| Variable                           | FMD N=12599 | FMD missing N=2411 | PAT N=11125 | PAT missing N=3885 |
|-----------------------------------|-------------|--------------------|-------------|-------------------|
| Age, years                        | 55 (45/64)  | 57 (48/66)         | 55 (45/64)  | 57 (47/66)        |
| Women, % (No)                     | 48.9 (6156/12599) | 52.7 (1270/2411) | 48.5 (5394/11125) | 52.3 (2032/3885) |
| BMI, (kg/m²)                      | 26.6 (23.9/29.9) | 26.9 (24.1/31.1) | 26.5 (23.9/29.8) | 26.8 (24.0/30.9) |
| Current smoking, % (No)           | 19.6 (2463/12576) | 18.7 (448/2399)  | 19.5 (2162/11105) | 19.4 (749/3870)  |
| Diabetes, % (No)                  | 9.1 (1142/12563)  | 10.6 (253/2392)   | 9.0 (998/11093)  | 10.3 (397/3862)  |
| Dyslipidemia, % (No)              | 34.4 (4328/12570) | 35.4 (848/2395)   | 34.2 (3802/11103) | 35.6 (1374/3862) |
| Lipid-lowering medication, % (No) | 13.1 (1629/12466) | 14.9 (355/2390)   | 12.9 (1418/11001) | 14.7 (566/3855)  |
| Hypertension, % (No)              | 48.9 (6160/12594) | 54.3 (1306/2407)  | 48.8 (5433/11122) | 52.4 (2033/3879) |
| Antihypertensive medication, % (No) | 28.6 (3596/12592) | 34.7 (834/2401)   | 28.5 (3168/11120) | 32.6 (1262/3873) |
| Cardiovascular disease, % (No)    | 12.7 (1584/12486) | 15.2 (362/2376)   | 12.4 (1368/11027) | 15.1 (578/3835)  |
| Systolic blood pressure (mm Hg)   | 129.5 (119/141.5) | 131 (121/144)     | 129.5 (119/141.5) | 130.5 (120/143)  |
| Heart rate (bpm)                  | 68 (61.5/75.5)  | 68.5 (62/75.7)     | 68 (61.5/75.5)  | 68 (61.5/76)     |

Data are presented as median and 25<sup>th</sup>/75<sup>th</sup> percentile for continuous variables and percentage (numbers with condition/total number) for dichotomous variables.

BMI stands for body mass index.
**Supplementary Table 2.** Baseline characteristics of individuals with intermediate 10-year risk of cardiovascular death

| Variable                                      | Low risk group N=11,680 | Intermediate risk group N=3,239 | High risk group N=20 |
|-----------------------------------------------|-------------------------|---------------------------------|----------------------|
| Age (years)                                   | 51 (44, 59)             | 67 (63, 70)                      | 67 (65/70)           |
| Women No. (%)                                 | 6680 (57.2)             | 701 (21.6)                       | 0                    |
| BMI (kg/m²)                                   | 26.3 (23.6, 29.9)       | 27.6 (25.2, 30.5)                | 28.5 (27.0, 30.5)    |
| Current smoking No. (%)                       | 2164 (18.5)             | 720 (22.2)                       | 20 (100)             |
| Diabetes No. (%)                              | 828 (7.1)               | 548 (16.9)                       | 7 (35)               |
| Dyslipidemia No. (%)                          | 3555 (30.5)             | 1588 (49.1)                      | 10 (50)              |
| Lipid-lowering medication No. (%)             | 1246 (10.8)             | 725 (22.5)                       | 1 (5)                |
| Hypertension No. (%)                          | 4828 (41.3)             | 2580 (79.7)                      | 20 (100)             |
| Antihypertensive medication No. (%)           | 2802 (24)               | 1593 (49.2)                      | 8 (40)               |
| Cardiovascular disease No. (%)                | 1247 (10.7)             | 684 (21.5)                       | 1 (5)                |
| Systolic blood pressure (mm Hg)               | 126 (117, 136.5)        | 145 (134, 157)                   | 173 (155.2, 177.3)   |
| Heart rate (bpm)                              | 68.5 (62.0, 75.5)       | 67.5 (60.5, 75.5)                | 77.0 (64.4, 82.5)    |

