Abstract

Aqueous extract of leaves, bark and seeds of Meliaazedarach.L and Thujaorientalis L were assayed at 1, 5 and 10g/L concentration with different time period to check their effect on seed germination, fresh and dry weight and seedling growth of Pennesitiumamericanum L. Result revealed that aqueous extracts of both plants at all concentration and time period had significantly inhibited seed germination off.P.ammericanum L. when compared with control. The inhibitory effect increases with increasing concentration of extracts and time period. The bark extract of all concentration of T.orientalis in 24hr and 48hrs show stimulation in seedling growth while other parts and extracts of all parts of M.azedarachin all concentration and time period show inhibition in all parameters. The order of inhibition when compared different parts of M.azedarach was seeds > bark > leaves while that of T.orientalis was leaves > bark > seeds. Hence it is concluded that aqueous extract of these plants contain water soluble allelochemicals which inhibit the seed germination and seedling growth of P. americanum L. It is suggested that these chemicals may be used as herbicides.

Keywords: Meliaazedarach.L; Thujaorientalis.L; Pennesitiumamericanum.L; Aqueous Extract; Seed Germination; Seedling Growth. Fresh and Dry Weight; Allelochemicals.

1. Introduction

Allelopathy can be defined as the ability of plant to stimulate or inhibit the growth of other plants in the environment by releasing chemicals or Allelopathy can also be defined as any direct or indirect, beneficial or harmful effects of one plant on other through the production of allelochemicals that it release into the environment [9]. Allelopathy is the relationship between plants by means of allelochemicals released into the environment and exists in natural plant community for long time period and it include both promotion and inhibition [13].All parts of plants such as Leaves, Fruits, Stem, seeds and roots contain allelochemicals which are released into the environment by the process of volatilization, root exudation, leaching and decomposition [12]. These chemicals are known to affect development, reproduction, growth, germination and distribution of a number of plant species [14]. Germination and growth inhibitory effects of plants are associated to allelopathy. Allelopathy plays an important role in agro–ecosystem and natural ecosystem and has both stimulatory and inhibitory effect by releasing allelochemicals into the environment [3]. Meliaazedarach L. is an evergreen tree which belongs to family Meliaceae. It is commonly known as chinaberry tree and closely related to neem[7] It is one of most important specie because it contains variety of secondary metabolites such as triterpenoids and lemanoinds. This plant is widely distributed and moderate sizes deciduous tree with cylindrical bark the leaves are opposite and alternate. This plant is widely used medicinally. [9]

Thujaorientalis belongs to family Cupressaceae. It is monoeocious an evergreen tree. This plant contain of phyto constituents such as flavonoids and terpenoids that showed the biological activities [3]. It has great medicinal value. It has antiviral action and immune pharmacological potential [16].

2. Materials and methods

2.1. Extract preparation

One gram, 5g and 10g leaves, stems and seeds of Meliaazedarac L. and Juglanregia L. were extracted in 100 ml of distilled water in separate Erlenmeyer flasks (250 ml) for 24, 48 and 72 h at room temperature. The extracts were filtered through ordinary filter papers. The extracts were stored in air tight glass vials and in a fridge at 4°C till further analysis.

2.2. Germination of seeds

The seeds were germinated on filter paper which was cut in round shape equal to diameter to Petri dish. Twice folded filter paper was placed at the base of Petri dish. Five seeds of P. americanum were placed randomly on filter paper. These Petri dishes were placed in a germinator at 20°C and 20% humidity. For all the treatments the a biotic factors were same. Three replicates were used for each plant and for each extract. In controlled conditions only distilled water was used.

2. Materials and methods

2.1. Extract preparation

One gram, 5g and 10g leaves, stems and seeds of Meliaazedarac L. and Juglanregia L. were extracted in 100 ml of distilled water in separate Erlenmeyer flasks (250 ml) for 24, 48 and 72 h at room temperature. The extracts were filtered through ordinary filter papers. The extracts were stored in air tight glass vials and in a fridge at 4°C till further analysis.

2.2. Germination of seeds

The seeds were germinated on filter paper which was cut in round shape equal to diameter to Petri dish. Twice folded filter paper was placed at the base of Petri dish. Five seeds of P. americanum were placed randomly on filter paper. These Petri dishes were placed in a germinator at 20°C and 20% humidity. For all the treatments the a biotic factors were same. Three replicates were used for each plant and for each extract. In controlled conditions only distilled water was used.
2.3. Measurements of parameters

To determine the allelopathic effects, seed germination, length of plumule and radical, moisture content of seedlings, fresh and dry weight of seedlings of P. americum were noted against different concentrations of extracts. Readings were taken after 7 day. The length of plumule, radical was measured by scale. The fresh and dry weights of seedlings were taken by digital balance. The germination percentage was also calculated by following formula:

\[
\text{Germination percentage} = \frac{\text{Number of germinated seeds}}{\text{Total number of seeds}} \times 100
\]

3. Results

The present study was conducted to check the allelopathic effect of leaves, stem and seeds on germination rate, fresh and dry weight and seedling growth of pennisitumamericanum. The result were

3.1. Leaves extract of thujaorientalis L.

Dried leaves of 1gm, 5gm, 10gm were soaked for 24, 48, 72 hours. These extracts were used for seed treatments. The germination rate of control was 93%. The leaves extract in all concentration and time period show inhibition in germination rate. The fresh and dry weight of control was 0.2g and 0.07g. 1gm aqueous extract of leaf in 48hrs and (5, 10g) in 48hrs show stimulation in seedling growth and fresh and dry weight. (Table 1.1).

