Degree of the Exceptional Component of the Space of Holomorphic Foliations of Degree Two and Codimension One in $\mathbb{P}^3$
Degree of the Exceptional Component of the Space of Holomorphic Foliations of Degree Two and Codimension One in \( \mathbb{P}^3 \)

Tese apresentada ao Departamento de Matemática da Universidade Federal de Minas Gerais, como requisito para a obtenção do grau de doutor em Matemática.

UFMG

Orientador: Israel Vainsencher

Belo Horizonte - MG
May, 2018
AGRADECIMENTOS

Ao professor e orientador Israel Vainsencher por todo incentivo, apoio, amizade e dedicação ao longo desse trabalho.
À minha esposa Aline por toda paciência e compreensão nesse período, pelo carinho de sempre e por todo amor que inclui em minha vida.
Aos meus pais Sergio e Laura por tudo, e em particular por sempre me incentivarem a chegar até aqui.
À professora Viviana Ferrer Cuadrado (UFF) pelas conversas e solicitações sempre atendidas.
Aos amigos que fizeram essa jornada ser ainda mais agradável, em especial aos grandes companheiros Pedro, Bruno, Gilberto e Divane.
Aos professores do núcleo de Matemática do IF Sudeste MG – Campus Juiz de Fora pela amizade e o apoio para minha qualificação.
A todos que, de alguma forma, contribuíram para esse trabalho, meus agradecimentos.
RESUMO

O propósito deste trabalho é obter o grau da componente excepcional, $E(3)$, do espaço de folheações holomórficas de grau 2 e codimensão um em $\mathbb{P}^3$. Trata-se de uma componente de dimensão treze, descrita no célebre trabalho de Alcides Lins-Neto e Dominique Cerveau, [13]. $E(3)$ é o fecho da órbita, sob a ação natural de Aut$\mathbb{P}^3$, da folheação definida pela forma diferencial

$$\omega = (3fg - 2gdf)/x_0, \quad \text{onde} \quad f = x_0^2x_3 - x_0x_1x_2 + \frac{x_1^3}{3}, \quad g = x_0x_2 - \frac{x_1^2}{2}.$$

Nossa tarefa inicial é descrever uma caracterização geométrica para o par $g, f$. Isto nos levará à construção de um espaço de parâmetros como um fibrado explícito sobre a variedade de bandeiras completas de $\mathbb{P}^3$. Fazendo uso de ferramentas de teoria da interseção equivariante, podemos calcular o número desejado como uma integral sobre o nosso espaço de parâmetros.

**Palavras-chave:** Folheações Holomórficas. Componente excepcional. Grau.
ABSTRACT

The purpose of this work is to obtain the degree of the exceptional component, $E(3)$, of the space of holomorphic foliations of degree two and codimension one in $\mathbb{P}^3$. As shown in the celebrated work by Dominique Cerveau and Alcides Lins Neto [13], $E(3)$ is a 13-dimensional component. It is the closure of the orbit under the natural action of $\text{Aut}\mathbb{P}^3$ of the foliation defined by the differential form

$$\omega = \frac{(3fdg - 2gdf)}{x_0}, \text{ where } f = \frac{x_0^2x_3 - x_0x_1x_2 + \frac{x_1^3}{3}}{3}, \ g = x_0x_2 - \frac{x_1^2}{2}.$$ 

Our first task is to unravel a geometric characterization of the pair $g, f$. This leads us to the construction of a parameter space as an explicit fiber bundle over the variety of complete flags. Using tools from equivariant intersection theory, especially Bott’s formula, the degree is expressed as an integral over our parameter space.

**Keywords:** Holomorphic Foliations. Exceptional Component. Degree.

1 INTRODUCTION

A holomorphic foliation of codimension one and degree $d$ in the complex projective space $\mathbb{P}^n$ is given by a differential 1-form

$$\omega = A_0 dx_0 + \cdots + A_n dx_n$$

where $A_0, \ldots, A_n$ are homogeneous polynomials of degree $d + 1$, satisfying the conditions

1. (projectivity) $A_0 x_0 + \cdots + A_n x_n = 0$

2. (integrability) $\omega \wedge d\omega = 0$.

These conditions define a closed scheme $\mathcal{F}(d,n)$ in the projective space of global sections of the twisted cotangent sheaf $\Omega^1_{\mathbb{P}^n}(d + 2)$. It is further required that the singular locus of $\omega$ (defined by the common zeros of the polynomials $A_i$, $i = 0, \ldots, n$) be of codimension greater than or equal to two. This corresponds to the inexistence of a common factor of positive degree for the polynomials $A_i$ thus defining a Zariski open subset $\mathcal{F}(d,n)$. Naturally, the closure $\overline{\mathcal{F}(d,n)}$ possesses a decomposition into irreducible components.

In [13], a full description of the components of $\overline{\mathcal{F}(2,n)}$, $n \geq 3$ is given. We learn that there are six components of $\overline{\mathcal{F}(2,3)}$:

1. Linear pull-backs $S(2,3)$ : For a degree 2 foliation $\mathcal{F}$ in $\mathbb{P}^2$ and a linear rational map $\alpha : \mathbb{P}^3 \dashrightarrow \mathbb{P}^2$, take the pull-back $\mathcal{F}^* = \alpha^*(\mathcal{F})$.

2. Rational $\mathcal{R}(2,2)$ : Take homogeneous polynomials $f, g$ both of degree 2 and make the 1-form $\omega = fdg - gdf$.

3. Rational $\mathcal{R}(1,3)$ : Take homogeneous polynomials $f$ of degree 1 and $g$ of degree 3, and form $\omega = fdg - 3gdf$.

4. Logarithmic $\mathcal{L}(1,1,1,1)$ : Take four linear polynomials $f_1 \cdots f_4$ and complex numbers $\lambda_1, \ldots, \lambda_4$ with $\lambda_1 + \cdots + \lambda_4 = 0$. Then, write

$$\omega = \lambda_1 f_2 f_3 f_4 df_1 + \lambda_2 f_1 f_3 f_4 df_2 + \lambda_3 f_1 f_2 f_4 df_3 + \lambda_4 f_1 f_2 f_3 df_4.$$ 

5. Logarithmic $\mathcal{L}(1,1,2)$ : Take $f_1, f_2$ linear polynomials, $f_3$ quadratic, and complex numbers $\lambda_1, \ldots, \lambda_3$ with $\lambda_1 + \lambda_2 + 2\lambda_3 = 0$. Then, write

$$\omega = \lambda_1 f_2 f_3 df_1 + \lambda_2 f_1 f_3 df_2 + \lambda_3 f_1 f_2 df_3.$$
6. The exceptional component $E(3)$: This is the orbit closure of the foliation defined by the differential form

$$\omega = \frac{3f_0g_0 - 2g_0df_0}{x_0},$$

where $f_0 = x_0^2x_3 - x_0x_1x_2 + \frac{x_1^3}{3}, g_0 = x_0x_2 - \frac{x_1^2}{2}$. (1.1)

We will study in detail the component $E(3)$ along this work. The main point is to describe the geometry of the family of pairs $g, f$ in the orbit closure.

Two important invariants of a projective scheme are its dimension and degree. For some components of spaces of foliations the degree has been found in recent works. For instance, in [6] the authors managed to compute the degrees of the rational components of type $\mathcal{R}(n, d, d)$ in $\mathbb{P}^n$, $n \geq 3, d > 1$:

$$\deg \mathcal{R}(n, d, d) = \frac{1}{N_d - 1} \left( \binom{2N_d - 2}{N_d} \right),$$

where $N_d = \binom{n + d}{d} - 1$. As a particular case, the degree of the rational component $\mathcal{R}(2, 2)$ is 1430. Also the degrees of rational components of type $\mathcal{R}(n, d_0, d_1)$ where $d_0$ divides $d_1$ were found:

$$\deg \mathcal{R}(n, d_0, d_1) = \left( \frac{N_{d_1} + N_{d_0} - 1}{N_{d_0}} \right) - \frac{d_1}{d_0} \left( \frac{N_{d_1} + N_{d_0} - 1}{N_{d_0} - 1} \right),$$

and so the degree of $\mathcal{R}(1, 3)$ is 700.

The degrees of the rational components $\mathcal{R}(n, 2, 3)$ were also computed in [6] for $n \leq 5$ and in [11] this is extended to the degree of rational components $\mathcal{R}(n, 2, 2r+1)$ for general $n, r$.

The case of linear pullbacks was done by Viviane Ferrer and Israel Vainsencher (to appear). For linear pullbacks of foliations of degree $d$ in $\mathbb{P}^2$, the degree of the component $\mathcal{S}(d, 3)$ is

$$\deg \mathcal{S}(d, 3) = \frac{1}{182} \frac{(d + 4)!}{(d + 1)!} (d^2 + 6d + 11)(d^2 + 2d + 3),$$

so we have $\deg \mathcal{S}(2, 3) = 1320$.

To the best of my knowledge, for the logarithmic components the degrees have not been determined. In [5] the authors showed that these components are generically reduced.

In this thesis we handle the construction of an adequate parameter space for the exceptional component, enabling us to achieve the calculation of the degree of

$$E(3) \subset \mathbb{P}(H^0(\Omega_{\mathbb{P}^3}^1(4))) = \mathbb{P}^{44}.$$
closures, cf. [2]. We took another path, essentially trying and deciphering an algebro-geometric characterization of that pair (cubic, quadric) from the explicit expressions (1.1) given just above. Eventually, this lead to our construction of an explicit smooth, projective variety $Y_4$ (cf. Proposition 2, page 32) endowed with a generically injective morphism onto $E(3)$.

Our strategy for the exceptional component starts with a complete flag in $\mathbb{P}^3$

$$p \ (\text{point}) \in \ell \ (\text{line}) \subset v \ (\text{plane}),$$

over which we describe suitable cubic forms $f$ and quadratic forms $g$ that fulfill some special conditions. The polynomials $g, f$ will give us the differential 1-form

$$\omega = \frac{3f \, dg - 2gdf}{h},$$

where $h$ is an equation of the plane $v$ of the given flag.

It turns out that $\omega$ can be zero for certain values of otherwise acceptable $g, f$, for instance, $g = x_0^2$, $f = x_0^3$. The main technical difficulty is how to handle the indeterminacy locus of the rational map

$$(g, f) \mapsto \omega$$

leading to a resolution of its indeterminacies. As we will see, this indeterminacy locus is a non-reduced and reducible scheme. The resolution of indeterminacies is done by a careful analysis of the irreducible components of the indeterminacy locus, blown up one at a time.

Once accomplished the resolution of the map, we obtain a line bundle $W$ over $Y_4$, pullback of $\mathcal{O}_{\mathbb{P}^4}(-1)$, with each fiber spanned by a differential 1-form possibly in the boundary of $E(3)$. Since the dimension of the exceptional component is 13, the required degree is (see Theorem 3)

$$\int c_{\text{top}}^{-13}(W).$$

This will be done in Chapter 2. In Chapter 3, we proceed to compute this integral. In order to do this, we will apply Bott’s formula

$$\int -c_{\text{top}}^{13}(W) = \sum_F \frac{-c_{\text{top}}^T(W)^{13} \cap [F]_T}{c_{\text{top}}^T(N_F)},$$

where the sum runs through all the fixed components of a suitable action of the torus $T := \mathbb{C}^\ast$ on $Y_4$, induced from an action on $\mathbb{P}^3$. The $N_F$ appearing in the denominator denotes the normal bundle of a fixed component $F$ in $Y_4$.

Putting together the contributions from a total of 1728 fixed isolated points and 120 fixed lines we find in Theorem 4 the number 168208 as the desired degree.

In the appendix we include the scripts for Macaulay2 used to study the resolution of the indeterminacies and to compute the sum of all contributions in Bott’s formula.
1.1 NOTATION AND CONVENTIONS

Let $x_0, x_1, x_2, x_3$ denote homogeneous coordinates of $\mathbb{P}^3$.

Write

$$S_d = \langle x_0^d, x_0^{d-1}x_1, \ldots, x_3^d \rangle$$

for the vector space of homogeneous polynomials of degree $d$. If no confusion arises, we abuse and write $S_d$ for the trivial vector bundle $S_d \times X$ over some base variety $X$.

The dual projective space $\mathbb{P}^3 = \mathbb{P}(S_1)$ comes equipped with a tautological line sub-bundle,

$$O_{\mathbb{P}^3}(-1) \hookrightarrow S_1.$$

Given a vector bundle $\mathcal{V}$, we write $\mathbb{P}(\mathcal{V})$ for the projective bundle of rank one subspaces of the fibers of $\mathcal{V}$. It comes endowed with a tautological rank one subline bundle

$$O_{\mathbb{P}(\mathcal{V})}(-1) \hookrightarrow \mathcal{V},$$

where we omit the pullback $\mathcal{V}_{|\mathbb{P}(\mathcal{V})}$.

For an action of $\mathbb{C}^*$ in $X$, we denote $t \circ v$ for the image of the point $(t, v) \in \mathbb{C}^* \times X$ by the action.

For clarity, we will use a left square ($\square$) also at the end of examples.
2 DESCRIPTION OF THE EXCEPTIONAL COMPONENT

2.1 ASSOCIATED COMPLETE FLAG

In [13] the authors describe the exceptional component of foliations in $\mathbb{P}^3$ starting with the two homogeneous polynomials

$$f_0 := x_0^2x_3 - x_0x_1x_2 + \frac{x_1^3}{3} \quad \text{and} \quad g_0 := x_0x_2 - \frac{x_1^2}{2} \quad (2.1)$$

from which arises the integrable differential 1-form

$$\omega_0 := \frac{2g_0df_0 - 3f_0dg_0}{x_0}.$$

Explicitly,

$$\omega_0 = \left( x_1x_2^2 - 2x_1^2x_3 + x_0x_2x_3 \right)dx_0 + \left( x_0(3x_1x_3 - 2x_2^2)dx_1 ight. \\
\left. + x_0(x_1x_2 - 3x_0x_3)dx_2 + x_0(2x_0x_2 - x_1^2)dx_3 \right).$$

The singular locus of such a foliation consists of a union of three curves (cf. appendix 4.1):

1. the conic given by the ideal $\langle x_0, x_2^2 - 2x_1x_3 \rangle$ (it lies in the plane $x_0 = 0$);
2. the line $\ell_0$ defined by $x_0 = x_1 = 0$;
3. the twisted cubic given by $\langle 2x_2^2 - 3x_1x_3, x_1x_2 - 3x_0x_3, x_1^2 - 2x_0x_2 \rangle$.

Notice that these three components meet at the point $p_0 := (0 : 0 : 0 : 1) \in \mathbb{P}^3$. The line $\ell_0$ is tangent to the twisted cubic, the plane is the osculating plane at $p_0$ and the conic is the osculating conic. The component $E(3)$ consists of the orbit of $\omega_0$ under the group $\text{Aut}\mathbb{P}^3$ of automorphism of $\mathbb{P}^3$; its dimension is equal to 13 (see [3]).

Let us examine the geometry of the surface defined by our cubic form (2.1) $f_0$.

We see that it is an irreducible cubic, singular along the line $\ell_0$. Moreover, given a point $p_t = (0 : 0 : t : 1) \in \ell_0$, the tangent cone to our cubic surface at the point $p_t$ has equation

$$x_0^2 - tx_0x_1 = x_0(x_0 - tx_1).$$

Thus, the tangent cone is a pair of planes containing the double line $\ell_0$, one of which is fixed and the other varies with the point $p_t$.

We have also perceived that at the special point $p_0 = (0 : 0 : 0 : 1)$ the tangent cone to the cubic is the double plane $x_0^2 = 0$. 

Therefore, our cubic \( f_0 \) comes endowed with a companion complete flag

\[
\varphi_0 : \ p_0 = \{x_0 = x_1 = x_2 = 0\} \in \ell_0 = \{x_0 = x_1 = 0\} \subset v_0 = \{x_0 = 0\}. \tag{2.2}
\]

Such a cubic belongs to one of the strata of cubics singular along a line, as described in [1] and revisited in [4].

As for the quadric

\[
g_0 = x_0 x_2 - \frac{x_1^2}{2},
\]

notice we have a cone containing the line \( \ell_0 \) and vertex \( p_0 \). Moreover, the tangent plane to the cone at the smooth points on \( \ell_0 \) is precisely the same plane \( v_0 \).

**Remark 1.** The flag can move under the action of an automorphism of \( \mathbb{P}^3 \), but it can be recovered directly from the 1-form \( \omega \) defining the exceptional foliation, just by looking at the singular locus. For any such \( \omega \), the singular locus has three components - a conic living on the new plane, the new line and a twisted cubic that meets the other two components just at the new point; the line is tangent to the twisted cubic, the plane is the osculating plane and the conic is the osculating conic. By the way, the dimension 13 mentioned just above is the dimension of the family of pointed twisted cubics.

These considerations about the cubic/quadric pairs as in (2.1) lead us to consider the construction of a parameter space for the family of exceptional foliations by starting with the variety \( F \) of complete flags on \( \mathbb{P}^3 \),

\[
p(\text{point}) \in \ell(\text{line}) \subset \pi(\text{plane}).
\]

Given such a flag we take:

- A cubic surface \( f \) with the properties:
  1. \( f \) is singular along \( \ell \);
  2. the tangent cone to \( f \) at each point \( q \in \ell \) is the union of two planes \( \pi \cup \alpha_q \).
  3. \( \alpha_p = \pi \), that is, at the point \( p \) the tangent cone is the double plane.

- A quadratic cone \( g \) with the properties:
  1. the line \( \ell \) is contained in the cone \( g \);
  2. the plane \( \pi \) is tangent to \( g \) along the line \( \ell \);
  3. the point \( p \) is in the vertex of the cone.
Definition 1. For simplicity we will call here a cubic or a quadric that meet the requirements above as special.

An exceptional foliation is then given by the differential form
\[ \omega = \frac{3fdg - 2gdf}{h}, \]
where \( h \) is an equation of the plane \( \pi \).

At this point, we realize that after the construction of special pairs \((f, g)\), it is still necessary to impose the condition that the differential form \(3fdg - 2gdf\) be divisible by the equation of the plane. We refer to this as the divisibility condition. It deserves a closer look. In order to better understand this divisibility condition, let us fix a complete flag as in (2.2).

The conditions about the cubic surface show that its equation can be expressed as
\[
\begin{align*}
 f &= (a_0x_0 + a_1x_1 + a_2x_2 + a_3x_3)x_0^3 + a_4x_0x_1^2 + a_5x_0x_1x_2 + a_6x_1^3, \\
 g &= b_0x_0^2 + b_1x_0x_1 + b_2x_0x_2 + b_3x_1^2.
\end{align*}
\]

We register for later use the following invariant description.

Lemma 1. The 7 monomials appearing in \( f \)
\[ x_0^3, x_0^2x_1, x_0^2x_2, x_0^2x_3, x_0x_1^2, x_0x_1x_2, x_1^3 \]
are the monomial generators of the subspace of cubics,
\[ x_0^2(x_0, \ldots, x_3) + x_0(x_0, x_1)(x_0, x_1, x_2) + (x_0, x_1)^3 \subset S_3. \]
Likewise, the 4 monomials \( x_0^2, x_0x_1, x_0x_2, x_1^2 \) in the quadric \( g \) generate the subspace \( x_0(x_0, x_1, x_2) + (x_0, x_1)^2 \subset S_2. \)

Varying the flag, we obtain equivariant vector subbundles with respective ranks 7 and 4,
\[ \mathcal{A} \subset S_3 \quad \text{and} \quad \mathcal{B} \subset S_2. \]

Projectively we obtain, at this stage, the variety
\[ \mathbb{P}(\mathcal{A}) \times_{\mathbb{P}^2} \mathbb{P}(\mathcal{B}), \]
a \( \mathbb{P}^6 \times \mathbb{P}^3 \) bundle of pairs \((f, g)\) over a fixed flag.

Continuing the discussion about the divisibility condition, we may write
\[
3fdg - 2gdf = x_0w_0 + [(3a_6b_1 - 2a_4b_3)x_1^4 + (3a_6b_2 - 2a_5b_3)x_1^3x_2] dx_0,
\]
where \( w_0 \) is a 1-form. From this it follows that the divisibility condition is given, on the fiber over \( \varphi_0 \), by the equations
\[
\begin{align*}
 3a_6b_1 &= 2a_4b_3, \\
 3a_6b_2 &= 2a_5b_3.
\end{align*}
\]
This locus consists of two irreducible components inside \( \mathbb{P}^6 \times \mathbb{P}^3 \), both of codimension two:

\[
\begin{cases}
3a_6b_1 = 2a_4b_3 \\
3a_6b_2 = 2a_5b_3 \\
a_4b_2 = a_5b_1
\end{cases}
\]  \hspace{1cm} (2.5)

and

\[
a_6 = b_3 = 0.
\]

For a pair \((g, f)\) satisfying \((\ast\ast)\), we actually get

\[
\begin{cases}
f = x_0 \left( a_0x_0^2 + a_1x_0x_1 + a_2x_0x_2 + a_3x_0x_3 + a_4x_1^2 + a_5x_1x_2 \right), \\
g = x_0 \left( b_0x_0 + b_1x_1 + b_2x_2 \right).
\end{cases}
\]

It means that a general element in the second component \((\ast\ast)\) consists of a cubic and a quadric both divisible by the equation of the plane, certainly not interesting for our study of the exceptional component.

Henceforth, we refer to the divisibility condition as the three equations (2.5).

Recalling the dimension, 13, of the exceptional component, it is reassuring to find

\[
\begin{array}{cccc}
\text{dimension of} & \text{\(\mathbb{P}^6\) of special cubics} & \text{\(\mathbb{P}^3\) of special quadric cones} & \text{divisibility} \\
\text{complete flags} & 6 & 6 & 3 \\
\text{condition} & -2 & & = 13.
\end{array}
\]

2.2 CONSTRUCTION OF A PARAMETER SPACE

Let \( G = \mathbb{G}(1, 3) \) be the Grassmann variety of lines in \( \mathbb{P}^3 \), with tautological sequence

\[
S \hookrightarrow G \times \mathbb{C}^4 \longrightarrow Q,
\]

where \( \text{rank}(S) = 2 \). Denote by \( Q^\vee \) the dual of \( Q \). We also have the tautological sequence over \( \mathbb{P}^3 \),

\[
\mathcal{O}_{\mathbb{P}^3}(-1) \hookrightarrow \mathbb{P}^3 \times \mathbb{C}^4 \longrightarrow \mathcal{P}
\]

Then,

\[
\mathbb{P}(S) = \{(p, \ell) \mid p \in \ell\} \subset \mathbb{P}^3 \times G
\]

\[
\mathbb{P}(Q^\vee) = \{ (\ell, \pi) \mid \ell \subset \pi \} \subset G \times \mathbb{P}^3.
\]

The variety of complete flags is just the fiber product

\[
\mathbb{F} = \mathbb{P}(S) \times_C \mathbb{P}(Q^\vee) = \{ (p, \ell, \pi) \mid p \in \ell \subset \pi \} \subset \mathbb{P}^3 \times G \times \mathbb{P}^3.
\]

The tautological bundles of these spaces lift to bundles over \( \mathbb{F} \) still denoted by the same letters. They fit together into the diagram (pullbacks omitted),

\[
\begin{array}{cccc}
\mathcal{O}_{Q^\vee}(-1) = \mathcal{O}_{\mathbb{P}^3}(-1) & \hookrightarrow & Q^\vee & \longrightarrow \mathcal{P}^\vee & \longrightarrow & S_1 := (\mathbb{C}^4)^\vee \\
\varphi_0 : & \langle x_0 \rangle & \subset & \langle x_0, x_1 \rangle & \subset & \langle x_0, x_1, x_2 \rangle & \subset & \langle x_0, \ldots, x_3 \rangle
\end{array}
\]
where the bottom row indicates the corresponding fibers over our favorite flag (2.2) \( \varphi_0 \).

Now, recall from (2.4) the rank 7 subbundle \( \mathcal{A} \subset S_3 \) of special cubics and the rank 4 vector subbundle \( \mathcal{B} \subset S_2 \) of special quadric cones over the variety \( \mathcal{F} \) of complete flags. In view of Lemma 1, we have the surjections

\[
(O_{Q^\vee}(-2) \otimes S_1) \oplus (O_{Q^\vee}(-1) \otimes Q^\vee \otimes P^\vee) \oplus \text{Sym}_3 Q^\vee \twoheadrightarrow \mathcal{A} \subset S_3
\]

\[
(O_{Q^\vee}(-1) \otimes P^\vee) \oplus \text{Sym}_2 Q^\vee \twoheadrightarrow \mathcal{B} \subset S_2.
\]

By construction, the vector bundles \( \mathcal{A}, \mathcal{B} \) fit into the exact sequences

\[
\begin{align*}
S_1 \otimes O_{\mathbb{P}^3}(-2) & \hookrightarrow \mathcal{A} \twoheadrightarrow \mathcal{A} := \mathcal{A}/ \left( S_1 \otimes O_{\mathbb{P}^3}(-2) \right) \\
O_{\mathbb{P}^3}(-2) & \hookrightarrow \mathcal{B} \twoheadrightarrow \mathcal{B}.
\end{align*}
\]

(2.6)

**Remark 2.** For later use, remember that knowing the fibers of an equivariant, say \( \mathbb{C}^* \)-vector bundle over the variety \( \mathcal{F} \) of complete flags suffices to get our hands on the \( \mathbb{C}^* \)-equivariant Chern classes.

We recall the fiber \( \mathcal{A}_{\varphi_0} \) is spanned by the classes

\[
x_0 x_1^2, x_0 x_1 x_2, x_1^3 \mod. x_0^2 S_1.
\]

We have likewise the subbundle \( O_{\mathbb{P}^3}(-2) \subset \mathcal{B} \) and the corresponding quotient \( \mathcal{B} \).

The fiber of \( \mathcal{B} \) over \( \varphi_0 \) has the generators

\[
x_0 x_2, x_0 x_2, x_1^2 \mod. \langle x_0^2 \rangle.
\]

This shows the following:

**Lemma 2.** \( \mathcal{A} \) is isomorphic to \( \left( Q^\vee / O_{\mathbb{P}^3}(-1) \right) \otimes \mathcal{B} \).

**Proof.** Indeed, on the fiber over \( \varphi_0 \) we have

\[
\left( Q^\vee / O_{\mathbb{P}^3}(-1) \right)_{\varphi_0} = \langle x_0, x_1 \rangle / \langle x_0 \rangle = \langle x_1 \rangle
\]

hence

\[
\left( \left( Q^\vee / O_{\mathbb{P}^3}(-1) \right) \otimes \mathcal{B} \right)_{\varphi_0} = \langle x_1 \rangle \otimes \langle x_0 x_2, x_0 x_2, x_1^2 \rangle = \mathcal{A}_{\varphi_0},
\]

where the = signs mean isomorphisms of representations of the stabilizer of the flag \( \varphi_0 \).

We define

\[
\mathbb{X} = \mathbb{P}(\mathcal{B})
\]

(2.7)

the corresponding projective bundle of special quadrics. The fiber \( \mathbb{X}_{\varphi_0} \) is the \( \mathbb{P}^3 \) of special quadrics over the flag \( \varphi_0 = (p_0, \ell_0, v_0) \) fixed in (2.2).
Next, we rewrite the divisibility condition (2.5) as the following system of linear equations in the variables \((a) = (a_4, a_5, a_6)\) with coefficients \((b) = (b_0, b_1, b_2, b_3)\) \(\in \mathbb{P}^3\),

\[
\begin{bmatrix}
2b_3 & 0 & -3b_1 \\
0 & -2b_3 & 3b_2 \\
-b_2 & b_1 & 0
\end{bmatrix}
\begin{bmatrix}
a_4 \\
a_5 \\
a_6
\end{bmatrix}
= \begin{bmatrix}
0 \\
0 \\
0
\end{bmatrix}.
\] (2.8)

The matrix of the coefficients has determinant zero and generic rank two. Computing the 2×2-minors, we find that the rank of the coefficients matrix will be less than two when \(b_1 = b_2 = b_3 = 0\) \(\leftrightarrow x_0^2\). Off the point \(x_0^2\) the solution space is spanned by the vector product of two rows, \((-3b_1b_2 : -3b_2^2 : -2b_2b_3) = (3b_1 : 3b_2 : 2b_3)\).

Our idea now is to describe the locus of special cubic forms with the divisibility condition as a \(\mathbb{P}^4\)-bundle over \(X\) (since it has codimension two in the \(\mathbb{P}^6\) of special cubics). But to make it possible, we need to replace \(X\) by a new space, \(X'\), for which the rank of the coefficients matrix is two everywhere.