**Vascular function measures**

| Vascular function measures                      | Low risk group N=11,680 | Intermediate risk group N=3,239 | High risk group N=20 |
|------------------------------------------------|-------------------------|---------------------------------|----------------------|
| Baseline brachial artery diameter (mm)          | 4.15 (3.6, 4.8)         | 4.9 (4.4, 5.4)                  | 5.2 (4.55, 5.4)      |
| FMD (%)                                        | 7.75 (4.7, 11.6)        | 6.1 (4, 8.7)                    | 8.6 (5.5, 12.7)      |
| Ln baseline pulse amplitude (arbitrary units)   | 6.0 (5.3, 6.6)          | 6.4 (5.8, 6.9)                  | 6.7 (6.3, 7.2)       |
| PAT ratio                                      | 0.7 (0.4/0.96)          | 0.5 (0.2, 0.8)                  | 0.7 (0.2, 0.2)       |

Data are presented as median and 25<sup>th</sup>/75<sup>th</sup> percentile for continuous variables and n (percentage) for dichotomous variables.

Abbreviations: BMI, body mass index; FMD, flow mediated dilatation; PAT, peripheral arterial tonometry.
**Supplementary Table 3.** C-indices for the clinical model and vascular function measures in intermediate risk individuals based on SCORE Deutschland (N=3,239)

| Model                                           | C-index (95% Confidence interval) |
|-------------------------------------------------|-----------------------------------|
| Basic model                                     | 0.695 (0.661, 0.752)              |
| Base model + baseline brachial artery diameter  | 0.700 (0.669, 0.758)              |
| Base model + FMD                                | 0.703 (0.672, 0.764)              |
| Base model + In baseline pulse amplitude        | 0.700 (0.671, 0.765)              |
| Base model + PAT ratio                          | 0.696 (0.664, 0.760)              |

Bootstrap analysis with 1000-fold re-sampling was used to correct for over-optimism.

The basic model comprised age, sex, current smoking, body mass index, systolic blood pressure, heart rate, hypertension treatment, diabetes, LDL/HDL cholesterol, lipid treatment, and prevalent cardiovascular disease.
**Supplementary Table 4.** Selected Cox models with ln baseline pulse amplitude

| Beta (95% CI)          | HR (95% confidence interval) | P Value | Predictors                                                                 |
|------------------------|-----------------------------|---------|----------------------------------------------------------------------------|
| 0.4199 (0.3490, 0.4908) | 1.52 (1.42, 1.63)           | <0.001  | ln baseline pulse amplitude                                                |
| 0.3967 (0.3012, 0.4921) | 1.49 (1.35, 1.64)           | <0.001  | ln baseline pulse amplitude, male sex                                     |
| 0.3782 (0.3029, 0.4535) | 1.46 (1.35, 1.57)           | <0.001  | ln baseline pulse amplitude, BMI, BMI²                                     |
| 0.3113 (0.2376, 0.3850) | 1.37 (1.27, 1.47)           | <0.001  | ln baseline pulse amplitude, Systolic BP, Antihypertensive medication      |
| 0.4369 (0.3658, 0.5081) | 1.55 (1.44, 1.66)           | <0.001  | ln baseline pulse amplitude, heart rate                                    |
| 0.4246 (0.3532, 0.4961) | 1.53 (1.42, 1.64)           | <0.001  | ln baseline pulse amplitude, current smoking                              |
| 0.3879 (0.3146, 0.4611) | 1.47 (1.37, 1.59)           | <0.001  | ln baseline pulse amplitude, LDL/HDL, (LDL/HDL)², lipid-lowering medication |
| 0.3505 (0.2781, 0.4228) | 1.42 (1.32, 1.53)           | <0.001  | ln baseline pulse amplitude, diabetes                                     |
| 0.3472 (0.2746, 0.4198) | 1.42 (1.32, 1.52)           | <0.001  | ln baseline pulse amplitude, cardiovascular disease                        |
| 0.1962 (0.1228, 0.2696) | 1.22 (1.13, 1.31)           | <0.001  | ln baseline pulse amplitude, age                                           |
| -0.0014 (-0.0998, 0.0969) | 1.00 (0.91, 1.10)         | 0.98    | ln baseline pulse amplitude, age, male sex                                |