| S/n | Treatments | Germination percentage (%) | Fresh weight (g) | Dry weight (g) | Seedling growth Length of radical (cm) | Length of plumule (cm) |
|-----|------------|--------------------------|-----------------|---------------|--------------------------------------|------------------------|

3.2. Aqueous extract of stem

Aqueous extract of stem in all concentration show inhibition in germination percentage and other parameters but some extract 1g in (24hr, 72hr) and 5g in (48hr) show stimulation in seedling growth while other show inhibition in all parameters. (Table 1.2)

3.3. Aqueous extracts of seed

Aqueous extracts of seed also show inhibition in germination rate and other parameters but some extract such as 5g and 1g in (24hr) show increase in fresh and dry weight while other extract show decrease in fresh and dry weight. 1g and 5 g in (24hr, 72hrs) also show stimulation in seedling growth. (Table 1.3)

| S/n | Treatments | Germination percentage (%) | Fresh weight (g) | Dry weight (g) | Seedling growth Length of radical (cm) | Length of plumule (cm) |
|-----|------------|--------------------------|-----------------|---------------|--------------------------------------|------------------------|

3.4. Melia azedarach L.

3.4.1. Aqueous extract of leaves

The leaves extract of M. azedarach in all concentration in time period of 72h showed 0% germination. While in other time period showed inhibition in all parameters. (Table 1.4)

Table 1.4: Effect of Aqueous Extract of Leaves of M. Azedarach on Seed Germination, Seedling Growth and Fresh and Dry Weight of P. Americanum.

| s/n | Treatments | Germination percentage (%) | Fresh weight (g) | Dry weight (g) | Length of radical (cm) | Length of plumule (cm) | Seedling growth |
|-----|-------------|----------------------------|-----------------|----------------|------------------------|------------------------|-----------------|
| 1   | Control     | 93                         | 0.2             | 0.07           | 4.1 ± 1.7              | 1.6 ± 0.2              |                 |
| 2   | 1gm         |                            | 47              | 0.04           | 0.6 ± 0.4             | 0.13 ± 0.02            |                 |

3.4.3. Aqueous extracts of seeds

The aqueous extracts of seeds of M. azedarach in all concentrations and time period showed 0% germination.

4. Discussion

Allopathy is the ability of plant to stimulate or inhibit the growth of plants by secreting many chemicals in the environment [10]. The allelopathic potential of aqueous extracts of different parts of both plants at different concentration and time period was evaluated on seed germination percentage, fresh and dry weight and seedling growth of P. americanum. All aqueous extract of M. azedarach markedly inhibited all parameters but inhibitory effect increases with increasing concentration and time period. Aqueous extract of seed had more inhibitory effect than other parts when compared. The chemicals which show allelopathic activity are present in different parts of plants including stem, leaves, flowers, seeds and fruits. These chemicals are released into the environment by means of leaching, root exudation, decomposition of residue and volatilization [8].

Aqueous extract of leaves and stem of Calotropis procera had inhibitory effect on seedling growth, germination and fresh and dry weight of Pennisetum americanum L. Both plants showed inhibition in seed germination. Melia azedarach L. showed more inhibition than other plants. Seedling growth is not equally affected by all plants. Thujaorientalis L. in some concentration showed stimulation in seedling growth. Leaves and stem extract of Rhazyastrica also inhabit germination rate and seedling growth of P. americanum L. Leaves had more inhibitory effect than stem [5]. The aqueous extract of seeds, leaves and stem of Melia azedarach L. in all concentrations (1gm, 5gm, 10gm) showed inhibitory effect on all parameters of Pennisetum americanum L which increases with increasing concentration of extract. The order of inhibition was seed > leaves > stem.

Alcoholic and aqueous extract of different parts (fruits, leaves and wood mix) of Melia azedarach L reduced seedling growth as well as germination rate of Luctca sativa. Rate of inhibition varied with extract type and its concentration and order of inhibition was fruit extract > leaves extract > leaves and wood mix extract [7].

Aqueous extracts of seeds of M. azedarach L. showed complete inhibition in all concentrations. The percentage of germination is zero (0) in all concentrations. Inhibitory effect is due to water soluble allelochemicals. The aqueous extract of stem, leaves and seeds of T. orientales L. reduced germination percentage and fresh and dry weight of Pennisetum americanum L but show stimulation in seedling growth.

Leaves extract of T. orientales L in all concentrations and stem extract in 48hrs and 24hrs showed stimulation in seedling growth. The order of inhibition when compared to different parts of plant was leaves > stem > seeds. M. azedarach had more allelopathic effect than T. orientalis L. Results showed that both plants contain allelochemicals which show inhibitory effect against P. americanum.

5. Conclusion

From the present study it is concluded that Melia azedarach L. and Thujaorientalis L. have allelochemicals which are secondary metabolites. These chemicals inhibit the seed germination, fresh and dry weight and seedling growth of Pennisetum americanum L by affecting their respiration, cell division and different metabolic activities. M. azedarach L. has strong allelopathic potential. Plants show inhibitory effect due to water soluble allelochemicals present in their aqueous extracts. It can be used as herbicides for weed management.
