Abstract

Previous studies have shown links between heavy metals and many health issues. However, data on the association between heavy metals and mortality in the general population are still limited. Therefore, the aim of this study was to investigate the relationship between heavy metals and overall mortality in the general population. We enrolled 2,497 participants (1,001 males and 1,496 females) living in southern Taiwan, and measured levels of seven heavy metals: lead (Pb) in blood and cadmium (Cd), nickel (Ni), copper (Cu), chromium (Cr), manganese (Mn) and arsenic (As) in urine. The median follow-up period was 41.8 (4-50) months, during which 40 (1.6%) patients died. Compared to the participants who survived, those who died had higher urine Cd, higher urine Cu and lower urine Mn levels. Multivariate analysis showed that high urine Cd (per 1 mg/L; hazard ratio [HR], 1.352; 95% confidence interval [CI], 1.089-1.680; \(p = 0.006\)), high urine Cu (per 1 mg/dL; HR, 1.350; 95% CI, 1.151-1.583; \(p < 0.001\)), and low urine Mn (per 1 mg/L; HR, 0.717; 95% CI, 0.557-0.923; \(p = 0.010\)) were associated with increased overall mortality. In conclusion, our results demonstrated that high levels of urine Cd and Cu and low urine Mn level were associated with increased overall mortality in general population.

Introduction

Heavy metals are defined as metallic elements that have a relatively high density compared to water. Some metals such as zinc, copper (Cu), iron, manganese (Mn), and cobalt are required for various biochemical and physiological functions in humans at low concentrations, but they become toxic at higher concentrations. Other heavy metals such as lead (Pb), mercury, and cadmium (Cd) are not known to have any beneficial effects on human health and their accumulation in the human body is deleterious to human health(Rehman et al. 2018). Heavy metals are common environmental contaminants and toxicity due to heavy metals is a growing concern(Jaishankar et al. 2014). Heavy metals can disrupt metabolic functions through various mechanisms and their toxicity depends on factors such as dose, chemical form, and route of exposure, in addition to age, sex, and nutritional and genetic status of the exposed individual(Tchounwou et al. 2012). Moreover, heavy metals can accumulate in organs such as liver, heart, kidneys, and brain and disrupt normal biological functions.

Some heavy metals such as arsenic (As), Cd, chromium (Cr), Pb, and mercury, are systemic toxicants, which have been shown to cause adverse health effects in humans, including developmental abnormalities, cardiovascular diseases, renal injury, neurologic and neurobehavioral disorders, diabetes, hematologic and immunologic disorders, and various types of cancer(Tchounwou et al. 2012). Heavy metal-induced toxicity has been shown to be through the production of reactive oxygen species, resulting in oxidative damage and adverse effects on health(Rehman et al. 2018). Previous studies have reported associations between mortality and various heavy metals. For example, Pb exposure has been shown to be a risk factor for cardiovascular mortality and even a low blood Pb concentration has been associated with increased risks of all-cause mortality, cardiovascular disease, and cancer(Byun et al. 2020; Lanphear et al. 2018; Lustberg and Silbergeld 2002; Schober et al. 2006). In addition, exposure to low concentrations of Cd has also been associated with increased risks of overall and cardiovascular
mortality (Larsson and Wolk 2016; Menke et al. 2009; Tellez-Plaza et al. 2012; Wang et al. 2011). For nickel (Ni), increased rates of mortality and cancer have been reported in Ni workers and people living in highly polluted environments (Chen et al. 2015; Huang et al. 2013; Khlifi et al. 2013; Lightfoot et al. 2010). Chronic As exposure through contaminated drinking water has also been associated with increase all-cause and chronic disease-related mortality (Argos et al. 2010; Meliker et al. 2007). In addition, several studies have reported potential associations between high serum Cu concentrations and increased overall, cancer, and cardiovascular-related mortality (Eshak et al. 2018; Grammer et al. 2014; Leone et al. 2006; Wu et al. 2004).

