Abstract

Marine microalgae constitute natural sources of carotenoids used in a variety of drugs, and pharmaceutical, food and cosmetic applications. In this study, inducible effects of K$_2$HPO$_4$ on the accumulation of some apo carotenoids including chlorophyll-a and b, beta carotene, astaxanthin, lycopene and pheophytin were explored using a completely randomized design with five treatments and three replications. Cellular extracts were carried out with dimethyl sulfoxide solvent. A Duncan’s test was performed on data obtained through spectrophotometric absorption of studied metabolites. Our results showed a significant difference among the treatments. The metabolites content in cellular extracts at the stationary phase of algae were estimated at the highest level of 4.5 and 3.58 mg/g for chlorophyll-a, and beta carotene, respectively, in the fifth treatment level. Astaxanthin and lycopene were 1.505 and 2.84 mg/g, respectively, in the second treatment. There was no significant difference between the chlorophyll-b and pheophytin pigments when compared to the control.

Keywords: Apo carotenoids; Microalgae; Spirulina

Introduction

Ahmed et al. investigated apo carotenoids in cell extracts of 12 species of saltwater microalgae along shoreline and subtropical regions and showed that six carotenoids (xanithine, lutein, epoxide, zeaxanthin, and alpha- and beta-carotenes) were the major carotenoids in different microalgae species [1]. The large number of existing species of microalgae constitutes a unique reservoir of biodiversity, which supports potential commercial exploitations of many novel products besides vitamins, pigments and polyunsaturated fatty acids [2]. Also, microalgae species can be used as bio remediators; for example, both *Spirulina platensis* and *Chlorella vulgaris* proved to be efficient in terms of metal accumulation in two-week-long experiments [3]. With the exception of molybdenum, the bioaccumulation capacity of *Chlorella* exceeded that of *Spirulina*. Iron (789.7 ± 102.7 mg kg$^{-1}$) and zinc (378.1 ± 5.5 mg kg$^{-1}$) were accumulated to a large extent by *Chlorella vulgaris*, while the bioaccumulation ability of *Spirulina platensis* proved to be the most significant for iron (676.9 ± 27.6 mg kg$^{-1}$) and molybdenum (5.79 ± 1.1 mg kg$^{-1}$).

Apo carotenoids are bio-active compounds derived from carotenoids. These compounds are derived metabolically from the failure of the oxidative of C40 [4,5] (Figure 1). Given that there is a significant amount of carotenoids in microalgae, species with high carotenoid content are needed to be explored. This study aimed at the evaluation of di-potassium hydrogen phosphate (K$_2$HPO$_4$) effects on the accumulation of some secondary metabolites in *Spirulina* cysts at the stationary phase.

Materials and Methods

In this study, the modified Giulards solution with vitamin B-complex was used as a microalgae growth medium. The salinity of sea water used for culture medium was 12-13 grams per liter so as to be disinfected by 70% chlorine solution. Five levels of K$_2$HPO$_4$ were applied as desired treatments in suspension culture under a completely randomized design (CRD) (Table 1).

Metabolites were extracted using DMSO (dimethyl sulfoxide) solvent under 55 °C. After filtering of extracts from any solid materials, the ratio of absorption read in a suitable range of wavelength for Apo carotenoids included chlorophyll-a and b, b-carotene, astaxanthin, lycopene, and pheophytin. Statistical analysis was performed using GenStat 12.1, and Duncan’s test was used at 5% (P<0.05) significance level.

Carotenoid production appears to be one of the most successful case studies of blue biotechnology. Since the rising market demand for pigments from natural sources has promoted a large-scale cultivation of microalgae for synthesis of such compounds, significant decreases in production costs are expected in coming years. In the present research, microalgae are now urged—which would have a major impact upon development and optimization of this (and alternative) microalga-based technologies.
