Abstract

In this paper we prove long time existence for a large class of fully nonlinear, reversible and parity preserving Schrödinger equations on the one dimensional torus. We show that for any initial condition even in $x$, regular enough and of size $\varepsilon$ sufficiently small, the lifespan of the solution is of order $\varepsilon^{-N}$ for any $N \in \mathbb{N}$ if some non resonance conditions are fulfilled. After a paralinearization of the equation we perform several para-differential changes of variables which diagonalize the system up to a very regularizing term. Once achieved the diagonalization, we construct modified energies for the solution by means of Birkhoff normal forms techniques.

1 Introduction

This paper is devoted to get lower bounds for the lifespan of small solutions of the following fully nonlinear Schrödinger type equation
\[ i\partial_t u + \partial_{xx} u + P_{\bar{m}} u * u + f(u, u_x, u_{xx}) = 0, \quad u = u(x, t), \quad x \in \mathbb{T}, \tag{1.1} \]
where \( T := \mathbb{R}/2\pi \mathbb{Z} \), the nonlinearity \( f \) is a polynomial of degree \( q \geq 2 \) defined on \( \mathbb{C}^3 \) vanishing at order 2 near the origin of the form
\[ f(z_0, z_1, z_2) = \sum_{p=2}^{\bar{q}} \sum_{(\alpha, \beta) \in A_p} C_{\alpha, \beta}(z_0)\alpha_0(z_1)\beta_0(z_2)\alpha_1(z_1)\beta_1(z_2)\alpha_2(z_2), \quad C_{\alpha, \beta} \in \mathbb{C}, \tag{1.2} \]
where
\[ A_p := \{ (\alpha, \beta) := (\alpha_0, \beta_0, \alpha_1, \beta_1, \alpha_2, \beta_2) \in \mathbb{N}^6 \text{ s.t. } \sum_{i=0}^2 (\alpha_i + \beta_i) = p \}; \tag{1.3} \]
the potential \( P_{\bar{m}}(x) = (\sqrt{2\pi})^{-1} \sum_{j \in \mathbb{Z}} \hat{\rho}(j)e^{ijx} \) is a real function with real Fourier coefficients and the term \( P_{\bar{m}} u \) denotes the convolution between the potential \( P_{\bar{m}}(x) \) and \( u(x) = (\sqrt{2\pi})^{-1} \sum_{j \in \mathbb{Z}} \hat{u}(j)e^{ijx} \)
\[ P_{\bar{m}} u(x) = \int_{\mathbb{T}} P_{\bar{m}}(x - y)u(y)dy = \sum_{j \in \mathbb{Z}} \hat{\rho}(j)\hat{u}(j)e^{ijx}. \]

Concerning the convolution potential \( P_{\bar{m}}(x) \) we define its \( j \)-th Fourier coefficient as follows. Fix \( M > 0 \) and set
\[ \hat{\rho}(j) := \hat{\rho}_{\bar{m}}(j) = \sum_{k=1}^M \frac{m_k}{(j2k\pi)^{\bar{m}}}, \tag{1.4} \]
where \( \bar{m} = (m_1, \ldots, m_M) \) is a vector in \( \mathcal{O} := [-1/2, 1/2]^M \) and \( (j) = \sqrt{1 + |j|^2} \). We shall assume some extra structure on the polynomial nonlinearity \( f \). Setting \( z = \xi + i\eta \) in \( \mathbb{C} \) (with \( \xi \) and \( \eta \) in \( \mathbb{R} \)) we define the Wirtinger derivatives \( \partial_z = \frac{i}{2}(\partial_\xi - i\partial_\eta), \partial_{\bar{z}} = \frac{i}{2}(\partial_\xi + i\partial_\eta) \) and we assume the following

**Hypothesis 1.1.** The function \( f \) in (1.1) and in (1.2) satisfies the following:

1. parity-preserving: \( f(z_0, z_1, z_2) = f(-z_0, -z_1, z_2) \);
2. Schrödinger-type: \( (\partial_{\bar{z}} f)(z_0, z_1, z_2) \in \mathbb{R} \);
3. reversibility-preserving: \( f(z_0, z_1, z_2) = f(z_0, z_1, z_2) \),

for any \( (z_0, z_1, z_2) \) in \( \mathbb{C}^3 \).