Although the effects of heavy metals on human health have been widely discussed in the literature, studies on the effect of heavy metal concentrations within relative normal limits on mortality in the general population are still limited. Therefore, the aim of this study was to investigate the relationships between heavy metals, including Pb in blood, and Cd, Ni, Cu, Cr, Mn, and As in urine with overall mortality in people living in southern Taiwan.

**Materials And Methods**

**Subject Recruitment**

We conducted a health survey from June 2016 to September 2018 in southern Taiwan, which was promoted thorough advertisements. All subjects who attended the health survey and were willing to participate in this study were enrolled. Subsequently, they all underwent physical examinations and an experienced physician recorded their clinical histories. Anthropometric measurements including systolic blood pressure, diastolic blood pressure, and weight and height were taken.

**Ethics Statement**

The study protocol was approved by the Institutional Review Board of Kaohsiung Medical University Hospital (number: KMUHIRB-G(II)-20190011).

All participants provided informed consent before study enrollment.

**Collection of Demographic, Medical, and Laboratory Data**

In addition to the anthropometric measurements, the following variables were recorded at baseline: demographics (age and sex), medical history (diabetes mellitus [DM], hypertension, hyperlipidemia, and laboratory data (fasting glucose, serum creatinine, triglycerides, total cholesterol, high [HDL]- and low density lipoprotein [LDL]-cholesterol). Body mass index (BMI) was calculated as weight/height squared (kg/m²).

**Measurement of Blood and Urine Heavy Metal Concentrations**
The concentrations of seven heavy metals (Pb in blood and Cd, Ni, Cu, Cr, Mn, and As in urine) were measured using graphite furnace atomic absorption spectrometry (ICP-MS, NexION 300 Series, Perkin Elmer). Details of this analysis have been reported by the National Institute of Environmental Research.

### Definition of Overall Mortality

Data on overall mortality were collected from the Collaboration Center of Health Information Application (CCHIA), Ministry of Health and Welfare, Executive Yuan, Taiwan, up to July 2020.

### Statistical Analysis

Statistical analysis was performed using SPSS version 22.0 for Windows (SPSS Inc. Chicago, USA). Data were expressed as percentages, means ± standard deviations, or medians (25th – 75th percentiles) for heavy metals. Between-group differences in categorical variables were analyzed using the chi-square test and between-group differences in continuous variables were analyzed using the independent t test. Multivariate Cox proportional hazard analysis was used to identify associations between the heavy metals and overall mortality. Significant variables in univariate analysis were entered into the multivariate analysis. A $p$ value of less than 0.05 was considered to indicate a statistically significant difference.

### Results

The mean age of the 2,497 participants (1,001 males and 1,496 females) was 54.3 ± 14.0 years. A comparison of the clinical characteristics between the survivors and non-survivors is shown in Table 1. Compared to the survivors, the non-survivors were older and had higher prevalence rates of DM and hypertension, a higher level of creatinine, and lower level of LDL-cholesterol. In addition, the non-survivors had higher urinary concentrations of Cd and Cu and a lower urinary concentration of Mn.
Table 1
Comparison of clinical characteristics between the survivors and non-survivors

| Characteristics         | All (n = 2,497) | Survival (n = 2,457) | Death (n = 40) | p    |
|-------------------------|-----------------|----------------------|----------------|------|
| Age (year)              | 54.3 ± 14.0     | 54.1 ± 14.0          | 69.1 ± 11.4    | < 0.001 |
| Male gender (%)         | 40.1            | 40.0                 | 45.0           | 0.523 |
| DM (%)                  | 10.3            | 9.9                  | 32.5           | 0.005 |
| Hypertension (%)        | 24.8            | 24.3                 | 55.0           | < 0.001 |
| Hyperlipidemia (%)      | 2.2             | 2.2                  | 2.5            | 0.912 |
| BMI (kg/m²)             | 25.0 ± 3.9      | 25.0 ± 3.9           | 25.2 ± 4.5     | 0.834 |
| SBP (mmHg)              | 131.8 ± 19.8    | 131.7 ± 19.7         | 137.2 ± 21.3   | 0.083 |
| DBP (mmHg)              | 77.4 ± 11.7     | 77.4 ± 11.7          | 78.1 ± 11.6    | 0.691 |
| Laboratory parameters   |                 |                      |                |      |
| Fasting glucose (mg/dL) | 99.6 ± 27.2     | 99.5 ± 27.1          | 106.9 ± 31.7   | 0.087 |
| Serum Creatinine (mg/dL)| 0.95 ± 0.29     | 0.94 ± 0.28          | 1.18 ± 0.53    | 0.007 |