Precisely, we think of the fiberwise solution space to (2.8) as defining a rational map \(\psi : \mathbb{P}(\mathcal{A}) \rightarrow \mathbb{P}(\mathcal{B})\), notation as in (2.6), which on the fiber over the standard flag \(\varphi_0\) (2.2) reads

\[
\psi : (b) \mapsto (a_4 : a_5 : a_6) = (3b_1 : 3b_2 : 2b_3).
\] (2.9)

Look at the closure \(X'\) of the graph of \(\psi\). On the fiber over \(\varphi_0\), this is the blowup of \(\mathbb{P}^3 = \mathbb{P}(\mathcal{B})\) at the point \(x_0^2\). As a matter of fact, this turns out to be the restriction to the fiber over \(\varphi_0\) of the blowup of \(\mathbb{P}\) along the section \(\mathbb{P}(\mathcal{O}_{\mathbb{P}^3}(-2)) \hookrightarrow \mathbb{P}(\mathcal{B})\) over \(F\). We have the diagram

\[
\begin{array}{cccccc}
\mathbb{P}(\mathcal{O}_{\mathbb{P}^3}(-2)) & \longrightarrow & \mathbb{P}(\mathcal{B}) & \longrightarrow & \mathbb{P}(\mathcal{A}) & \longrightarrow & \mathbb{P}(\mathcal{B}) \\
\downarrow & \downarrow \psi' & \downarrow \psi & \downarrow \psi & \downarrow \psi & \downarrow \psi \\
\mathbb{P}(\mathbb{P}(\mathcal{A})) & \longrightarrow & \mathbb{P}(\mathcal{B}) & \longrightarrow & \mathbb{P}(\mathcal{A}) & \longrightarrow & \mathbb{P}(\mathcal{B}) \\
\downarrow & \downarrow \psi & \downarrow \psi & \downarrow \psi & \downarrow \psi & \downarrow \psi & \downarrow \psi \\
\mathbb{F} & \longrightarrow & \mathbb{P}(\mathcal{A}) & \longrightarrow & \mathbb{P}(\mathcal{B}) & \longrightarrow & \mathbb{F}
\end{array}
\]

where the leftmost inclusion is defined by taking the square of the equation of the plane in the flag. The equality \(\mathbb{P}(\mathcal{A}) = \mathbb{P}(\mathcal{B})\) comes from Lemma 2; under this identification, we have

\[
\mathcal{O}_{\mathbb{A}}(-1) = \mathcal{O}_{\mathbb{B}}(-1) \otimes (\mathcal{O}/\mathcal{O}_{\mathbb{P}^3}(-1)).
\]

Pulling back the tautological line subbundle via \(\psi'\), we get the diagrams

\[
S_1 \otimes \mathcal{O}_{\mathbb{P}^3}(-2) \hookrightarrow \mathcal{A}' \longrightarrow \mathcal{O}_{\mathbb{A}}(-1)
\]

\[
\begin{array}{c}
\Rightarrow \\
\downarrow \\
\downarrow \\
\end{array}
\]

\[
S_1 \otimes \mathcal{O}_{\mathbb{P}^3}(-2) \hookrightarrow \mathcal{A} \longrightarrow \mathcal{A}
\] (2.10)
and

\[ O_{\mathbb{P}^3}(-2) \hookrightarrow B' \twoheadrightarrow O_{\mathbb{P}^1}(-1) \]

\[ || \Downarrow \Downarrow \]

\[ O_{\mathbb{P}^3}(-2) \hookrightarrow B \twoheadrightarrow B' \]

where \( \text{rank } \mathcal{A}' = 5 \), \( \text{rank } \mathcal{B}' = 2 \). We have

\[ X' = \mathbb{P}(B') \]

(2.12)

where \( \mathbb{P}(B) \) over \( F \). We define

\[ Y = \mathbb{P}(A') \]

(2.13)

Proposition 1. A general point in \( Y \) corresponds to a pair \((g, f)\) of special quadric, cubic satisfying the divisibility condition.

Proof. The assertion follows from the previous considerations. \( \square \)

Remark. Since all constructions performed so far, as well as in the sequel are equivariant, henceforth we drop the reference to the fiber over our favorite flag \( \varphi_0 \), and simplify notation writing, until further notice,

\[ X = X_{\varphi_0}, \mathcal{A} = A_{\varphi_0}, \ldots, \text{etc.} \]

In view of Lemma 2, the rational map (2.9) can also be written as the rational linear projection map

\[ \psi_{\mathbb{P}^2} : X \rightarrow \mathbb{P}(\mathbb{P}(B)) \]

\[ g := b_0x_0^2 + b_1x_0x_1 + b_2x_0x_2 + b_3x_1^2 \implies g' := b_1x_0x_1 + b_2x_0x_2 + b_3x_1^2 \]

(2.16)

Here, the \( x_i \) are homogeneous coordinates in \( \mathbb{P}^2 = \text{fiber of } \mathbb{P}(\mathbb{P}(B)) \) over \( \varphi_0 \). The map \( \psi' \) is (see (2.9))

\[ \psi' : X' \rightarrow \mathbb{P}(\mathcal{A}) \]

\[ (g, g') \mapsto 3u_1x_0x_1^2 + 3u_2x_0x_1x_2 + 2u_3x_1^3 \]

Notice that the divisibility condition (2.5) has now the expression

\[
\begin{align*}
3a_6u_1 &= 2a_4u_3 \\
3a_6u_2 &= 2a_5u_3 \\
a_4u_2 &= a_5u_1
\end{align*}
\]

(2.16)
Set

\[ U_0 := \mathbb{A}^3 \subset \mathbb{X} = \mathbb{P}^3 \ni (1 : 0 : 0) \leftrightarrow x_0^2, \]

i.e., we put \( b_0 = 1 \) and \( b_1, b_2, b_3 \) are affine coordinates on \( U_0 \). We write

\[ g = x_0^2 + b_1 x_0 x_1 + b_2 x_0 x_2 + b_3 x_1^2 \in U_0. \]

Let \( U_0' \subset U_0 \times \mathbb{P}^2 \) be defined by \( u_1 = 1 \). So \( b_2 = b_1 u_2, b_3 = b_1 u_3 \). Thus the affine coordinates on \( U_0' \) are \( b_1, u_2, u_3 \). We have

\[ g' = x_0 x_1 + u_2 x_0 x_2 + u_3 x_1^2. \]

The rational map (2.9) gives

\[ (a_4 : a_5 : a_6) = (3 : 3u_2, 2u_3), \quad \text{so} \quad \frac{a_4}{3} = \frac{a_5}{3u_2} = \frac{a_6}{2u_3} \quad \text{and} \quad a_5 = u_2 a_4, a_6 = \frac{2}{3} u_3 a_4. \]

Recall \( \mathcal{A} = \langle x_0 x_1^2, x_0 x_1 x_2, x_1^3 \mod. x_0^2 S_1 \rangle \). We have the trivialization,

\[ \mathcal{O}_{\mathcal{X}}(-1)|_{U_0} = \langle x_0 x_1^2 + u_2 x_0 x_1 x_2 + \frac{2}{3} u_3 x_1^3 \rangle \]

and

\[ \mathcal{A}|_{U_0'} = x_0^2 S_1 + (x_0 x_1^2 + u_2 x_0 x_1 x_2 + \frac{2}{3} u_3 x_1^3). \]

We have \( Y|_{U_0} = U_0' \times \mathbb{P}^4 \). We redefine homogeneous coordinates \( (a_i) \) on the \( \mathbb{P}^4 \) factor and write

\[
\begin{align*}
(f, g) &= \left( a_0 x_0 + a_1 x_1 + a_2 x_2 + a_3 x_3 x_0^2 + a_4 x_0 x_1 x_2 + \frac{2}{3} u_3 x_1^3, \right) \\
&= x_0^3 + b_1 (x_0 x_1 + u_2 x_0 x_2 + u_3 x_1^2). \\
\end{align*}
\]

(2.17)

For example, choose \( g = x_0^2, \quad g' = x_0 x_1 + u_2 x_0 x_2 + u_3 x_1^2 \in \mathbb{X}', \quad (u_2, u_3) \in \mathbb{A}^2 \). We may pick \( f = x_0 x_1^2 + u_2 x_0 x_1 x_2 + \frac{2}{3} u_3 x_1^3 \) in the fiber of \( Y \) over \( (g, g') \) and evaluate

\[
\omega = \frac{3 f d g - 2 g d f}{x_0} = \left( 4 x_0 x_1^2 + 4 u_2 x_0 x_1 x_2 + 4 u_3 x_1^3 \right) dx_0 - \left( 4 x_0^2 x_1 + 2 u_2 x_0^2 x_2 + 4 u_3 x_0 x_1 x_2 \right) dx_1 - 2 u_2 x_0^2 x_1 dx_2.
\]

(2.18)

Thus, \( \omega \) spans a linear space of dimension one over the chosen points. If this space were well defined for all points of \( Y \), we would have a line subbundle \( \mathcal{W} \) of the trivial bundle of twisted differential forms, pullback of the \( \mathcal{O}_{\mathbb{P}^1}(-1) \) of the corresponding projective space where \( E(3) \) lives. So \( Y \) would be an adequate parameter space for the exceptional component.

However, there are indeterminacies in \( Y \) corresponding to the vanishing of the form \( w = 3 f d g - 2 g d f \), e.g., when \( f = x_0^3, g = x_0^2 \), just to give an example.
2.3. Indeterminacies of \( \omega \)

The next step is to solve the indeterminacies of the rational map

\[
\begin{align*}
Y & \longrightarrow \mathbb{P}(H^0(\Omega^1_{\mathbb{P}^3}(4))) \\
(g, g', f) & \mapsto \omega = \frac{3fdg - 2gdf}{x_0}
\end{align*}
\] (2.19)

Note that \( g' \) is implicit in this formula: its coefficients appear in \( f \), cf. (2.17).

We will see below (cf. §2.3) that the indeterminacy locus of this map is a non-reduced and reducible scheme. But its reduction consists of two beautiful components.

One of them corresponds to the points \((g, g', f)\) parametrized by \((s : t) \in \mathbb{P}^1\), where

\[
f = (sx_0 + tx_1)^3, \quad g = (sx_0 + tx_1)^2, \quad g' = x_1(2sx_0 + tx_1).
\]

The other component corresponds to a section over the whole \( \mathbb{P}^2 \) fiber of the exceptional divisor of \( X' \) over \( g = x_0^2 \), with \( f = x_0^3 \), i.e., the points of the form \((x_0^2, g', x_0^3)\), with \( g' \) as in (2.15), cf. the diagram below:

\[
\begin{array}{c}
Y \\ \mathbb{P}^4\text{-bundle} \rightarrow X' \rightarrow \mathbb{P}^3 \\
\downarrow \downarrow \downarrow \downarrow \downarrow \downarrow \\
\{ (x_0^2, g', x_0^3) \} \rightarrow \{ (x_0^2, g') \} = \mathbb{P}^2 \rightarrow \{ x_0^2 \}
\end{array}
\] (2.20)

This second component is then the \( \mathbb{P}^2 \) projectivization of the space

\[
\langle x_0x_1, x_0x_2, x_1^2 \rangle.
\] (2.21)

The (global) equations of the indeterminacy locus of the map (2.19) are too hard to treat. However, locally they look rather friendly. Let us work over an affine cover of \( X' \) to deal with it.

2.3 INDETERMINACIES OF \( \omega \)

Let’s sketch our plan to solve the indeterminacies of the map \((g, g', f) \mapsto \omega (2.19)\).

The links to appendix 4 refer to scripts for the software Macaulay2 that perform the calculations.

Notation as in (2.14), we list the typical neighborhoods to consider.

2.3.1 \( \bullet \) \( b_3 = 1 \)

In this case, \( u_1 = b_1, u_2 = b_2, u_3 = 1 \) and the divisibility condition (2.5), (2.16) is

\[
\begin{align*}
3a_6b_1 &= 2a_4 \\
3a_6b_2 &= 2a_5 \\
a_4b_2 &= a_5b_1
\end{align*}
\]
Observe that the third equation is irrelevant, and we can write

\[
\begin{align*}
  f &= (a_0 x_0 + a_1 x_1 + a_2 x_2 + a_3 x_3) x_0^2 + a_6 \left( \frac{2}{3} b_1 x_0 x_1^2 + \frac{2}{3} b_2 x_0 x_1 x_2 + x_1^3 \right), \\
  g &= b_0 x_0^2 + b_1 x_0 x_1 + b_2 x_0 x_2 + x_1^2.
\end{align*}
\]  

(2.22)

Presently our \( \mathbb{P}^4 \) of special cubics has homogeneous coordinates \( a_0, a_1, a_2, a_3, a_6 \). Compute \( \omega \) as in 4.2.1.1. We find

\[
\omega = \left( (3a_0 b_1 - 2a_1 b_0) x_0^2 x_1 + \cdots + a_3 b_2 x_0 x_2 x_3 \right) dx_0 + \cdots + 2a_3 (b_0 x_0^3 + \cdots + b_2 x_0^2 x_2) dx_3.
\]

Notice that if we set \( a_6 = 0 \) the expression for \( \omega \) acquires the terms

\[
\cdots + (a_1 b_1 + 6a_0) x_0 x_1^2 + 4a_1 x_1^3 + 4a_2 x_1^2 x_2 + 4a_3 x_1^2 x_3 + \cdots \] dx_0 + \cdots
\]

Hence, if this is zero then

\[
a_0 = a_1 = a_2 = a_3 = a_6 = 0,
\]

(2.23)

which is impossible since \( (a_0 : a_1 : a_2 : a_3 : a_6) \in \mathbb{P}^4 \).

It means that over the neighborhood \( b_3 = 1 \) we do not have any indeterminacies when \( a_6 = 0 \). Thus in order to study the indeterminacy locus we can take \( a_6 = 1 \).

Setting \( a_6 = 1 \) in the expression of \( \omega \) and collecting the coefficients in the resulting 1-form, we see that the indeterminacy locus is given by the ideal (cf. 4.2.1.2)

\[
J = \langle a_3, 3b_1 b_2 - 4a_2, 6a_0 - 6b_0 b_1 + a_1 b_1, 3b_1^2 - 8a_1 + 12b_0, b_2^2 b_2 (a_1 - 3b_0), (a_1 - 3b_0)^2 \rangle.
\]

Note that it contains the square \( \langle b_2, a_1 - 3b_0 \rangle^2 \).

The radical is

\[
J_{\text{red}} := \text{rad}(J) = \langle 8a_0 - b_1^2, a_2, b_2, a_3, 4b_0 - b_1^2, 4a_1 - 3b_1^2 \rangle.
\]

(2.24)

It is generated by a regular sequence (the affine coordinates here are \( a_0, a_1, a_2, a_3, b_0, b_1, b_2 \)), therefore we have a locally complete intersection. Plugging (2.24) into (2.22) we find

\[
f = \left( \frac{b_1}{2} x_0 + x_1 \right)^3, \quad g = \left( \frac{b_1}{2} x_0 + x_1 \right)^2.
\]

(2.25)

**Definition 2.** We call \( C \) the curve defined locally by the above ideal \( J_{\text{red}} \).

Blowing up \( \mathbb{Y} \) along this one dimensional variety \( C \) does not solve the indeterminacies yet, but makes the resulting ones very nice.

Indeed, let \( \mathbb{A}^7 \) the open dense set defined by \( b_3 = a_6 = 1 \). The blowup of this \( \mathbb{A}^7 \) along \( C \) is

\[
\mathbb{Y}_1 = \{ ((a, b), (s_0 : \cdots : s_5)) \mid s_i \cdot e_j = s_j \cdot e_i \} \subset \mathbb{A}^7 \times \mathbb{P}^5,
\]

(2.26)
where \( e_i, \ 0 \leq i \leq 5 \), are the equations of \( J_{\text{red}} \), ordered as displayed in (2.24).

We will write the equations of \( Y_1 \) as

\[
\begin{align*}
8a_0 - b_1^2 &= s_0a_2 \\
b_2 &= s_2a_2 \\
a_3 &= s_3a_2 \\
4b_0 - b_1^2 &= s_4a_2 \\
4a_1 - b_1^2 &= s_5a_2.
\end{align*}
\] (2.27)

The exceptional divisor \( \mathbb{P}(N_{C|Y}) \) is a \( \mathbb{P}^5 \)-bundle over \( C \), where \( N_{C|Y} \) denotes the normal bundle of \( C \) in \( Y \).

Choose \( a_2 \) for the local equation of the exceptional divisor, so take \( s_1 = 1 \). The equations (2.27) become (cf. 4.2.1.3),

\[
\begin{align*}
8a_0 - b_1^2 &= s_0a_2 \\
b_2 &= s_2a_2 \\
a_3 &= s_3a_2 \\
4b_0 - b_1^2 &= s_4a_2 \\
4a_1 - b_1^2 &= s_5a_2.
\end{align*}
\]

Substituting into the expression of \( \omega \), we find (see the expression for \( w_{n1} \) in 4.2.1.3), yes, a horrible expression. But is easy to see that the equation \( a_2 \) of the exceptional divisor divides this new \( \omega \). Then, we can perform this division to obtain the new expression of \( \omega \) in the present coordinates \( b_1, a_2, s_0, s_2, s_3, s_4, s_5 \). And now we are able to look at the indeterminacy locus of this new \( \omega \), finding the generators (ideal \( J_{n1} \) in 4.2.1.3)

\[
J'' = \langle 3s_4 - 2s_5, s_0 - b_1s_5, 4 - 3b_1s_2, a_2 \rangle \] (2.28)

(remember that we are doing this on the neighborhood \( s_1 = 1 \) of \( \mathbb{P}^5 \)).

We can perform this analysis on the other 5 standard neighborhoods of \( \mathbb{P}^5 \) to see that the ideal of the new indeterminacy locus is, in homogeneous coordinates of \( \mathbb{P}^5 \), given by the dehomogenization of (2.29) w.r.t. the variable \( s_1 \), cf. the ideal \( w_{n1} \) in 4.2.1.4

\[
J'' = \langle 3s_4 - 2s_5, s_3 - b_1s_5, 4s_1 - 3b_1s_2, \text{exc} \rangle ,
\] (2.29)

where the \( \text{exc} \) in ideal \( J'' \) represents the chosen local equation of the exceptional divisor (in (2.28) this is the equation \( a_2 \)).

This ideal \( J'' \) corresponds to a ruled surface with basis \( C \) (due to the presence of the \( \text{exc} \) equation), which is a \( \mathbb{P}^1 \)-subbundle of the exceptional divisor: note that the other four equations are homogeneous linear equations in the variables \( s \).

Hence, we have now a reduced and irreducible local complete intersection of dimension two. Since it is the full indeterminacy locus, a blowup along this subscheme will solve the indeterminacies over the neighborhood \( b_3 = 1 \). Thus, the map to \( \omega \) becomes a morphism after blowing up this neighborhood. (cf. [9], ex. 7.17.3, page 168).

**Definition 3.** We call \( R \) the ruled surface defined by the ideal \( J'' \) (2.29).
Let us register for future use (see Table 3, page 45) the blowup of \( \mathbb{Y}_1 \) along \( R \) as
\[
\{(b_i, s_i) : v_i = v_j \cdot e_i \} \subset \mathbb{A}^7 \times \mathbb{P}^4,
\tag{2.30}
\]
where \( e_i, \ 0 \leq i \leq 4 \), are the equations of \( J'' \), ordered as in (2.29).

As in (2.27), the equations of this blowup are
\[
\frac{3s_4 - 2s_5}{v_0} = \frac{s_4}{v_1} = \frac{s_0 - b_1s_5}{v_2} = \frac{4s_1 - 3b_1s_2}{v_3} = \frac{\text{exc}}{v_4}.
\tag{2.31}
\]

2.3.2 \( \bullet \) \( b_0 = 1 \) and \( u_1 = 1 \).

Keep the notation as in (2.14).

Taking \( u_1 = 1 \), the interesting equations are
\[
\begin{align*}
\left\{ \begin{array}{l}
\ b_2 = b_1u_2 \\
\ b_3 = b_1u_3
\end{array} \right. & \quad \text{and} \quad \left\{ \begin{array}{l}
\ 3a_6 = 2a_4u_3 \\
\ a_5 = a_4u_2
\end{array} \right.,
\end{align*}
\]
where the former corresponds to the blowup of our \( \mathbb{P}^3 \) of special quadrics at \( x_0^2 \) and the latter to divisibility. We have
\[
\left\{ \begin{array}{l}
\ f = (a_0x_0 + a_1x_1 + a_2x_2 + a_3x_3)x_0^2 + a_4(x_0x_1^2 + u_2x_0x_1x_2 + \frac{2}{3}u_3x_1^3) \\
\ g = x_0^2 + b_1x_0x_1 + b_1u_2x_0x_2 + b_1u_3x_2^2.
\end{array} \right.
\]

After computing \( \omega \) and collecting coefficients, we realize that if \( a_0 = 0 \) then there is no indeterminacy (similar to (2.23)). Hence, take \( a_0 = 1 \) (cf. 4.2.2.1).

The indeterminacy locus is again a non-reduced scheme. The reduction now presents a surprise in relation to the previous neighborhood: its ideal can be written as 4.2.2.2
\[
J_{\text{red}} = \text{rad}(J) = \langle 3b_1^2 - 4a_4, a_3, a_2, 2a_1 - 3b_1, b_1u_2, b_1(b_1 - 4u_3) \rangle,
\tag{2.32}
\]
so it is reducible. There are two components: (see primaryDecomposition K in 4.2.2.2)

1. A component \( C \), with ideal
\[
J_C = \langle b_1 - 4u_3, a_1 - 6u_3, a_2, a_3, a_4 - 12u_3^2, u_2 \rangle
\tag{2.33}
\]
which represents (compare with (2.25))
\[
f = (x_0 + 2u_3x_1)^3, \quad g = (x_0 + 2u_3x_1)^2,
\]
the same curve \( C \) as before, viewed in the present neighborhood.

2. A component with ideal
\[
J_E = \langle a_1, a_2, a_3, a_4, b_1 \rangle,
\tag{2.34}
\]
which is the whole \( \mathbb{P}^2 \)-fiber of the exceptional divisor of \( X' \) over \( g = x_0^2 \), and \( f = x_0^3 \). See (2.20).
Notice that there is precisely one point in the intersection of these two components, since
\[ J_C + J_E = \langle a_1, a_2, a_3, a_4, b_1, u_2, u_3 \rangle. \]
This ideal represents the single point \( (g, g', f) = (x_0^2, x_0x_1, x_0^3) \in \mathcal{Y} \).

**Definition 4.** We call \( E \) the component given by the ideal \( J_E \) (2.34).

Let’s see what happens when we make the blowup of \( \mathcal{Y} \) first along \( C \), followed by a blowup on \( E' \), the strict transform of \( E \).

**2.3.2.1 Blowing up along \( C \)**

Now, let \( \mathbb{A}^7 \) be the affine neighborhood defined by \( b_0 = a_0 = u_1 = 1 \). The blowup of this \( \mathbb{A}^7 \) along \( C \) is

\[ \mathcal{Y}_1 = \{ ((a, b), (s_0 : \ldots : s_5)) \mid s_i \cdot e_j = s_j \cdot e_i \} \subset \mathbb{A}^7 \times \mathbb{P}^5, \]

where \( e_i, \ 0 \leq i \leq 5 \), are the equations of \( J_C \), ordered as in (2.33).

We will write the equations of \( \mathcal{Y}_1 \) as

\[
\begin{align*}
\frac{b_1 - 4u_3}{s_0} &= \frac{a_1 - 6u_3}{s_1} = \frac{a_2}{s_2} = \frac{a_3}{s_3} = \frac{a_4 - 12u_2^2}{s_4} = \frac{u_2}{s_5}.
\end{align*}
\]

(2.35)

There are many choices for the local equation of the first exceptional divisor, as we see in (2.33). Let us pick, say, \( \text{exc}_1 = u_2 \). Then, we make the following substitutions on the expression of \( \omega \), which corresponds to \( s_5 = 1 \) in (2.35), (cf. 4.2.2.3):

\[
\begin{align*}
\frac{b_1 - 4u_3}{s_0} &= s_0u_2 \\
\frac{a_1 - 6u_3}{s_1} &= s_1u_2 \\
\frac{a_2}{s_2} &= s_2u_2 \\
\frac{a_3}{s_3} &= s_3u_2 \\
\frac{a_4 - 12u_2^2}{s_4} &= s_4u_2
\end{align*}
\]

The new 7 affine coordinates on the blowup are

\[ s_0, s_1, s_2, s_3, s_4, u_2, u_3. \]

(2.36)

After these substitutions, one can check that the new expression for \( \omega \) is divisible by \( u_2 \). Dividing, we obtain the transform of \( \omega \) over the first blowup (cf. wn_5 in 4.2.2.3).

**Definition 5.** Denote by \( \mathcal{Y}_1 \to \mathcal{Y} \) the blowup of \( \mathcal{Y} \) along \( C \).

Recall (2.32) the radical \( J_{\text{red}} = \text{rad}(J) \) represents the union \( C \cup E \). After the blowup of \( \mathcal{Y} \) along \( C \), calculations as in 4.2.2.3 reveal that the strict transform of \( J_{\text{red}} \) is given by

\[ J'_E = \langle s_3, s_2, 3s_0 - 2s_1, 6u_3 + s_1u_2, 3s_4 + s_1^2u_2 \rangle. \]

(2.37)

It coincides with the strict transform \( E' \) of \( E \) under the first blowup.
2.3.2.2 Blowup along $E'$

We take $E'$ as our new blowup center.

**Definition 6.** Denote by $Y_2 \to Y_1$ the blowup of $Y_1$ along $E'$.

After the blowup along $C$, the reduction of the new indeterminacy locus in $Y_1$ consists again of two components: the component $E'$ (2.37), and the ruled surface $R$ (Definition 3), with ideal (cf. 4.2.2.4)

$$\langle u_2, s_3, s_2 - 6u_3, 3s_0 - 2s_1, 3s_1u_3 - s_4 \rangle.$$

Note the presence of the local equation $\text{exc}_1 = u_2$, representing the base $C$, and the other four linear equations in the “fiber” variables $s$.

These two components intersect in codimension one in $R$, since the sum of their ideals is (cf. 4.2.2.4)

$$\langle u_3, u_2, s_4, s_3, s_2, 3s_0 - 2s_1 \rangle.$$ 

Thus, the blowup along $E'$ does not change the structure of $R$, that is, its strict transform $R' \subset Y_2$ is a ruled surface, a $\mathbb{P}^1$–bundle over the (transform of the) curve $C$.

The blowup of the $A_7$ (2.36) along $E'$ is

$$Y_2 = \{(u, s), (t_0 : \ldots : t_4) \mid t_i \cdot e_j = t_j \cdot e_i \} \subset \mathbb{A}^7 \times \mathbb{P}^4,$$

where $e_i$, $0 \leq i \leq 4$, are the equations of $J_{E'}$, ordered as in (2.37), and $(u, s)$ as in (2.36).

We will write the equations of $Y_2 \subset \mathbb{A}^7 \times \mathbb{P}^4$ as

$$\frac{s_3}{t_0} = \frac{s_2}{t_1} = \frac{3s_0 - 2s_1}{t_2} = \frac{6u_3 + s_1u_2}{t_3} = \frac{3s_4 + s^2u_2}{t_4}. \quad (2.38)$$

Choose now the equation $\text{exc}_2 = s_2$ in (2.37) as the new local exceptional equation, i.e, take $t_1 = 1$. Equations (2.38) become

$$\begin{cases}
    s_3 &= t_0s_2 \\
    3s_0 - 2s_1 &= t_2s_2 \\
    6u_3 + s_1u_2 &= t_3s_2 \\
    3s_4 + s^2u_2 &= t_4s_2
\end{cases}$$

The new 7 affine coordinates on $Y_2$ are

$$t_0, t_2, t_3, t_4, u_2, s_1, s_2. \quad (2.39)$$

Again, the expression of the renewed $\omega$, obtained by these substitutions, is divisible by the equation of the exceptional divisor ($s_2$ in this case).

However, after this division, the map to $\omega$ is not solved yet, (cf. 4.2.2.4).

There are now two components in the new indeterminacy locus. One of them is

$$J_{R'} = \langle u_2, t_3 - 1, t_2, t_0, 3s_1 - 2t_4 \rangle. \quad (2.40)$$

The ideal $J_{R'}$ represents the ruled surface $R'$ which is a $\mathbb{P}^1$–subbundle of the (transform of the) exceptional divisor $\mathbb{P}(\mathcal{N}_{C|Y})$ (the same as (2.29), viewed in other neighborhood).
2.3.2.3 Blowup along \( R' \)

**Definition 7.** Denote by \( Y_3 \to Y_2 \) the blowup of \( Y_2 \) along \( R' \).

This blowup, in the affine chart \( s_5 = 1, t_1 = 1 \), is

\[
Y_3 = \left\{ \left( (u, s, t), (v_0 : \ldots : v_4) \right) \mid v_i \cdot e_j = v_j \cdot e_i \right\} \subset \mathbb{A}^7 \times \mathbb{P}^4,
\]

where \( e_i, \ 0 \leq i \leq 4 \), are the equations of \( J_{R'} \), ordered as in (2.40), and \( (u, s, t) \) as in (2.39).

We will write the equations of \( Y_3 \) as

\[
\begin{align*}
\frac{u_2}{v_0} &= \frac{t_3 - 1}{v_1} = \frac{t_2}{v_2} = \frac{t_0}{v_3} = \frac{3s_1 - 2t_4}{v_4}.
\end{align*}
\]

(2.41)

Choose now the equation \( \text{exc}_3 = u_2 \) in (2.40) as the new local exceptional equation, i.e., take \( v_0 = 1 \). Equations (2.41) become

\[
\begin{align*}
\frac{t_3 - 1}{v_1} &= v_1 u_2, \\
\frac{t_2}{v_2} &= v_2 u_2, \\
\frac{t_0}{v_3} &= v_3 u_2, \\
\frac{3s_1 - 2t_4}{v_4} &= v_4 u_2.
\end{align*}
\]

The new 7 affine coordinates on \( Y_3 \) are

\[
v_1, v_2, v_3, v_4, u_2, s_2, t_4.
\]

(2.42)

In \( Y_3 \) the indeterminacy locus reduces to (\( J_\text{nu}_11 \) in 4.2.2.5)

\[
J_L = \langle s_2, v_1, v_2, v_3, v_4, v_4 \rangle.
\]

(2.43)

2.3.2.4 Blowup along \( L \)

The component represented by the ideal \( J_L \) (2.43) is easy to describe. Since the affine variables are as listed in (2.42), the six linear equations represent a line inside the (transform of) the second blowup center \( E \) (note the presence of the equation \( \text{exc}_2 = s_2 \) in \( J_L \)), a line parametrized by the variable \( u_2 \).

**Definition 8.** We call \( L \) the component described by the ideal \( J_L \) (2.43).

Finally, we solve the indeterminacies by blowing up along the still remaining indeterminacy locus, the component \( L \).

**Definition 9.** We will denote by \( Y_4 \to Y_3 \) the blowup of \( Y_3 \) along \( L \).

To put coordinates for later use (see Table 8, page 56), set

\[
Y_4 = \left\{ \left( (u, s, t, v), (z_0 : \ldots : z_5) \right) \mid z_i \cdot e_j = z_j \cdot e_i \right\} \subset \mathbb{A}^7 \times \mathbb{P}^5,
\]
where \( e_i \), \( 0 \leq i \leq 5 \), are the equations of \( J_L \), ordered as in (2.43), and \((u, s, t, v)\) as in (2.42). The equations of \( Y_4 \subset A^7 \times \mathbb{P}^3 \) are

\[
\begin{align*}
\frac{s_2}{z_0} &= v_1 = \frac{v_2}{z_2} = \frac{v_3}{z_3} = \frac{v_4}{z_4} = \frac{t_4}{z_5}.
\end{align*}
\]

(2.44)

Over \( Y_4 \) the map is solved, at least in the affine chart \([s_5 = t_1 = v_0 = 1]\), (cf. 4.2.2.6).