We shall study equation (1.1) on the Sobolev space
\[ H^s := H^s(\mathbb{T}; \mathbb{C}) := \left\{ u(x) = \sum_{j \in \mathbb{Z}} \hat{u}(j)e^{ijx} : \|u\|_{H^s}^2 := \sum_{j \in \mathbb{Z}} |\hat{u}(j)|^2(2^s)^{2s} < +\infty \right\}, \tag{1.5} \]
with \( s \) to be chosen big enough.

The goal of this article is to show that solutions of (1.1) produced by initial data even in \( x \) of size \( \varepsilon \ll 1 \) are defined over a time interval of length \( c_N\varepsilon^{-N} \) for any \( N \) smaller than \( M \) and for a large set of parameters \( \bar{m} \) in \([-1/2, 1/2]^M \).

The main result of the paper is the following.
**Theorem 1.1 (Long time existence).** Fix $M \in \mathbb{N}$ and consider equation (1.1). Assume that $f$ satisfies Hypothesis (1.2). Then there is a zero Lebesgue measure set $N^c \subset O$ such that for any integer $0 \leq N \leq M$ and any $\tilde{m} \in O \setminus N^c$ there exists $s_0 \in \mathbb{R}$ such that for any $s \geq s_0$ there are constants $\rho_0 \in (0, 1)$, $c_{N} > 0$ and $C_{N} > 0$ such that the following holds true. For any $0 < r \leq r_0$ and any even function $u_0$ in the ball of radius $r$ of $H^s(\mathbb{T}; \mathbb{C})$, the equation (1.1) with initial datum $u_0$ has a unique solution, which is even in $x$, and is given by

$$u(t, x) \in C^0\left([-T_r, T_r]; H^s(\mathbb{T})\right), \quad \text{with} \quad T_r \geq C_N r^{-N}.$$ 

Moreover one has that

$$\sup_{t \in (-T_r, T_r)} \|u(t, \cdot)\|_{H^s} \leq C_N r.$$

**Comments on the hypotheses.** Since the Fourier coefficients in (1.4) decay as $\langle j \rangle^{-3}$ as $j$ goes to $\infty$, the potential $P_{\tilde{m}}(x)$ is a function in $H^s$ for any $s < 5/2$ (in particular it is of class $C^1(\mathbb{T}; \mathbb{R})$). In [15] (see Theorem 1.2 therein) it is shown that, if $P_{\tilde{m}}(x)$ is a function of class $C^1$ with real Fourier coefficients, under the Hypothesis (1.1) (in such a theorem the reversibility structure of the nonlinearity in item 3 of Hyp. 1.1 is not needed) for any even function $u_0$ in the Sobolev space $H^5$ the Cauchy problem associated to the equation (1.1) with initial datum $u_0$ is locally in time well posed in $H^5(\mathbb{T})$ if $s$ is big enough and the Sobolev norm of $u_0$ is small enough.

In more natural problems the convolution potential is replaced by a multiplicative one. Since the convolution is a diagonal operator on the Fourier space it is easier the study the resonances of the equation. The particular structure of the Fourier coefficients of the convolution potential in (1.4) is inspired to the Dirichlet spectrum of $-\partial_{xx} + V(x)$.

Indeed (see Section 5.3 of [6] and the references therein) for any $\rho \in \mathbb{N}^+$ it admits an asymptotic expansion of the form

$$\lambda_j \sim j^2 + c_0(V) + c_1(V) j^{-2} + \ldots + c_\rho(V) j^{-2-2\rho},$$

where $c_k(V)$, for $k \in \mathbb{N}^+$, are certain multilinear functions of the Fourier coefficients of $V(x)$.

Item 1 in Hypothesis (1.1) implies that if $u(x)$ is even in $x$ then so is the function $f(u, u_x, u_{xx})$. Since the Fourier coefficients of $P_{\tilde{m}}(x)$ in (1.4) are even in $j$, the flow of the equation (1.1) leaves invariant the space of even functions. We assume item 2 in order to avoid the presence of parabolic terms in the nonlinearity, so that the equation (1.1) is a Schrödinger type one.