Abbreviations. DM, diabetes mellitus; BMI, body mass index; SBP, systolic blood pressure; DBP, diastolic blood pressure; HDL, high-density lipoprotein; LDL, low-density lipoprotein; Pb, lead; Cd, cadmium; Ni, nickel; Cu, copper; Cr, chromium; Mn, manganese; As, arsenic.
Predictors of Overall Mortality

The median follow-up period was 41.8 (range 4–50) months for all participants, during which 40 (1.6%) patients died. Table 2 shows the associations among demographic, medical, laboratory, and heavy metal data with overall mortality. In the univariate analysis, old age (per 1 year; hazard ratio [HR], 1.097; 95% confidence interval [CI], 1.066–1.128; \( p < 0.001 \)), DM (HR, 4.049; 95% CI, 2.089–7.848; \( p < 0.001 \)), hypertension (HR, 3.478; 95% CI, 1.865–6.485; \( p < 0.001 \)), high serum creatinine (per 1 mg/dL; HR, 1.998; 95% CI, 1.482–2.695; \( p < 0.001 \)), low LDL-cholesterol (per 1 mg/dL; HR, 0.990; 95% CI, 0.980–0.999; \( p = 0.037 \)), high urine Cd (per 1 µg/L; HR, 1.290; 95% CI, 1.070–1.554; \( p = 0.008 \)), high urine Cu (per 1 µg/dL; HR, 1.378; 95% CI, 1.241–1.549; \( p < 0.001 \)), and low urine Mn (per 1 µg/L; HR, 0.726; 95% CI, 0.567–0.930; \( p = 0.011 \)) were associated with increased overall mortality.
### Table 2

Predictors of overall mortality using Cox proportional hazards model

| Parameters                  | Univariable analysis |  |
|-----------------------------|----------------------|---|
| **HR (95% CI)**             | **p**                |   |
| **Age (per 1 year)**        | 1.097 (1.066–1.128)  | < 0.001 |
| **Male (vs. female)**       | 1.259 (0.675–2.347)  | 0.469 |
| **DM**                      | 4.049 (2.089–7.848)  | < 0.001 |
| **Hypertension**            | 3.478 (1.865–6.485)  | < 0.001 |
| **Hyperlipidemia**          | 1.193 (0.164–8.685)  | 0.862 |
| **BMI (per 1 kg/m^2)**      | 1.007 (0.929–1.090)  | 0.873 |
| **SBP (per 1 mmHg)**        | 1.012 (0.998–1.027)  | 0.090 |
| **DBP (per 1 mmHg)**        | 1.007 (0.981–1.033)  | 0.615 |
| **Labortaory data**         |                      |   |
| **Fasting glucose (per 1 mg/dL)** | 1.006 (0.998–1.014) | 0.141 |
| **Creatinine (per 1 mg/dL)** | 1.998 (1.482–2.695)  | < 0.001 |
| **Total cholesterol (per 1 mg/dL)** | 0.994 (0.985–1.002) | 0.155 |
| **Triglyceride (per 1 mg/dL)** | 1.001 (0.999–1.003) | 0.366 |
| **HDL-cholesterol (per 1 mg/dL)** | 0.986 (0.962–1.010) | 0.254 |
| **LDL-cholesterol (per 1 mg/dL)** | 0.990 (0.980–0.999) | 0.037 |
| **Blood**                   |                      |   |
| **Pb (per 1 µg/dL)**        | 1.067 (0.931–1.222)  | 0.350 |
| **Urine**                   |                      |   |
| **Cd (per 1 µg/L)**         | 1.290 (1.070–1.554)  | 0.008 |
| **Ni (per 1 µg/L)**         | 1.001 (0.989–1.013)  | 0.866 |
| **Cu (per 1 µg/dL)**        | 1.378 (1.241–1.529)  | < 0.001 |
| **Cr (per 1 µg/L)**         | 1.101 (0.534–2.268)  | 0.795 |
| **Mn (per 1 µg/L)**         | 0.726 (0.567–0.930)  | 0.011 |
| **As (per 1 µg/L)**         | 1.001 (1.000-1.003)  | 0.127 |