The calculations in all other standard neighborhoods reveal that this sequence of blowups still work to solve the map. (See 4.2.2.7).

**Theorem 1.** The four blowups of \( Y \) along \( C, E, R \) and \( L \) will solve the map \((g, f) \mapsto \omega\) on the neighborhood \( b_0 = 1, u_1 = 1\).

There are other four standard neighborhoods of \( Y \) to be checked, corresponding to \([b_2 = 1]\), \([b_1 = 1]\), \([b_0 = 1 \text{ and } u_2 = 1]\), \([b_0 = 1 \text{ and } u_3 = 1]\). The four blowups described will solve the maps over each of these neighborhoods, cf. 4.2.3, 4.2.4, 4.2.5

### 2.4 SUMMARY

The whole discussion of the indeterminacy loci was made over our fixed flag (2.2). Since the blowup centers as described were actually fibers of bundles over the variety of complete flags \( F \), we have at the end a bundle which constitutes the desired parameter space:

\[
\begin{array}{ccccccccc}
Y_4 & \text{blowup} L & \rightarrow & Y_3 & \text{blowup} R & \rightarrow & Y_2 & \text{blowup} E & \rightarrow & Y_1 & \text{blowup} C & \rightarrow & Y \\
\downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
Y & \text{\( P^4 \) bundle} & \rightarrow & X & \text{blowup} P(O_{\mathbb{P}^3}(-2)) & \rightarrow & X & \text{\( P^3 \) bundle} & \rightarrow & F & = \text{all flags} \\
\end{array}
\]

(2.45)

This can be summarized as follows:

**Theorem 2.** Let \( Y_4 \) be the variety obtained by the four blowups as described above. Then \( Y_4 \) is equipped with a morphism onto the exceptional component \( E(3) \).

By construction, \( Y_4 \) is equipped with a line bundle \( \mathcal{W} \), pullback of the line bundle \( O_{\mathbb{P}^4}(-1) \) over \( \mathbb{P}^4 = \mathbb{P}(H^0(\Omega_{\mathbb{P}^3}^1(4))) \). The fiber of \( \mathcal{W} \) over a point in \( Y_4 \) is the rank one space spanned by the computed 1-form \( \omega \).

\[
\begin{array}{ccc}
\mathcal{W} = \Phi^*(O(-1)) & \quad & O(-1) \\
\downarrow & \quad & \downarrow \\
Y_4 & \Phi & \mathbb{P}(H^0(\Omega_{\mathbb{P}^3}^1(4))) \supset E(3) = \Phi(Y_4)
\end{array}
\]

**Proposition 2.** The map \( \Phi : Y_4 \rightarrow E(3) \) is generically injective.

**Proof.** For a given \( \omega \in E(3) \) (off the boundary) we already saw that the flag can be recovered (see Remark 1, page 18). Hence, we can look at a fiber over a fixed flag.
So fix the flag \( \varphi_0 = (p_0, \ell_0, v_0) \). The fiber of \( \mathbb{X} \) at this flag is the \( \mathbb{P}^3 \) of special quadrics

\[
g = b_0 x_0^2 + b_1 x_0 x_1 + b_2 x_0 x_2 + b_3 x_1^2.
\]

Now, we will pay attention to the dense open set where \( b_2 = 1 \), so

\[
g = b_0 x_0^2 + b_1 x_0 x_1 + x_0 x_2 + b_3 x_1^2. \tag{2.46}
\]

The divisibility condition (2.5) shows that the fiber of \( Y \) over a quadric as in (2.46) is the \( \mathbb{P}^4 = \{(a_0 : a_1 : a_2 : a_3 : a_5)\} \) of special cubics

\[
f = (a_0 x_0 + a_1 x_1 + a_2 x_2 + a_3 x_3) x_0^2 + a_5 \left( b_1 x_0 x_1^2 + x_0 x_1 x_2 + \frac{2}{3} b_3 x_1^2 \right).
\]

Computing \( \omega = \frac{3fdg - 2gdf}{x_0} \) one can see that there are no indeterminacies on this neighborhood \([b_2 = 1]\) (cf. 4.2.5). Moreover,

\[
2g \frac{\partial f}{\partial x_3} - 3f \frac{\partial g}{\partial x_3} = 2a_3 gx_0^2,
\]

and the quadric \( g \) can be recovered from \( \omega \) just by looking at the coefficient of \( dx_3 \) (at least on the dense open set \( a_3 = 1 \)).

The coefficient of \( dx_2 \) in \( \omega \) is

\[
\frac{1}{x_0} \left( 2g \frac{\partial f}{\partial x_2} - 3f \frac{\partial g}{\partial x_2} \right) = \frac{(2a_2 b_0 - 3a_0) x_0^3 + (2a_2 b_0 + 2a_2 b_1 - 3a_1) x_0^2 x_1 + (-a_5 b_1 + 2a_2 b_3) x_0 x_1^2 - a_2 x_0^2 x_2 - a_5 x_0 x_1 x_2 - 3a_3 x_0 x_2 x_3}{x_0}.
\]

Hence the coefficients \( a_2 \) and \( a_5 \) can be recovered from \( x_0^2 x_2 dx_2 \) and \( x_0 x_1 x_2 dx_2 \), respectively. And since the coefficients \( b_0 \) and \( b_1 \) are also known one can obtain from \( \omega \) the coefficients \( a_0 \) and \( a_1 \) from \( x_0^3 dx_2 \) and \( x_0^2 x_1 dx_2 \), respectively.

**Theorem 3.** The degree of the exceptional component of codimension one and degree two foliations in \( \mathbb{P}^3 \) is given by

\[
\int_{\mathbb{Y}_4} -c_1^{13}(\mathcal{W}) \cap [\mathbb{Y}_4].
\]

**Proof.** We have \( \dim(\mathbb{Y}_4) = 13 \). Since the map \( \Phi \) is generically injective the required degree is (cf. definition of \( \deg_{\tilde{X}} \tilde{X} \) in [8], page 83)

\[
\int_{\mathbb{Y}_4} c_1(\Phi^* \mathcal{O}(1))^{13} \cap [\mathbb{Y}_4] = \int_{\mathbb{Y}_4} -c_1(\Phi^* \mathcal{O}(-1))^{13} \cap [\mathbb{Y}_4] = \int_{\mathbb{Y}_4} -c_1(\mathcal{W})^{13} \cap [\mathbb{Y}_4].
\]
3 CALCULATION OF THE DEGREE

3.1 ACTION OF A TORUS

In order to obtain the value of the integral in Theorem 3, we will apply Bott’s formula

$$\int_{\mathbb{Y}_4} -c_1^{13}(W) \cap [\mathbb{Y}_4] = \sum_{F} -\frac{c_1^{T}(W)^{13} \cap [F]|_{T}}{c_{\text{top}}(\mathcal{N}_F|_{\mathbb{Y}_4})},$$

where the sum runs through all fixed components $F$ under a convenient action of the torus $\mathbb{C}^*$. Fix an action

$$\mathbb{C}^* \times \tilde{\mathbb{P}}^3 \rightarrow \tilde{\mathbb{P}}^3$$

$$(t, x_i) \mapsto t^{w_i}x_i$$

of $\mathbb{C}^*$ in $\tilde{\mathbb{P}}^3$ with distinct weights $w_i, i \in \{0, 1, 2, 3\}$.

For a good choice of these weights, the only fixed flags are the standard ones (cf. 5.1),

$$p_{ijk} = \{x_i = x_j = x_k = 0\} \in \ell_{ij} = \{x_i = x_j = 0\} \subset v_i = \{x_i = 0\}.$$

Hence, we have 24 fixed flags.

The reader not familiarized with Bott’s formula may consult the reference [12], in special the examples with a fixed component of positive dimension. See also the appendix 5.2.

3.2 FIXED POINTS OVER A FLAG

Now, consider our favourite fixed flag $\varphi_0 = (p_0, \ell_0, v_0)$ (2.2).

The induced action on $\mathbb{X}'$ is given by

$$\begin{align*}
g &= b_0x_0^2 + b_1x_0x_1 + b_2x_0x_2 + b_3x_1^2 \\ t \circ g &= t^{w_0}b_0x_0^2 + t^{w_0+w_1}b_1x_0x_1 + t^{w_0+w_2}b_2x_0x_2 + t^{2w_1}b_3x_1^2 \\
g' &= u_1x_0x_1 + u_2x_0x_2 + u_3x_1^2 \\ t \circ g' &= t^{w_0+w_1}u_1x_0x_1 + t^{w_0+w_2}u_2x_0x_2 + t^{2w_1}u_3x_1^2.
\end{align*}$$

We recognize at once the six isolated fixed points

$$\begin{align*}
x'_1 &= (x_0x_1), \quad x'_2 := (x_0x_2), \quad x'_3 := (x_3^2), \quad x'_4 := (x_0^2, x_0, x_1), \quad x'_5 := (x_0^2, x_0x_2), \quad x'_6 := (x_0^2, x_1^2).
\end{align*}$$

The last three points lie in the exceptional $\mathbb{P}^2$ of the blowup of $\mathbb{P}^3 = \{(b_0 : \cdots : b_3)\}$ at the point $x_0^3 \leftrightarrow (1 : 0 : 0 : 0)$.

Over each of these six points, in the fiber $\mathbb{Y}_4'$ of $\mathbb{Y}$ we have 5 other isolated fixed points, since this fiber is a $\mathbb{P}^4$ (again, for a good choice of the weights, cf. 5.1.2).
For example, take the fixed point \( x_1' = x_0 x_1 \). The fiber \( \mathcal{Y}_{x_1'} \) is the \( \mathbb{P}^4 \) of special cubics
\[
f = a_0 x_0^3 + a_1 x_0^2 x_1 + a_2 x_0^2 x_2 + a_3 x_0^2 x_3 + a_4 x_0 x_1^2,
\]
by the divisibility condition (2.5) applied to (2.3). Thus, the five fixed cubics here are
\[
y_1' := x_0^3, \ y_2' := x_0^2 x_1, \ y_3' := x_0^2 x_2, \ y_4' := x_0^2 x_3, \ y_5' := x_0 x_1^2.
\]
For the pair \((x_1', y_3') = (x_0 x_1, x_0^2 x_2) \in \mathcal{Y}\), one can compute
\[
\omega = \frac{3x_1' dy_3' - 2y_3' dx_1'}{x_0} = -x_0 x_1 x_2 dx_0 + 3x_0^2 x_2 dx_1 - 2x_0^3 x_1 dx_2.
\]
The fiber of the line bundle \( \mathcal{W} \) over the fixed point \((x_0 x_1, x_0^2 x_2)\) is the \( \mathbb{C} \)-linear space spanned by
\[
\omega = x_0 x_1 x_2 dx_0 - 3x_0^2 x_2 dx_1 + 2x_0^3 x_1 dx_2.
\]
Notice that presently there are many fixed points outside of the indeterminacy locus of the map \((g, f) \mapsto \omega\) (see Table 1 below). Their contribution for Bott’s formula can be immediately computed.

We present a table of the 30 fixed points described until here. Computations in 4.2.6.
### 3.2. Fixed Points over a Flag

| fixed point at $\mathcal{X}' : x_i'$ | fixed point at $\mathcal{Y}, y_j'$ | generator of fiber in $\mathcal{W}$ |
|--------------------------------------|-----------------------------------|---------------------------------|
| $x_0^1$ | $\omega = x_0^2x_1dx_0 - x_0^3dx_1$ | $\omega = x_0^2x_1dx_0 - x_0^3dx_1$ |
| $x_0^2$ | $\omega = x_0^2x_1dx_0 - x_0^3dx_1$ | $\omega = x_0^2x_1dx_0 - x_0^3dx_1$ |
| $x_0^3$ | $\omega = x_0^2x_2dx_0 - 3x_0^2x_2dx_1 + 2x_0^2x_1dx_2$ | $\omega = x_0^2x_2dx_0 - 3x_0^2x_2dx_1 + 2x_0^2x_1dx_2$ |
| $x_0^3$ | $\omega = x_0^2x_3dx_0 - 3x_0^2x_3dx_1 + 2x_0^2x_1dx_3$ | $\omega = x_0^2x_3dx_0 - 3x_0^2x_3dx_1 + 2x_0^2x_1dx_3$ |
| $x_0^3$ | $\omega = x_0^2x_1dx_0 - x_0^3dx_1$ | $\omega = x_0^2x_1dx_0 - x_0^3dx_1$ |
| $x_0^3$ | $\omega = x_0^2x_2dx_0 - x_0^3dx_2$ | $\omega = x_0^2x_2dx_0 - x_0^3dx_2$ |
| $x_1^2$ | $\omega = 2x_1^2x_2dx_0 - 3x_0x_1x_2dx_1 + x_0x_1^2dx_2$ | $\omega = 2x_1^2x_2dx_0 - 3x_0x_1x_2dx_1 + x_0x_1^2dx_2$ |
| $x_1^3$ | $\omega = 2x_1^2x_3dx_0 - 3x_0x_1x_3dx_1 + x_0x_1^2dx_3$ | $\omega = 2x_1^2x_3dx_0 - 3x_0x_1x_3dx_1 + x_0x_1^2dx_3$ |
| $x_0^2, x_0^1$ | not defined | not defined |
| $x_0^2, x_0^1$ | not defined | not defined |
| $x_0^2, x_0^1$ | not defined | not defined |
| $x_0^2, x_0^1$ | not defined | not defined |
| $x_0^2, x_1^2$ | not defined | not defined |
There are 26 fixed points in $\mathcal{Y}$ off the indeterminacy locus. In the following examples we will compute the contribution of the fixed points for Bott’s formula (3.1).

**Example 1.** Let us compute the contribution of the point $(g, f) = (x_0 x_1, x_0^2 x_2)$. We have

$$\omega = x_0 x_1 x_2 d x_0 - 3 x_0^2 x_2 d x_1 + 2 x_0^3 x_1 d x_2,$$

hence the induced action reads

$$t \circ \omega = t^{w_0} x_0 t^{w_1} x_1 t^{w_2} x_2 d (t^{w_0} x_0) - 3 t^{2 w_0} x_0^2 t^{w_2} x_2 d (t^{w_1} x_1) + 2 t^{2 w_0} x_0^2 t^{w_1} x_1 d (t^{w_2} x_2)$$

$$= t^{2 w_0 + w_1 + w_2} \cdot (x_0 x_1 x_2 d x_0 - 3 x_0^2 x_2 d x_1 + 2 x_0^3 x_1 d x_2),$$

and so the equivariant Chern class is

$$c_1^T (W)_{(x_1', x_2')} = 2 w_0 + w_1 + w_2. \tag{3.4}$$

Since this component of fixed points consists of a single point, its normal space coincides with the tangent space of $\mathcal{Y}$ at this point. It decomposes as

$$T_{(x_0 x_1, x_0^2 x_2)} \mathcal{Y} = T_{(p, \ell, v)} \mathbb{P}^4 \oplus T_{(x_0 x_1)} \mathcal{X} \oplus T_{(x_0^2 x_2)} \mathcal{Y}_{x_0 x_1} = \tag{3.5}$$

$$= \left( \frac{x_1}{x_0} + \frac{x_2}{x_0} + \frac{x_3}{x_1} + \frac{x_2}{x_1} + \frac{x_3}{x_2} + \left( \frac{x_0^2}{x_0 x_1} + \frac{x_0 x_2}{x_0 x_1} + \frac{x_0^3}{x_0 x_1} \right) \right) +$$

$$+ \left( \frac{x_0^2}{x_0 x_2} + \frac{x_0^2}{x_1 x_2} + \frac{x_0 x_3}{x_1 x_2} + \frac{x_0^2 x_1}{x_0 x_2} + \frac{x_0^3 x_1}{x_0 x_2} \right),$$

where this sum represents the decomposition into eigenspaces; the weight of $\frac{x_i}{x_j}$ is $w_i - w_j$. From this, it follows that the contribution of the point $(x_0 x_1, x_0^2 x_2)$ in Bott’s formula is the fraction

$$\frac{-(2 w_0 + w_1 + w_2)^{13}}{(w_0 - w_1)^3 (w_2 - w_0)^2 (w_3 - w_0) (w_2 - w_1)^3 (w_3 - w_1) (w_3 - w_2)^2 (2 w_1 - w_0 - w_2)}. \tag{3.6}$$

Let us illustrate the general process used to compute the tangent spaces in (3.5). For the fiber $\mathcal{Y}_{x_0 x_1}$, since $b_2 = b_3 = 0$ and $b_1 = 1$, the divisibility condition (2.5) reads $a_5 = a_6 = 0$, so this fiber consists of special cubics

$$f = a_0 x_0^3 + a_1 x_0^2 x_1 + a_2 x_0^2 x_2 + a_3 x_0^2 x_3 + a_4 x_0 x_1^2.$$

To compute the tangent space of this $\mathbb{P}^4$–fiber over the fixed point $x_0^2 x_2$ (5.8), we write

$$T_{x_0^2 x_2} \mathcal{Y}_{x_0 x_1} = \langle x_0^3, x_0^2 x_1, x_0^2 x_3, x_0 x_1^2 \rangle \otimes \langle x_0^2 x_2 \rangle^\vee = \tag{3.7}$$

$$= [x_0^3 \otimes (x_0^2 x_2)^\vee] \oplus [(x_0^2 x_1) \otimes (x_0^2 x_2)^\vee] \oplus [(x_0^2 x_3) \otimes (x_0^2 x_2)^\vee] \oplus [(x_0 x_1^2) \otimes (x_0^2 x_2)^\vee] =$$

$$= \dfrac{x_0^3 x_2}{x_0^2 x_2} + \dfrac{x_0^2 x_1}{x_0^2 x_2} + \dfrac{x_0^2 x_3}{x_0^2 x_2} + \dfrac{x_0 x_1^2}{x_0^2 x_2}.$$
Example 2. Next, take a fixed point over the exceptional divisor of $X'$. Say, take the fixed point $(x_0^2, x_0 x_2, x_0^2 x_3)$. The tangent space of $Y$ at this point decomposes as

$$T_{(x_0^2, x_0 x_2, x_0^2 x_3)} Y = T_{(p, \ell, v)} F \oplus T_{(x_0^2, x_0 x_2)} X' \oplus T_{(x_0^2 x_3)} Y_{x_0^2, x_0 x_2}$$

and the tangent space of $X'$ decomposes as

$$T_{x_0^2, x_0 x_2} X' = L_{x_0^2, x_0 x_2} \oplus T_{L_{x_0^2, x_0 x_2}} P(\mathbb{N}_{x_0^2|x}) \tag{3.8}$$

where $L_{x_0^2, x_0 x_2}$ is the line represented by the point $(x_0^2, x_0 x_2) \in P(\mathbb{N}_{x_0^2|x})$.

Since $x_0$ is a point in $X$, we have

$$\mathbb{N}_{x_0^2|x} = T_{x_0^2} X = \frac{x_0 x_1}{x_0^2} + \frac{x_0 x_2}{x_0} + \frac{x_0^2}{x_0}$$

and

$$T_{L_{x_0^2, x_0 x_2}} P(\mathbb{N}_{x_0^2|x}) = \left( \frac{x_0 x_1}{x_0^2} \cdot \frac{x_0^2}{x_0 x_2} \right) + \left( \frac{x_0 x_2}{x_0} \cdot \frac{x_0^2}{x_0 x_2} \right) = \frac{x_0 x_1}{x_0 x_2} + \frac{x_0 x_2}{x_0^2}.$$ 

The three eigenspaces in (3.8) are the summands as displayed below:

$$T_{x_0^2, x_0 x_2} X' = \left( \frac{x_0 x_2}{x_0^2} \right) + \left( \frac{x_0 x_1}{x_0 x_2} + \frac{x_0^2}{x_0 x_2} \right). \tag{3.9}$$

\[ \square \]

In a similar way of examples 1 and 2 we can compute the contributions for the 26 “well resolved” points of Table 1.

### 3.3 Degree of a Fiber

At any point $q \in \mathbb{Y}_4$ lying over $(p, \ell, v) \in F$, the tangent space of $\mathbb{Y}_4$ decomposes as

$$T_{(p, \ell, v, q)} \mathbb{Y}_4 = T_{(p, \ell, v)} F \oplus T_q \mathbb{Y}_4(p, \ell, v),$$

where $T_q \mathbb{Y}_4(p, \ell, v)$ means the tangent space of the fiber of $\mathbb{Y}_4$ over the flag $(p, \ell, v) \in F$. Now, since we have fixed the flag $(p_0, \ell_0, v_0)$ we will omit the summand $T_{(p, \ell, v)} F$ in the following sections, and focus on the rank 7 space $T_q \mathbb{Y}_4(p_0, \ell_0, v_0) = T_q \mathbb{Y}_4$.

Note that over a fixed flag, the fiber $\mathbb{Y}_4(p, \ell, v)$ is a smooth projective variety of dimension 7. This gives a subvariety of exceptional foliations which are obtained from a fixed flag. We can ask about the degree of this 7-dimensional variety, and the answer can be expressed as the integral (in a same way as Theorem 3)

$$\int_{\mathbb{Y}_4(p, \ell, v)} -c_1^{\ast}(\mathcal{V}) \cap [\mathbb{Y}_4(p, \ell, v)].$$

From now on we fix the flag $\varphi_0$ in (2.2) to compute the degree of the image of that fiber. This procedure reduces the affine coordinates to 7 instead of 13, simplifying the computational aspects.
3.4 CONTRIBUTIONS OVER THE BLOWUP CENTERS

In $\mathbb{Y}$ there exist 30 fixed points (Table 1); for 26 of them we may compute immediately the contributions as shown in (3.6). There are still four remaining points to consider.

3.4.1 $(g, f) = (x_1^2, x_1^3)$.

Notice that this point lives in the neighborhood $a_6 = b_3 = 1$. See 2.3.1.

First, we do the blowup of $Y$ along the curve $C$ (2.25)

$$f = \left(\frac{b_1}{2} x_0 + x_1\right)^3, \quad g = \left(\frac{b_1}{2} x_0 + x_1\right)^2.$$  

It's a local complete intersection. We will look at the local equations, and use a trick as explained below to give adequate weights to the local coefficients of a general quadric and cubic.

From (3.3), the $\mathbb{P}^3 = \{(b_0 : b_1 : b_2 : b_3)\}$ of special quadrics has action

$$[t, (b_0 : b_1 : b_2 : b_3)] \mapsto (t^{2w_0} b_0 : t^{w_0+w_1} b_1 : t^{w_0+w_2} b_2 : t^{2w_1} b_3)$$ (3.10)

The trick is to look at the affine chart $b_3 = 1$,

$$(b_0, b_1, b_2) = \left(\frac{b_0}{b_3}, \frac{b_1}{b_3}, \frac{b_2}{b_3}\right)$$

and set

$$[t, (b_0, b_1, b_2)] \mapsto \left(\frac{t^{2w_0} b_0}{t^{2w_1} b_3}, \frac{t^{w_0+w_1} b_1}{t^{2w_1} b_3}, \frac{t^{w_0+w_2} b_2}{t^{2w_1} b_3}\right)$$

Thus, we gain naturally local weights for coordinates around the fixed point $x_1^2$:

$$w_{b_0} = 2w_0 - 2w_1, \quad w_{b_1} = w_0 - w_1, \quad w_{b_2} = w_0 + w_2 - 2w_1$$ (3.11)

These are weights for the points of $\mathbb{A}^3$. For the respective linear functions the local weights have opposite sign, i.e., the linear function $b_1$ has local weight $-w_{b_1} = w_1 - w_0$, and the linear function $b_2$ has local weight $-w_{b_2} = 2w_1 - w_0 - w_2$. Then,

$$t \circ (b_1 x_0 x_1^2) = t^{u_1-u_0} b_1 t^{u_0+2u_1} x_0 x_1^2 = t^{3u_1} b_1 x_0 x_1^2, \quad t \circ (b_2 x_0 x_1 x_2) = t^{2u_1-u_0-u_2} b_2 t^{u_0+u_1+w_2} x_0 x_1 x_2 = t^{3u_1} b_2 x_0 x_1 x_2.$$

The special cubics are (2.22)

$$f = a_0 x_0^3 + a_1 x_0^2 x_1 + a_2 x_0^2 x_2 + a_3 x_0 x_1^2 + a_6 \left(\frac{3}{2} b_1 x_0 x_1^2 + \frac{3}{2} b_2 x_0 x_1 x_2 + x_1^3\right).$$

The $\mathbb{P}^4 = \{(a_0, a_1 : a_2 : a_3 : a_6)\}$ of special cubics inherits the induced action

$$[t, (a_0 : a_1 : a_2 : a_3 : a_6)] \mapsto (t^{3w_0} a_0 : t^{2w_0+w_1} a_1 : t^{2w_0+w_2} a_2 : t^{2w_0+w_3} a_3 : t^{3w_1} a_6)$$ (3.12)
In the affine chart $a_6 = 1$ we write

$$(a_0, a_1, a_2, a_3) = \left( \frac{a_0}{a_6}, \frac{a_1}{a_6}, \frac{a_2}{a_6}, \frac{a_3}{a_6} \right)$$

and set

$$[t, (a_0, a_1, a_2, a_3)] \mapsto \left( \frac{t^3 a_0}{t^{3a_1} a_6}, \frac{t^2 a_0 + w_1 a_1}{t^{3a_1} a_6}, \frac{t^2 a_0 + w_2 a_2}{t^{3a_1} a_6}, \frac{t^2 a_0 + w_3 a_3}{t^{3a_1} a_6} \right)$$

In this way we can set local weights around the fixed point $(x_1^2, x_1^3)$

$$w_{a_0} = 3w_0 - 3w_1, \quad w_{b_0} = 2w_0 - 2w_1,$$
$$w_{a_1} = 2w_0 - 2w_1, \quad w_{b_1} = w_0 - w_1,$$
$$w_{a_2} = 2w_0 - 3w_1 + w_2, \quad w_{b_2} = w_0 - w_1 + w_2,$$
$$w_{a_3} = 2w_0 - 3w_1 + w_3.$$

The local equations of the first blowup center are (see ideal $J_{red}$ in (2.24)):

$$\begin{cases}
8a_0 - b_1^3 & \text{(weight } 3w_1 - 3w_0) \\
2a_2 & \text{(weight } 3w_1 - 2w_0 - w_2) \\
b_2 & \text{(weight } 2w_1 - w_0 - w_2) \\
a_3 & \text{(weight } 3w_1 - 2w_0 - w_3) \\
4b_0 - b_1^2 & \text{(weight } 2w_1 - 2w_0) \\
4a_1 - 3b_1^2 & \text{(weight } 2w_1 - 2w_0)
\end{cases}$$

Notice that the above are all weighted homogeneous equations. The first blowup produces as exceptional divisor a $P^5$-bundle over the curve $C$, to wit, the projectivized normal bundle $P(N_{C|Y})$. Since $J_{red}/J_{red}$ is the conormal sheaf of $C$, the weights of the normal bundle have opposite sign by duality. Then, over a fixed point in $C$, we have a (2.26)

$$P^5 = \{(s_0 : s_1 : s_2 : s_3 : s_4 : s_5)\}$$

with a natural induced action and weights

$$w_{s_0} = 3w_0 - 3w_1, \quad w_{s_3} = 2w_0 + w_3 - 3w_1,$$
$$w_{s_1} = 2w_0 + w_2 - 3w_1, \quad w_{s_4} = 2w_0 - 2w_1,$$
$$w_{s_2} = w_0 + w_2 - 2w_1, \quad w_{s_5} = 2w_0 - 2w_1.$$

$$t \circ (s_0 : s_1 : s_2 : s_3 : s_4 : s_5) = (t^{w_0} s_0 : t^{w_1} s_1 : t^{w_2} s_2 : t^{w_3} s_3 : t^{w_4} s_4 : t^{w_5} s_5) \quad (3.13)$$

Over the fixed point $q := (x_1^2, x_1^3) \in C$ we have a $P^5$ with four isolated fixed points, and since $w_{s_4} = w_{s_5}$, a fixed one dimensional component

$$\ell_1 = P^1 = \{0 : 0 : 0 : 0 : s_4 : s_5\} \quad (3.14)$$
Let us describe the fiber of the normal bundle over \( q \). First of all, we have

\[
T_q \mathbb{Y} = T_{(x_1^3)} X \oplus T_{(x_1^2)} \mathbb{Y} x_1^2
\]

(3.15)

At the point \( g = x_1^2 \) we have \( b_1 = b_2 = 0 \), so the fiber \( \mathbb{Y} x_1^2 \) is the \( \mathbb{P}^4 \) of special cubics

\[
f = a_0 x_0^3 + a_1 x_0^2 x_1 + a_2 x_0^2 x_2 + a_3 x_0^2 x_3 + a_6 x_1^3
\]

and (3.15) reads

\[
T_q \mathbb{Y} = \left( \frac{x_0^2}{x_1^2} + \frac{x_0 x_2}{x_1^2} \right) \oplus \left( \frac{x_0^3}{x_1^3} + \frac{x_1^2}{x_1^2} + \frac{x_0 x_2}{x_1^2} + \frac{x_0 x_3}{x_1^2} \right).
\]

The blowup center is the curve \( C \) parametrized by \( sx_0 + x_1 \), so (as in (3.7))

\[
T_q C = \frac{x_0}{x_1}
\]

From the short exact sequence

\[
T_q C \hookrightarrow T_q \mathbb{Y} \twoheadrightarrow N_{qC|Y},
\]

one can find

\[
N_{qC|Y} = \left( \frac{x_0^2}{x_1^2} + \frac{x_0 x_2}{x_1^2} \right) \oplus \left( \frac{x_0^3}{x_1^3} + \frac{x_1^2}{x_1^2} + \frac{x_0 x_2}{x_1^2} + \frac{x_0 x_3}{x_1^2} \right)
\]

(3.16)

Note the presence of the two summands \( \frac{x_0^2}{x_1^2} \) representing two (independent) eigenvectors associated to the same weight. A simple comparison of the weights reveals the associations with the homogeneous coordinates \( s_i \); for example, the fixed point \( s'_0 = (1 : 0 : 0 : 0 : 0 : 0) \), with weight \( w_{s_0} = 3w_0 - 3w_1 \) (cf (3.13)) is associated to the eigenvector \( \frac{x_0^3}{x_1^2} \), with weight \( 3w_0 - 3w_1 \).