Item 3, together with the fact that the convolution potential $P_{\tilde{m}}(x)$ is real valued, makes the equation (1.1) reversible with respect to the involution

$$S : u(x) \mapsto \overline{u}(x), \quad (1.6)$$

in the sense that it has the form $\partial_t u = X(u)$ with $S \circ X = -X \circ S$. Since $f$ is assumed to be a polynomial function as in (1.2), item 3 of the hypothesis is equivalent to require that the coefficients $C_{\alpha, \beta}$ are real. One of the important dynamical consequences of the reversible structure of the equation is that if $u(t, x)$ is a solution of the equation with initial condition $u_0$ then $S(u(-t, x)) = \overline{u}(-t, x)$ solves the same equation with initial condition $\overline{u}_0$. This symmetry of the equation is essential for our scope and will play a fundamental role in the paper.

We have chosen to study a polynomial nonlinearity in order to avoid extra technicalities.

**Birkhoff Normal Form approach and some related literature.** Equation (1.1) belongs to the following general class of problems:

$$u_t = Lu + f(u), \quad (1.7)$$

where $L$ is an unbounded linear operator with discrete spectrum made of purely imaginary eigenvalues $\lambda_j \in i\mathbb{R}$, $f(u)$ is a non linear function and $u$ belongs to some Sobolev space. In the last years several authors investigated whether there is a stable behavior of solutions of small amplitude. By stable solution we mean that its Sobolev norms $\| \cdot \|_{H^s}$ remain bounded for long times.
This problem is non trivial in the case that the system \( (\text{KG}) \) does not enjoy conservation laws able to control Sobolev norms with high index \( s \). In such a case the only general fruitful approach seems to be the Birkhoff Normal Form (BNF) procedure. Below we briefly describe the basic ideas and the difficulties that arise in implementing such a procedure.

According to the local existence theory (at a sufficiently large order of regularity), presuming that it is the case, assuming that the nonlinearity \( f(u) \) vanishes quadratically at the origin, we deduce that if the size of the initial datum is \( \varepsilon \ll 1 \) then the corresponding solution may be extended up to a time of magnitude \( 1/\varepsilon \). The basic idea to prove a longer time of existence using a BNF approach is to reduce the size of the nonlinearity near the origin. In other words one looks for a change of coordinates in order to cancel out, from the nonlinearity, when possible, all the monomials of homogeneity less than \( N \) for some \( N \geq 2 \). In this way, in the new coordinates system, one has that \( f(u) \sim u^N \), and hence the lifespan would be of order \( \varepsilon^{-N+1} \). In performing such changes of coordinates non trivial problems arise:

1. **Small divisors** appear: the small divisors involves linear combinations of the eigenvalues \( \lambda_j, j \in \mathbb{N} \), of the linear operator \( L \) in \( (\text{KG}) \) of the form

   \[
   \lambda_{j_1} + \cdots + \lambda_{j_k} - \lambda_{j_{k+1}} - \cdots - \lambda_{j_N}
   \]

   for \( 0 \leq \ell \leq N \) with \( N \in \mathbb{N} \). One must impose *non-resonance* conditions, i.e. lower bounds on the quantity in \( (1.8) \) whether possible.

2. it is not possible to cancel out all the monomials of low degree of homogeneity from the nonlinearity but, starting form \( (\text{KG}) \), one obtains a system of the form

   \[
   u_t = Lu + Z(u) + P(u),
   \]

   where \( P(u) \sim u^N \) and the non linear term \( Z \) (which is usually called “resonant normal form”) commutes with the operator \( L \). Under some algebraic assumptions on the nonlinearity \( f(u) \) the dynamics generated by the resonant term \( Z(u) \) is stable. The most studied models in literature are the *Hamiltonian* and the *reversible* PDEs.

Without trying to be exhaustive we quote below some relevant contributions to this subject.

Concerning semi-linear PDEs (i.e. when the non linearity \( f(u) \) does not contain derivatives of \( u \) ) the long time existence problem has been extensively studied in literature in the case of Hamiltonian PDEs. We quote for instance the papers by Bambusi [4], Bambusi-Grebert [6] and by Delort-Szeftel [12, 13]. Regarding BNF theory for reversible PDEs we mention [15] by Grebert-Faou. The paper [5] regards long time existence of solutions for the semi-linear Klein-Gordon equation on Zoll manifolds, here are collected all the ideas of the preceding (and aforementioned) literature.

