Figure S1 Correlations between change of circulatory physiological parameter and odds ratio of mortality after 6 months from treatment initiation.

Horizontal axis represents mean ± relative standard error, Vertical axis represents mean ± standard error of the change. The correlation between mean change rates of clinical parameters (SAP, MAP, HR, ESV, EDV) and estimated indices (CO, EF, Es, MVO₂, Ea, TPR, TAC) integrated by meta-analysis, and the mean odds ratios of mortality obtained from 21 large-scale clinical trials was represented.