Values expressed as hazard ratio (HR) and 95% confidence interval (CI). Abbreviations are the same as in Table 1.
In the multivariate Cox proportional hazard analysis, after adjusting for age, DM, hypertension, serum creatinine, and LDL-cholesterol, high urine Cd (per 1 µg/L; HR, 1.352; 95% CI, 1.089–1.680; \( p = 0.006 \)), high urine Cu (per 1 µg/dL; HR, 1.350; 95% CI, 1.151–1.583; \( p < 0.001 \)), and low urine Mn (per 1 µg/L; HR, 0.717; 95% CI, 0.557–0.923; \( p = 0.010 \)) were significantly associated with increased overall mortality (Table 3).

**Table 3**

Association of heavy metals with overall mortality using multivariate Cox proportional hazards model

| Heavy metals | Multivariable |             |
|--------------|--------------|-------------|
|              | HR (95% CI)  | \( p \)     |
| Blood        |              |             |
| Pb (per 1 µg/dL) | 1.024 (0.865–1.231) | 0.780       |
| Urine        |              |             |
| Cd (per 1 µg/L)  | 1.352 (1.089–1.680) | 0.006       |
| Ni (per 1 µg/L)   | 1.004 (0.990–1.018) | 0.599       |
| Cu (per 1 µg/dL) | 1.350 (1.151–1.583) | < 0.001     |
| Cr (per 1 µg/L)   | 1.015 (0.513–2.009) | 0.966       |
| Mn (per 1 µg/L)   | 0.717 (0.557–0.923) | 0.010       |
| As (per 1 µg/L)   | 1.001 (0.999–1.003) | 0.424       |

Values expressed as hazard ratio (HR) and 95% confidence interval (CI). Abbreviations are the same as in Table 1.

Covariates in the multivariable model included age, sex, DM, hypertension, creatinine, and LDL-cholesterol.

**Discussion**

In this study, we evaluated the relationships between heavy metals and overall mortality in 2,497 participants living in southern Taiwan and found that high urine Cd, high urine Cu, and low urine Mn were associated with increased overall mortality.

The first important finding of this study is that high urine Cd was associated with increased overall mortality. Cd is a non-essential nutrient and an extremely toxic industrial and environmental pollutant which is classified as a human carcinogen (Faroon et al. 2012). Cigarette smoke is a major source of Cd exposure and food is the major source of Cd exposure in non-smokers (Genchi et al. 2020). Cd compounds are mainly used in re-chargeable Ni-Cd batteries and emissions of Cd have increased substantially in the 20th century (Jarup 2003). As urinary Cd excretion is slow, Cd accumulates in the body, particularly in the kidneys and liver, with a reported biological half-life of 10–30 years (Faroon et al. 2012). Chronic Cd toxicity has been associated with renal tubular dysfunction, reduced bone mineral
density, normochromic anemia, and some cancers (Jarup 2002). In the present study, we found that high urine Cd was associated with increased overall mortality, which is consistent with previous studies (Larsson and Wolk 2016; Menke et al. 2009; Ruiz-Hernandez et al. 2017; Tellez-Plaza et al. 2012; Wang et al. 2011). There is no margin of safety between exposure and the point of departure in the general population, and therefore it is important to limit exposure to Cd as far as possible (Jarup and Akesson 2009).