In the case that the non linearity \( f \) contains derivatives of \( u \) if one would follow the strategy used in the semilinear case, one would end up with only formal results in the following sense: the change of coordinates would be unbounded because one faces the well known problem of *loss of derivatives*. We remark that this loss of derivatives is originated by the presence of derivatives in the nonlinearity and it is not a small divisors problem. In this direction we quote the early paper concerning the *pure-gravity water waves* (WW) equation by Craig-Worfolk [10].

In the case that \( f(u) \) in \( (\text{KG}) \) contains derivatives of \( u \) of order strictly less than the order of \( L \), we quote the paper by Yuan-Zhang [19]. They studied an equation of the form \( (\text{WW}) \) with the particular nonlinearity \( f(u,u_x) = -(i/2\pi)(|u|^2 u)_x \) exploiting its Hamiltonian structure.

The first rigorous long time existence result concerning quasi-linear equations, i.e. when \( f \) contains derivatives of \( u \) of the same order of \( L \) has been obtained by Delort. In [11] the author studied quasi-linear Hamiltonian perturbations of the *Klein-Gordon* (KG) equation on the circle, and in [14] the same equation on higher dimensional spheres. Here the author introduces some classes of multilinear maps which defines *para-differential* operators (in the case of (KG)
operators of order 1) enjoying a *symbolic* calculus. We remark that in such papers the author deeply use the fact that the (KG) has a linear *dispersion law* (i.e. the operator $L$ in this case has order 1).

A new different approach in the case of *super-linear* dispersion law (i.e. $L > 1$) has been proposed by Berti-Delort in [7] for the *capillary water waves* equation. The starting point is to rewrite the equation as a *para-differential* system which involves a *para-differential* term and a smoothing remainder. Hence the BNF procedure is divided into two steps:

1. Instead of reducing directly the size of the non linearity (as done in [11] for (KG) or formally in [9] and [10] for the (WW)) the authors perform some para-differential reductions in order to conjugate the para-differential term to an other one which is diagonal with constant coefficients in $x$ up to a remainder which is a very regularizing term (i.e. maps $H^s$ to $H^{s+ho}$ with $\rho \gg 0$). In this procedure it is fundamental that the symbols of positive order are purely imaginary, in such a way that the associated para-differential operator is skew self-adjoint. This condition is ensured by some algebraic structure of the equation. A related regularization procedure of the unbounded terms of the equations has been previously developed in order to study the linearized equation associated to a quasi-linear system in the context of a Nash-Moser iterative scheme (see for instance [1, 8, 2, 3, 17, 18]).

2. The second part of the procedure consists in two sub-steps. In the first one a BNF procedure is used in order to reduce the size of the paradifferential term. The loss of derivatives appearing in the BNF procedure affects only the coefficients of the equations which are low frequencies thanks to the paradifferential structure; the authors may afford to loose a large number of derivatives on these coefficients since they are working with very smooth functions. Concerning the reduction in size of the smoothing remainder they construct some modified energies by means of, again, a BNF-type procedure. The loss of derivatives due to the small divisors, in this case, is compensated by the fact that the remainder is a very smoothing operator.

For more details on this strategy we refer the reader to the introduction of [7].

We mention that in [18], [17] it has been shown that a large class of *fully non linear* Schrödinger type equations admits quasi-periodic in time, and hence globally defined and stable, small amplitude solutions. Hence it would be interesting to study whether other stability phenomena appear.

The goal of this paper is to extend the BNF theory to a class of *fully non linear* Schrödinger equations by adapting the ideas of [7].

**Plan of the paper.** First of all it is convenient to work on product spaces and consider instead of (1.1) the so called *vector NLS*. We need some further notation. We define the following Sobolev spaces

$$H^s := H^s(\mathbb{T}, \mathbb{C}^2) := (H^s \times H^s) \cap \mathcal{G},$$

$$\mathcal{G} := \{(u^+, u^-) \in L^2(\mathbb{T}; \mathbb{C}) \times L^2(\mathbb{T}; \mathbb{C}) : u^+ = u^-\}.$$  \hspace{1cm} (1.9)

endowed with the product topology. We set $H^\infty := \cap_{s \in \mathbb{R}} H^s$. On $H^0$ we define the scalar product

$$(U, V)_{H^0} := \int_\mathbb{T} U \cdot \nabla V dx.$$ \hspace{1cm} (1.10)