For short, we use the following notation for points of the \( \mathbb{P}^5 \)-fiber:

\[
s'_0 = (1 : 0 : 0 : 0 : 0 : 0), \quad s'_1 = (0 : 1 : 0 : 0 : 0 : 0) \]
\[
s'_2 = (0 : 0 : 1 : 0 : 0 : 0), \quad s'_3 = (0 : 0 : 0 : 1 : 0 : 0) \]
\[
s'_4 = (0 : 0 : 0 : 0 : 1 : 0), \quad s'_5 = (0 : 0 : 0 : 0 : 0 : 1)
\]

**Example 3.** To compute the contribution of the fixed point

\[(q, s'_0) = ((x_1^2, x_1^3), (1 : 0 : 0 : 0 : 0 : 0)) \in \mathbb{Y}_1,
\]

write

\[
T_{(q,s'_0)} \mathbb{Y}_1 = T_q C \oplus \mathcal{L}_{x_0^3/s_1^3} \oplus T_{[x_{e_0}^3/s_1^3]} \mathbb{P}(N_{qC|Y}).
\]
This leads us to the decomposition

\[
T_{(q,s'_0)} \mathbb{Y}_1 = \left( \frac{x_0}{x_1} \right) + \left( \frac{x_0^3}{x_1^3} \right) + \left[ \left( \frac{x_0^2}{x_1^2} + \frac{x_0^2 x_2}{x_1^2} + \frac{x_0^2 x_3}{x_1^2} + \frac{x_0^2 x_2}{x_1^2} + x_0 x_2 \right) \right] \cdot \left( \frac{x_0^3}{x_1^3} \right)^* = \left( \frac{x_0}{x_1} \right) + \left( \frac{x_0^3}{x_1^3} \right) + \left( \frac{x_1}{x_0} + \frac{x_2}{x_0} + \frac{x_3}{x_0} + \frac{x_1 x_2}{x_0^2} \right) \cdot \left( \frac{x_0^3}{x_1^3} \right)^* .
\]

Thus,

\[
c^2_7 (T_{(q,s'_0)} \mathbb{Y}_1) = 3(w_0 - w_1)^4 (w_2 - w_0)(w_3 - w_0)(w_1 + w_2 - 2w_0) .
\]

Now, we look for the equivariant Chern class \( c^7_7 (\mathcal{W}) \). To obtain the fiber of \( \mathcal{W} \) at the point \((q, s'_0)\) perform the blowup, choosing the first equation (exc:= 8a_0 - b_1^3 (2.24)) to be the equation of the exceptional divisor. Step by step: (cf. 4.2.1.4 and 4.2.1.5)

1. Write

\[
\begin{align*}
f & = a_0 x_0^3 + a_1 x_0^2 x_1 + a_2 x_0^2 x_2 + a_3 x_0^2 x_3 + \frac{3}{2} b_1 x_0 x_1^2 + \frac{3}{2} b_2 x_0 x_1 x_2 + x_1^3 \\
g & = b_0 x_0^2 + b_1 x_0 x_1 + b_2 x_0 x_2 + x_1^2 ;
\end{align*}
\]

2. Compute

\[
\omega = \frac{3 f dg - 2 g df}{x_0} ;
\]

3. Do the substitutions into \( \omega \),

\[
\begin{align*}
a_2 & = s_1 (8a_0 - b_1^3) \\
b_2 & = s_2 (8a_0 - b_1^3) \\
a_3 & = s_3 (8a_0 - b_1^3) \\
b_0 - b_1^2 & = s_4 (8a_0 - b_1^3) \\
a_1 - b_1^3 & = s_5 (8a_0 - b_1^3)
\end{align*}
\]

4. Divide by the equation exc=8a_0 - b_1^3;

5. Evaluate the new obtained expression at the fixed point, simply by taking the coefficients

\[
a_0 = b_1 = 0 \text{ (the point } (f = x_1^3, g = x_1^2)) , \]

\[
s_1 = s_2 = s_3 = s_4 = s_5 = 0 \text{ (the point } (1 : 0 : 0 : 0 : 0 : 0)).
\]

After the blowup, we can see that (cf. Fwn_0 in 4.2.1.5)

\[
\omega = x_0 x_1^2 dx_0 - x_0^3 x_1 dx_1 ,
\]

so \( c^7_7 (\mathcal{W})|_{(q,s'_0)} = 2w_0 + 2w_1 \) (see (3.4)).

\( \square \)

However, we will not always find a well defined \( \omega \) because there are indeterminacies remaining – we don’t solve all of them with this single blowup. But in example 3 we were lucky at the chosen point.

Next, we present a table with the four fixed points and the fixed \( \mathbb{P}^1 \): 4.2.1.5
Table 2 – Fixed points over \( f = x_1^3, g = x_1^2 \)

| fixed point/ \( \mathbb{P}^1 \) | associated generator of fiber in \( W \) |
|-----------------------------------|---------------------------------------------|
| \((s_0 : s_1 : s_2 : s_3 : s_4 : s_5)\) | (eigenvector) |
| \((1:0:0:0:0:0)\) \(x_0^3/x_1^3\) | \(\omega = x_0x_1^2dx_0 - 2x_0^2x_1dx_1\) |
| \((0:1:0:0:0:0)\) \(x_0^2x_2/x_1^3\) | \(\omega = 2x_1^2x_2dx_0 - 3x_0x_1x_2dx_1 + x_0x_1^2dx_2\) |
| \((0:0:1:0:0:0)\) \(x_0x_2/x_1^4\) | not defined |
| \((0:0:0:1:0:0)\) \(x_0^2x_3/x_1^5\) | \(\omega = 2x_1^2x_3dx_0 - 3x_0x_1x_3dx_1 + x_0x_1^2dx_3\) |
| \((0:0:0:0:4:s)\) \(x_0^2/x_1^6\) | \(\omega = (2s_5 - 3s_4)x_1^3dx_0 - (2s_5 - 3s_4)x_0x_1^2dx_1\) |

There are three well resolved points over \( q = (x_1^2, x_1^3) \): the points \( s_0', s_1' \) and \( s_3' \). Now we need to study the indeterminacy point \((0:0:1:0:0:0)\) and the fixed line \( \ell_1 \).

### 3.4.1.1 Resolution at the point \( s_2' = (0:0:1:0:0:0) \).

The new indeterminacy locus is the ruled surface \( R \), defined by the ideal (see (2.29))

\[
J'' = (3s_4 - 2s_5, s_3, s_0 - b_1s_5, 4s_1 - 3b_1, b_2) .
\]

(3.17)

Over the point \( s_2' = (0:0:1:0:0:0) \) we have a (2.30)

\[
\mathbb{P}^4 = \{(v_0 : v_1 : v_2 : v_3 : v_4)\} = \mathbb{P}(N_{(q,s_2')}R_{(y_1)}).
\]

The action passes to this \( \mathbb{P}^4 \) by looking to the normal space, see (3.22). But we can use our trick to see the induced action, just like it was done in §3.4.1.

Indeed, we are in the neighborhood \( s_2 = 1 \), and in this affine chart,

\[
(s_0, s_1, s_3, s_4, s_5) = \left( \begin{array}{ccccc} s_0 & s_1 & s_3 & s_4 & s_5 \end{array} \right) .
\]

Thus, we have local weights for affine points around \( s_2 = 1 \), given by (see (3.13))

\[
\begin{align*}
w^L_{s_0} &= w_{s_0} - w_{s_2} = 2w_0 - w_1 - w_2 & w^L_{s_3} &= w_{s_3} - w_{s_2} = w_0 + w_3 - w_1 - w_2 \\
w^L_{s_1} &= w_{s_1} - w_{s_2} = w_0 - w_1 & w^L_{s_4} &= w_{s_4} - w_{s_2} = w_0 - w_2 \\
w^L_{s_5} &= w_{s_5} - w_{s_2} = w_0 - w_2
\end{align*}
\]

Remember that the equations have opposite sign weights by duality. The local equations of the blowup center \( R \) are

\[
\begin{align*}
3s_4 - 2s_5 & \quad \text{(weight } w_2 - w_0) \\
s_3 & \quad \text{(weight } w_1 + w_2 - w_0 - w_3) \\
s_0 - b_1s_5 & \quad \text{(weight } w_1 + w_2 - 2w_0) \\
4s_1 - 3b_1 & \quad \text{(weight } w_1 - w_0) \\
b_2 & \quad \text{(weight } 2w_1 - w_0 - w_2)
\end{align*}
\]

and so relations (2.31) induce
\[ w_{v_0} = w_0 - w_2 \quad \quad w_{v_3} = w_0 - w_1 \]
\[ w_{v_1} = w_0 + w_3 - w_1 - w_2 \quad \quad w_{v_4} = w_0 + w_2 - 2w_1 \]
\[ w_{v_2} = 2w_0 - w_1 - w_2 \]

\[ t \circ (v_0 : v_1 : v_2 : v_3 : v_4) = (t^{w_0}v_0 : t^{w_1}v_1 : t^{w_2}v_2 : t^{w_3}v_3 : t^{w_4}v_4) \quad (3.18) \]

This \( \mathbb{P}^4 \) has five isolated fixed points since the weights are distinct pairwise. (cf. 4.2.1.6).

| fixed point \((v_0 : v_1 : v_2 : v_3 : v_4)\) | associated eigenvector | generator of fiber in \( \mathcal{W} \) |
|---------------------------------|-----------------------|----------------------------------|
| \((1 : 0 : 0 : 0 : 0)\)        | \(\frac{x_0}{x_2}\)   | \(\omega = x_1^2dx_0 - x_0x_1^2dx_1\) |
| \((0 : 1 : 0 : 0 : 0)\)        | \(\frac{x_0x_3}{x_2x_3}\) | \(\omega = 2x_1^2x_3dx_0 - 3x_0x_1x_3dx_1 + x_0x_2^2dx_3\) |
| \((0 : 0 : 1 : 0 : 0)\)        | \(\frac{x_0}{x_2}\)   | \(\omega = x_0x_2^2dx_0 - x_0^2x_1dx_1\) |
| \((0 : 0 : 0 : 1 : 0)\)        | \(\frac{x_0}{x_1}\)   | \(\omega = 2x_1x_2^2dx_0 - 3x_0x_1x_2dx_1 + x_0x_2^2dx_2\) |
| \((0 : 0 : 0 : 0 : 1)\)        | \(\frac{x_0}{x_1}\)   | \(\omega = x_1x_2^2dx_0 - 2x_0x_2^2dx_1 + x_0x_1x_2dx_0\) |

Now we look at the tangent spaces at these points. We are able to write (see (3.16))

\[ \mathcal{N}_{qC|Y} = \frac{x_0^2}{x_1^2} + \frac{x_0x_2}{x_1} + \frac{x_0x_3}{x_1} + \frac{x_0^2}{x_1} + \frac{x_0x_2}{x_1} + \frac{x_0^2}{x_1}. \]

Remember that the indeterminacy point \( s'_2 \) corresponds to \( \frac{x_0x_2}{x_1^2} \) (Table 2). The blowup center is the ruled surface \( R \), a \( \mathbb{P}^1 \)-bundle over \( C \). The tangent space of this surface \( R \) decomposes as

\[ T_{(q,s'_2)}R = T_qC \oplus T_{s'_2} \mathbb{P}^1. \quad (3.19) \]

The equations of this \( \mathbb{P}^1 \) are (3.17)

\[
\begin{align*}
3s_4 - 2s_5 &= 0 \\
\quad s_3 &= 0 \\
\quad s_0 - b_1s_5 &= 0 \\
4s_1 - 3b_1 &= 0,
\end{align*}
\]

hence this is the \( \mathbb{P}^1 \)-fiber of points

\[(b_1s_5 : \frac{3}{4}b_1 : s_2 : 0 : \frac{2}{3}s_5 : s_5).\]

At the fixed point \((x_1^3, x_1^2, s'_2)\) we have \( b_1 = 0 \), so this is the

\[ \mathbb{P}^1 = \{(0 : 0 : s_2 : 0 : \frac{2}{3}s_5 : s_5)\}, \quad (3.20) \]
and

\[ T_{s_2'} \mathbb{P}^1 = \frac{s_5}{s_2} = \frac{x_0^2}{x_1^2}, \quad \frac{x_1^2}{x_0x_2} = \frac{x_0}{x_2}. \]  

(3.21)

A note for (3.21): at the \( \mathbb{P}^1 = \{(s_2 : s_5)\} \) (3.20) we look at the point \( s_2' = (1 : 0) \). The equation of this point in \( \mathbb{P}^1 \) is \( s_5' = 0 \), the linear form vanishing at the point. From this, the tangent space of \( \mathbb{P}^1 \) at this point is

\[ s_5' = s_5. \]

At this moment we “overload” the notation to distinguish between the equation \( s_5' \) and coordinate of the point \( s_5 \).

Using the expression (3.21) in (3.19) gives

\[ T_{(q,s_2')_1} R = \frac{x_0}{x_1} + \frac{x_0}{x_2}. \]

The short exact sequence

\[ T_{(q,s_2')_1} R \hookrightarrow T_{(q,s_2')_1} Y_1 \to N_{(q,s_2')_1 R|Y_1} \]

allows us to write

\[ N_{(q,s_2')_1 R|Y_1} = \frac{x_0x_2}{x_1^2} + \frac{x_0}{x_2} + \frac{x_0^2}{x_1x_2} + \frac{x_0x_3}{x_1x_2}. \]  

(3.22)

We may conclude from this the existence of the five isolated points associated to these weights, as we have already done in Table 3.

**Example 4.** For \( v_3' = (0 : 0 : 0 : 1 : 0) \) in Table 3 one has

\[ c^T_7(W)_{(q,s_2',v_3')} = w_0 + 2w_1 + w_2, \]

since

\[ W_{(q,s_2',v_3')} = (2x_1^2x_2dx_0 - 3x_0x_1x_2dx_1 + x_0x_1^2dx_2). \]

The tangent space of \( Y_3 \) at this fixed point is

\[ T_{(q,s_2',v_3')} Y_3 = T_{(q,s_2')} R \oplus L_{x_0/x_1} \oplus T[L_{x_0/x_1}] \mathbb{P}(N_{(q,s_2')_1 R|Y_1}) \]

\[ = \left( \frac{x_0}{x_1} + \frac{x_0}{x_2} \right) + \left( \frac{x_0}{x_1} \right) + \left( \frac{x_2}{x_1} + \frac{x_1}{x_2} + \frac{x_0}{x_2} + \frac{x_3}{x_2} \right). \]

This yields the equivariant class

\[ c^T_7(T_{(q,s_2',v_3')} Y_3) = (w_0 - w_1)^2(w_0 - w_2)^2(w_2 - w_1)^2(w_2 - w_3). \]
3.4. Contributions over the blowup centers

3.4.1.2 Resolution on the fixed \( \mathbb{P}^1 \) over \((x^2_1, x^3_1)\).

Inside the line \( \ell_1 = \{(0 : 0 : 0 : s_4 : s_5)\} \) there’s another indeterminacy point \( p_\ell = (0 : 0 : 0 : 2 : 3) \): recall the fiber of \( \mathcal{W} \) at this line \( \ell_1 = \{(0 : 0 : 0 : s_4 : s_5)\} \) is

\[
\omega = (2s_5 - 3s_4)x^3_0dx_0 - (2s_5 - 3s_4)x_0x^2_1dx_1,
\]

(3.23)

see Table 2. We may be tempted to divide (3.23) by the common factor \( 2s_5 - 3s_4 \), but we need to pay attention to some things:

- There is a single point in \( \ell_1 \), the point \( p_\ell = \{(0 : 0 : 0 : 2 : 3)\} \) in the indeterminacy locus (note that \( \omega \) (3.23) vanishes at this point). In fact, this point satisfies the equations of our next blowup center \( R \) (2.29).
- After the blowup along \( R \), over the point \( p_\ell \) there is a \( \mathbb{P}^4 = \mathbb{P}(\mathcal{N}_{(q,p_\ell)}|_{\mathcal{Y}_1}) \), with five fixed points, for which the contributions to Bott’s formula can not be forgotten. The fibers of \( \mathcal{W} \) over these points are all distinct, see Table 4.

Then, the contribution of the fixed component \( \ell_1 \) can not be computed yet. We just obtained in (3.16)

\[
\mathcal{N}_{qC|\mathcal{Y}} = \frac{x^3_0}{x^4_1} + \frac{x^2_0}{x^3_1} + \frac{x^2_0x_2}{x^2_1} + \frac{x^2_0x_3}{x^2_1} + \frac{x^2_0}{x^2_1} + \frac{x_0x_2}{x^2_1}.
\]

Then

\[
T_{(q,p_\ell)}\mathcal{Y}_1 = T_qC \oplus \mathcal{L}_{x^3_0/x^4_1} \oplus T[\mathcal{L}_{x^2_0/x^3_1}]\mathbb{P}(\mathcal{N}_{qC}|\mathcal{Y}) = \frac{x_0}{x_1} + \frac{x^2_0}{x^3_1} + \frac{x_2}{x_0} + \frac{x_0}{x_1} + \frac{x_3}{x_1} + 1.
\]

(3.24)

Note the summand 1 corresponding to an eigenvector with weight 0.

The ruled surface \( R \), with base \( C \) has fiber over the point \( q = (x^2_1, x^3_1) \)

\[
\mathbb{P}^1 = \{(0 : 0 : s_2 : 0 : 2s_5 : 3s_5)\}
\]

(compare with (3.20), and remember that \( p_\ell \) is the point \( s_2 = 0 \)). It follows from this

\[
T_{(q,p_\ell)}R = T_qC \oplus T_{p_\ell}\mathbb{P}^1 = \frac{x_0}{x_1} + \frac{x_3}{x_0}.
\]

(3.25)

The exceptional \( \mathbb{P}^4 = \mathbb{P}(\mathcal{N}_{(q,p_\ell)}|_{\mathcal{Y}_1}) \), where

\[
\mathcal{N}_{(q,p_\ell)}|_{\mathcal{Y}_1} = \frac{x^2_0}{x^3_1} + \frac{x_0}{x_1} + 1 + \frac{x_2}{x_0} + \frac{x_3}{x_1}.
\]

(3.26)
3. Calculation of the Degree

### Table 4 – Fixed points over \((x^3_1,x^2_1), p_{t_1} = (0 : 0 : 0 : 1 : 3/2)\)

| fixed point \((v_0 : v_1 : v_2 : v_3 : v_4)\) | associated eigenvector | generator of fiber in \(W\) |
|------------------------------------------|------------------------|-----------------------------|
| \((1 : 0 : 0 : 0 : 0)\) \(\omega = x^2_1 dx_0 - x_0 x^2_1 dx_1\) | \(x_3/x_1\) | \(\omega = 2 x^2_1 x_3 dx_0 - 3 x_0 x_1 x_3 dx_1 + x_0 x^2_1 dx_3\) |
| \((0 : 1 : 0 : 0 : 0)\) \(\omega = x_0 x^2_1 dx_0 - x^2_0 x_1 dx_1\) | \(x_0/x_1\) | \(\omega = x_0 x^2_1 dx_0 - x^2_0 x_1 dx_1\) |
| \((0 : 0 : 1 : 0 : 0)\) \(\omega = 2 x^2_1 x_2 dx_0 - 3 x_0 x_1 x_2 dx_1 + x_0 x^2_1 dx_2\) | \(x_2/x_1\) | \(\omega = x_0 x^2_1 dx_0 - x^2_0 x_1 dx_1\) |
| \((0 : 0 : 0 : 1 : 0)\) \(\omega = x^2_0 x_1 dx_0 - x^3_0 dx_1\) | \(x^2_0/x_1^2\) | \(\omega = x^2_0 x_1 dx_0 - x^3_0 dx_1\) |

Notice that we have five fixed points, but the strict transform \(\tilde{\ell}_1\) of \(\ell_1\) passes through one of them (the point \(v'_0 := (1 : 0 : 0 : 0 : 0)\), associated to the weight 0). Hence, we gain the contribution of four isolated fixed points. For the point \(v'_0\), we will compute the contribution of the strict transform \(\tilde{\ell}_1\), since this point lies inside a higher dimensional component of the fixed point locus. 4.2.1.7

**Example 5.** For \(v'_2 = (0 : 0 : 1 : 0 : 0)\) we can compute, using (3.26) and (3.25),

\[
T_{(q,p_{t_1},v'_2)} Y_3 = T_{(q,p_{t_1})} R \oplus L_{x_0/x_1} \oplus T_{[s_{x_0/x_1}]} \mathbb{P}(N_{(q,p_{t_1})}R|Y_1) = \\
\quad = \left( \frac{x_0}{x_1} + \frac{x_2}{x_0} \right) + \left( \frac{x_0}{x_1} + \frac{x_1}{x_0} + \frac{x_2}{x_0} + \frac{x_3}{x_0} \right)
\]

and

\[
c_{i}^{T}(T_{(q,p_{t_1},v'_2)} Y_3) = (w_0 - w_1)^4(w_2 - w_0)^2(w_0 - w_3).
\]

Moreover, Table 4 shows \(W|_{(q,p_{t_1},v'_2)} = (x_0 x^2_1 dx_0 - x^2_0 x_1 dx_1)\), so

\[
c_{i}^{T}(W)|_{(q,p_{t_1},v'_2)} = 2 w_0 + 2 w_1.
\]

\(\square\)

The fixed point \(v'_0 = (1 : 0 : 0 : 0 : 0)\) lies in the strict transform \(\tilde{\ell}_1\) of \(\ell_1\). The action is trivial on \(\ell_1 = \{(0 : 0 : 0 : 0 : s_4 : s_5)\}\), since \(w_{s_4} = w_{s_5}\), and it follows from (3.24) the decomposition of the fiber of normal bundle

\[
N_{(q,p_{t_1})\ell_1|Y_1} = \frac{x_0}{x_1} + \frac{x^2_0}{x_1^2} + \frac{x_2}{x_0} + \frac{x_0}{x_1} + \frac{x_3}{x_1} = T_{q}C = C_{t_1} L_{x_0/x_1} = C_{t_1}(-1) N_{p_{t_1}p_{t_5}} = C_{t_1}(1) = \mathbb{P}^5.
\]

The term \(T_{q}C\) corresponds to the pullback of the tangent space of \(C\), restricted to the \(\ell_1\) that lives in the \(\mathbb{P}^5\)-fiber.

To find the decomposition of \(N_{(q,p_{t_1},v'_0)\tilde{\ell}_1|Y_3}\), remember (3.26) and (3.25) to write

\[
T_{(q,p_{t_1},v'_0)} Y_3 = T_{(q,p_{t_1})} R \oplus L_{1} \oplus T_{[s_{1}]} \mathbb{P}(N_{(q,p_{t_1})}R|Y_1) = \\
\quad = \left( \frac{x_0}{x_1} + \frac{x^2_0}{x_1^2} + \frac{x_2}{x_0} + \frac{x_0}{x_1} + \frac{x_3}{x_1} \right).
\]

With (3.27) and (3.29), notice that this contribution of \( \tilde{\omega} \) associated with weight 0. This will always be repeated on the other fixed lines ahead.

Despite this, the global description of normal bundle \( N_{\tilde{\ell}_1|Y_3} \) do not need to be the same as in (3.27). There are integers \( d_1, \ldots, d_6 \) with

\[
N_{(q,p_{\ell_1},v'_0)\tilde{\ell}_1|Y_3} = \frac{x_0}{x_1} \frac{x_2}{x_1} + \frac{x_0^2}{x_2^2} + \frac{x_0}{x_1} \frac{x_2}{x_1} + \frac{x_0}{x_1} \frac{x_1}{x_1} + \frac{x_0}{x_1} \frac{x_1}{x_1} .
\]

(3.30)

**Example 6. 4.3.14.1** With (3.30), we can compute the contribution of \( \tilde{\ell}_1 \) for Bott.

The equivariant Chow ring of \( \tilde{\ell}_1 = \mathbb{P}^1 \) is

\[
A^T_*(\tilde{\ell}_1) = A_*(\tilde{\ell}_1) \otimes \mathbb{Z}[t],
\]

where \( A_*(\tilde{\ell}_1) = \mathbb{Z}[h]/h^2 \). The decomposition of \( N_{(q,p_{\ell_1},v'_0)\tilde{\ell}_1|Y_3} \) gives

\[
c^T_6(N_{\tilde{\ell}_1|Y_3}) = (w_0 - w_1 + d_1 h)(2w_0 - 2w_1 + d_2 h)(w_2 - w_0 + d_3 h)(w_0 - w_1 + d_4 h)(w_2 - w_1 + d_5 h)(w_3 - w_1 + d_6 h)
\]

i.e., \( c^T_6(N_{\tilde{\ell}_1|Y_3}) = w + dh \), where

\[
w = 2(w_0 - w_1)^3(w_2 - w_1)(w_3 - w_1)(w_2 - w_0)
\]

\[
d = (w_0 - w_1)^2[2(w_2 - w_0)(w_2 - w_1)(w_3 - w_1)d_1 + \ldots + 2(w_0 - w_1)(w_2 - w_1)(w_2 - w_0)d_6].
\]

Along the strict transform \( \tilde{\ell}_1 \), the line bundle \( W|_{\tilde{\ell}_1} \) is trivial (the fibers are generated by \( \omega = x^2dx_0 - x_0x^2dx_1 \) everywhere). Hence \( c_1(W|_{\tilde{\ell}_1}) = 0 \), and then \( c^T_1(W|_{\tilde{\ell}_1}) = w_0 + 3w_1 \).

The contribution of the fixed \( \tilde{\ell}_1 \) may be computed by

\[
\int_{\tilde{\ell}_1} -c^T_1(W|_{\tilde{\ell}_1})^7/C^T_6(N_{\tilde{\ell}_1|Y_3}) = -\int_{\tilde{\ell}_1} (w_0 + 3w_1)^7/w + dh = -\int_{\tilde{\ell}_1} (w_0 + 3w_1)^7(w - dh)/w^2 ,
\]

where in the last equality we multiplied by \( w - dh \) both the numerator and the denominator, and used that \( h^2 = 0 \) (since \( A_*(\tilde{\ell}_1) = \mathbb{Z}[h]/h^2 \)).

Taking the coefficient of \( h \) we find

\[
\int_{\tilde{\ell}_1} -c^T_1(W|_{\tilde{\ell}_1})^7/C^T_6(N_{\tilde{\ell}_1|Y_3}) = d(w_0 + 3w_1)^7/w^2 .
\]

Notice that this contribution of \( \tilde{\ell}_1 \) is a linear expression on the unknown integers \( d_1, \ldots, d_6 \). Further ahead, we will find some useful relations for \( d_i \)'s, see Proposition 3.61. \( \square \)
3.4.2 \((g, g', f) = (x_0^2, x_0x_1, x_0^3)\).

We will adapt the same ideas of section 3.4.1 to compute the contributions of all fixed components that appear over the point \(q := (g, g', f) = (x_0^2, x_0x_1, x_0^3)\) when solving the indeterminacies as in §2.3.2.

The fixed point lie in the neighborhood \(a_0 = b_0 = u_1 = 1\). Take

\[
\begin{align*}
  f &= x_0^3 + a_1 x_0^2 x_1 + a_2 x_0^2 x_2 + a_3 x_0^2 x_3 + a_4 (x_0 x_1^2 + u_2 x_0 x_1 x_2 + \frac{3}{2} u_3 x_1^2) \\
  g &= x_0^2 + b_1 (x_0 x_1 + u_2 x_0 x_2 + u_3 x_1^2).
\end{align*}
\]

The coefficients inherit the weights

\[
\begin{align*}
  w_{a_1} &= w_1 - w_0, & w_{b_1} &= w_1 - w_0, \\
  w_{a_2} &= w_2 - w_0, & w_{a_2} &= w_2 - w_1, \\
  w_{a_3} &= w_3 - w_0, & w_{a_3} &= w_1 - w_0, \\
  w_{a_4} &= 2w_1 - 2w_0.
\end{align*}
\]

Presently the equations of \(C\) are (2.33)

\[
\begin{align*}
  b_1 - 4u_3 & \quad \text{(weight } w_0 - w_1) \\
  a_1 - 6u_3 & \quad \text{(weight } w_0 - w_1) \\
  a_2 & \quad \text{(weight } w_0 - w_2) \\
  a_3 & \quad \text{(weight } w_0 - w_3) \\
  a_4 - 12u_3^2 & \quad \text{(weight } 2w_0 - 2w_1) \\
  u_2 & \quad \text{(weight } w_1 - w_2)
\end{align*}
\]

(Remember that, for equations, the weights have opposite sign to the dual points).

Notice that these are all weighted homogeneous equations. Hence, over the indeterminacy point \(q = (x_0^2, x_0x_1, x_0^3)\) we have a

\[
\mathbb{P}^5 = \{ (s_0 : s_1 : s_2 : s_3 : s_4 : s_5) \} = \mathbb{P}(\mathcal{N}_{\mathcal{C}|\mathcal{Y}})
\]

with a natural induced action and weights (2.35)

\[
\begin{align*}
  w_{s_0} &= w_1 - w_0, & w_{s_3} &= w_3 - w_0, \\
  w_{s_1} &= w_1 - w_0, & w_{s_4} &= 2w_1 - 2w_0, \\
  w_{s_2} &= w_2 - w_0, & w_{s_5} &= w_2 - w_1,
\end{align*}
\]

(3.32)

Over this \(\mathbb{P}^5\) we have four isolated fixed points and a fixed line \(\ell_2\).
Table 5 - Fixed points over \((g, g', f) = (x_0^2, x_0 x_1, x_0^3)\)

| fixed point \(\mathbb{P}^1\) | associated eigenvector \(\omega\) | generator of fiber in \(\mathcal{W}\) |
|--------------------------------|---------------------------------|---------------------------------|
| \((s_0 : s_1 : 0 : 0 : 0 : 0)\) | \(x_1/x_0\) \(\omega = (3s_0 - 2s_1)x_0^3dx_0 - (3s_0 - 2s_1)x_0^3dx_1\) | |
| \((0 : 0 : 1 : 0 : 0 : 0)\) | \(x_2/x_0\) \(\omega = x_0^2x_2dx_0 - x_0^3dx_2\) | |
| \((0 : 0 : 0 : 1 : 0 : 0)\) | \(x_3/x_0\) \(\omega = x_0^2x_3dx_0 - x_0^3dx_3\) | |
| \((0 : 0 : 0 : 0 : 1 : 0)\) | \(x_4^2/x_0^3\) \(\omega = x_0^2x_4^2dx_0 - x_0^3x_1dx_1\) | |
| \((0 : 0 : 0 : 0 : 1)\) | \(x_2/x_1\) not defined | |

See 4.2.2.8 for calculations. In this case, there are still two points to solve, to wit,

\[ s_5' = (0 : 0 : 0 : 0 : 0 : 1) \]

and the point

\[ p_{\ell_2} = (2 : 3 : 0 : 0 : 0 : 0) \in \ell_2 = \{(s_0 : s_1 : 0 : 0 : 0 : 0)\}. \]  
(3.33)

The second step is to blowup along the transform of \(E\) (2.45).

