1. General Information

Commercial reagents were purchased from Aldrich, TCI, Energy Chemical and J&K chemical, and were used as received. Solvents were purchased from Sinopharm Chemical Reagent Co., Ltd, and used as received. All reactions were carried out under an atmosphere of nitrogen unless otherwise noted. Chromatographic purification of products was accomplished by flash chromatography using silica gel. Thin-layer chromatography (TLC) was performed on Silicycle 250 mm silica gel F-254 plates. $^1$H, $^{19}$F NMR, and $^{13}$C NMR spectra were recorded on Bruker 400 (400, 376, and 100 MHz) and Bruker 600 (600, 564, and 150 MHz), and are internally referenced to residual solvent signals (for CDCl$_3$, $\delta$ 7.26 and 77.0 ppm). Data for $^1$H NMR and $^{19}$F NMR are reported as follows: chemical shift ($\delta$ ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, br = broad), integration, coupling constant (Hz). $^{13}$C spectra were reported as chemical shifts in ppm and multiplicity where appropriate. High resolution mass spectra were obtained at Shanghai Institute of Organic Chemistry mass spectrometry facilities. All alkenes were used from commercial suppliers or prepared using standard literature procedures.
2. Substrate preparations and characterizations

was prepared according to a literature procedure: The solution of (4-Vinylphenyl) methanol (1 mmol, 134 mg), 2-(1-(4-chlorobenzoyl)-5-methoxy-2-methyl-1\(^H\)-indol-3-yl)acetic acid (1 mmol), dicyclohexylmethanedimine (DCC) (1.2 mmol, 247 mg) and \(N,N\)-dimethylpyridin-4-amine (DMAP) (1.2 mmol, 146 mg) in DCM (10 mL) was stirred at room temperature for overnight. The reaction mixture was diluted with dichloromethane, and then washed with water. The organic layer was dried over anhydrous magnesium sulfate, and concentrated in vacuo. The residue was purified by column chromatograph (PE: EA = 5:1) to afford the product as a white solid (203.0 mg, 42%).

4.4 Stern-Volmer fluorescence quenching studies.

(a) Absorption and emission spectroscopy

UV-vis spectra were collected on an Agilent Cary 5000 spectrophotometer. Emission spectra was collected on a Fluorolog-3 spectrofluorometer. All samples were degassed with a stream of argon for 10 minutes, then excited at 375 nm.

The concentration of HE is $1\times10^{-5}$ M. The emission intensity at 442 nm was collected with excited wavelength of 373 nm in DMSO using a Shimadzu RF-5301pc spectrofluorophotometer. After degassing the sample with a stream of argon for 10-15 minutes, plots were constructed according to the Ster-Volmer equation $I_0/I = 1 + kq t_0[Q]$.