The second important finding of this study is that high urine Cu was correlated with increased overall mortality. Cu is common in the environment and an essential nutrient. Cu acts as a critical cofactor and plays important roles in many metalloenzymes involved in drug metabolism, hemoglobin formation, pigment formation, cellular respiration, iron oxidation, carbohydrate metabolism, catecholamine biosynthesis, connective tissue formation, and antioxidant defense mechanisms (Dorsey and Ingerman 2004; Madsen and Gitlin 2007). The most common routes of exposure to Cu in humans are through inhalation, oral intake, and dermal contact, but mainly through food. Cu is taken up by the liver and excreted in bile or secreted into plasma (Gaetke and Chow 2003). The most sensitive adverse effect of excess exposure to Cu is gastrointestinal tract irritation, causing acute nausea, vomiting, and diarrhea (Taylor et al. 2020). At higher doses, Cu toxicity can cause headache, gastrointestinal hemorrhage, hemolytic anemia, and liver and kidney failure (Scheiber et al. 2013). Cu is not known to be carcinogenic or mutagenic or to have reproductive or in utero effects (Taylor et al. 2020). On the other hand, Cu deficiency can cause anemia, leucopenia, and myeloneuropathy (Wazir and Ghobrial 2017). In the present study, high urine Cu was associated with an increase in mortality, which is consistent with previous studies (Eshak et al. 2018; Grammer et al. 2014; Leone et al. 2006; Wu et al. 2004). The mechanism for this increase in mortality is unclear, however it may be related to increased inflammation, oxidative stress, or the metabolic syndrome (Bo et al. 2008; Wen et al. 2020). High concentrations of Cu have been shown to potentially cause oxidative damage to proteins, lipids, and DNA and also to play a role in neurodegenerative disorders (Gaetke and Chow 2003).

Another important finding of this study is that low urine Mn was associated with increased overall mortality. Mn is an essential nutrient that plays a role in growth and tissue formation, metabolism, and reproduction (Chen et al. 2018; Wu et al. 2017). Mn is mainly absorbed through the gastrointestinal tract, but also through inhalation and intravenous routes (O'Neal and Zheng 2015). Mn is primarily eliminated via fecal hepatobiliary excretion and to a lesser extent urinary excretion. Mn deficiency is rare and is related to reduced fertility, deficient bone formation, impaired growth, skeletal defects, birth defects, altered lipid and carbohydrate metabolism, and abnormal glucose tolerance in both animals and humans (Li and Yang 2018). Mn is a cofactor in various enzymes and plays crucial roles in reproduction, development, digestion, energy production, antioxidant defense, regulation of neuronal activities, and immune responses (Chen et al. 2018), which may partially explain our present finding, i.e. low urine Mn was associated with increased overall mortality.

There are several limitations to this study. First, the follow-up period was relatively short, and a longer follow-up period may provide a better understanding of the associations between heavy metal
concentrations and mortality. Nevertheless, our findings highlight the important link between heavy metals and mortality. Second, we could not identify the sources or routes of heavy metal exposure in our study cohort. Even though we measured blood and urinary concentrations of the heavy metals and obtained serum biochemical data, different exposure methods and routes may have different effects. Finally, we measured total As concentrations but could not measure level of inorganic As in urine due to limitations in our equipment, and this may have led to an underestimation of the contribution of As on mortality.

In conclusion, our results demonstrated that in general population, high urine Cd and Cu and low urine Mn were associated with increased overall mortality.

The datasets used and analyzed during the current study are available from the corresponding author on reasonable request.

Competing interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Funding

The research presented in this article is supported by the grant from Kaohsiung Municipal Hsiao-Kang Hospital (kmhk-109-008), Kaohsiung Medical University, Kaohsiung, Taiwan.