### 3.4.2.1 Resolution on the point \((x_0^2, x_0 x_1, x_0^3, s_5')\)

Now, we take the blowup along the strict transform of \(E\) and look at the fixed point \(s_5' = (0 : 0 : 0 : 0 : 0 : 1) \in \mathbb{Y}_1\).

Remember that to find the equations of the transform, we have an ideal (see (2.32))

\[ J_{\text{red}} = \text{rad}(J) = (3b_1^2 - 4a_4, a_3, a_2, 2a_1 - 3b_1, b_1 u_2, b_1(b_1 - 4u_3)), \]

which represents the two components, the curve \(C\) and the surface \(E\). Take the transform of this ideal \(J_{\text{red}}\) by the blowup along \(C\).

The ideal of the strict transform of \(E\) is (2.37)

\[ J'_E = \langle s_3, s_2, 3s_0 - 2s_1, 6u_3 + s_1 u_2, 3s_4 + s_1^2 u_2 \rangle. \]

Over the point \(s_5' = (0:0:0:0:1)\) we have \(\mathbb{P}^4 = \{(t_0 : t_1 : t_2 : t_3 : t_4)\} = \mathbb{P}(N_{(q,s_5')}E|\mathbb{Y}_1)\).

Let’s see how the action passes to this \(\mathbb{P}^4\). We are in the neighborhood \(s_5 = 1\), and in this affine chart,

\[ (s_0, s_1, s_2, s_3, s_4) = \left(\frac{s_0}{s_5}, \frac{s_1}{s_5}, \frac{s_2}{s_5}, \frac{s_3}{s_5}, \frac{s_4}{s_5}\right). \]

Thus, from (3.32) we have local weights for affine coordinates around \(s_5 = 1\), given by

\[
\begin{align*}
    w_{s_0}^L &= w_{s_0} - w_{s_5} = 2w_1 - w_0 - w_2 & w_{s_2}^L &= w_1 - w_0 \\
    w_{s_1}^L &= w_{s_1} - w_{s_5} = 2w_1 - w_0 - w_2 & w_{s_3}^L &= w_3 + w_1 - w_0 - w_2 \\
    w_{s_4}^L &= 3w_1 - 2w_0 - w_2
\end{align*}
\]  
(3.34)
Remember that the equations have opposite sign weights by duality. The local equations of the blowup center $E$ are (from (3.31) and (3.34))

$$
\begin{align*}
\mathbf{s}_3 & \quad \text{(weight } w_0 + w_2 - w_1 - w_3) \\
\mathbf{s}_2 & \quad \text{(weight } w_0 - w_1) \\
3\mathbf{s}_0 - 2\mathbf{s}_1 & \quad \text{(weight } w_0 + w_2 - 2w_1) \\
6\mathbf{u}_3 + \mathbf{s}_1\mathbf{u}_2 & \quad \text{(weight } w_0 - w_1) \\
3\mathbf{s}_4 + \mathbf{s}_1^2\mathbf{u}_2 & \quad \text{(weight } 2w_0 + w_3 - 3w_1)
\end{align*}
$$

and so relations (2.38) induce

$$
\begin{align*}
w_{t_0} &= w_1 + w_3 - w_0 - w_2 \\
w_{t_1} &= w_1 - w_0 \\
w_{t_2} &= 2w_1 - w_0 - w_2
\end{align*}
$$

$$
t \circ (t_0 : t_1 : t_2 : t_3 : t_4) = (t^{w_{t_0}}t_0 : t^{w_{t_1}}t_1 : t^{w_{t_2}}t_2 : t^{w_{t_3}}t_3 : t^{w_{t_4}}t_4) \quad (3.35)
$$

An important remark is that the point $q = (x_0^2, x_0x_1, x_0^3)$ lives in the intersection of the two components $C$ and $E$.

Now we will describe the tangent space of $Y_2$ at the fixed points.

The first blowup center $C$ is parametrized by $x_0 + tx_1$, hence

$$
T_qC = \frac{x_1}{x_0} . \quad (3.36)
$$

The tangent space of $Y$ at $q$ decomposes as

$$
T_qY = T_{(x_0^2, x_0x_1)}X' \oplus T_{x_0}Y_{(x_0^2, x_0x_1)},
$$

and the fiber $Y_{(x_0^2, x_0x_1)}$ is the projectivization of

$$
x_0^3 \oplus x_0^2x_1 \oplus x_0^2x_2 \oplus x_0^2x_3 \oplus x_0x_1^2 .
$$

From this results

$$
T_qY = \left( \frac{x_1}{x_0} + \frac{x_2}{x_1} + \frac{x_1}{x_0} \right) + \left( \frac{x_1}{x_0} + \frac{x_2}{x_0} + \frac{x_3}{x_0} + \frac{x_1^2}{x_0^2} \right)
$$

and the the normal bundle of $C$ in $Y$ at $q$ is

$$
\mathcal{N}_{qC|Y} = \frac{x_2}{x_1} + \frac{x_1}{x_0} + \frac{x_1}{x_0} + \frac{x_2}{x_0} + \frac{x_3}{x_0} + \frac{x_1^2}{x_0^2} \quad (3.37)
$$

(cf. Table 5). On the indeterminacy point $s'_5 = (0 : 0 : 0 : 0 : 1)$, related to $\frac{x_2}{x_1}$ (3.32), we have

$$
T_{(q, s'_5)}Y_1 = T_qC \oplus \mathcal{L}_{x_2/x_1} \oplus T_{\mathcal{L}_{x_2/x_1}} \mathbb{P}(\mathcal{N}_{qC|Y}).
$$
This yields

\[
T(q,s'_5)\mathbb{Y}_1 = \begin{pmatrix} x_1 \\ x_0 \end{pmatrix} + \begin{pmatrix} x_2 \\ x_1 \end{pmatrix} + \begin{pmatrix} x_1^2 \\ x_0x_2 \\ x_1 \end{pmatrix} + \begin{pmatrix} x_2^2 \\ x_0x_2 \\ x_1 \end{pmatrix} + \begin{pmatrix} x_1x_3 \\ x_0x_2 \\ x_1 \end{pmatrix} + \begin{pmatrix} x_3^3 \\ x_0x_2 \end{pmatrix}.
\]

Now, \( E' \) is the transform of \( E \) under the first blowup. But \( C \cap E = \{q\} \), and so \( T(q,s'_5)E' \) is the tangent space of the blowup of \( \mathbb{P}^2 \) at one point.

On \( E \), spanned by \( \langle x_0x_1, x_0x_2, x_3^2 \rangle \) (2.21), we have

\[
T_{x_0x_1}E = \frac{x_2}{x_1} + \frac{x_1}{x_0}
\]

and

\[
T(q,s'_5)E' = \mathcal{L}_{\frac{x_2}{x_1}} \oplus T_{\frac{x_2}{x_1}}\mathbb{P}(\mathcal{N}_{\frac{x_2}{x_1}}|E) = \frac{x_2}{x_1} + \frac{x_1^2}{x_0x_2}.
\]

The short exact sequence

\[
T(q,s'_5)E' \hookrightarrow T(q,s'_5)\mathbb{Y}_1 \rightarrow \mathcal{N}(q,s'_5)E'|\mathbb{Y}_1
\]

shows us that (compare with (3.35))

\[
\mathcal{N}(q,s'_5)E'|\mathbb{Y}_1 = \frac{x_1}{x_0} + \frac{x_1^2}{x_0x_2} + \frac{x_1x_3}{x_0x_2} + \frac{x_3^3}{x_0x_2}.
\]

There are 3 fixed points and a fixed line \( \ell_3 := \{(0 : t_1 : 0 : t_3 : 0)\} \). 4.2.2.9

**Table 6 – Fixed points over \((q,s'_5) = (x_0^2, x_0x_1, x_0^3), (0 : 0 : 0 : 0 : 0 : 1)\)**

| fixed point/ \( \mathbb{P}^1 \) | associated eigenvector | generator of fiber in \( \mathcal{W} \) |
|-------------------------------|------------------------|-----------------------------------|
| \((t_0 : t_1 : t_2 : t_3 : t_4)\) | \(x_1x_3/x_0x_2\) | \(\omega = x_0^3x_3dx_0 - x_0^3dx_3\) |
| \((0 : 0 : 1 : 0 : 0)\) | \(x_1^2/x_0x_2\) | \(\omega = x_0^3x_1dx_0 - x_0^3dx_1\) |
| \((0 : 0 : 0 : 0 : 1)\) | \(x_1^3/x_0^2x_2\) | \(\omega = x_0x_1^3dx_0 - x_0^2x_1dx_1\) |
| \((0 : t_1 : 0 : t_3 : 0)\) | \(x_1/x_0\) | \(\omega = (t_3 - t_1)x_0^2x_1dx_0 - (t_3 - t_1)x_0^3dx_2\) |

**Example 7.** For \( t'_0 = (1 : 0 : 0 : 0 : 0) \) we have \( \omega = x_0^3x_3dx_0 - x_0^3dx_3, \) so

\[
c^2_7(\mathcal{W})|_{(q,s'_5,t'_0)} = 3w_0 + w_3.
\]

The tangent space at this point, for \( c^2_7(T(q,s'_5,t'_0)\mathbb{Y}_2) \), is

\[
T(q,s'_5,t'_0)\mathbb{Y}_2 = T(q,s'_5)E' \oplus \mathcal{L}_{\frac{x_2}{x_0x_2}} \oplus T_{\frac{x_2}{x_0x_2}}\mathbb{P}(\mathcal{N}(q,s'_5)E'|\mathbb{Y}_1) =
\]

\[
= \left(\frac{x_2}{x_1} + \frac{x_1^2}{x_0x_2}\right) + \left(\frac{x_1x_3}{x_0x_2}\right) + \left(\frac{x_2}{x_3} + \frac{x_1}{x_3} + \frac{x_2}{x_0x_3}\right).
\]
3. Calculation of the Degree

There is still one indeterminacy point \( p_{\ell_3} = (0 : 1 : 0 : 1 : 0) \in \ell_3 \). The point \( q' := (q, s'_5, p_{\ell_3}) \) lies in the neighborhood \( t_1 = 1 \). The ideal of the next blowup center \( R \) is (ideal \( JRn_7 \) in 4.2.2.9)

\[
J_R = \langle u_2, t_3 - 1, t_2, t_0, 3s_1 - 2t_4 \rangle. \tag{3.39}
\]

Let \( \mathbb{P}^4 = \{(v_0 : v_1 : v_2 : v_3 : v_4)\} = \mathbb{P}(N_{q'R_{Y_2}}) \) the fiber of the exceptional divisor over \( q' \). Here, the fixed points locus consists of three well solved fixed points, the strict transform \( \ell_3 \) of \( \ell_3 \) and a new indeterminacy point \( (q', v'_0) \) 4.2.2.10.

| fixed point \((v_0 : v_1 : v_2 : v_3 : v_4)\) | associated eigenvector \(x_2/x_1\) | generator of fiber in \(W\) |
|----------------------------------|-----------------|------------------|
| \((1 : 0 : 0 : 0 : 0)\)           | not defined     |                  |
| \((0 : 1 : 0 : 0 : 0)\)           | 1               | \(\omega = x_0^2x_2dx_0 - x_0^3dx_2\) |
| \((0 : 0 : 1 : 0 : 0)\)           | \(x_1/x_2\)     | \(\omega = x_0^2x_3dx_0 - x_0^3dx_3\) |
| \((0 : 0 : 0 : 1 : 0)\)           | \(x_3/x_2\)     | \(\omega = x_0^2x_1dx_0 - x_0^3dx_1\) |
| \((0 : 0 : 0 : 0 : 1)\)           | \(x_1^2/x_0x_2\) |                  |

Weights to \( \mathbb{P}^4 = \mathbb{P}(N_{q'R_{Y_2}}) \). In the affine chart \( t_1 = 1 \),

\[
(t_0, t_2, t_3, t_4) = \left(\frac{t_0}{t_1}, \frac{t_2}{t_1}, \frac{t_3}{t_1}, \frac{t_4}{t_1}\right). \tag{3.35}
\]

Thus, from (3.35) we have local weights for affine points around \( t_3 = 1 \), given by

\[
\begin{align*}
w_{t_0}^L &= w_3 - w_2 & w_{t_3}^L &= 0 \\
w_{t_2}^L &= w_1 - w_2 & w_{t_4}^L &= 2w_1 - w_0 - w_2 \tag{3.40}
\end{align*}
\]

The local equations of the blowup center \( R \) (3.39) are, from (3.31), (3.34) and (3.40)

\[
\begin{aligned}
& u_2 \quad (\text{weight } w_1 - w_2) \\
& t_3 - 1 \quad (\text{weight } 0) \\
& t_2 \quad (\text{weight } w_2 - w_1) \\
& t_0 \quad (\text{weight } w_2 - w_3) \\
& 3s_1 - 2t_4 \quad (\text{weight } w_0 + w_2 - 2w_1)
\end{aligned}
\]

and so relations (2.38) induce

\[
\begin{align*}
w_{v_0} &= w_2 - w_1 & w_{v_3} &= w_3 - w_2 \\
w_{v_1} &= 0 & w_{v_4} &= 2w_1 - w_0 - w_2 \\
w_{v_2} &= w_1 - w_2 \\
\end{align*}
\]

\[
t \circ (v_0 : v_1 : v_2 : v_3 : v_4) = (t^{w_{v_0}}v_0 : t^{w_{v_1}}v_1 : t^{w_{v_2}}v_2 : t^{w_{v_3}}v_3 : t^{w_{v_4}}v_4) \tag{3.41}
\]
3.4. Contributions over the blowup centers

Note that the fixed point \( v_1' = (0 : 1 : 0 : 0 : 0) \) is associated to the weight \( w_{v_1} = 0 \), and we write 1 as in Table 7 for this eigenvalue. It is quite useful for calculations, like in (3.28).

Let’s see the decomposition of \( \mathcal{N}_{q'R|Y_2} \). As done for \( t_6' \) (3.38), for \( p_{t_3} \) we have

\[
T_{(q',s'_5,p_{t_3})}\mathbb{Y}_2 = \left( \frac{x_2}{x_1} + \frac{x_1^2}{x_0x_2} \right) + \left( \frac{x_1}{x_0} \right) + \left( \frac{x_3}{x_2} + \frac{x_1^2}{x_0x_2} + 1 \right).
\]

(3.42)

Among the equations of \( R \) (3.39) we have exc\(_1 = u_2 \) (the basis \( C \)) and the \( \mathbb{P}^1 \)

\[
\{ (t_0 : t_1 : t_2 : t_3 : t_4) = (0 : 1 : 0 : 1 : 3s_1/2) \}.
\]

The point \( p_{t_3} = (0 : 1 : 0 : 1 : 0) \) is the point of equation \( s_1 = 0 \), and \( T_{p_{t_3}}\mathbb{P}^1 = \frac{t_3'}{s_1'} = \frac{t_3}{s_1} \).

\[
T_q'R = T_qC \oplus T_{p_{t_3}}\mathbb{P}^1 = \frac{x_1}{x_0}(3.36) + \frac{x_1^2}{x_0x_2}(3.34) + (3.40),
\]

\[
\mathcal{N}_{q'R|Y_2} = \frac{x_2}{x_1} + \frac{x_3}{x_2} + \frac{x_1}{x_0} + \frac{x_1^2}{x_0x_2} + 1.
\]

**Example 8.** 4.3.14.2 The fixed point \( v_1' \) lies in the strict transform \( \ell \) of \( \ell_3 \). From (3.42) we have the decomposition of the normal bundle

\[
\mathcal{N}_{\tilde{\ell}_3|Y_2} = \frac{x_2}{x_1} + \frac{x_1^2}{x_0x_2} + \frac{x_1}{x_0} + \frac{x_3}{x_2} + \frac{x_1^2}{x_0x_2}.
\]

The decomposition for the normal bundle of \( \tilde{\ell}_3 \) is, for some integers \( d_7, \ldots, d_{12} \),

\[
\mathcal{N}_{\tilde{\ell}_3|Y_3} = \frac{x_2}{x_1} + \frac{x_1^2}{x_0x_2} + \frac{x_1}{x_0} + \frac{x_3}{x_2} + \frac{x_1^2}{x_0x_2}.
\]

The contribution of the fixed line \( \tilde{\ell}_3 \) may be computed as

\[
\int_{\tilde{\ell}_3} \frac{-c_1^T(\mathcal{W}|_{\tilde{\ell}_3})^7}{c_0^T(\mathcal{N}_{\tilde{\ell}_3|Y_3})} = -\int_{\tilde{\ell}_3} \frac{(3w_0 + w_2)^7}{w + dh} = \int_{\tilde{\ell}_3} \frac{(3w_0 + w_2)^7}{w^2}w + dh,
\]

where

\[
w = -(w_2 - w_1)^2(2w_1 - w_0 - w_2)^2(w_1 - w_0)(w_3 - w_2)
\]

\[
d = (2w_1 - w_0 - w_2)^2(w_1 - w_0)(w_1 - w_2)(w_3 - w_2)d_7 + \cdots + (w_2 - w_1)^2(w_0 - w_1)(w_3 - w_2)(2w_1 - w_0 - w_2)d_{12}
\]

and we multiplied by \( w + dh \) in both the numerator and the denominator, and used that \( h^2 = 0 \).

Taking the coefficient of \( h \) we find a linear expression on \( d_7, \ldots, d_{12} \),

\[
\int_{\tilde{\ell}_3} \frac{-c_1^T(\mathcal{W}|_{\tilde{\ell}_3})^7}{c_0^T(\mathcal{N}_{\tilde{\ell}_3|Y_3})} = \frac{d(3w_0 + w_2)^7}{w^2}.
\]

\[
\square
\]
We still have to solve the indeterminacy over the point \((q', v_0')\), see Table 7. We will take a look at the neighborhood \(v_0 = 1\).

The affine variables now are \((v_1, v_2, v_3, v_4, u_2, s_2)\). The final blowup center is the one dimensional component \(L\) (see page 32) defined by the equations

\[
s_2 = v_1 = v_2 = v_3 = v_4 = t_4 = 0.
\]

The component \(L\) is parametrized by \(u_2\), and \(T_{(q', v_0')} L = w_{u_2} = x_2/x_1 \) (3.31).

Over the point \((q', v_0')\) is defined a \(\mathbb{P}^5 = \mathbb{P}(N_{(q', v_0')} L|\mathcal{Y}_3) = \{(z_0 : z_1 : z_2 : z_3 : z_4 : z_5)\}\). Since we are in the affine chart \(v_0 = 1\), we have local weights assigned to coordinates \(z\) from (3.41), and with (3.34), (3.40) we gain Table 8 (cf. 4.2.2.11).

Table 8 – Fixed points over \([x_0^2, x_0 x_1, x_0^3], (0 : 1 : 0 : 1 : 0), v_0']\)

| fixed point \((z_0 : z_1 : z_2 : z_3 : z_4 : z_5)\) | associated eigenvector | generator of fiber in \(\mathcal{W}\) |
|---------------------------------|------------------------|-------------------------|
| \((1 : 0 : 0 : 0 : 0 : 0)\) | \(x_1/x_0\) | \(\omega = x_0 x_2^2 dx_0 - x_0^2 x_2 dx_2\) |
| \((0 : 1 : 0 : 0 : 0 : 0)\) | \(x_1/x_2\) | \(\omega = x_0^2 x_2 dx_0 - x_0^2 x_2 dx_2\) |
| \((0 : 0 : 1 : 0 : 0 : 0)\) | \(x_2/x_3\) | \(\omega = x_0 x_1 dx_0 - x_0^3 dx_1\) |
| \((0 : 0 : 0 : 1 : 0 : 0)\) | \(x_1 x_3/x_2^2\) | \(\omega = x_0^2 x_3 dx_0 - x_0^3 dx_3\) |
| \((0 : 0 : 0 : 0 : 1 : 0)\) | \(x_1^2/x_3 x_2^2\) | \(\omega = x_0 x_1^2 dx_0 - x_0^3 x_1 dx_1\) |
| \((0 : 0 : 0 : 0 : 0 : 1)\) | \(x_1^3/x_4 x_2^2\) | \(\omega = 2 x_0 x_1 x_2 dx_0 - x_0^4 x_1 x_2 dx_1 - x_0^3 x_1 x_2 dx_2\) |

To get the contributions of these points, write

\[
T_{(q', v_0')} \mathcal{Y}_3 = T_{q'} R \oplus \mathcal{L}_{x_1} \oplus T_{[\mathcal{L}_{x_1}]} \mathbb{P}(N_{(q')} R|\mathcal{Y}_2) = \left( \frac{x_1^2}{x_0 x_2} + \frac{x_1}{x_0} \right) + \left( \frac{x_2}{x_1} \right) + \left( \frac{x_1 x_3}{x_2^2} + \frac{x_1^2}{x_2} + \frac{x_1^3}{x_0 x_2^3} + \frac{x_1^2}{x_0 x_2} \right). 
\]

The short exact sequence

\[
T_{(q', v_0')} L \hookrightarrow T_{(q', v_0')} \mathcal{Y}_3 \rightarrow N_{(q', v_0')} L|\mathcal{Y}_3
\]

shows

\[
N_{(q', v_0')} L|\mathcal{Y}_3 = \frac{x_1}{x_0} + \frac{x_1}{x_2} + \frac{x_1 x_3}{x_2^2} + \frac{x_1^2}{x_2} + \frac{x_1^3}{x_0 x_2^3} + \frac{x_1^2}{x_0 x_2}. 
\]

(3.43)

Example 9. For \(z_4' = (0 : 0 : 0 : 0 : 1 : 0)\) we have \(\omega = x_0 x_1^2 dx_0 - x_0^2 x_1 dx_1\), so

\[
c_1^T(\mathcal{W})|_{(q', v_0', z_4')} = 2 w_0 + 2 w_1.
\]

The tangent space at this point is

\[
T_{(q', v_0', z_4')} \mathcal{Y}_4 = T_{(q', v_0')} L \oplus \mathcal{L}_{x_1} \oplus T_{[\mathcal{L}_{x_1}]} \mathbb{P}(N_{(q', v_0')} L|\mathcal{Y}_3) = \left( \frac{x_1}{x_0 x_2} \right) + \left( \frac{x_1}{x_0 x_2^2} \right) + \left( \frac{x_1^2}{x_0 x_2} \right). 
\]

(3.44)
3.4. Contributions over the blowup centers

\[ \left( \frac{x_2}{x_1} \right) + \left( \frac{x_1^3}{x_0 x_2} \right) + \left( \frac{x_1}{x_0} + \frac{x_1}{x_2} + \frac{x_1 x_2}{x_2^2} + \frac{x_1 x_3}{x_0 x_2} \right) \cdot \frac{x_0 x_2}{x_1^3} = \frac{x_2}{x_1} + \left( \frac{x_1^3}{x_0 x_2} \right) + \left( \frac{x_2}{x_1} + \frac{x_0 x_2}{x_1^2} + \frac{x_0 x_3}{x_1 x_2} + \frac{x_2}{x_1} \right) \Rightarrow \]

\[ c^T_4(T(q,v_0,v_4) \mathcal{Y}_4) = 2(w_2 - w_1)^3(3w_1 - w_0 - 2w_2)(w_0 + w_2 - 2w_1)(w_0 - w_1)(w_0 + w_3 - 2w_1). \]

\[ \square \]

3.4.2.2 Resolution on the fixed line over \((x_0^2, x_0 x_1, x_0^3)\)

After the blowup of \( \mathcal{Y} \) along \( C \) we obtain, over the fixed point \( q = (x_0^2, x_0 x_1, x_0^3) \), the indeterminacy point \( s'_5 \) which was fully solved in the previous section. But there is another indeterminacy point at the fixed line \( \ell_2 \) (3.33, see Table 5).

Let \( \mathbb{P}^4 = \{(t_0 : t_1 : t_2 : t_3 : t_4)\} = \mathbb{P}(\mathcal{N}_{(q,p_{\ell_2})E'|\mathcal{Y}_2}) \) the fiber of the projectivized normal bundle over \( p_{\ell_2} = (1 : 3/2 : 0 : 0 : 0) \). The ideal of \( E' \) is, in affine chart \( s_0 = 1 \),

\[ J_{E'} = \langle s_4 - 3u_3, s_3, s_2, 2s_1 - 3, b_1 \rangle. \]

Note that \( s_0 = 1 \) represents the choice of \( \text{exc}_1 = b_1 - 4u_3 \) for the local equation of the first exceptional divisor, see (2.35). The local weights induced by (3.32) are

\[ \begin{align*}
    w_{s_1}^L &= w_{s_1} - w_{s_0} = 0 & w_{s_3}^L &= w_3 - w_1 \\
    w_{s_2}^L &= w_{s_2} - w_{s_0} = w_2 - w_1 & w_{s_4}^L &= w_1 - w_0 \\
    & & w_{s_5}^L &= w_0 + w_2 - 2w_1
\end{align*} \]  

(3.45)

From equations of \( J_{E'} \) and (3.45)+(3.31) we obtain the weights on this \( \mathbb{P}^4 \). 4.2.2.12

Table 9 – Fixed points over \((x_0^2, x_0 x_1, x_0^3), p_{\ell_2} = (1 : 3/2 : 0 : 0 : 0)\)

| fixed point / \( \mathbb{P}^1 \) | associated eigenvector | generator of fiber \( \text{in } \mathcal{W} \) |
|----------------------------------|-----------------------|----------------------------------|
| \((t_0 : t_1 : t_2 : t_3 : t_4)\) | \( x_1/x_0 \) \( \omega = (3t_4 - 8t_0)x_0x_1^2dx_0 - (3t_4 - 8t_0)x_0^2x_1dx_1 \) |
| \((0 : 1 : 0 : 0)\) | \( x_3/x_1 \) \( \omega = x_3^2x_0dx_0 - x_3^3dx_3 \) |
| \((0 : 0 : 1 : 0)\) | \( x_2/x_1 \) \( \omega = x_2^2x_0dx_0 - x_2^3dx_2 \) |
| \((0 : 0 : 0 : 1)\) | 1 \( \omega = x_0^3x_1dx_0 - x_0^3dx_1 \) |

Oh no! There is another fixed line \( \ell_4 = \{(t_0 : 0 : 0 : 0)\} \). We also have two fixed points and the strict transform \( \tilde{\ell}_2 \) of \( \ell_2 \).

Remember that (3.37)

\[ \mathcal{N}_{qC|\mathcal{Y}} = \frac{x_2}{x_1} + \frac{x_1}{x_0} + \frac{x_1}{x_0} + \frac{x_2}{x_0} + \frac{x_3}{x_0} + \frac{x_2^2}{x_0}. \]
Since $p_{\ell_2}$ has weight $\frac{x_1}{x_0}$ (Table 5),

$$T_{(q,p_{\ell_2})}Y_1 = T_qC \oplus L_{x_1} \oplus T_{[L_{x_1}]} \mathbb{P}(\mathcal{N}_{q,C|Y})$$

$$= \frac{x_1}{x_0} + \frac{x_1}{x_0} + \frac{x_0x_2}{x_1} + \frac{x_2}{x_1} + 1 + \frac{x_3}{x_1} + \frac{x_1}{x_0}.$$ (3.46)

Since $E$ is spanned by $\langle x_0x_1, x_0x_2, x_1^2 \rangle$ (2.21) we have

$$T_{x_0x_1}E = \frac{x_2}{x_1} + \frac{x_1}{x_0}$$

and

$$T_{(q,p_{\ell_2})}E' = L_{x_1/x_0} \oplus T_{[L_{x_1}]} \mathbb{P}(\mathcal{N}_{x_1/x_0|E}) = \frac{x_1}{x_0} + \frac{x_0x_2}{x_1}. \quad (3.47)$$

Hence the fiber $\mathbb{P}^4 = \mathbb{P}(\mathcal{N}_{(q,p_{\ell_2})E'|Y_1})$ of the exceptional divisor, where (cf. Table 9)

$$\mathcal{N}_{(q,p_{\ell_2})E'|Y_1} = \frac{x_1}{x_0} + \frac{x_2}{x_1} + 1 + \frac{x_3}{x_1} + \frac{x_1}{x_0}.$$ (3.48)

This will enable us to find the contributions of the fixed points.