Beta coefficients and hazard ratios (95% confidence interval) are provided. CI stands for confidence interval.
### Supplementary Table 5. Baseline characteristics by prevalent cardiovascular disease status

| Variable                               | No CVD N=12916 | Prevalent CVD N=1946 |
|----------------------------------------|----------------|----------------------|
| Age (years)                            | 54.0 (45.0/63.0) | 63.0 (53.0/69.0)     |
| Women, % (No.)                         | 51.9 (6703/12916) | 34.1 (663/1946)      |
| BMI (kg/m²)                            | 26.4 (23.7/29.7) | 28.3 (25.2/31.5)     |
| Current smoking, % (No.)               | 19.6 (2526/12900) | 18.8 (365/1941)      |
| Diabetes, % (No.)                      | 7.6 (985/12876)  | 19.2 (373/1939)      |
| Dyslipidemia, % (No.)                  | 31.2 (4021/12888) | 55.7 (1081/1941)     |
| Lipid-lowering medication, % (No.)     | 9.5 (1214/12780)  | 37.9 (731/1928)      |
| Hypertension, % (No.)                  | 47.0 (6063/12909) | 67.3 (1309/1945)     |
| Antihypertensive medication, % (No.)   | 26.0 (3359/12914) | 51.3 (998/1945)      |
| Systolic blood pressure (mm Hg)        | 129 (119/141)    | 133 (122/145.5)      |
| Heart rate (bpm)                       | 68 (62/75.5)     | 67.5 (60/76)         |
| CVD risk SCORE                         | 1.0 (0/4.0)      | 3.0 (1.0/6.0)        |

#### Vascular function measures

| Baseline brachial artery diameter (mm) | 4.27 (3.64/4.90) | 4.69 (4.07/5.21) |
| FMD (%)                                | 7.52 (4.67/11.13) | 6.24 (3.90/9.34) |
| Ln baseline pulse amplitude (arbitrary units) | 6.05 (5.33/6.69) | 6.38 (5.71/6.87) |
| PAT ratio                              | 0.68 (0.35/0.95)  | 0.49 (0.19/0.84)   |

Data are presented as median and 25th/75th percentile for continuous variables and percentage (numbers) for dichotomous variables.

Abbreviations: BMI, body mass index; CVD cardiovascular disease; FMD, flow mediated dilatation; PAT, peripheral arterial tonometry.
**Supplementary Table 6.** Vascular function measures in relation to mortality in multivariable-adjusted Cox regression analyses in individuals without manifest cardiovascular disease, N=12916

| Variable                              | Hazard ratio per standard deviation (95% confidence interval) | P value | N events |
|---------------------------------------|---------------------------------------------------------------|---------|----------|
| Baseline brachial artery diameter, mm | 0.95 (0.84, 1.07)                                             | 0.41    | 563      |
| FMD, %                                | 0.99 (0.89, 1.10)                                             | 0.82    | 519      |
| Ln baseline pulse amplitude           | 0.90 (0.81, 1.01)                                             | 0.068   | 470      |
| PAT ratio                             | 1.0 (0.91, 1.11)                                              | 0.94    | 470      |

All models adjusted for age, sex, current smoking, body mass index, systolic blood pressure, heart rate, hypertension treatment, diabetes, LDL/HDL cholesterol and lipid treatment.
Supplementary Figure 1. Survival curves stratified by median vascular function measures for baseline brachial artery diameter, FMD, In baseline pulse amplitude, and PAT ratio for cardiac mortality (N=106). P-values are for the log rank test.
Supplementary Figure 2. Vascular function measures in relation to incident cardiovascular disease in multivariable-adjusted Cox regression analyses in the subgroup of individuals with a low ten-year risk of fatal cardiovascular disease (318 events). Provided are hazard ratios per standard deviation increase in vascular function measure and 95% confidence intervals. Hazard ratios (HR) are per standard deviation (SD).

Age- and sex-adjusted and cardiovascular risk factors (CVRF)-adjusted models are presented. The latter include age, sex, current smoking, body mass index, systolic blood pressure, heart rate, hypertension treatment, diabetes, LDL/HDL cholesterol, and lipid treatment. FMD stands for flow-mediated dilatation, PAT for peripheral arterial tonometry.

| Vascular function measure          | P-value | Adjustment |
|------------------------------------|---------|------------|
| Baseline brachial artery diameter  | 0.0018  | Age and sex|
|                                    |         | CVRF       |
| FMD                                | 0.0023  | Age and sex|
|                                    |         | CVRF       |
| Ln baseline pulse amplitude        | 0.016   | Age and sex|
|                                    |         | CVRF       |
| PAT ratio                          | 0.031   | Age and sex|
|                                    |         | CVRF       |

HR [per SD]
**Supplementary Figure 3.** Vascular function measures in relation to total mortality in multivariable-adjusted Cox regression analyses in the subgroup of individuals with a low ten-year risk of fatal cardiovascular disease (459 events). Provided are hazard ratios per standard deviation increase in vascular function measure and 95% confidence intervals. Hazard ratios (HR) are per standard deviation (SD).