We introduce also the following subspace of even functions of $x$ in $H^s$:

$$H^s_e := H^s_e(\mathbb{T}, \mathbb{C}^2) := (H^s \times H^s) \cap H^0,$$

$$H^s_c := H^s_c(\mathbb{T}, \mathbb{C}) := \{ u \in H^s : u(x) = u(-x) \}.$$ \hspace{1cm} (1.11)

We define the operator $\lambda$ as $\lambda[u] := \partial_{xx} u + P_m(x) * u$. One has that

$$\lambda[e^{ijx}] := \lambda_j e^{ijx}, \quad \lambda_j := (ij)^2 + \hat{p}(j), \quad j \in \mathbb{Z},$$ \hspace{1cm} (1.12)
As first step in subsections 4.1, 4.2 we perform several changes of coordinates which diagonalize the matrix symbols and operators which admit multilinear expansions. We remark that we cannot use directly the paralinearization performed in Section 4. We conjugate this matrix to another one whose symbols are constant in space, of the symbol $a$.

With this notation equation (1.1) is equivalent to the system

$$
\hat{U} := iE \left[ A \hat{U} + \left( \frac{f(u, u_x, u_{xx})}{f(u, u_x, u_{xx})} \right) \right], \quad \hat{U} = (u, \bar{u}) \in H^s.
$$

From now on we will study the system (1.15) instead of equation (1.1).

We describe here the ideas of the proof of Theorem 4.1. In Section 2 we define the classes of operators and of symbols we need and we develop some composition theorems for classes of para-differential and smoothing operators. Such classes of operators have been introduced and widely studied in [7].

The first step is to rewrite the system (1.15) as a para-differential system of the form (3.1) with classes of operators have been introduced and widely studied in [7]. This is the content of Theorem 3.1 in Section 3. Let us describe briefly the structure of the system obtained in Theorem 3.1.

Consider a symbol $a(x, \xi)$ having finite regularity in $x$. Let $\chi$ be a $C_0^\infty$ cut-off function with sufficiently small support and equal to 1 close to 0, then we set $a_\chi(x, \xi) = \mathcal{F}_x^{-1}(a(x, \xi)\chi(\xi))$. In other words the new symbol $a_\chi(x, \xi)$ is a localization in the Fourier space, and therefore a regularization in the physical space, of the symbol $a(x, \xi)$. Then we can define the Bony-Weyl quantization of the symbol $a$ as follows

$$
\text{Op}^{BW}(a(x, \xi)) \varphi = \frac{1}{2\pi} \int e^{i(x-y)\xi} a_\chi \left( \frac{x+y}{2}, \xi \right) \varphi(y) dy d\xi.
$$

Theorem 3.1 ensures that the original system is equivalent to the following para-differential one

$$
\partial_t U = iE(A U + \text{Op}^{BW}(A U; x, \xi)U + R(U)U)
$$

where $R(U)$ is a $2 \times 2$ matrix of smoothing remainder, $A(U; x, \xi)$ is a $2 \times 2$ matrix of symbol with the following properties:

- the map $(x, \xi) \mapsto A(U; x, \xi)$ depends in a non linear way on the function $U$ solution of (1.15);
- for any $N > 1$ the matrix of symbols $A(U; x, \xi)$ admits an expansion in homogeneous matrices of symbols up to a non homogeneous one of size $O(||U||_N^N)$;
- the operator $\text{Op}^{BW}(A(U; x, \xi))$ maps $H^s$ in $H^{s-2}$ for any $s$, provided that $U$ belongs to $H^{s_0}$ for $s_0$ large enough;
- $R(U)$ maps $H^s$ in $H^{s+\rho}$ for $s$ large enough and $\rho \sim s$.

We remark that we cannot use directly the paralinearization performed in Section 4 of [10] since we need to adapt it to symbols and operators which admit multilinear expansions.