**Example 10. 4.3.14.3** For the fixed line $\ell_2$, we have from (3.46)

$$\mathcal{N}_{\ell_2|Y_1} = \begin{elementmatrix}
\frac{x_1}{x_0} \\
\frac{x_1}{x_0} + \frac{x_0x_2}{x_1} \\
\frac{x_2}{x_1} + \frac{x_3}{x_1} + \frac{x_1}{x_0} \end{elementmatrix}$$

The normal bundle of $\tilde{\ell}_2$ is, for some integers $d_{13}, \ldots, d_{18},$

$$\mathcal{N}_{\tilde{\ell}_2|Y_2} = \begin{elementmatrix}
\frac{x_1}{x_0} & \frac{x_1}{x_0} & \frac{x_1}{x_0} & \frac{x_1}{x_0} \\
\frac{x_2}{x_1} & \frac{x_2}{x_1} & \frac{x_1}{x_1} & 0 \\
\frac{x_1}{x_1} & \frac{x_1}{x_1} & \frac{x_1}{x_1} & \frac{x_1}{x_1} \\
\mathcal{O}_{\tilde{\ell}_2(d_{13})} & \mathcal{O}_{\tilde{\ell}_2(d_{14})} & \mathcal{O}_{\tilde{\ell}_2(d_{15})} & \mathcal{O}_{\tilde{\ell}_2(d_{16})} & \mathcal{O}_{\tilde{\ell}_2(d_{17})} & \mathcal{O}_{\tilde{\ell}_2(d_{18})}
\end{elementmatrix}$$

so

$$c_6^T(\mathcal{N}_{\tilde{\ell}_2|Y_2}) = \prod_{i=13,14,18} (w_1 - w_0 + d_i h)) (w_0 + w_2 - 2w_1 + d_{15} h)(w_2 - w_1 + d_{16} h)(w_3 - w_1 + d_{17} h) \pmod{h^2}.$$ From Table 9, $\mathcal{W}|_{\tilde{\ell}_2}$ is $\langle x_0^2 x_1 dx_0 - x_0 x_1 dx_1 \rangle$ for all $\tilde{p} \in \tilde{\ell}_2$ (the restriction $\mathcal{W}|_{\tilde{\ell}_2}$ is trivial), and so $c_1^T(\mathcal{W}|_{\tilde{\ell}_2}) = 3w_0 + w_1$. Like Examples 6 and 8, we gain a linear expression on $d_{13}, \ldots, d_{18}$

$$\int_{\tilde{\ell}_2} c_6^T(\mathcal{N}_{\tilde{\ell}_2|Y_2}) c_1^T(\mathcal{W}|_{\tilde{\ell}_2}) = \frac{d(3w_0 + w_1)^7}{w^2}.$$ 

\[\square\]
3.4. Contributions over the blowup centers

In view of Table 9, the fiber of \( W \) over a point \((t_0 : t_4) \in \ell_4\) is spanned by

\[
\omega = (3t_4 - 8t_0)x_0x_1^2dx_0 - (3t_4 - 8t_0)x_0^2x_1dx_1.
\]

Thus, the fixed line \( \ell_4 \) meets the next blowup center \( R \) at the fixed point

\[
p_{\ell_4} = (3 : 0 : 0 : 0 : 8).
\]

The ideal of \( R \) is locally given by

\[
J_R = (3t_4 - 8, t_3, t_1, t_2 - 4s_5, 2s_4 - 9u_3). \tag{3.50}
\]

Let \( \mathbb{P}^4 = \{(v_0 : v_1 : v_2 : v_3 : v_4)\} = \mathbb{P}(N_{(q,p_{\ell_4})R|Y_2}) \) over \( p_{\ell_4} = (1 : 0 : 0 : 0 : 8/3) \). After taking the convenient weights we are able to find the Table 10 below (cf. 4.2.2.13).

| fixed point \((v_0 : v_1 : v_2 : v_3 : v_4)\) | associated eigenvector | generator of fiber in \( W \) |
|---|---|---|
| \((1 : 0 : 0 : 0 : 0)\) | \(x_0/x_1\) | \(\omega = x_0x_1^2dx_0 - x_0^2x_1dx_1\) |
| \((0 : 1 : 0 : 0 : 0)\) | \(x_0x_3/x_1^2\) | \(\omega = x_0^2x_1dx_0 - x_0^3dx_3\) |
| \((0 : 0 : 1 : 0)\) | \(x_0x_2/x_1^2\) | \(\omega = x_0^2x_2dx_0 - x_0^3dx_2\) |
| \((0 : 0 : 0 : 1)\) | \(x_1/x_0\) | \(\omega = x_0^2dx_0 - x_0x_1^2dx_1\) |

For short, write here \( q'' = [(x_0^2, x_0x_1, x_1^3), p_{\ell_2}, p_{\ell_4}] \). From (3.47)+(3.48),

\[
T_{q''}Y_2 = T_{(q,p_{\ell_2})E'} \oplus L_{x_1/x_0} \oplus T_{[L_{x_1/x_0}]\mathbb{P}(N_{(q,p_{\ell_2})E'|Y_1})} = \left(\frac{x_1}{x_0} + \frac{x_0x_2}{x_1^2}\right) + \left(\frac{x_1}{x_0}\right) + \left(\frac{x_0x_2}{x_1^2} + \frac{x_0}{x_1} + \frac{x_0x_3}{x_1^2} + 1\right). \tag{3.51}
\]

The ruled surface \( R \) has equations \(2s_4 - 9u_3\), representing the (transform of) basis \( C \) and the other four linear equations of (3.50) represent the \( \mathbb{P}^1\)

\[
\{(t_0 : t_1 : t_2 : t_3 : t_4) = (1 : 0 : 4s_5 : 0 : 8/3)\}.
\]

The point \( p_{\ell_4} = (1 : 0 : 0 : 0 : 8/3) \) is the point of equation \( s_5 = 0 \), thus (3.36)+(3.45)

\[
T_{q''}R = T_qC \oplus T_{p_{\ell_4}\mathbb{P}^1} = \frac{x_1}{x_0} + \frac{t_0^{q'}}{s_5^{q'}} = \frac{x_1}{x_0} + \frac{s_5^{q'}L}{1} = \frac{x_1}{x_0} + \frac{x_0x_2}{x_1^2}.
\]

From (3.51) remains

\[
N_{q''R|Y_2} = \frac{x_1}{x_0} + \frac{x_0x_2}{x_1^2} + \frac{x_0}{x_1} + \frac{x_0x_3}{x_1^2} + 1.
\]
Example 11. For \( v'_1 = (0 : 1 : 0 : 0 : 0) \), associated to \( x_0/x_1 \) (Table 10),
\[
T_{(q', v'_1)} Y_3 = T_{q' R} \oplus \mathbb{L}_{x_1^2} \oplus T_{L_{x_1}} \mathbb{F}(\mathbb{N}_{q' R}[y_2]) = \frac{x_1}{x_0} + \frac{x_0 x_2}{x_1^2} + \frac{x_0}{x_1} + \frac{x_2}{x_1} + \frac{x_3}{x_1} + \frac{x_1}{x_0} \Rightarrow \\
\begin{align*}
\mathcal{C}^T_{(q', v'_1)} Y_3 = -2(w_0 - w_1)^4(w_0 + w_2 - 2w_1)(w_0 - w_1)(w_3 - w_1). \\
\text{And } W|_{(q', v'_1)} = \langle x_0^2 x_1 dx_0 - x_0^3 dx_1 \rangle, \text{ so } c^T_1(W|_{(q', v'_1)}) = 3w_0 + w_1.
\end{align*}
\]

Example 12. 4.3.14.4 For the fixed line \( \ell_4 \), we have
\[
\mathcal{N}_{\ell_4}|y_2 = \frac{x_0}{x_0} + \frac{x_0 x_2}{x_1^2} + \frac{x_0}{x_1}, \quad \mathcal{N}_{\ell_4}|y_3 = \frac{x_1}{x_0} + \frac{x_0 x_2}{x_1^2} + \frac{x_0}{x_1} + \frac{x_0 x_2}{x_1^2} + \frac{x_0}{x_1} + \frac{x_0}{x_1} + \frac{x_0}{x_1}.
\]
and for unknown integers \( d_{19}, \ldots, d_{24} \),
\[
\int_{\ell_4} -c^T_1(W|_{\ell_4}) = \frac{d \cdot (2w_0 + w_1)^7}{w^2},
\]
where
\[
w = -(w_1 - w_0)^3(w_0 + w_2 - 2w_1)^2(w_0 + w_3 - 2w_1),
\]
\[
d = \prod_{i=19, 21} (w_1 - w_0 + d_i h)[\prod_{j=20, 22} (w_0 + w_2 - 2w_1 + d_j h)](w_0 + w_3 - 2w_1 + d_23 h)(w_0 - w_1 + d_{24} h)
\]
(mod \( h^2 \)).

Finally we complete the contributions over the fixed point \( (x_0^2, x_0x_1, x_0^3) \)!

3.4.3 \((g, g', f) = (x_0^2, x_0x_2, x_0^3)\). Next, we study the indeterminacy point \( q := (x_0^2, x_0x_2, x_0^3) \).

It lies in the neighborhood \( a_0 = b_0 = w_2 = 1 \), so take
\[
\begin{align*}
f &= x_0^3 + a_1 x_0^2 x_1 + a_2 x_0^2 x_2 + a_3 x_0 x_3 + a_5 (u_1 x_0 x_2 + x_0 x_1 x_2 + \frac{2}{3} u_3 x_1^2), \\
g &= x_0^2 + b_1 x_0 x_1 + b_2 x_0 x_2 + b_3 x_1^2.
\end{align*}
\]
The local coefficients are equipped with the weights
\[
\begin{align*}
w_{a_1} &= w_1 - w_0, & w_{b_2} &= w_2 - w_0, \\
w_{a_2} &= w_2 - w_0, & w_{a_1} &= w_1 - w_2, \\
w_{a_3} &= w_3 - w_0, & w_{a_3} &= 2w_1 - w_0 - w_2, \\
w_{a_5} &= w_1 + w_2 - 2w_0.
\end{align*}
\]
Notice that in this neighborhood there are no points in the first blowup center $C$. The local equations of $E$ are

\[
\begin{align*}
  a_1 & \text{ (degree } w_0 - w_1) \\
  a_2 & \text{ (degree } w_0 - w_2) \\
  a_3 & \text{ (degree } w_0 - w_3) \\
  a_5 & \text{ (degree } 2w_0 - w_1 - w_2) \\
  b_2 & \text{ (degree } w_0 - w_2)
\end{align*}
\]

Notice that these are all homogeneous equations. Hence, over the indeterminacy point $(x_0^2, x_0x_2, x_3^0)$ we have a $\mathbb{P}^4 = \{(t_0 : t_1 : t_2 : t_3 : t_4)\} = \mathbb{P}(N_{E|Y_1})$ with a natural induced action and weights

\[
\begin{align*}
  w_{t_0} &= w_1 - w_0 & w_{t_3} &= -2w_0 + w_1 + w_2 \\
  w_{t_1} &= w_2 - w_0 & w_{t_4} &= w_2 - w_0 \\
  w_{t_2} &= w_3 - w_0
\end{align*}
\]

(3.53)

The methods to compute the contributions of $c_1^T(W)$ and the tangent space at the fixed points are similar to those explained in the previous section 3.4.2. Now, we have

\[
T_qE' = T_qE = \frac{x_1}{x_2} + \frac{x_2^2}{x_0x_2}
\]

(3.54)

(without any changes by the blowup in $C$).

Over this $\mathbb{P}^4$ there are three fixed points and a fixed $\ell_5 = \{(0 : t_1 : 0 : 0 : t_4)\}$. 4.2.3.1 Table 11 – Fixed points over $(g, g', f) = (x_0^2, x_0x_2, x_3^0)$

| fixed point/ $\mathbb{P}^1$ | associated eigenvector | generator of fiber in $\mathcal{W}$ |
|-----------------------------|------------------------|----------------------------------|
| $(1 : 0 : 0 : 0 : 0)$       | $x_1/x_0$              | $\omega = x_0^2x_1dx_0 - x_0^3dx_1$ |
| $(0 : 0 : 1 : 0 : 0)$       | $x_3/x_0$              | $\omega = x_0^2x_3dx_0 - x_0^3dx_3$ |
| $(0 : 0 : 0 : 1 : 0)$       | $x_1x_2/x_0^2$         | $\omega = 2x_0x_1x_2dx_0 - x_0^2x_2dx_1 - x_0^3x_1dx_2$ |
| $(0 : 1 : 0 : 0 : t_4)$     | $x_2/x_0$              | $\omega = (3t_4 - 2t_1)x_0^2x_2dx_0 - (3t_4 - 2t_1)x_0^3dx_2$ |

There’s one indeterminacy point $p_{\ell_5} := (0 : 3 : 0 : 0 : 2)$ inside the fixed line $\ell_5$. The remaining indeterminacy locus is

\[
L : u_3 = t_3 = t_2 = 2t_1 - 3 = 2t_0 - 3u_1 = b_2 = 0.
\]

(3.55)

The affine variables are $b_2, u_1, u_3, t_0, t_1, t_2, t_3$, and $L$ is parametrized by $u_1$, so

\[
T_{(q,p_{\ell_5})}L = w_{u_1} = \frac{x_1}{x_2}.
\]

(3.56)
The blowup of $\mathbb{Y}_2$ along $L$ gives over $p_{t_5} = (0 : \frac{3}{2} : 0 : 0 : 1)$, as fiber of exceptional divisor,

$$\mathbb{P}^5 = \{ (z_0 : z_1 : z_2 : z_3 : z_4 : z_5) \} = \mathbb{P} (\mathcal{N}_{(q,p_{t_5})L|\mathbb{Y}_2}).$$

Weights to $\mathbb{P}^5 = \mathbb{P} (\mathcal{N}_{(q,p_{t_5})L|\mathbb{Y}_2})$. In the affine chart $t_4 = 1$,

$$(t_0, t_1, t_2, t_3) = \left( \frac{t_0}{t_4}, \frac{t_1}{t_4}, \frac{t_2}{t_4}, \frac{t_3}{t_4} \right).$$

Thus, from (3.53) we have local weights for affine points around $t_4 = 1$, given by

$$w^L_{t_0} = w_1 - w_2 \quad w^L_{t_2} = w_3 - w_2 \quad w^L_{t_1} = 0 \quad w^L_{t_3} = w_1 - w_0$$

(3.57)

The local equations of the blowup center $L$ (3.55) are, from (3.52) and (3.57)

$$\begin{cases}
  u_3 \quad (\text{weight } w_0 - 2w_1 + w_2) \\
  t_3 \quad (\text{weight } w_0 - w_1) \\
  t_2 \quad (\text{weight } w_2 - w_3) \\
  2t_1 - 3 \quad (\text{weight } 0) \\
  2t_0 - 3u_1 \quad (\text{weight } w_2 - w_1) \\
  b_2 \quad (\text{weight } w_0 - w_2)
\end{cases}$$

thus,

$$w_{z_0} = 2w_1 - w_0 - w_2 \quad w_{z_3} = 0$$

$$w_{z_1} = w_1 - w_0 \quad w_{z_4} = w_1 - w_2$$

$$w_{z_2} = w_3 - w_2 \quad w_{z_5} = w_2 - w_0$$

$$t \circ (z_0 : z_1 : z_2 : z_3 : z_4 : z_5) = (t^{w_{z_0}} z_0 : t^{w_{z_1}} z_1 : t^{w_{z_2}} z_2 : t^{w_{z_3}} z_3 : t^{w_{z_4}} z_4 : t^{w_{z_5}} z_5)$$

(3.58)

From (3.58) we have the following table 4.2.3.2

| fixed point $(z_0 : z_1 : z_2 : z_3 : z_4 : z_5)$ | associated eigenvector | generator of fiber in $\mathcal{W}$ |
|-----------------------------------------------|------------------------|---------------------------------|
| $(1 : 0 : 0 : 0 : 0 : 0)$                     | $x_1^2/x_0 x_2$        | $\omega = x_0 x_2^2 dx_0 - x_0^2 x_1 dx_1$ |
| $(0 : 1 : 0 : 0 : 0 : 0)$                     | $x_1/x_0$              | $\omega = 2x_0 x_1 x_2 dx_0 - x_0^2 x_2 dx_1 - x_0^2 x_1 dx_2$ |
| $(0 : 0 : 1 : 0 : 0 : 0)$                     | $x_3/x_2$              | $\omega = x_0^2 x_3 dx_0 - x_0^3 dx_3$ |
| $(0 : 0 : 0 : 1 : 0 : 0)$                     | $x_1/x_2$              | $\omega = x_0^2 x_2 dx_0 - x_0^3 dx_2$ |
| $(0 : 0 : 0 : 0 : 1 : 0)$                     | $x_1/x_2$              | $\omega = x_0 x_2 x_1 dx_0 - x_0^2 dx_1$ |
| $(0 : 0 : 0 : 0 : 0 : 1)$                     | $x_2/x_0$              | $\omega = x_0 x_2^2 dx_0 - x_0^2 x_2 dx_2$ |
Example 13. 4.3.14.5 On the point \( q = (x_0^2, x_0 x_2, x_0^3) \), we have (cf. (3.9))

\[ T_q Y = \frac{x_2}{x_0} + \frac{x_1}{x_2} + \frac{x_1^2}{x_0 x_2} + \frac{x_1}{x_0} + \frac{x_2}{x_0} + \frac{x_3 x_2}{x_0^2}. \]

From (3.54), and the summand \( x_2/x_0 \) for \( p_{\ell_5} \) (Table 11), one can find

\[ N_{\ell_5|Y_2} = \frac{1}{x_2} + \frac{x_1^2}{x_0 x_2} + \frac{x_2}{x_0} + \frac{x_3}{x_2} + \frac{x_1}{x_0}. \]

For some integers \( d_{25}, \ldots, d_{30} \) we have

\[ N_{\ell_5|Y_4} = \frac{x_1}{x_2} + \frac{x_1^2}{x_0 x_2} + \frac{x_2}{x_0} + \frac{x_1}{x_0}. \]

Since \( c_4^T(\mathcal{W}|_{\ell_5}) = 3w_0 + w_2 \) (cf. Table 12), like examples (6), (8), (10), (12) we obtain a linear expression in \( d_{25}, \ldots, d_{30} \),

\[ \int_{\ell_5} \frac{-c_4^T(\mathcal{W}|_{\ell_5})}{c_4^T(N_{\ell_5|Y_4})} = \frac{d(3w_0 + w_2)^2}{w^2}. \]

3.4.4 (\( g, g', f \) = \( (x_0^2, x_1^2, x_0^3) \)).

At last, let’s see how to solve indeterminacies around the point \( q := (x_0^2, x_1^2, x_0^3) \).

It lies in the neighborhood \( a_0 = b_0 = u_3 = 1 \), and then

\[
\begin{align*}
\left\{ \begin{array}{l}
f = x_0^3 + a_1 x_0^2 x_1 + a_2 x_0 x_2 + a_3 x_0^2 x_3 + a_6 (\frac{3}{2} u_1 x_0 x_1^2 + \frac{3}{2} u_2 x_0 x_1 x_2 + x_1^3) \\
g = x_0^2 + b_3 u_1 x_0 x_1 + b_3 u_2 x_0 x_2 + b_3 x_1^2.
\end{array} \right. \\
\end{align*}
\]

The weights of the local coefficients are

\[
\begin{align*}
w_{a_1} &= w_1 - w_0 & w_{b_3} &= 2w_1 - 2w_0 \\
w_{a_2} &= w_2 - w_0 & w_{u_1} &= w_0 - w_1 \\
w_{a_3} &= w_3 - w_0 & w_{u_2} &= w_0 - 2w_1 + w_2 \\
w_{a_6} &= 3w_1 - 3w_0 \\
\end{align*}
\]

The ideal of the curve \( C \) is

\[ J_C = (u_2, a_3, a_2, 2a_1 - 3b_3 u_1, 2a_6 - b_3^2 u_1, b_3 u_1^2 - 4). \]

Note the presence of the equation \( b_3 u_1^2 = 4 \). Since on the fixed point \( q = (x_0^2, x_1^2, x_0^3) \) we have \( b_3 = u_1 = 0 \), it means that the fixed point is outside of this first blowup center.

Next, we look at the second blowup center, the component \( E \) with equations
3. Calculation of the Degree

\[
\begin{align*}
  b_3 & \quad (\text{degree } 2w_0 - 2w_1) \\
  a_1 & \quad (\text{degree } w_0 - w_1) \\
  a_2 & \quad (\text{degree } w_0 - w_2) \\
  a_3 & \quad (\text{degree } w_0 - w_3) \\
  a_6 & \quad (\text{degree } 3w_0 - 3w_1).
\end{align*}
\]

We have a \( \mathbb{P}^4 = \{(t_0 : t_1 : t_2 : t_3 : t_4)\} = \mathbb{P}(N_{\mathcal{E}|\mathcal{Y}}) \) over the point \( q = (x_0^2, x_1^2, x_0^3) \), with induced action and weights

\[
\begin{align*}
  w_{t_0} &= 2w_1 - 2w_0 \\
  w_{t_1} &= w_1 - w_0 \\
  w_{t_2} &= w_2 - w_0 \\
  w_{t_3} &= w_3 - w_0 \\
  w_{t_4} &= 3w_1 - 3w_0
\end{align*}
\]

(3.60)

Here, there are five isolated fixed points. The table over this \( \mathbb{P}^4 \) is 4.2.4.1

Table 13 – Fixed points over \((x_0^2, x_1^2, x_0^3)\)

| fixed point \((t_0 : t_1 : t_2 : t_3 : t_4)\) | associated eigenvector | generator of fiber in \(\mathcal{W}\) |
|------------------------------------------|------------------------|---------------------------------|
| (1 : 0 : 0 : 0 : 0) | \(x_0^2/x_0^2\) | \(\omega = x_0x_0^3dx_0 - x_0^2x_1dx_1\) |
| (0 : 1 : 0 : 0 : 0) | \(x_1/x_0\) | \(\omega = x_0^2x_1dx_0 - x_0^3dx_1\) |
| (0 : 0 : 1 : 0 : 0) | \(x_2/x_0\) | \(\omega = x_0^2x_2dx_0 - x_0^3dx_2\) |
| (0 : 0 : 0 : 1 : 0) | \(x_3/x_0\) | \(\omega = x_0^2x_3dx_0 - x_0^3dx_3\) |
| (0 : 0 : 0 : 0 : 1) | \(x_1^3/x_0^2\) | \(\omega = x_0^3dx_0 - x_0x_1^2dx_1\) |

This completes the description of the fixed points.

3.5 SUM OF THE CONTRIBUTIONS

The methods to solve the indeterminacies of the map \((g, f) \mapsto \omega\) show us that there are over a fixed flag:

\[\begin{align*}
\cdot & \quad 26 \text{ fixed points at } \mathcal{Y} \text{ (see Table 1, page 37)}; \\
\cdot & \quad 6 \text{ fixed points at } \mathcal{Y}_1 \text{ (3 on Table 2 and 3 on Table 5)}; \\
\cdot & \quad 13 \text{ fixed points at } \mathcal{Y}_2 \text{ (3 on Table 6, 2 on Table 9, 5 on Table 13 and 3 on Table 11)}; \\
\cdot & \quad 16 \text{ fixed points at } \mathcal{Y}_3 \text{ (5 on Table 3, 4 on Table 4, 3 on Table 7 and 4 on Table 10)}; \\
\cdot & \quad 11 \text{ fixed points at } \mathcal{Y}_4 \text{ (6 on Table 8 and 5 on Table 12)}; \\
\cdot & \quad 5 \text{ fixed } \mathbb{P}^1 \text{ (1 on Tables 4, 7, 9, 10 and 12)}.
\]

Running over all flags, we obtain a total of \(72 \cdot 24 = 1728\) fixed points and \(5 \cdot 24 = 120\) fixed lines.

There are so many points! We can do the sum of all contributions using the freeware Macaulay2. The scripts can be found in the appendix 4.3, 4.4.

By examples 6, 8, 10, 12 and 13 this sum is a linear expression in unknowns \(d_1, \ldots, d_{30}\).

**Lemma 3.** The integers \(d_1, \ldots, d_{30}\) satisfy the relations

\[
\begin{align*}
2d_1 + d_2 + 2d_4 + 2 &= 0 \\
2d_7 - 2d_{10} - 2d_{26} - 2d_{30} + 1 &= 0 \\
d_{13} + d_{14} + d_{18} + 2 &= 0 \\
d_{19} + d_{21} - 2d_{24} + 2 &= 0 \\
2d_{25} + 2d_{26} + 2d_{28} + 2d_{30} + 1 &= 0 \\
\end{align*}
\]

\[
\begin{array}{c|c|c|c}
& d_3 = 1 & d_5 = 0 & d_6 = 0 \\
\hline
d_8 + d_{12} = 0 & d_9 + d_{30} + 1 = 0 & d_{11} = 0 \\
d_{15} = 1 & d_{16} = 0 & d_{17} = 0 \\
d_{20} + d_{22} = 0 & d_{23} = 0 \\
d_{27} = -2 & d_{29} = 0 \\
\end{array}
\] (3.61)

**Proof.** Take the particular weights \(w_0 = 0, w_1 = 1, w_2 = 5, w_3 = 25\) (cf. 5.2).

The degree of fibers is the same for every base flag that we look. For example, for the flag \(\varphi_0 (2.2)\) the degree is (see somad\(_{(0,0,1)}\) in 4.3.15)

\[
-\frac{729}{320}d_1 - \frac{729}{640}d_2 + \frac{729}{1600}d_3 - \frac{729}{320}d_4 + \cdots + \frac{3125}{192}d_{30} + \frac{49642909}{3974400}
\] (3.62)

and for the flag \(\varphi_1\),

\[
\varphi_1 : \ p_1 = \{x_0 = x_1 = x_3 = 0\} \in \ell_0 = \{x_0 = x_1 = 0\} \subset v_1 = \{x_1 = 0\},
\]

the degree is (see somad\(_{(1,0,0)}\) in 4.3.15)

\[
-\frac{1}{6000}d_1 - \frac{1}{12000}d_2 - \frac{1}{144000}d_3 - \frac{1}{6000}d_4 + \cdots - \frac{210827008}{121875}d_{30} + \frac{7491488544437}{5070000000}
\] (3.63)

Since the degrees are the same, we gain the equation (3.62)=(3.63). And we have 24 fixed flags, so actually we get 23 linear equations on the 30 variables \(d_i\). This system of equations has the 18 independent linear equations (3.61), cf. ideal II in 4.3.16.

**Remark 3.** The relations (3.61) are enough to compute the Chern classes of the normal bundles of fixed lines, and also for compute the degree of a fiber. To example, for the line \(\tilde{\ell}_1\) we have (3.30)

\[
\mathcal{N}_{(q,p_{\ell_1},v_{\ell_1})|\ell_1|v_3} = \frac{x_0}{c_{\ell_1}(d_1)} + \frac{x_2}{c_{\ell_1}(d_2)} + \frac{x_0}{c_{\ell_1}(d_3)} + \frac{x_2}{c_{\ell_1}(d_4)} + \frac{x_0}{c_{\ell_1}(d_5)} + \frac{x_2}{c_{\ell_1}(d_6)}
\]

Since \(d_3 = 1, \ d_5 = 0 \) and \(d_6 = 0\), we obtain

\[
c^T_6(\mathcal{N}_{\ell_1|v_3}) = (w_0 - w_1 + d_1h)(2w_0 - 2w_1 + d_2h)(w_0 - w_1 + d_4h)(w_2 - w_0 + h)(w_2 - w_1)(w_3 - w_1)
\]

\[
c^T_6(\mathcal{N}_{\ell_1|v_3}) = w + dh, \text{ where}
\]

\[
w = 2(w_0 - w_1)^3(w_2 - w_1)(w_3 - w_1)(w_2 - w_0)
\]

\[
d = [(w_0 - w_1)^2(w_2 - w_1)(w_3 - w_1)] \cdot \frac{2d_1 + 2d_2 + 2d_4}{(w_2 - w_0) + 2(w_0 - w_1)},
\]

\[
d = 2(w_0 - w_1)^2(w_2 - w_1)(w_3 - w_1)(2w_0 - w_1 - w_2).
\]
Proposition 3. (Degree of a Fiber) The degree of the 7-dimensional variety of exceptional foliations over a fixed flag is 21.

Proof. Simply replace the relations (3.61) in (3.62), cf. 4.3.16

When running over all the complete flags of \( \mathbb{P}^3 \) we obtain the full exceptional component of foliations. The contributions on Bott’s formula are computed replacing the power 7 on the numerators by 13, and multiplying the denominators by \( c^T_6(T_{(p,\ell,v)}\mathbb{F}) \), where \((p, \ell, v)\) runs over the fixpoints of the variety \( \mathbb{F} \) of complete flags in \( \mathbb{P}^3 \) (see (3.1) and (3.5)).

If \( \{x_i, x_j, x_k, x_m\} \) is a basis of \( (\mathbb{C}^4)^\vee \) and the fixed complete flag is
\[
p_{ijk} = \{x_i = x_j = x_k = 0\} \subset \ell_{ij} = \{x_i = x_j = 0\} \subset v_i = \{x_i = 0\},
\]
then
\[
T_{(p_{ijk},\ell_{ij},v_i)}\mathbb{F} = \frac{x_j}{x_i} + \frac{x_k}{x_i} + \frac{x_m}{x_j} + \frac{x_m}{x_j} + \frac{x_m}{x_k},
\]
and so
\[
c^T_6(T_{(p_{ijk},\ell_{ij},v_i)}\mathbb{F}) = (w_j - w_i)(w_k - w_i)(w_m - w_i)(w_k - w_j)(w_m - w_j)(w_m - w_k).
\]

Theorem 4. The degree of the exceptional component of foliations of codimension one and degree two in \( \mathbb{P}^3 \) is 168208.

3.6 A GEOMETRIC INTERPRETATION OF THE DEGREE

For a codimension one foliation in \( \mathbb{P}^n \), given by the differential form
\[
\omega = \sum_{i=0}^{n} A_i dx_i,
\]
the hyperplane defined by the distribution at a point \( p \in \mathbb{P}^n \) is
\[
H = \sum_{i=0}^{n} A_i(p)x_i = 0.
\]

Thus, a tangent direction \( v = (v_0 : \ldots : v_n) \in \mathbb{P}(T_p\mathbb{P}^3) \) lies on this hyperplane \( H \) if
\[
\sum_{i=0}^{n} A_i(p) \cdot v_i = 0.
\]

This can be thought of as a linear equation on the coefficients of the \( A_i \). Hence, the point \((p, v) \in \mathbb{P}(T\mathbb{P}^3)\) defines a hyperplane in the projective space of distributions.
\[
\omega(p) \cdot v = 0.
\]
The equation (3.64) shows that the degree of a $m$–dimensional component of the space of codimension one foliations in $\mathbb{P}^n$ can be interpreted as the number of such foliations that are tangent to $m$ general directions in $\mathbb{P}^n$.

In particular, Theorem 4 means that there are 168208 exceptional foliations tangent to 13 general directions in $\mathbb{P}^3$. 
Here, we present scripts for the software Macaulay2 to perform some calculations. You may open a session in http://habanero.math.cornell.edu:3690/ and perform the computations just by cut&paste.