Age- and sex-adjusted and cardiovascular risk factors (CVRF)-adjusted models are presented. The latter include age, sex, current smoking, body mass index, systolic blood pressure, heart rate, hypertension treatment, diabetes, LDL/HDL cholesterol, and lipid treatment. FMD stands for flow-mediated dilatation, PAT for peripheral arterial tonometry.

| Vascular function measure               | P-value | Adjusted | Age and sex | CVRF |
|-----------------------------------------|---------|----------|-------------|------|
| Baseline brachial artery diameter       | 0.34    |          |             |      |
| FMD                                     | 0.87    |          |             |      |
| Ln baseline pulse amplitude             | 0.65    |          |             |      |
| PAT ratio                               | 0.043   |          |             |      |

Hazard ratios (HR) are per standard deviation (SD).
Supplementary Figure 4. Vascular function measures in relation to cardiac mortality in multivariable-adjusted Cox regression analyses in the subgroup of individuals with a low ten-year risk of fatal cardiovascular disease (45 deaths). Provided are hazard ratios (HR) per standard deviation (SD) increase in vascular function measure and 95% confidence intervals.

Age- and sex-adjusted and cardiovascular risk factors (CVRF)-adjusted models are presented. The latter include age, sex, current smoking, body mass index, systolic blood pressure, heart rate, hypertension treatment, diabetes, LDL/HDL cholesterol, lipid treatment, and prevalent cardiovascular disease. FMD stands for flow-mediated dilatation, PAT for peripheral arterial tonometry.
Supplementary Figure 5. Vascular function measures in relation to incident cardiovascular disease in multivariable-adjusted Cox regression analyses in the subgroup of individuals with an intermediate ten-year risk of fatal cardiovascular disease (268 events). Provided are hazard ratios (HR) per standard deviation (SD) increase in vascular function measure and 95% confidence intervals.

Age- and sex-adjusted and cardiovascular risk factors (CVRF)-adjusted models are presented. The latter include age, sex, current smoking, body mass index, systolic blood pressure, heart rate, hypertension treatment, diabetes, LDL/HDL cholesterol, lipid treatment, and prevalent cardiovascular disease. FMD stands for flow-mediated dilatation, PAT for peripheral arterial tonometry.
Supplementary Figure 6. Vascular function measures in relation to mortality in multivariable-adjusted Cox regression analyses in the subgroup of individuals with an intermediate ten-year risk of fatal cardiovascular disease (518 events). Provided are hazard ratios (HR) per standard deviation (SD) increase in vascular function measure and 95% confidence intervals.

Age- and sex-adjusted and cardiovascular risk factors (CVRF)-adjusted models are presented. The latter include age, sex, current smoking, body mass index, systolic blood pressure, heart rate, hypertension treatment, diabetes, LDL/HDL cholesterol, lipid treatment, and prevalent cardiovascular disease. FMD stands for flow-mediated dilatation, PAT for peripheral arterial tonometry.

| Vascular function measure | P-value | Adjusted models |
|---------------------------|---------|-----------------|
| Baseline brachial artery diameter | 0.38 | Age and sex, CVRF |
| FMD | 0.24 | Age and sex, CVRF |
| Ln baseline pulse amplitude | 0.00042 | Age and sex, CVRF |
| PAT ratio | 0.94 | Age and sex, CVRF |

Supplementary Figure 7. Vascular function measures in relation to cardiac mortality in multivariable-adjusted Cox regression analyses in the subgroup of individuals with an intermediate ten-year risk of fatal cardiovascular disease (45 deaths). Provided are hazard ratios (HR) per standard deviation (SD) increase in vascular function measure and 95% confidence intervals.

Age- and sex-adjusted and cardiovascular risk factors (CVRF)-adjusted models are presented. The latter include age, sex, current smoking, body mass index, systolic blood pressure, heart rate, hypertension treatment, diabetes, LDL/HDL cholesterol, lipid treatment, and prevalent cardiovascular disease. FMD stands for flow-mediated dilatation, PAT for peripheral arterial tonometry.
Supplementary Figure 8. Hazard ratios of baseline pulse amplitude plotted against age.

Dashed lines represent 95% confidence intervals. The gray line indicates a hazard ratio of 1.