Acknowledgements

Mortality data were provided by the Collaboration Center of Health Information Application, Ministry of Health and Welfare, Executive Yuan.
Author’s contributions

Yi-Hsueh Liu reviewed the articles and wrote the manuscript. Chih-Wen Wang, Da-Wei Wu, and Wen-Hsien Lee analyzed and interpreted the data. Ying-Chih Chen, Chiu-Hui Li, Chun-Chi Tsai, and Wen-Yi Lin provided consultation and validation. Szu-Chia Chen, Chih-Hsing Hung, and Chao-Hung Kuo supervised the work. Ho-Ming Su revised the manuscript draft and the final version of the submitted manuscript. All authors read and approved the final manuscript.

Table 1. Comparison of clinical characteristics between the survivors and non-survivors

| Characteristics          | All (n = 2,497) | Survival (n = 2,457) | Death (n = 40) | p      |
|--------------------------|-----------------|----------------------|----------------|--------|
| Age (year)               | 54.3 ± 14.0     | 54.1 ± 14.0          | 69.1 ± 11.4    | <0.001 |
| Male gender (%)          | 40.1            | 40.0                 | 45.0           | 0.523  |
| DM (%)                   | 10.3            | 9.9                  | 32.5           | 0.005  |
| Hypertension (%)         | 24.8            | 24.3                 | 55.0           | <0.001 |
| Hyperlipidemia (%)       | 2.2             | 2.2                  | 2.5            | 0.001  |
| BMI (kg/m²)              | 25.0 ± 3.9      | 25.0 ± 3.9           | 25.2 ± 4.5     | 0.834  |
| SBP (mmHg)               | 131.8 ± 19.8    | 131.7 ± 19.7         | 137.2 ± 21.3   | 0.083  |
| DBP (mmHg)               | 77.4 ± 11.7     | 77.4 ± 11.7          | 78.1 ± 11.6    | 0.691  |
| Laboratory parameters    |                |                      |                |        |
| Fasting glucose (mg/dL)  | 99.6 ± 27.2     | 99.5 ± 27.1          | 106.9 ± 31.7   | 0.087  |
| Serum Creatinine (mg/dL) | 0.95 ± 0.29     | 0.94 ± 0.28          | 1.18 ± 0.53    | 0.007  |
| Triglyceride (mg/dL)     | 126.1 ± 97.4    | 126.0 ± 97.3         | 138.2 ± 100.2  | 0.428  |
| Total cholesterol (mg/dL)| 199.2 ± 37.5    | 199.3 ± 37.4         | 191.4 ± 43.3   | 0.186  |
| HDL-cholesterol (mg/dL)  | 53.0 ± 13.6     | 53.0 ± 13.6          | 50.5 ± 15.4    | 0.237  |
| LDL-cholesterol (mg/dL)  | 118.9 ± 34.0    | 119.1 ± 33.9         | 108.4 ± 36.1   | 0.048  |
| Blood Pb (mg/dL)         | 1.5 (1.0-2.2)   | 1.8 (1.0-2.2)        | 2.1 (1.3-2.8)  | 0.201  |
| Urine Cd (mg/L)          | 0.8 (0.3-1.4)   | 1.1 (0.2-1.4)        | 1.5 (0.5-2.4)  | 0.017  |
| Ni (mg/L)                | 2.5 (1.5-3.7)   | 3.3 (1.5-3.7)        | 3.8 (1.9-5.4)  | 0.829  |
| Cu (mg/dL)               | 1.5 (1.0-2.0)   | 1.6 (1.0-2.0)        | 2.55 (1.5-3.6) | <0.001 |
| Cr (mg/L)                | 0.1 (0.1-0.1)   | 0.1 (0.1-0.1)        | 0.1 (0.1-0.1)  | 0.787  |
| Mn (mg/L)                | 1.7 (0.9-3.0)   | 2.2 (0.9-3.0)        | 1.5 (0.6-2.0)  | 0.019  |
| As (mg/L)                | 77.9 (44.5-140.2)| 118.2 (44.0-139.4)   | 159.9 (69.9-205.4) | 0.064 |

Abbreviations. DM, diabetes mellitus; BMI, body mass index; SBP, systolic blood pressure; DBP, diastolic blood pressure; HDL, high-density lipoprotein; LDL, low-density lipoprotein;
Pb, lead; Cd, cadmium; Ni, nickel; Cu, copper; Cr, chromium; Mn, manganese; As, arsenic.