### 4.1 THE STANDARD EXCEPTIONAL FOLIATION

Rx=QQ[x_0..x_3]; R = Rx[dx_0..dx_3,SkewCommutative=>true];
X = vars Rx; dX = vars R;
f=x_0^2*x_3-x_0*x_1*x_2+(1/3)*x_1^3;
g=x_0*x_2-(1/2)*x_1^2;

-- computing df and dg
matrix{{f}}; diff(X,oo); mdf=sub(oo,R); df = determinant(oo * (transpose dX));
matrix{{g}}; diff(X,oo); mdg=sub(oo,R); dg = determinant(oo * (transpose dX));

-- the explicity 1-form
w = 2*g*df - 3*f*dg; w=w//x_0

-- the singular locus. Taking the polinomials A_i
(m,c)=coefficients w;
c=sub(c,Rx); I=ideal c

-- the components of the singular locus
primaryDecomposition I

### 4.2 RESOLUTION OF THE MAP

We start by the resolution of the indeterminacies of the map \((g, f) \mapsto \omega\). This was done by looking over standard neighborhoods that cover \(X'\). We present here two neighborhoods, leaving the others to the reader.

#### 4.2.1 Neighborhood \(b_3 = a_6 = 1\)

#### 4.2.1.1 Computing \(\omega\)

Ra=QQ[a_0 .. a_6,b_0..b_3,s_0..v_5];
\[ Rx = \text{Ra}[x_0 .. x_3]; R = \text{Rx}[dx_0 .. dx_3,\text{SkewCommutative}=>true]; \]
\[ X = \text{vars} Rx; dX = \text{vars} R; X3 = \text{basis}(3,Rx); X4 = \text{basis}(4,Rx); \]
\[ f1 = a_0*x_0^3 + a_1*x_0^2*x_1 + a_2*x_0^2*x_2 + a_3*x_0^2*x_3; \]
\[ f2 = a_4*x_0*x_1^2 + a_5*x_0*x_1*x_2 + a_6*x_1^3; \]
\[ f = f1 + f2; \]
\[ g = b_0*x_0^2 + b_1*x_0*x_1 + b_2*x_0*x_2 + b_3*x_1^2; \]
\[ f = \text{sub}(f,\{a_4=>(3/2)*b_1,a_5=>(3/2)*b_2,a_6=>1\}); \]
\[ g = \text{sub}(g,b_3=>1); \]
\[ \text{w} = 2*g*\text{df} - 3*f*\text{dg}; \]
\[ \text{w} = \text{w} \% x_0; \]

\[ 4.2.1.2 \text{ Indeterminacy Locus} \]
\[ \text{w} \]

\[ 4.2.1.3 \text{ Blowup along } C \]
\[ e_0 = 8*a_0-b_1^3; \]
\[ e_1 = a_2; \]
\[ e_2 = b_2; \]
\[ e_3 = a_3; \]
4.2. Resolution of the map

\[ e_4 = 4b_0 - b_1^2; \]
\[ e_5 = 4a_1 - 3b_1^2; \]

-- the substitution to local equation \( a_2 \) are done
-- by list \( m_1 \) below
\[
\begin{align*}
m_{11} &= \{ a_0 \Rightarrow (1/8)b_1^3 + (1/8)a_2s_0, \quad b_2 \Rightarrow a_2s_2, \quad a_3 \Rightarrow a_2s_3 \}; \\
m_{12} &= \{ b_0 \Rightarrow (1/4)b_1^2 + (1/4)a_2s_4, \quad a_1 \Rightarrow (3/4)b_1^2 + (1/4)a_2s_5 \}; \\
m_1 &= \text{flatten(append}(m_{11}, m_{12})) ;
\end{align*}
\]

\[ wnt_1 = \text{sub}(w, m_1) ; \]
-- to verify that \( wn_1t \) is divisible by \( a_2 \), compute
-- \( wn_1 \% a_2 \), and see if this remainder is zero.
\[ wn_1 = wnt_1 \% a_2 ; \]

-- collect the new indeterminacy locus ideal \( Jn_1 \)
\[
\text{matrix}(\{ \{ wn_1 \} \} ; \quad (p, r) = \text{quotientRemainder}(oo, dx) ; \\
(p, r) = \text{quotientRemainder}(\text{sub}(\text{transpose } p, Rx), X3) ; \\
Jn_1 = \text{ideal } p; \quad Jn_1 = \text{trim } Jn_1; \quad Jn_1 = \text{sub}(Jn_1, Ra) ;
\]

4.2.1.4 Running other neighborhoods

-- now, we will run over all 6 local equations

for \( i \) from 0 to 5 do ( \( exc = e_i ; \)
\[ l11 = \{ a_0 \Rightarrow (1/8)(s_0*exc + b_1^3), \quad a_2 \Rightarrow s_1*exc, \quad b_2 \Rightarrow s_2*exc \}; \]
\[ l12 = \{ a_3 \Rightarrow s_3*exc, \quad b_0 \Rightarrow (1/4)(s_4*exc + b_1^2), \quad a_1 \Rightarrow (1/4)(s_5*exc + 3*b_1^2) \}; \]
\[ l = \text{flatten}(\text{append}(l11, l12)) ; \]
\[ m_i = \text{delete}(l_i, l) ; \]
\[ Jn_i = \text{sub}(J, m_i) ; \]
\[ Jn_i = Jn_i : exc ; \]
\[ wn_i = \text{sub}(w, m_i) ; \]
\[ wn_i = wn_i \% exc ; \)

-- the \( Jn_i \) are the new indeterminacy locus ideals, seen locally.
-- all \( Jn_i, 0 \leq i \leq 5 \), are irreducible and reduced
-- and \( Jn_3 = 1 \) means that the map was solved in this neighborhood
for i from 0 to 5 do (  
print(# primaryDecomposition Jn_i, radical Jn_i == Jn_i);  
)

for i from 0 to 5 do (  
exc=e_i;  
JR_i = ideal(3*s_4-2*s_5, s_3, exc, 3*b_1*s_2-4*s_1, s_0-b_1*s_5);  
print(sub(JR_i,s_i=>1)==Jn_i);  
)

4.2.1.5 Fibers to Table 2  
-- in the previous section, we’ve computed the expressions  
-- wn_i of w after the blowup along C. Now, we look  
-- at the fixed points for the referred Table2.  
M1={a_0=>0,a_1=>0,a_2=>0,a_3=>0,b_0=>0,b_1=>0,b_2=>0};  
M2={s_0=>0,s_1=>0,s_2=>0,s_3=>0};  
M3={s_4=>0,s_5=>0};  
M12=flatten(append(M1,M2));

-- a little caution now: there’s a fixed P1 (s_4:s_5).  
-- for this reason we’ve set separated M3 above.

for i from 0 to 5 do (  
Fwn_i=sub(wn_i,M12);  
if i<4 then Fwn_i=sub(Fwn_i,M3);  
print(s'_i,Fwn_i);  
)

-- look closely at the fibers over the fixed P1!

4.2.1.6 Fibers to Table 3  
-- Fwn_2=0 means indeterminacy. We continue with equations of R  
e_6=3*s_4-2*s_5;  
e_7=s_3;  
e_8=s_0-b_1*s_5;  
e_9=4*s_1-3*b_1;  
e_10=b_2;

for i from 6 to 10 do (
4.2. Resolution of the map

\[ \text{exc} = e_i; \]
\[ l_{11} = \{ s_4 \mapsto (1/3)(v_0 \cdot \text{exc} + 2s_5), s_3 \mapsto v_1 \cdot \text{exc}, s_0 \mapsto v_2 \cdot \text{exc} + b_1 s_5 \}; \]
\[ l_{12} = \{ s_1 \mapsto (1/4)(v_3 \cdot \text{exc} + 3b_1), b_2 \mapsto v_4 \cdot \text{exc} \}; \]
\[ l = \text{flatten}(\text{append}(l_{11}, l_{12})); \]
\[ m_i = \text{delete}(l_{(i-6)}, l); \]
\[ Jn_{2_i} = \text{sub}(Jn_2, m_i); \]
\[ Jn_{2_i} = Jn_{2_i} : \text{exc}; \]
\[ w_{n2_i} = \text{sub}(w_{n2}, m_i); \]
\[ w_{n2_i} = w_{n2_i} // \text{exc}; \]

\[ M_4 = \{ v_0 \mapsto 0, v_1 \mapsto 0, v_2 \mapsto 0, v_3 \mapsto 0, v_4 \mapsto 0 \}; \]

for \( i \) from 6 to 10 do (
\[ Fw_{n2_i} = \text{sub}(w_{n2_i}, M_1); \]
\[ Fw_{n2_i} = \text{sub}(Fw_{n2_i}, M_3); \]
\[ Fw_{n2_i} = \text{sub}(Fw_{n2_i}, M_4); \]
\[ \text{print}(v'_{(i-6)}, Fw_{n2_i}); \]
)

4.2.1.7 Fibers to Table 4

-- the point \( p_1 = (0:0:0:1:3/2) \) has \( s_4 = 1, s_5 = 3/2 \)
-- ideal of next blowup center \( R \) is \( Jn_4 \)
\[ Jn_4 = \text{ideal}(2s_5 - 3, s_3, 2s_0 - 3b_1, 4s_1 - 3b_1 s_2, 4b_0 - b_1^2) \]

\[ e_6 = 2s_5 - 3; \]
\[ e_7 = s_3; \]
\[ e_8 = 2s_0 - 3b_1; \]
\[ e_9 = 4s_1 - 3b_1 s_2; \]
\[ e_{10} = 4b_0 - b_1^2; \]

for \( i \) from 6 to 10 do (\n\[ \text{exc} = e_i; \]
\[ l_{11} = \{ s_5 \mapsto (1/2)(v_0 \cdot \text{exc} + 3), s_3 \mapsto v_1 \cdot \text{exc}, s_0 \mapsto (1/2)(v_2 \cdot \text{exc} + 3b_1) \}; \]
\[ l_{12} = \{ s_1 \mapsto (1/4)(v_3 \cdot \text{exc} + 3b_1 s_2), b_0 \mapsto (1/4)(v_4 \cdot \text{exc} + b_1^2) \}; \]
\[ l = \text{flatten}(\text{append}(l_{11}, l_{12})); \]
\[ m_i = \text{delete}(l_{(i-6)}, l); \]
\[ Jn_{4_i} = \text{sub}(Jn_4, m_i); \]
\[ Jn_{4_i} = Jn_{4_i} : \text{exc}; \]
wn4_i = sub(wn4, m_i);
wn4_i = wn4_i // exc; )

-- all Jn4_i=1, 6<=i<=10.

for i from 6 to 10 do ( 
  Fwn4_i = sub(wn4_i, M12);
  Fwn4_i = sub(Fwn4_i, s_5 => 3/2);
  Fwn4_i = sub(Fwn4_i, M4);
  print(v'_(i-6), Fwn4_i);
)

-- Fwn4_i, i=6..10 is the generator of W over (x_1^2, x_1^3, pl, v_(6-i))
-- this completes the resolution over (x_1^2, x_1^3).

4.2.2 Neighborhood \( a_0 = b_0 = u_1 = 1 \)

4.2.2.1 Computing \( \omega \)

restart
Ra = QQ[a_0..b_6, s_0..v_5, z_0..z_5];
Rx = Ra[x_0 .. x_3]; R = Rx(dx_0 .. dx_3, SkewCommutative=>true];
X = vars Rx; dX = vars R; X3 = basis(3, Rx); X4 = basis(4, Rx);
f1 = a_0*x_0^3 + a_1*x_0^2*x_1 + a_2*x_0^2*x_2 + a_3*x_0^2*x_3;
f2 = a_4*x_0*x_1^2 + a_5*x_0*x_1*x_2 + a_6*x_1^3;
f = f1 + f2;
g = b_0*x_0^2 + b_1*x_0*x_1 + b_2*x_0*x_2 + b_3*x_1^2;

-- first blowup \( X' \) --> \( X \)
g = sub(g, {b_0 => 1, b_2 => u_2*b_1, b_3 => u_3*b_1});
f = sub(f, {a_5 => a_4*u_2, a_6 => (2/3)*a_4*u_3});

matrix{{f}}; diff(X, oo); mdf = sub(oo, R); df = determinant(oo * (transpose dX));
matrix{{g}}; diff(X, oo); mdg = sub(oo, R); dg = determinant(oo * (transpose dX));

-- the 1-form \( w \)
w = 2*g*df - 3*f*dg; w = w // x_0;

-- indeterminacy locus of (g, f) --> \( w \)
4.2. Resolution of the map

matrix\{w\}; \ (p,r) = \text{quotientRemainder}(oo,dX); \\
(p,r) = \text{quotientRemainder}(\text{sub}(\text{transpose} \ p, Rx),\ X3); \\
J = \text{ideal} \ p; \ J = \text{trim} \ J; \ J = \text{sub}(J, Ra);

-- if a_0=0 there's no indeterminacy \\
\text{trim}(\text{sub}(J, a_0=>0)) \\
-- this means that a_0=...=a_4=0, impossible.

4.2.2.2 Components of reduced indeterminacy locus

-- next, we can set a_0=1 to play with indeterminacy locus

w = \text{sub}(w, a_0=>1); \\
J = \text{sub}(J, a_0=>1); \\
K = \text{trim}(\text{radical} \ J); \\
\text{primaryDecomposition} \ K

-- The primary decomposition of K reveals two ideals. \\
-- Namely, the codimension one component is C and the \\
-- codimension two component is E.

-- These two components meet at one point \\
\text{trim}(oo_0+oo_1)

4.2.2.3 First blowup center: C

-- we start with the local ideal of C \\
-- and choose u_2 for local equation

-- the list of substitutions is m_5 below:

m_51 = \{b_1=>4*u_3+u_2*s_0, \ a_1=>6*u_3 + u_2*s_1, \ a_2=>u_2*s_2\}; \\
m_52 = \{a_3=>u_2*s_3, \ a_4=>12*u_3^2+u_2*s_4\}; \\
m_5 = \text{flatten}(\text{append}(m_51, m_52));

-- now, plug it into w \\
wn_5 = \text{sub}(w, m_5);
-- verify if the new expression is divisible by u_2
wn_5 % u_2 == 0

-- since the answer is true, may perform the division
wn_5=wn_5 // u_2;

-- the new indeterminacy locus
Jn_5=sub(J,m_5);
Jn_5=trim(Jn_5 : u_2);

-- and the strict transform of K=J_red
Kn_5=sub(K,m_5);
Kn_5=trim(Kn_5 : u_2);

-- The strict transform of E
JE=ideal(a_1..a_4,b_1);
SJE=sub(JE,m_5):u_2;
SJE==Kn_5

-- this means that the strict transform E' of E
-- coincides with the strict transform of J_red

4.2.2.4 Second blowup center: E

-- After the blowup along C, the ruled surface
-- R appears in the reduction of the
-- indeterminacy locus, rad(Jn_5).
-- This reduction consists of E' and R

primaryDecomposition(radical Jn_5);
trim(oo_0+oo_1)

-- this means that this intersection is a curve

-- Now, we'll perform the blowup along E
-- this is done by changes m_7 below:

m_71={s_3=>t_0*s_2, s_0=>(1/3)*(t_2*s_2+2*s_1)};
m_72={u_3=>(1/6)*(t_3*s_2 - s_1*u_2), s_4=>(1/3)*(t_4*s_2-s_1^2*u_2)};

\[ JE = (\text{radical} \ J) : \text{MMM}; \]

-- the p.D. of radical J is composed by these two ideals MMM and JE
\[ \text{primaryDecomposition} \ \text{radical} \ J \]

-- choose a_1u_1 - 6 for the exceptional equation
\[ \text{exc} = a_1 \cdot u_1 - 6; \]

\[ m_{41} = \{u_2 = s_0 \cdot \text{exc}, a_3 = s_1 \cdot \text{exc}, a_2 = s_2 \cdot \text{exc}\}; \]
\[ m_{42} = \{b_3 = (1/9) \cdot (s_3 \cdot \text{exc} + a_1^2), a_6 = (1/27) \cdot (s_5 \cdot \text{exc} + a_1^3)\}; \]
\[ m_4 = \text{flatten}(\text{append}(m_{41}, m_{42})); \]

-- new indeterminacy locus
\[ Jn_4 = \text{sub}(J, m_4); \]
\[ Jn_4 = Jn_4 : \text{exc}; \]
-- the second blowup center $E$
\[ J_{E_4} = \text{sub}(J_E, m_4); \]
\[ J_{E_4} = J_{E_4} : \text{exc}; \]
\[ w_{n_4} = \text{sub}(w, m_4); \]
\[ w_{n_4} = w_{n_4} // \text{exc}; \]

-- equations of $E'$
\[ e_6 = s_3; \]
\[ e_7 = a_1; \]
\[ e_8 = s_2; \]
\[ e_9 = s_1; \]
\[ e_{10} = s_5; \]

for $i$ from 6 to 10 do
    \[ e_i = s_3; \]
    \[ e_i = a_1; \]
    \[ e_i = s_2; \]
    \[ e_i = s_1; \]
    \[ e_{10} = s_5; \]
    \[ \text{exc} = e_i; \]
    \[ l_{11} = \{s_3 \Rightarrow t_0 \ast \text{exc}, a_1 \Rightarrow t_1 \ast \text{exc}, s_2 \Rightarrow t_2 \ast \text{exc}\}; \]
    \[ l_{12} = \{s_1 \Rightarrow t_3 \ast \text{exc}, s_5 \Rightarrow t_4 \ast \text{exc}\}; \]
    \[ l = \text{flatten} (\text{append}(l_{11}, l_{12})); \]
    \[ m_i = \text{delete}(l_{-(i-6)}, l); \]
    \[ J_{n_4 i} = \text{sub}(J_{n_4}, m_i); \]
    \[ J_{n_4 i} = J_{n_4 i} : \text{exc}; \]
    \[ w_{n_4 i} = \text{sub}(w_{n_4}, m_i); \]
    \[ w_{n_4 i} = w_{n_4 i} // \text{exc}; \]

-- After this two blowups, the indeterminacy locus becomes reduced
for $i$ from 6 to 10 do print(radical $J_{n_4 i} = J_{n_4 i}$);

-- moreover, $J_{n_4 i}$ is irreducible, $6 \leq i \leq 10$
-- note that $J_{n_4 9} = 1$ (the map was solved here), thus
-- # primaryDecomposition $J_{n_4 i}$ will return 0.
-- The ideals $J_{n_4 i}$, $i \not= 9$, represents
-- the ruled surface $R$, and so codim = 5.
for $i$ from 6 to 10 do print(# primaryDecomposition $J_{n_4 i}$, codim $J_{n_4 i}$);
Thus, the next blowup along $R$ will solve the map.

we leave to the reader as an exercise the verifications over the neighborhood $[b_1=1]$. Over $[b_2=1]$ there's no indeterminacies.

4.2.4.1 Fibers to Table 13

since the indeterminacy point $q$ is outside of first blowup center $C$, we will go directly to equations of $E$

\[
\begin{align*}
e_0 &= b_3; \\
e_1 &= a_1; \\
e_2 &= a_2; \\
e_3 &= a_3; \\
e_4 &= a_6;
\end{align*}
\]

\[
M1 = \{a_1 => 0, a_2 => 0, a_3 => 0, a_6 => 0, b_3 => 0, u_1 => 0, u_2 => 0\};
\]

\[

somad_(a,b,c) = soma;
4.4. Degree of the Exceptional Component

\[
\II = \II + (\text{somad}_{(a,b,c)} - \text{somad}_{(0,0,0)});
\]

4.3.16 Degree to Proposition 3

-- The relations for d's
\[
\II = \text{trim(sub(II,Ra))}
\]

-- and the degree of a fiber
\[
\text{soma} = \text{sub}(-\text{somad}_{(0,0,1)}, Ra/\II)
\]

The minus sign is due to the minus in
\[
\int_{\mathbb{Y}_4(p,\ell,v)} -c_1^7(W) \cap [\mathbb{Y}_4(p,\ell,v)].
\]

The variable soma returns the result, 21, of Proposition 3.

4.4 DEGREE OF THE EXCEPTIONAL COMPONENT

The scripts are similar to the presented in the previous section.

5 APPENDIX B

5.1 INDUCED ACTION

For a given action of $\mathbb{C}^*$ in $\mathbb{P}^3$,

$$\xi : \quad \mathbb{C}^* \times \mathbb{P}^3 \rightarrow \mathbb{P}^3,$$

$$[t, (q_0 : q_1 : q_2 : q_3)] \mapsto (t^{-w_0}q_0 : t^{-w_1}q_1 : t^{-w_2}q_2 : t^{-w_3}q_3),$$

we have, for each $t \in \mathbb{C}^*$, a linear map $T_t : \mathbb{C}^4 \rightarrow \mathbb{C}^4$ defined on canonical basis $\{e_0, e_1, e_2, e_3\}$ by $T_t(e_i) = t^{-w_i}e_i$.

The dual space $(\mathbb{C}^4)\vee$ has dual basis $\{x_0, x_1, x_2, x_3\}$, the linear forms with

$$x_i(e_j) = \delta_{ij} = \begin{cases} 1, & \text{if } i = j \\ 0, & \text{if } i \neq j \end{cases}.$$ 

Under $T_t$ we obtain another basis of $\mathbb{C}^4$, the basis $\beta = \{t^{-w_0}e_0, t^{-w_1}e_1, t^{-w_2}e_2, t^{-w_3}e_3\}$. The dual basis of $\beta$ is the basis $\alpha = \{y_0, y_1, y_2, y_3\}$ of $(\mathbb{C}^4)\vee$ given by linear forms with

$$y_i(t^{-w_j}e_j) = \delta_{ij} : \quad y_i(e_j) = t^{w_j}\delta_{ij}.$$ 

Thus, the dual basis is $\alpha = \{t^{w_0}x_0, t^{w_1}x_1, t^{w_2}x_2, t^{w_3}x_3\}$, and so the action $\xi$ induces an action $\xi\vee$ on $\tilde{\mathbb{P}}^3$ just by

$$
\begin{align*}
x_0 &\mapsto t^{w_0}x_0 \\
x_1 &\mapsto t^{w_1}x_1 \\
x_2 &\mapsto t^{w_2}x_2 \\
x_3 &\mapsto t^{w_3}x_3
\end{align*}
\quad (5.1)
$$

For a point $(1 : q_1 : q_2 : q_3) \in \mathbb{P}^3$ the action $\xi$ gives

$$t \circ (1 : q_1 : q_2 : q_3) = (t^{-w_0} : t^{-w_1}q_1 : t^{-w_2}q_2 : t^{-w_3}q_3) = (1 : t^{w_0-w_1}q_1 : t^{w_0-w_2}q_2 : t^{w_0-w_3}q_3).$$

If the weights $w_i$, $0 \leq i \leq 3$, are all distinct, then for $t \neq \pm1$ the point will be changed. Therefore, the only fixed point is the point $(1:0:0:0)$. In a similar way, the other fixed points by the action $\xi$ are $(0:1:0:0)$, $(0:0:1:0)$ and $(0:0:0:1)$.

The same rule holds for planes: for distinct weights $w_i$ the only fixed planes are the standard ones, $x_i = 0$, $0 \leq i \leq 3$, and so there is only four fixed points on $\tilde{\mathbb{P}}^3$ (Note: the planes $x_i = 0$ are fixed, but not point-a-point).

However, if we set $w_0 = w_1$ then all points of the line $(q_0 : q_1 : 0 : 0)$ will be fixed by the action, point-a-point, and so we gain a fixed component in $\mathbb{P}^3$ of positive dimension.
5.1.1 Action on lines

Let $G = G(1, 3)$ the grassmannian of lines in $\mathbb{P}^3$, and consider the Plücker embedding $\mathbb{G} \sim Q \subset \mathbb{P}^5$, where $Q = \{(p_{01} : p_{02} : p_{03} : p_{12} : p_{13} : p_{23}) \in \mathbb{P}^5| p_{01}p_{23} - p_{02}p_{13} + p_{03}p_{12} = 0\}$. ([7], example 2.1, pg.68).

The Plücker embedding associates a line

$$
\ell = \begin{cases} 
    a_0x_0 + a_1x_1 + a_2x_2 + a_3x_3 = 0 \\
    b_0x_0 + b_1x_1 + b_2x_2 + b_3x_3 = 0
\end{cases}
$$

to the point of $Q$ whose coordinates are the $(2 \times 2)$–minors of the coefficients matrix

$$
\begin{bmatrix}
    a_0 & a_1 & a_2 & a_3 \\
    b_0 & b_1 & b_2 & b_3
\end{bmatrix}.
$$

The action (5.1) applied on $\ell$ gives the line

$$
t \circ \ell = \begin{cases} 
    a_0t^{w_0}x_0 + a_1t^{w_1}x_1 + a_2t^{w_2}x_2 + a_3t^{w_3}x_3 = 0 \\
    b_0t^{w_0}x_0 + b_1t^{w_1}x_1 + b_2t^{w_2}x_2 + b_3t^{w_3}x_3 = 0
\end{cases},
$$

and the coefficients matrix of $t \circ \ell$ is

$$
\begin{bmatrix}
    t^{w_0}a_0 & t^{w_1}a_1 & t^{w_2}a_2 & t^{w_3}a_3 \\
    t^{w_0}b_0 & t^{w_1}b_1 & t^{w_2}b_2 & t^{w_3}b_3
\end{bmatrix}.
$$

Computing the $(2 \times 2)$–minors of this matrix, we conclude that the action passes to $Q$ by

$$
t \circ \underline{p} = (t^{w_0+w_1}p_{01} : t^{w_0+w_2}p_{02} : t^{w_0+w_3}p_{03} : t^{w_1+w_2}p_{12} : t^{w_1+w_3}p_{13} : t^{w_2+w_3}p_{23}).
$$

Thus, for distinct weights, the Plücker relation $p_{01}p_{23} - p_{02}p_{13} + p_{03}p_{12} = 0$ guarantees that the only fixed lines by the action are the standard ones $x_i = x_j = 0, i, j \in \{0, 1, 2, 3\}$.

5.1.2 Action on quadrics and cubics

The set of quadric surfaces of $\mathbb{P}^3$ form a $\mathbb{P}^9$, with induced action from $\xi^\lor$ (5.1). For $g = b_0x_0^2 + b_1x_0x_1 + \cdots + b_9x_3^2$, the induced action gives

$$
t \circ g = t^{2w_0}b_0x_0^2 + t^{w_0+w_1}b_1x_0x_1 + \cdots + t^{2w_3}b_9x_3^2.
$$

For fixed quadrics to be only the monomials $x_ix_j = 0$, it is not enough that the weights are different. Now, it is also necessary that the sums of weights, taken 2–a–2, to be different.

This is similar to cubics. For $f = a_0x_0^3 + a_1x_0^2x_1 + \cdots + a_{19}x_3^3$, the induced action is

$$
t \circ f = t^{3w_0}a_0x_0^3 + t^{2w_0+w_1}a_1x_0^2x_1 + \cdots + t^{3w_3}a_{19}x_3^3.
$$

Therefore, to have only isolated fixed cubics we need that the sums of weights, taken 3–a–3, to be different.

As an example, we can take

$$
(w_0, w_1, w_2, w_3) = (0, 1, 5, 25)
$$

and the components of fixed flags, quadrics and cubics are all isolated points.
5.2 THREE PLANES IN $\mathbb{P}^3$

The intention here is to show with a simpler example some methods used in calculations involving Bott’s formula.

A basic example is to find the number of points living in the intersection of three generic planes in $\mathbb{P}^3$. The answer to this question is widely known as 1, and can be expressed in terms of the Chow ring of $\mathbb{P}^3$ as

$$\int_{\mathbb{P}^3} c_1(O_{\mathbb{P}^3}(1))^3.$$

Now allow us to complicate the calculations a little more by computing this number on the blowup of $\mathbb{P}^3$ along a line, let’s say, along the line

$$\ell : x_1 = x_2 = 0.$$

Denote by $\pi : X \to \mathbb{P}^3$ this blowup, and $O(1)$ the pullback bundle

$$O(1) = \pi^*(O_{\mathbb{P}^3}(1)).$$

Now, we want to show how to compute $\int_X c_1(O(1))^3 = 1$ applying Bott’s formula,

$$\int_X c_1(O(1))^3 \cap [X] = \sum_F \int_F \frac{c^T(\mathcal{O}(1)|_F)^3 \cap [F]_T}{c^T_{\text{top}}(\mathcal{N}_{F|X})}$$

where the sum runs through all fixed components $F$ under an action of the torus $\mathbb{C}^*$.

To make things more fun, let’s set the action

$$\mathbb{C}^* \times \mathbb{P}^3 \to \mathbb{P}^3$$

$$(t, (s_0 : s_1 : s_2 : s_3)) \mapsto (t^{-1}s_0 : t^{-1}s_1 : t^{-2}s_2 : t^{-3}s_3)$$

This action induces an action on the linear forms just by change the signals because of duality, i.e,

$$x_0 \mapsto tx_0 \quad x_2 \mapsto t^2x_2$$
$$x_1 \mapsto tx_1 \quad x_3 \mapsto t^3x_3$$

(5.4)

Notice that the action on $\mathbb{P}^3$ gives two isolated fixed points and one fixed line

$$p_2 = (0 : 0 : 1 : 0) \notin \ell;$$
$$p_3 = (0 : 0 : 0 : 1) \in \ell;$$
$$d = (s_0 : s_1 : 0 : 0)$$

and the fixed component $d$ (the line of equations $x_2 = x_3 = 0$) cuts the blowup center $\ell$ in one point $p_0 = (1 : 0 : 0 : 0)$. We have to compute the contributions of the components of fixed points in the sum (5.3).
In the numerator of (5.3) we have \( c^T_1(\mathcal{O}(1)|_F) \). Since \( \mathcal{O}(1) \) is a line bundle, the equivariant Chern class of this bundle over a fixed component \( F \) is

\[
c^1_1(\mathcal{O}(1)|_F) = \lambda + c_1(\mathcal{O}(1)|_F),
\]

where \( \lambda \) is the weight of the fiber of the bundle on the fixed component \( F \) and \( c_1(\mathcal{O}(1)|_F) \) denotes the classical Chern class of \( \mathcal{O}(1) \) restricted to \( F \).

For an equivariant rank \( n \) bundle \( E \) over \( F = \mathbb{P}^1 \), one can split \( E \) as a direct sum of \( n \) line bundles \( E = \bigoplus \lambda E^\lambda \), for which the weight of the fiber of each \( E^\lambda \) is \( \lambda \). Hence (5.5) applies for each \( E^\lambda \),

\[
c^1_1(E^\lambda)|_F = \lambda + c_1(E|_F).
\]

It follows that the \( n \)-th equivariant Chern class of \( E \) can be obtained by the product

\[
c^n_1(E)|_F = \prod_\lambda c^T_1(E^\lambda)|_F. \quad (5.6)
\]

• Contribution of \( p_2 \)

The simplest point to compute the contribution in (5.3) is \( p_2 \). Since it is out of the blowup center, its contribution can be computed already in \( \mathbb{P}^3 \).

