2022. Antibiotic Prescribing Behavior Among Surgeon
Anucha Apsisarnthanarak, MD; Kittiya Jantharaboonwatt, PharmD; Sirithin Chassananonta, MD; Siriporn Tidwong, PharmD; Linda Mundy, MD, PhD; Thammasat University Hospital, Pathum Thani, Thailand; Bryn Mawr, Pennsylvania, Pennsylvania

Session: 236. Antibiotic Stewardship: Global
Saturday, October 5, 2019: 12:15 PM

Background. A comparative study was conducted to evaluate prescribed antibiotic (AB) use in surgical patients with the Transtheoretical Model of Behavior (TTM) and Theory of Planned Behavior (TPB).

Methods. A survey was conducted at Thammasat University Hospital from January 1 to 31, 2019. We evaluated the appropriateness of AB use in the surgical department reported per the hospital's Drug Use Evaluation (DUE) form. After review of the DUE forms, 70% of cases were conducted to explore antibiotic prescribing behavior based on TTM vs. TPB, using a standardized data collection tool. Data collected included demographics, indications, appropriateness of AB use, the individual prescriber's behavior based on TTM and TPB. The five TTM stages of change were categorized precontemplation, contemplation, preparation, action, and maintenance. In TPB assessment, we evaluated attitude toward AB uses, subjective norm to AB use behavior, and perceived behavior control of AB uses behavior.

Results. There were 92 AB uses from 64 prescriptions; 70 (70/92; 76%) used antibiotics appropriately. The majority of AB uses (62/92; 67%) were for treatment of infections. The most common reasons for inappropriate AB uses included inappropriate AB choices for treatment and prophylaxis of SSIs (n = 11, 50%) and inappropriate duration (n = 8, 36%). Physicians categorized in higher stages of TTM (action and maintenance) were strongly correlated with appropriate AB uses, while there was no correlation between the total TPR score and appropriate AB uses. By multivariate analysis, the TTM stages of change (P = 0.04), subjective norm (P = 0.003) and antibiotic prescriptions for surgical prophylaxis (OR = 0.15; P < 0.001) were associated with appropriate AB uses, while there was no correlation between the total TPB score and appropriate AB uses, while there was no correlation between the total TPB score and appropriate AB uses.

Conclusion. Antibiotic prescribers categorized by TTM stages strongly correlated with appropriate AB uses. Additional studies to assess appropriate AB prescribing behavior, based on TTM stages of change, offer an opportunity to optimize surgical care.

2023. Antimicrobial Resistance and Stewardship Knowledge and Perception among Medical and Pharmacy Students in Nigeria
Chukwuemeka Michael Ubaka, PhD; Natalie Schellack, PhD; Benedict Nwomeh, MD, MPH; Debra A. Goff, PharmD; University of Nigeria, Nsukka, Enugu, Nigeria; Sedofo Makatho Health Sciences University, Medunsa, Gauteng, South Africa; National Children's Hospital, Columbus, Ohio; The Ohio State University Wexner Medical Center, Columbus, Ohio

Session: 236. Antibiotic Stewardship: Global
Saturday, October 5, 2019: 12:15 PM

Background. Nigeria is the most populous country in Africa and has high rates of antimicrobial resistance (AMR). The practice of antimicrobial stewardship in Nigerian hospitals is very limited and the subject is rarely included in undergraduate medical and pharmacy curriculums. To further acceptance and implementation of antimicrobial stewardship programs (ASPs) in Nigeria health system, baseline measurements of the knowledge and perceptions held by graduating medical and pharmacy students towards AMR and ASPs were conducted.

Methods. The study was a cross-sectional questionnaire-based study of final year medical and pharmacy students from the two largest schools in the southeastern region of Nigeria. A previously published 20-items questionnaire measuring knowledge and perceptions toward AMR and ASPs was adopted for the study. Results: Results were expressed in frequencies and percentages.