As first step in subsections 4.1, 4.2 we perform several changes of coordinates which diagonalize the matrix $A(U; x, \xi)$. In this way the new system admits $L^2$-energy estimates. Since the non zero terms of the new diagonal matrix of symbols depends on $x$, this system does not admit $H^s$-energy estimates. Therefore subsections 4.3, 4.4, 4.5 are devoted to conjugate this matrix to another one whose symbols are constant in $x$. All these results are collected in Theorem 4.1 where we exhibit a nonlinear map $\Phi(U)U$ with the following properties:

(a) for any fixed $U$ in $H^{s_0}$, $s_0$ large enough, the map $\Phi(U)\cdot$ is a bounded linear map form $H^s$ to $H^s$ for any $s \geq 0$;
(b) set $V := \Phi(U)$, then one has $\|V\|_{H^s} \sim \|U\|_{H^s}$;
(c) the function $U$ solves (1.16) if and only if $V = \Phi(U)$ solves a system of the form (see (4.2))

$$\partial_t V = iE(AV + Op^{BW}(L(U; \xi)))V + Q(U),$$

for some diagonal and constant coefficients in $x$ matrix of symbol $L(U; \xi)$ and where $Q(U)$ is a $\rho$-smoothing remainder for some $\rho$ large.

The function $V$ solving (1.17) satisfies

$$\partial_t \|V(t)\|_{H^s}^2 \leq C\|U(t)\|_{H^{\rho_0}} \|V(t)\|_{H^s}^2,$$

therefore, as a consequence of Theorem 4.1, we have obtained

$$\|U(t)\|_{H^s}^2 \leq C\|U(0)\|_{H^{\rho_0}}^2 + C\int_0^t \|U(\tau)\|_{H^{\rho_0}} \|U(\tau)\|_{H^s}^2 d\tau, \quad s \geq s_0 \gg 1.$$  (1.18)

The type of changes of coordinates we use in Section 4 are inspired to those used in Section 3 in [16]. There are two key differences between this paper and the procedure followed in [16]. In the quoted paper we are only interested in giving some energy estimates on the solution in order to prove a local existence result. Here the situation is more complicated and we need further information in order to obtain a much longer time of existence. First of all in Theorem 4.1 we take into account that our operators and symbols admit multilinear expansions. This justify our definition of operators and symbols in Definitions 2.3 and 2.20. On the contrary in [16] we use classes more similar to the non homogeneous classes defined in Definitions 2.2 and 2.16. The second fundamental difference is that the final system in (4.2) is diagonal, constant coefficients in $x \in \mathbb{T}$, up to terms which are $\rho$-smoothing operators with $\rho$ arbitrary large. We remark that in [16] we only need bounded remainders.

In Section 5 we give the proof of Theorem 1.1. Notice that the r.h.s. in (1.18) is linear in $\|U(t)\|_{H^{\rho_0}}$ since both the matrix of symbols $L(U; \xi)$ and the matrix of operators $Q(U)$ are $O(\|U\|_{H^{\rho_0}})$. The aim of Sec. 5 is to prove an estimate of the form

$$\|U(t)\|_{H^s}^2 \leq C\|U(0)\|_{H^{\rho_0}}^2 + C\int_0^t \|U(\tau)\|_{H^{\rho_0}}^N \|U(\tau)\|_{H^s}^2 d\tau, \quad s \geq s_0 \gg 1, \quad N > 2.$$  (1.19)

After the reduction performed in Theorem 4.1, we have that the system (1.17) is very similar to a semi-linear one. Therefore we construct modified energies to prove the bound (1.19). In such construction we exploit the reversibility and parity preserving structures in order to prove that the resonant terms do not contribute to the energy estimates.

As explained before in the introduction we shall face the problems described in items (i)-(iii). We deal with the first issue in subsection 5.1 where we show that the $\lambda_j$ (defined in (1.12)) satisfy some non resonance conditions. This is the content of Proposition 5.5

Acknowledgements

We warmly thanks Prof. Massimiliano Berti for suggesting us this problem.

2 Para-differential calculus

In this Section we develop a para-differential calculus following the ideas (and notation) in [7]. We shall define several classes of symbols and operators that depend on some extra function $U$ (which in the application will be a solution of (1.15)). The main difference between our classes and those in [7] depends only on the extra function $U$: in their case
it stands for a zero-mean solution of the capillary water waves, while in our case it is a solution of the Schrödinger equation and it may have non zero mean.

