\nu + 3/2)}{\sqrt{\pi} \Gamma(\nu + 2)} \sum_{n=1}^{\infty} \left( g(n) - \frac{(\alpha - \beta)^{\nu+1}}{(2n)^{2\nu + 3}} \right) + \left( \sqrt{\alpha} - \sqrt{\beta} \right)^{\nu+1} \frac{\Gamma(\nu + 3/2)}{\sqrt{\pi} \Gamma(\nu + 2)} \left( \frac{\sqrt{\alpha} + \sqrt{\beta}}{2^{\nu+3}} \right) \zeta(2\nu + 3) - \frac{1}{4(\nu + 1) \left( \frac{\sqrt{\alpha} + \sqrt{\beta}}{\nu + 1} \right)^{\nu+1}} \right).
\]

(15.4)

Observe that both sides of (15.4) are analytic in \( \text{Re}(\nu) > -2 \) with a removable singularity at \( \nu = -1 \), because

\[
\lim_{\nu \to -1} \left( \frac{\Gamma(\nu + 3/2)}{\sqrt{\pi} \Gamma(\nu + 2)} \left( \frac{\sqrt{\alpha} + \sqrt{\beta}}{2^{\nu+3}} \right) \zeta(2\nu + 3) - \frac{1}{4(\nu + 1) \left( \frac{\sqrt{\alpha} + \sqrt{\beta}}{\nu + 1} \right)^{\nu+1}} \right) = \frac{\gamma}{2} + \frac{1}{2} \log(\sqrt{\alpha} + \sqrt{\beta}) - \log 2,
\]

(15.5)

which can be seen from expanding each side of (15.5) in Taylor series about \( \nu = -1 \). Thus, letting \( \nu \to -1 \) on both sides of (15.4) and using (15.5), we arrive at (15.3), where we used the identity [16, p. 908, Formula 8.113, no. 2]

\[
_2F_1 \left( \frac{1}{2}, \frac{1}{2}; 1; x^2 \right) = \frac{2}{\pi} K(x),
\]

where \( K(x) \) is defined in (15.2).

As previously indicated, the identity (15.3) is a generalization of the following identity of Watson [25].

**Corollary 15.2** For \( \text{Re}(\beta) > 0 \),

\[
2 \sum_{n=1}^{\infty} K_0(n\beta) = \pi \left( \frac{1}{\beta} + 2 \sum_{n=1}^{\infty} \left( \frac{1}{\beta^2 + 4\pi^2 n^2} - \frac{1}{2n\pi} \right) \right) + \gamma + \log \left( \frac{\beta}{2} \right) - \log 2\pi.
\]

(15.6)
Proof If we let $\alpha \to \beta$ in (15.3) and use the trivial facts

$$
\lim_{\alpha \to \beta} I_0(\pi(\sqrt{n\alpha} - \sqrt{n\beta})) K_0(\pi(\sqrt{n\alpha} + \sqrt{n\beta})) = K_0(2\pi\sqrt{n\beta})
$$

and $K(0) = \frac{1}{2}\pi$, we obtain (15.6).

Each of the identities (13.1), (14.1), and (14.3) can be analytically continued in the same manner as that for (15.1) for Corollary 15.1.

Letting $\nu = -\frac{1}{2}$ in (15.1), and using (2.3), (2.4), and (14.4), we obtain

$$
\frac{1}{2}\left(\sqrt{\alpha} - \sqrt{\beta}\right) + \sqrt{\frac{2}{\pi}}\pi \sum_{n=1}^{\infty} \frac{e^{-\frac{\pi}{\sqrt{2}}(\sqrt{n\alpha} + \sqrt{n\beta})}}{n} \sinh\left(\frac{\pi n}{\sqrt{2}}(\sqrt{\alpha} - \sqrt{\beta})\right)
$$

(15.7) = \frac{1}{2\sqrt{2}\pi\sqrt{\alpha - \beta}} \log\left(\frac{\alpha}{\beta}\right) + \frac{1}{\sqrt{2}\pi\sqrt{\alpha - \beta}} \sum_{n=1}^{\infty} \log\left(\frac{2n^2 + \alpha}{2n^2 + \beta}\right).

A rearrangement of (15.7) leads to

$$
\frac{\pi}{2}(\sqrt{\alpha} - \sqrt{\beta}) + \sqrt{\frac{2}{\pi}}\pi \sum_{n=1}^{\infty} \frac{e^{-\frac{\pi n}{\sqrt{2}}(\sqrt{\alpha} + \sqrt{\beta})}}{n} \sinh\left(\frac{\pi n}{\sqrt{2}}(\sqrt{\alpha} - \sqrt{\beta})\right)
$$

(15.8) = -\frac{1}{2\sqrt{2}} \log\left(\frac{\alpha}{\beta}\right) + \frac{1}{\sqrt{2}} \sum_{n=1}^{\infty} \log\left(\frac{2n^2 + \alpha}{2n^2 + \beta}\right).

Using the elementary Maclaurin series

$$
-\log(1 - x) = \sum_{k=1}^{\infty} \frac{x^k}{k}, \quad |x| < 1,
$$

in (15.8), we conclude that

$$
\frac{\pi}{2}(\sqrt{\alpha} - \sqrt{\beta}) + \frac{1}{\sqrt{2}} \log\left(\frac{1 - e^{-\pi\sqrt{2\alpha}}}{1 - e^{-\pi\sqrt{2\beta}}}\right) = \frac{1}{2\sqrt{2}} \log\left(\frac{\alpha}{\beta}\right) + \frac{1}{\sqrt{2}} \sum_{n=1}^{\infty} \log\left(\frac{2n^2 + \alpha}{2n^2 + \beta}\right).
$$

Acknowledgment The authors are very grateful to the referee for a thorough reading of their paper and for her/his accompanying suggestions, which improved the presentation in several instances.