Results. Completed questionnaires were received from 79.3% (361 of 455 students), of which 63% (226) were males. More pharmacy students had formal training on ASP compared with medical students (P < 0.01). Overall, appropriate prescription rate significantly increased from 24.7% (321/544) to 77.4% (421/544) (P < 0.01). The rate of unnecessary and inappropriate discharge antimicrobial prescription accounted for 27.5% (428/1,555) and 21.7% (337/1,555) to 8.5% (46/544) and 10.7% (58/544), respectively. A substantial improvement in discharge antimicrobial prescription against intra-abdominal infections and odontogenic infections during the intervention period was observed (changes in the proportion of appropriate prescription was 0.37 [P < 0.01] and 0.51 [P < 0.01], respectively.

Conclusion. An evidence-based, multifaceted intervention led to decreasing unnecessary prescription and optimizing physicians' antimicrobial prescriptions at the ED.

2025. Evaluation of the Impact of an Antimicrobial Stewardship Program in a Tertiary Hospital in Northern Italy: Efficacy of a Persuasive Approach on Antibiotics Consumption and Rate of Clostridium difficile Infection
Erica Chiari, MD; Davide Mangioni, MD; Ester Pollastri, MD; Laura Signorini, MD; Giovanni Miolesi, MD; Giuseppe Parainfio, MD; Evelyn Van Hauwermeiren, MD; Barbara Saccani, MD; Davide Bertelli, MD; Elena Festa, Pharmacist; Armando Caruso, MD; Roberta Stellini, MD; Francesca Castelli, MD; Department of Infectious and Tropical Diseases, Spedali Civili, Brescia, Italy; Infectious Diseases Unit, Department of Internal Medicine, Fondazione IRCCS Ca' Granda Ospedale Maggiore Policlinico, Milan, Italy; Infectious Diseases Unit, Department of Internal Medicine, Fondazione IRCCS Ca' Granda Ospedale Maggiore Policlinico, Brescia, Lombardia, Italy; Department of Microbiology and Virology, Spedali Civili, Brescia, Lombardia, Italy

Session: 236. Antibiotic Stewardship: Global
Saturday, October 5, 2019: 12:15 PM

Background. Antimicrobial resistance (AMR) situation in Italian hospitals and regions represents a major public health threat [ECDC, 2017]. Antimicrobial stewardship programs (ASPs), particularly when based on local epidemiology, have been beneficial in optimizing antibiotic therapy as well as reducing hospital rates of Clostridium difficile infection (CDI) and AMR [Apkan MR, Antibiotics 2016].

Methods. Our ASP program has been conducted at Spedali Civili General Hospital of Brescia, Northern Italy (1300-bed tertiary hospital), between the beginning of 2016 and the end of 2017. A preliminary analysis of local epidemiological data was performed (Table 1). Seven groups (“districts”) were identified according to microbiological and clinical similarities. This was a persuasive-based ASP. First, we trained physicians on general principles of AS, then guidelines for the management of “difficult-to-handle” infections were drafted based on international guidelines and local microbiological data (Table 2).

Results. Here we show the results of pre-ASP (2015) vs. post-ASP (2018) analysis on antibiotic consumption (AC) and CDI rates. AC is expressed in DDD/100 bed-days. The overall hospital AC decreased from 84.31 to 76.84 (%), consistently with national recommendations [Italian National Plan against AMR, 2017]. In accordance with the local guidelines developed within our ASP, carbapenem consumption decreased from 5.77 to 4.87 (~16%) and fluoroquinolones (FLQ) from 14.45 to 9.94 (−31%). At the same time piperacillin/tazobactam use increased from 5.53 to 8.46 (53%). 3°–4°G cephalosporins and glycopeptides consumption slightly reduced from 11.78 to 11.42 (~3%) and from 4.07 to 3.83 (~6%), respectively. AC of the different districts involved is reported in Table 3. CDI rates decreased from 0.0434/100 bed-days in 2015 to 0.0315/100 bed-days in 2018 (~27%) (Figure 1).

Conclusion. Our ASP was a persuasive-based program in a setting of high AMR rates. In short term, it has shown a positive impact in improving AC (in particular of broad-spectrum antibiotics with a high risk of resistance selection and CDI) and CDI rates. Audits for local guidelines adherence and the evaluation of AC, AMR and CDI rates are ongoing as long-term quality measures for assessing the impact of our ASP.