We introduce some notation. If $K \in \mathbb{N}, I$ is an interval of $\mathbb{R}$ containing the origin and $s \in \mathbb{R}^+$ we denote by $C^K_s(I, H^s(\mathbb{T}, \mathbb{C}^2))$ (respectively $C^K(I, H^s(\mathbb{T}, \mathbb{C}^2))$), the space of continuous functions $U$ of $t \in I$ with values in $H^s(\mathbb{T}, \mathbb{C}^2)$ (resp. $H^s(\mathbb{T}, \mathbb{C})$), which are $K$-times differentiable and such that the $k$-th derivative is continuous with values in $H^{s-2k}(\mathbb{T}, \mathbb{C}^2)$ (resp. $H^{s-2k}(\mathbb{T}, \mathbb{C})$) for any $0 \leq k \leq K$. We endow the space $C^K_s(I, H^s(\mathbb{T}, \mathbb{C}^2))$ (resp. $C^K_s(I, H^s(\mathbb{T}, \mathbb{C}))$) with the norm

$$
\sup_{t \in I} \|U(t, \cdot)\|_{K,s}, \quad \text{where} \quad \|U(t, \cdot)\|_{K,s} := \sum_{k=0}^{K} \|\partial^k_t U(t, \cdot)\|_{H^{s-2k}}. \tag{2.1}
$$

We denote by $C^K_{sR}(I, H^s(\mathbb{T}, \mathbb{C}^2))$, sometimes with $C^K_{sR}(I; \mathbb{H})$, the subspace of $C^K_s(I, H^s(\mathbb{T}, \mathbb{C}^2))$ made of the functions of $t$ with values in $\mathbb{H}^s(\mathbb{T}, \mathbb{C}^2)$ (see (1.9)). Recalling (1.11) we shall denote $C^K_s(I; H^s(\mathbb{T}, \mathbb{C}^2))$ (resp. $C^K_s(I; H^s(\mathbb{T}, \mathbb{C}))$) the subspace of $C^K_s(I, H^s(\mathbb{T}, \mathbb{C}^2))$ (resp. $C^K_s(I, H^s(\mathbb{T}, \mathbb{C}))$) made of the functions of $t$ with values in $H^s(\mathbb{T}, \mathbb{C}^2)$ (resp. $H^s(\mathbb{T}, \mathbb{C})$). Analogously $C^K_{sR}(I, H^s(\mathbb{T}, \mathbb{C}^2))$ denotes the subspace of $C^K_s(I; H^s(\mathbb{T}, \mathbb{C}^2))$ made of those functions which are even in $x$. Moreover if $r \in \mathbb{R}^+$ we set

$$
B^K_s(I, r) := \left\{ U \in C^K_s(I, H^s(\mathbb{T}, \mathbb{C}^2)) : \sup_{t \in I} \|U(t, \cdot)\|_{K,s} < r \right\}. \tag{2.2}
$$

For $n \in \mathbb{N}^+$ we denote by $\Pi_n$ the orthogonal projector from $L^2(\mathbb{T}, \mathbb{C}^2)$ (or $L^2(\mathbb{T}, \mathbb{C})$) to the subspace spanned by $\{e^{inx}, e^{-inx}\}$ i.e.

$$
(\Pi_n u)(x) = \hat{u}(n) \frac{e^{inx}}{\sqrt{2\pi}} + \hat{u}(-n) \frac{e^{-inx}}{\sqrt{2\pi}}, \tag{2.3}
$$

while in the case $n = 0$ we define the mean

$$
\Pi_0 u = \frac{1}{\sqrt{2\pi}} \hat{u}(0) = \frac{1}{2\pi} \int_T u(x) dx.
$$

If $\mathcal{U} = (U_1, \ldots, U_p)$ is a $p$-tuple of functions, $\bar{n} = (n_1, \ldots, n_p) \in \mathbb{N}^p$, we set

$$
\Pi_\bar{n} \mathcal{U} := (\Pi_{n_1} U_1, \ldots, \Pi_{n_p} U_p). \tag{2.4}
$$

For a family $(n_1, \ldots, n_{p+1}) \in \mathbb{N}^{p+1}$ we denote by

$$
\max_2(\langle n_1 \rangle, \ldots, \langle n_{p+1} \rangle),
$$

the second largest among the numbers $\langle n_1 \rangle, \ldots, \langle n_{p+1} \rangle$.

### 2.1 Spaces of Smoothing operators

The following is the definition of a class of multilinear smoothing operators.