The fiber of \( \mathcal{O}(1)|_{p_2} \) is generated by \( x_2 \), of weight \( \lambda = 2 \) (see (5.4)). And \( \dim(\{p_2\}) = 0 \), so \( c_1(\mathcal{O}(1)|_{p_2}) = 0 \). In view of (5.5) we have

\[
c^1_1(\mathcal{O}(1)|_{p_2}) = 2. \quad (5.7)
\]

The denominator is \( c^3_1(\mathcal{N}_{p_2}|_{\mathbb{P}^3}) \). But \( \mathcal{N}_{p_2}|_{\mathbb{P}^3} \simeq T_{p_2}\mathbb{P}^3 \) as the normal space of a point in an ambient is equal to the tangent space of this ambient at the point. To compute \( c^3_1(T_{p_2}\mathbb{P}^3) \), remember that the tangent bundle to any Grassmannian \( G = G(k, V) \) (rank \( V = r \)) is (see [7], Theorem 2.4, pg. 73)

\[
T_G = \text{Hom}_G(\mathcal{S}, \mathcal{Q}) = \mathcal{Q} \otimes \mathcal{S}^\vee,
\]

where

\[
\mathcal{S} \hookrightarrow (V = \mathbb{C}^r) \rightarrow \mathcal{Q}
\]

is the tautological sequence over \( G \); the fiber of \( \mathcal{Q}^\vee \subset V^\vee \) over a point in \( G \) corresponding to a \( k \)-linear subspace of \( V \) is the rank \( r-k \) space of linear forms spanned by the equations of this space. In particular, for \( G = \mathbb{P}^3 \), \( k = 1 \), \( r = 4 \), at the point \( p_2 = (0 : 0 : 1 : 0) \), given by the equations \( x_0 = x_1 = x_3 = 0 \), the fiber of \( \mathcal{Q} \) is spanned by the duals of these three equations; and the fiber of \( \mathcal{S}^\vee \) is spanned by \( \overline{x_2} := x_2 \mod \langle x_0, x_1, x_3 \rangle \). Therefore, using (5.8) the tangent space to \( \mathbb{P}^3 \) at the point \( p_2 \) can be written as

\[
T_{p_2}\mathbb{P}^3 = \langle x_0^\vee, x_1^\vee, x_3^\vee \rangle \otimes \langle x_2 \rangle = \langle x_0^\vee \otimes x_2, x_1^\vee \otimes x_2, x_3^\vee \otimes x_2 \rangle.
\]
The action induced on this tangent space is just

\[ t \circ (x_0^\vee \otimes x_2) = t^{-w_0} x_0^\vee \otimes t^{w_2} x_2 = t^{w_2-w_0} (x_0^\vee \otimes x_2) \]

\[ t \circ (x_1^\vee \otimes x_2) = t^{-w_1} x_1^\vee \otimes t^{w_2} x_2 = t^{w_2-w_1} (x_1^\vee \otimes x_2) \]

\[ t \circ (x_3^\vee \otimes x_2) = t^{-w_3} x_3^\vee \otimes t^{w_2} x_2 = t^{w_2-w_3} (x_3^\vee \otimes x_2) \]

where \( w_i \) is the weight of \( x_i \), \( i \in \{0, 1, 2, 3\} \) (here, \( w_0 = w_1 = 1 \), \( w_2 = 2 \) and \( w_3 = 3 \)). We will write

\[ T_{p_2} \mathbb{P}^3 = \frac{x_2}{x_0} + \frac{x_2}{x_1} + \frac{x_2}{x_3}. \]

In this notation, the \( T_{p_2} \mathbb{P}^3 \) is split into three line subbundles, and each one is associated to one weight. Using the expression (5.6), we find

\[ c_3^T(T_{p_2} \mathbb{P}^3) = (w_2 - w_0)(w_2 - w_1)(w_2 - w_3) = 1 \cdot 1 \cdot (-1) = -1. \]

Therefore, the contribution of the point \( p_2 \) is

\[ \frac{c_3^T(O(1)|_{p_2})^3}{c_3^T(T_{p_2} \mathbb{P}^3)} = \frac{8}{-1} = -8. \]  \hspace{1cm} (5.9)

\bullet Contribution over \( p_3 \)

The point \( p_3 = (0 : 0 : 0 : 1) \) lives inside the blowup center, the line \( \ell \).

The exceptional divisor of the blowup \( X \) of \( \mathbb{P}^3 \) along the line \( \ell \) is a \( \mathbb{P}^1 \)-bundle over the line \( \ell \), the projectivized normal bundle \( \mathbb{P}(\mathcal{N}_\ell|\mathbb{P}^3) \). So, over the point \( p_3 \) there is a \( \mathbb{P}^1 \)-fiber for which we expect two fixed points.

Since \( p_3 \) is the point of equations \( x_0 = x_1 = x_2 = 0 \), we have

\[ T_{p_3} \mathbb{P}^3 = \frac{x_3}{x_0} + \frac{x_3}{x_1} + \frac{x_3}{x_2}. \]  \hspace{1cm} (5.10)

The blowup center is \( \ell = \{(x_0 : 0 : 0 : x_3)\} \) (the variables here are only \( x_0 \) and \( x_3 \)). Over \( \ell \) the equation of \( p_3 \) is only \( x_0 = 0 \), and the tangent space to \( \ell \) at the point \( p_3 \) is

\[ T_{p_3} \ell = \frac{x_3}{x_0}. \]  \hspace{1cm} (5.11)

Next, beware of the fact that, although the normal bundle \( \mathcal{N}_\ell|\mathbb{P}^3 = \mathcal{O}_\ell(1) \oplus \mathcal{O}_\ell(1) \), these two summands are not isomorphic as \( \mathbb{C}^* \)-modules. The short exact sequence

\[ T \ell \rightarrow T\mathbb{P}^3|_\ell \rightarrow \mathcal{N}_\ell|\mathbb{P}^3 \]

shows us that

\[ (\mathcal{N}_\ell|\mathbb{P}^3)_{p_3} = \frac{x_3}{x_1} + \frac{x_3}{x_2} \]

\[ \frac{x_3}{w_3-w_1=2} + \frac{x_3}{w_3-w_2=1}. \]
Thus we have two isolated fixed points (since the weights are distinct). We will denote these points by

\[ q_1 = \left( p_3, \frac{x_3}{x_1} \right) \text{ and } q_2 = \left( p_3, \frac{x_3}{x_2} \right). \]

The fibers of \( \mathcal{O}(1) \) at these two points are the same, \( \mathcal{O}_{p_3}(1)_{p_3} = \langle x_3 \rangle \). Then, \( c_1^T(\mathcal{O}(1)|_{q_i}) = 3, \ i = 1, 2 \) in view of our choice of weights (5.4).

Now we look at the tangent space to \( X \) at these points, recalling \( N_{q_i|X} \simeq T_{q_i}X \).

For an inclusion of a smooth scheme \( Y \) into a smooth variety \( Z \), denote by \( \tilde{Z} \) the blowup of \( Z \) along \( Y \). The exceptional divisor can be identified with \( \mathbb{P}(N_{Y|Z}) \), and for a point \((y, s), y \in Y \text{ and } s \in \mathbb{P}(N_{Y|Z})\), the tangent space to \( \tilde{Z} \) can be split as

\[ T_{(y,s)} \tilde{Z} = T_y Y \oplus \mathcal{L}_s \oplus T_{[\mathcal{L}_s]} \mathbb{P}(N_{Y|Z}), \quad (5.12) \]

where \( \mathcal{L}_s \subset N_{Y|Z} \) is the line represented by the point \([\mathcal{L}_s] \in \mathbb{P}(T_y Z)\).

For the point \( q_1 \), (5.12) gives

\[ T_{q_1} X = T_{p_3} \ell \oplus \mathcal{L}_{x_3 \over x_1} \oplus T_{[\mathcal{L}_s]} \mathbb{P}(N_{p_3|\mathbb{P}^3}). \]

But \( N_{p_3|\mathbb{P}^3} = \frac{x_3}{x_1} + \frac{x_3}{x_2} \) and so

\[ T_{[\mathcal{L}_{x_3 \over x_1}]} \mathbb{P}(N_{p_3|\mathbb{P}^3}) = \begin{vmatrix} \frac{x_3}{x_2} \\ \frac{x_3}{x_1} \end{vmatrix} = \begin{vmatrix} x_1 \\ x_2 \end{vmatrix}. \]

This yields

\[ T_{q_1} X = \frac{x_3}{x_0} + \frac{x_3}{x_1} + \frac{x_1}{x_2}, \]

and

\[ c_3^T(T_{q_1} X) = (w_3 - w_0)(w_3 - w_1)(w_1 - w_2) = 2 \cdot 2 \cdot (-1) = -4. \]

With this, we have the contribution of the fixed point \( q_1 \):

\[ \frac{c_1^T(\mathcal{O}(1)|_{q_1})^3}{c_3^T(T_{q_1} X)} = \frac{27}{-4}. \quad (5.13) \]

In a similar way,

\[ T_{q_2} X = \frac{x_3}{x_0} + \frac{x_3}{x_2} + \frac{x_2}{x_1}, \]

so the contribution of \( q_2 \) is

\[ \frac{c_1^T(\mathcal{O}(1)|_{q_2})^3}{c_3^T(T_{q_2} X)} = \frac{27}{2}. \quad (5.14) \]
5.2. Three planes in $\mathbb{P}^3$

- Contribution over the fixed line $d$

The fixed component $d$ meets the blowup center $\ell$ in one point $p_0 = (1 : 0 : 0 : 0)$. Then its contribution to the sum (5.3) cannot be computed yet.

Like (5.10) and (5.11),

$$T_{p_0}\mathbb{P}^3 = \frac{x_0}{x_1} \frac{x_0}{x_2} \frac{x_0}{x_3}, \quad (5.15)$$

$$T_{p_0\ell} = \frac{x_0}{x_3}.$$ 

Hence,

$$N_{p_0\ell}\mathbb{P}^3 = \frac{x_0}{x_1} \frac{x_0}{x_2} \frac{x_0}{x_3} = 1 + \frac{x_0}{x_2},$$

where the notation 1 represents an eigenvector associated to the weight 0 (due to the weights $w_0 = w_1$). Therefore, over the point $p_0$ there are two isolated fixed points, namely $r_1 = (p_0, 1)$ and $r_2 = \left(p_0, \frac{x_0}{x_2}\right)$. It is over each of these points that we will compute the contributions to the sum (5.3).

The contribution of $r_2$ follows the same ideas like the points $q_1$ and $q_2$. Write (5.12)

$$T_{r_2X} = \frac{x_0}{x_3} \frac{x_0}{x_2} \frac{x_0}{x_3} \frac{x_0}{x_2};$$

so

$$c_3^T(T_{r_2X}) = (w_0 - w_3)(w_0 - w_2)(w_2 - w_0) = (-2) \cdot (-1) \cdot 1 = 2.$$

The fiber of $\mathcal{O}(1)|_{r_2}$ is spanned by $x_0$, so $c_1^T(\mathcal{O}(1)|_{r_2}) = 1$. Then,

$$\frac{c_1^T(\mathcal{O}(1)|_{r_2})^3}{c_3^T(T_{r_2X})} = \frac{1}{2}. \quad (5.16)$$

The last point is $r_1 = (p_0, 1)$. But this point lives in the strict transform $\tilde{d}$ of the line $d$, which constitutes a full component of fixed points and we will use this $\tilde{d}$ to compute the contribution in (5.3).

The bundle $\mathcal{O}(1)|_{\tilde{d}} = \mathcal{O}_{\tilde{d}}(1)$ has weight 1 since both $x_0$ and $x_1$ have this weight. But $\tilde{d}$ has dimension one, and $c_1(\mathcal{O}_{\tilde{d}}(1)) = h$. In view of (5.5),

$$c_1^T(\mathcal{O}_{\tilde{d}}(1)) = 1 + h.$$
The denominator in (5.3) is now $c_2^T(N_{d|X})$. In terms of weights, we can write over the point $r_1$
\[ T_{r_1}X = \frac{x_0}{x_3} + 1 + \frac{x_0}{x_2}. \]
From $T_{r_1}d = \frac{x_0}{x_1} = 1$, the normal space can be written as
\[ \mathcal{N}_{r_1,d|X} = \frac{x_0}{x_3} + \frac{x_0}{x_2}. \]
(5.17)

Notice that (5.17) gives a decomposition of $\mathcal{N}_{r_1,d|X}$ in two eigensubspaces, and we can compute $c_2^T(N_{d|X})$ like (5.6).

Remember that (5.15)
\[ T_{p_0}\mathbb{P}^3 = \frac{x_0}{x_1} + \frac{x_0}{x_2} + \frac{x_0}{x_3} \]
and
\[ T_{p_0}d = \frac{x_0}{x_1} = 1. \]
Then,
\[ \mathcal{N}_{p_0,d|X} = \frac{x_0}{x_3} + \frac{x_0}{x_2}. \]
(Note the same description as (5.17)). But this is the fiber of the normal bundle of a $\mathbb{P}^1$ in $\mathbb{P}^3$, which can be described as $\mathcal{N}_{d|\mathbb{P}^3} = \mathcal{O}_d(1) \oplus \mathcal{O}_d(1)$.

After the blowup, the normal bundle of $\tilde{d}$ in $X$ shall be modified, in accordance with the Proposition 4, page 133. It says that the subbundles related to the blowup center are unchanged, and the other subbundles shall be tensorized with $\mathcal{O}_{\tilde{d}}(-1)$. From $T_{p_0}\ell = \frac{x_0}{x_3}$ it follows that

- the subbundle $\mathcal{O}_d(1)$ related to the weight $\lambda_1 = \frac{x_0}{x_3}$ will not change after the blowup:
\[ \mathcal{N}_{\lambda_1,d|X} = \mathcal{O}_d(1). \]
- the subbundle $\mathcal{O}_d(1)$ related to the weight $\lambda_2 = \frac{x_0}{x_2}$ will change after the blowup:
\[ \mathcal{N}_{\lambda_2,d|X} = \mathcal{O}_d(1) \otimes \mathcal{O}_d(-1) = \mathcal{O}_d. \]

This will be denoted by
\[ \mathcal{N}_{r_1,d|X} = \begin{pmatrix} \frac{x_0}{x_3} & \frac{x_0}{x_2} \\ \mathcal{O}_d(1) & \mathcal{O}_d \end{pmatrix}. \]

Now we are able to use (5.6)
\[ c_2^T(\mathcal{N}_{r_1,d|X}) = (w_0 - w_3 + h)(w_0 - w_2) = 2 - h, \]
and so
\[ \int \frac{c_1^T(\mathcal{O}_d(1))^3}{c_2^T(\mathcal{N}_{\tilde{d}}|_X)} = \int \frac{(1 + h)^3}{2 - h} = \int \frac{(1 + h)^3(2 + h)}{4} \]
where in the last equality we multiplied both numerator and denominator by $2 + h$, and used that $h^2 = 0$ (of course, dim $\tilde{d} = 1$).

Expanding the numerator and taking the coefficient of $h$ we obtain the contribution
\[ \int \frac{c_1^T(\mathcal{O}_d(1))^3}{c_2^T(\mathcal{N}_{\tilde{d}}|_X)} = \frac{7}{4}. \] (5.18)

Putting together the contributions (5.9), (5.13), (5.14), (5.16) and (5.18) the number in (5.3) is
\[ -8 - \frac{27}{4} + \frac{27}{2} + \frac{1}{2} + \frac{7}{4} = 1. \]

5.3 NORMAL BUNDLE OF STRICT TRANSFORM

Now we will show the following:

**Proposition 4.** Let $\mathbb{P}^1 = \ell \subset \mathbb{P}^N$ and $Y \subset \mathbb{P}^N$ be a smooth $m$–dimensional subscheme with $\ell \cap Y = \{ p \}$, a single point. Let $X = \text{Bl}_Y \mathbb{P}^N$, $\tilde{\ell}$ the strict transform of $\ell$, and

\[ \mathcal{N}_{\ell|\mathbb{P}^N} = \mathcal{O}_\ell(a_1) \oplus \cdots \oplus \mathcal{O}_\ell(a_m) \oplus \mathcal{O}_\ell(a_{m+1}) \oplus \cdots \oplus \mathcal{O}_\ell(a_{N-1}). \]

If, for any $\mathbb{C}^*$–action that fix $\ell$ we have $Y$ invariant and the tangent space to $Y$ at $p$ is isomorphic as $\mathbb{C}^*$–module with the fibers

\[ T_p Y \simeq \mathcal{O}_\ell(a_1)|_p \oplus \cdots \oplus \mathcal{O}_\ell(a_m)|_p, \]

then we have the decomposition for $\mathcal{N}_{\tilde{\ell}|X}$,

\[ \mathcal{N}_{\tilde{\ell}|X} = \mathcal{O}_{\tilde{\ell}}(a_1) \oplus \cdots \oplus \mathcal{O}_{\tilde{\ell}}(a_m) \oplus \mathcal{O}_{\tilde{\ell}}(a_{m+1} - 1) \oplus \cdots \oplus \mathcal{O}_{\tilde{\ell}}(a_{N-1} - 1). \]

**Proof.** Let $\mathbb{P}^N = \{(x_0 : \ldots : x_N)\}$ and $\ell = \mathbb{P}^1 = \{(x_0 : x_1 : 0 : \ldots : 0)\}$, $p = (1 : 0 : \ldots : 0)$. We will compute $\int \mathbb{P}^N [\mathcal{O}_{\mathbb{P}^N}(1)]^N$ via Bott in two ways: directly in $\mathbb{P}^N$ and in the blowup along $Y$.

Fix $v \in \mathbb{Z}$, $v \geq 2$, and put an action on linear forms by
\[
\begin{align*}
x_0 & \mapsto tx_0 & x_2 & \mapsto t^v x_2 & x_i & \mapsto t^{v+i-2} x_i & (2 \leq i \leq N) \\
x_1 & \mapsto tx_1 & x_3 & \mapsto t^{v+1} x_3 & x_N & \mapsto t^{v+N-2} x_N
\end{align*}
\]

Thus, the weights of $x_0$ and $x_1$ are equal to 1 and the weight of $x_i$, $i \geq 2$, is $v + i - 2$. The line $\ell$ is a fixed component, and we can compute the contribution of this line now.
We have $c^T_1(\mathcal{O}_{P^N}(1)) = 1$ (weight of $x_0, x_1$) + $h = c_1(\mathcal{O}_\ell(1))$. And from
\[
\mathcal{N}_p, \ell|_{\mathbb{P}^N} = \frac{x_0}{\mathcal{O}(a_1)} + \frac{x_0}{\mathcal{O}(a_2)} + \cdots + \frac{x_0}{\mathcal{O}(a_{N-1})},
\]
\[
c^T_{N-1}(\mathcal{N}_{\ell|\mathbb{P}^N}) = [c_1(\mathcal{O}(a_1)) + 1 - v] \cdot [c_1(\mathcal{O}(a_2)) + 1 - v - 1] \cdots [c_1(\mathcal{O}(a_{N-1})) + 1 - v - N + 2]
\]
\[
c^T_{N-1}(\mathcal{N}_{\ell|\mathbb{P}^N}) = [a_1 h + 1 - v] \cdot [a_2 h - v] \cdots [a_{N-1} h - v - N + 3]
\]
\[
c^T_{N-1}(\mathcal{N}_{\ell|\mathbb{P}^N}) = Z + \left(\frac{a_1 Z}{1 - v} + \frac{a_2 Z}{-v} + \cdots + \frac{a_{N-1} Z}{-v - N + 3}\right) h
\]
\[
c^T_{N-1}(\mathcal{N}_{\ell|\mathbb{P}^N}) = Z \left(1 + \sum_{i=1}^{N-1} \frac{a_i}{2 - i - v} h\right),
\]
where
\[
Z = (1 - v)(-v)(-v - 1) \cdots (-v - N + 3) = (-1)^{N-1} \frac{(v + N - 3)!}{(v - 2)!}.
\]

The contribution of $\ell$ is
\[
\int_\ell \frac{c^T_1(\mathcal{O}_\ell(1))^N}{c^T_{N-1}(\mathcal{N}_{\ell|\mathbb{P}^N})} = \int_\ell \frac{1 + N h}{Z \cdot (1 + \sum a_i)} = \frac{1}{Z} \int_\ell (1 + N h)(1 - \sum_{i=1}^{N-1} \frac{a_i}{2 - i - v} h)
\]
\[
\int_\ell \frac{c^T_1(\mathcal{O}_\ell(1))^N}{c^T_{N-1}(\mathcal{N}_{\ell|\mathbb{P}^N})} = \frac{1}{Z} \left(N - \sum_{i=1}^{N-1} \frac{a_i}{2 - i - v}\right).
\]  
(5.19)

This contribution is the same if computed on the fixed points that arise over the point $p$ when we do the blowup along $Y$.

By the hypotheses of tangent space to $Y$ at $p$, this tangent space is ($1 \leq m \leq N - 2$)
\[
T_p Y = \frac{x_0}{x_2} + \frac{x_0}{x_3} + \cdots + \frac{x_0}{x_{m+1}}.
\]
So, $\mathcal{N}_p Y|_{\mathbb{P}^N} = 1 + \frac{x_0}{x_{m+2}} + \frac{x_0}{x_{m+3}} + \cdots + \frac{x_0}{x_N}$. There are $N - m - 1$ isolated fixed points, corresponding to $\frac{x_0}{x_i}$, and a point $\tilde{p} \in \ell$.

To get the contribution of $q_i := (p, \frac{x_0}{x_i})$, $m + 2 \leq i \leq N$, note that
\[
T_{q_i} X = \frac{x_0}{x_2} + \cdots + \frac{x_0}{x_{m+1}} + \text{omit} \frac{x_i}{x_i} + \text{omit} \frac{x_i}{x_{m+2}} + \cdots + \text{omit} \frac{x_i}{x_N}
\]
\[
c^T_N(T_{q_i} X) = (1 - v)(-v)(-v - 1) \cdots (-v - m + 2)(-1)(v + i - 3)^2(i - m - 2)(i - m - 3) \cdots (i - N)
\]
\[
c^T_N(T_{q_i} X) = (-1)^{N-1} \frac{(v + m - 2)!}{(v - 2)!} \cdot (v + i - 3)^2 \cdot \prod_{j=m+2}^{N} (j - i)
\]
Then, the contribution of the point \( q_i \) is

\[
\frac{(-1)^{N-1}(v - 2)!}{(v + m - 2)! \cdot (v + i - 3)^2 \cdot \prod_{j=m+2}^{N} (j - i)} \tag{5.20}
\]

Next, we compute the contribution of \( \tilde{\ell} \). Write

\[
\mathcal{N}_p \tilde{\ell},_X = \frac{x_0}{\mathcal{O}_{\ell}(b_1)} + \frac{x_0}{\mathcal{O}_{\ell}(b_2)} + \cdots + \frac{x_0}{\mathcal{O}_{\ell}(b_{N-1})},
\]

for unknowns \( b_i \). The computational aspects are the same as for \( \ell \), just changing \( a \) by \( b \), so the contribution of \( \tilde{\ell} \) is

\[
\frac{1}{Z} \left( N - \sum_{i=1}^{N-1} \frac{b_i}{2 - i - v} \right). \tag{5.21}
\]

The sum of contributions in (5.20) and (5.21) is equal to (5.19), and so we get the equation

\[
\frac{1}{Z} \left( N - \sum_{i=1}^{N-1} \frac{a_i}{2 - i - v} \right) = \frac{1}{Z} \left( N - \sum_{i=1}^{N-1} \frac{b_i}{2 - i - v} \right) + \sum_{i=m+2}^{N} \frac{(-1)^{N-1}(v - 2)!}{(v + m - 2)! (v + i - 3)^2 \prod_{j=m+2}^{N} (j - i)} \tag{5.22}
\]

\[
\downarrow \quad \text{multiply everything by } Z
\]

\[
\sum_{i=1}^{N-1} \frac{a_i}{2 - i - v} = \sum_{i=1}^{N-1} \frac{b_i}{2 - i - v} - \frac{(v + N - 3)!}{(v + m - 2)!} \sum_{i=m+2}^{N} \frac{1}{(v + i - 3)^2 \prod_{j=m+2}^{N} (j - i)}. \tag{5.22}
\]

Now, we can verify that the solutions

\[
b_1 = a_1, b_2 = a_2, \ldots, b_m = a_m, b_{m+1} = a_{m+1} - 1, \ldots, b_{N-1} = a_{N-1} - 1. \tag{5.23}
\]

holds for any \( v \in \mathbb{Z}, v \geq 2 \).

Setting the \( N - 1 \) values \( v = 2, v = 3, \ldots, v = N \) on equation (5.22) we obtain the linear system \( CB - CA = D \), where

\[
A = [a_1 \cdots a_{N-1}]^t, \quad B = [b_1 \cdots b_{N-1}]^t, \quad C = \begin{bmatrix}
1 & \frac{1}{2} & \cdots & \frac{1}{N-1} \\
\frac{1}{2} & \frac{1}{3} & \cdots & \frac{1}{N} \\
\vdots & \vdots & \ddots & \vdots \\
\frac{1}{N-1} & \frac{1}{N} & \cdots & \frac{1}{2N-3}
\end{bmatrix}_{(N-1) \times (N-1)}
\]

Since \( \det(C) \neq 0 \), the solution (5.23) is the unique solution for \( b's \) with respect to \( a's \). \( \square \)
Example 14. For \( N = 4 \) and \( m = 1 \) (i.e., blowup of \( \mathbb{P}^4 \) along a smooth curve), equation (5.22) reduces to
\[
\frac{a_1}{1-v} + \frac{a_2}{-v} + \frac{a_3}{-1-v} = \frac{b_1}{1-v} + \frac{b_2}{-v} + \frac{b_3}{-1-v} - \frac{2v+1}{v(v+1)}.
\]

It is a straightforward calculation the verification of the solution, for all \( v \in \mathbb{Z}, \ v \geq 2, \)
\[
b_1 = a_1, \quad b_2 = a_2 - 1, \quad b_3 = a_3 - 1. \quad (5.24)
\]

Moreover, setting values 2, 3 and 4 to \( v \) we obtain the linear system
\[
\begin{align*}
v = 2 & \quad \Rightarrow \quad 6a_1 + 3a_2 + 2a_3 = 6b_1 + 3b_2 + 2b_3 + 5 \\
v = 3 & \quad \Rightarrow \quad 6a_1 + 4a_2 + 3a_3 = 6b_1 + 4b_2 + 3b_3 + 7 \\
v = 4 & \quad \Rightarrow \quad 20a_1 + 15a_2 + 12a_3 = 20b_1 + 15b_2 + 12b_3 + 27
\end{align*}
\]
whose solutions are unique (5.24).

Next, we present scripts for *Macaulay2* to perform the calculations in the above proof. First, set values for \( N, m \) as you desire, provided that \( 2 \leq m \leq N - 2. \)

\[
\begin{align*}
N &= 4; \quad M = 1; \quad -- \quad 1 < M < N - 1 \\
\text{-- change these values if you want to.}
\end{align*}
\]

\[
\begin{align*}
R &= \text{QQ}[x_0..x_N,v,a_1..b_N]; \\
Rh &= R[h]/h^2;
\end{align*}
\]

\[
\begin{align*}
\text{-- setting the weights} \\
p01 &= \{x_0=>1,x_1=>1\}; \\
poth &= \text{apply}(N-1,i->x_0(i+1) => v+i); \\
pesos &= \text{flatten}(\text{append}(p01,poth));
\end{align*}
\]

\[
\begin{align*}
\text{-- tangent and normal spaces to } l \text{ and } Y (=d here) \\
TPN &= \text{apply}(N,i->x_0-x_(i+1)); \\
Tl &= x_0-x_1; \quad Nl = \text{delete}(Tl,TPN); \\
Td &= \text{apply}(M,i->x_0-x_(2+i)); \quad Nd = TPN-\text{set}(Td);
\end{align*}
\]

\[
\begin{align*}
\text{-- computing the contribution contl of line } l \\
cn &= \text{product}(\text{apply}(N-1,i->a_(i+1)*h+\text{sub}(Nl_i,pesos))'); \\
conj &= cn-2*(cn%h); \quad \text{den} = cn*conj; \\
num &= ((1+h)^N)*conj; \\
num &= num/h; \\
\text{den} &= \text{sub}(\text{den},R); \\
\text{num} &= \text{sub}(\text{num},R);
\end{align*}
\]
5.3. Normal bundle of strict transform

contl=num/den;

-- after the blowup

-- contributions of points \( x_i/x_0 \)
for i from 0 to N-M-1 do (  
eq=Nd_i;
if eq!\neq=x_0-x_1 then (  
Teq=delete(eq,Nd);
Teq=apply(N-M-1,j->Teq_j-eq);
Teq=append(Teq,eq);
Teq=flatten(append(Teq,Td));
Teq=apply(N,j->sub(Teq_j,pesos));
Te_i=product Teq;
);

-- the contribution contL of strict transform \( ^{\sim}l \)
lnL=product(apply(N-1,i->b_((1+i)*h+sub(Nl_i,pesos))));
conjL=cnL-2*(cnL%h);  denL=cnL*conjL;
numL=((1+h)^N)*conjL;
numL=numL//h;
denL=sub(denL,R);
numL=sub(numL,R);
contL=numL/denL;

-- sum of contributions
eq=0;
for i from 0 to N-M-1 do (  
if Nd_i!=x_0-x_1 then (  
eq=eq+(1/Te_i);
);

-- matching the contributions before and after the blowup
-- \( eq \) represents the obtained equation
\eq=eq+contL-contl;
\eq=numerator eq;

-- solutions of linear system and the equations like in exemple
I=ideal();
for i from 0 to N-2 do (  
eqt_i=sub(eq,v=>i+2);  
)
I=I+eqt_i;
print(i+2, eqt_i);
trim I

Remark 4. For $m = 0$, i.e., blowup of $X$ along a point, a similar result of Proposition 4 can be found in [10], Lemma 1.6, page 5.