Table 2. Predictors of overall mortality using Cox proportional hazards model

| Parameters                        | Univariable analysis |
|-----------------------------------|-----------------------|
|                                   | HR (95% CI)   | p     |
| Age (per 1 year)                  | 1.097 (1.066-1.128) | <0.001|
| Male (vs. female)                 | 1.259 (0.675-2.347) | 0.469 |
| DM                                | 4.049 (2.089-7.848) | <0.001|
| Hypertension                      | 3.478 (1.865-6.485) | <0.001|
| Hyperlipidemia                    | 1.193 (0.164-8.685) | 0.862 |
| BMI (per 1 kg/m²)                 | 1.007 (0.929-1.090) | 0.873 |
| SBP (per 1 mmHg)                  | 1.012 (0.998-1.027) | 0.090 |
| DBP (per 1 mmHg)                  | 1.007 (0.981-1.033) | 0.615 |
| Laboratory data                   |                       |       |
| Fasting glucose (per 1 mg/dL)     | 1.006 (0.998-1.014)  | 0.141 |
| Creatinine (per 1 mg/dL)          | 1.998 (1.482-2.695)  | <0.001|
| Total cholesterol (per 1 mg/dl)   | 0.994 (0.985-1.002)  | 0.155 |
| Triglyceride (per 1 mg/dL)        | 1.001 (0.999-1.003)  | 0.366 |
| HDL-cholesterol (per 1 mg/dL)     | 0.986 (0.962-1.010)  | 0.254 |
| LDL-cholesterol (per 1 mg/dL)     | 0.990 (0.980-0.999)  | 0.037 |
| Blood                             |                       |       |
| Pb (per 1 mg/dL)                  | 1.067 (0.931-1.222)  | 0.350 |
| Urine                             |                       |       |
| Cd (per 1 mg/L)                   | 1.290 (1.070-1.554)  | 0.008 |
| Ni (per 1 mg/L)                   | 1.001 (0.989-1.013)  | 0.866 |
| Cu (per 1 mg/dL)                  | 1.378 (1.241-1.529)  | <0.001|
| Cr (per 1 mg/L)                   | 1.101 (0.534-2.268)  | 0.795 |
| Mn (per 1 mg/L)                   | 0.726 (0.567-0.930)  | 0.011 |
| As (per 1 mg/L)                   | 1.001 (1.000-1.003)  | 0.127 |

Values expressed as hazard ratio (HR) and 95% confidence interval (CI). Abbreviations are the same as in Table 1.

Table 3. Association of heavy metals with overall mortality using multivariate Cox proportional hazards model
| Heavy metals | Multivariable HR (95% CI) | p     |
|--------------|---------------------------|-------|
| Blood Pb (per 1 mg/dL) | 1.024 (0.865-1.231) | 0.780 |
| Urine Cd (per 1 mg/L) | 1.352 (1.089-1.680) | 0.006 |
| Urine Ni (per 1 mg/L) | 1.004 (0.990-1.018) | 0.599 |
| Urine Cu (per 1 mg/dL) | 1.350 (1.151-1.583) | <0.001 |
| Urine Cr (per 1 mg/L) | 1.015 (0.513-2.009) | 0.966 |
| Urine Mn (per 1 mg/L) | 0.717 (0.557-0.923) | 0.010 |
| Urine As (per 1 mg/L) | 1.001 (0.999-1.003) | 0.424 |

Values expressed as hazard ratio (HR) and 95% confidence interval (CI). Abbreviations are the same as in Table 1. Covariates in the multivariable model included age, sex, DM, hypertension, creatinine, and LDL-cholesterol.