**Definition 2.1 $(p-$ homogeneous smoothing operator).** Let $p \in \mathbb{N}, \rho \in \mathbb{R}$ with $\rho \geq 0$. We denote by $\tilde{\mathcal{R}}^{-\rho}$ the space of $(p+1)$-linear maps from the space $(C^\infty(\mathbb{T}, \mathbb{C}^2))^p \times C^\infty(\mathbb{T}, \mathbb{C})$ to the space $C^\infty(\mathbb{T}, \mathbb{C})$ symmetric in $(U_1, \ldots, U_p)$, of the form

$$
(U_1, \ldots, U_{p+1}) \mapsto R(U_1, \ldots, U_p)U_{p+1}, \tag{2.5}
$$

that satisfy the following. There is $\mu \geq 0, C > 0$ such that

$$
\|\Pi_0 R(\Pi_\bar{n} \mathcal{U}) \Pi_{n_{p+1}} U_{p+1}\|_{L^2} \leq C \max_2(\langle n_1 \rangle, \ldots, \langle n_{p+1} \rangle)^{\rho+\mu} \prod_{j=1}^{p+1} \|\Pi_{n_j} U_j\|_{L^2}, \tag{2.6}
$$

where
for any \( U = (U_1, \ldots, U_p) \in (C^\infty(T; C^2))^p \), any \( U_{p+1} \in C^\infty(T; C) \), any \( \vec{n} = (n_1, \ldots, n_p) \in \mathbb{N}^p \), any \( n_0, n_{p+1} \in \mathbb{N} \). Moreover, if

\[
\Pi_{n_0} R(\Pi_{n_1} U_1, \ldots, \Pi_{n_p} U_p) \Pi_{n_{p+1}} U_{p+1} \neq 0,
\]

then there is a choice of signs \( \sigma_0, \ldots, \sigma_{p+1} \in \{-1, 1\} \) such that \( \sum_{j=0}^{p+1} \sigma_j n_j = 0 \).

We shall need also a class of non-homogeneous smoothing operators.

**Definition 2.2 (Non-homogeneous smoothing operators).** Let \( K' \leq K \in \mathbb{N} \), \( N \in \mathbb{N} \) with \( N \geq 1 \), \( \rho \in \mathbb{R} \) with \( \rho \geq 0 \) and \( r > 0 \). We define the class of remainders \( R_{K,K',N}[r] \) as the space of maps \( (V, u) \mapsto R(V)u \) defined on \( B_{s_0}^K(I, r) \times C^r_{2}(I, H^{s_0}(T, C)) \), which are linear in the variable \( u \) and such that the following holds true. For any \( s \geq s_0 \) there exist a constant \( C > 0 \) and \( r(s) \in [0, r[ \) such that for any \( V \in B_{s_0}^K(I, r) \cap C^r_{s}(I, H^{s_0}(T, C)) \), any \( u \in C^r_{s}(I, H^{s_0}(T, C)) \), any \( 0 \leq k \leq K - K' \) and any \( t \in I \) the following estimate holds true

\[
\| \partial_t^k (R(V)u)(t, \cdot) \|_{H^{r-k+s_0}r,N} \leq \sum_{k'+k'' = k} C \left[ \| u \|_{k', r,s_0} \| V \|_{k''+K', s_0}^{N} + \| u \|_{k', r,s_0} \| V \|_{k'''+K', s_0}^{N-1} \| V \|_{k'''+K', s_0} \| V \|_{k'''+K', s_0} \| V \|_{k'''+K', s_0} \right].
\]

We will often use the following general class.

**Definition 2.3 (Smoothing operator).** Let \( p, N \in \mathbb{N} \), with \( p \leq N \), \( N \geq 1 \), \( K, K' \in \mathbb{N} \) with \( K \leq K' \leq K \) and \( \rho \in \mathbb{R} \), \( \rho \geq 0 \). We denote by \( \Sigma R_{K,K',p}[r,N] \) the space of maps \( (V, t, u) \mapsto R(V, t)u \) that may be written as

\[
R(V; t)u = \sum_{q=p}^{N-1} R_q(V, \ldots, V) u + R_N(V; t)u,
\]

for some \( R_q \in \overline{R}_q^\rho \), \( q = p, \ldots, N - 1 \) and \( R_N \) belongs to \( R_{K,K',N}[r] \).

**Remark 2.4.** Let \( R_1(U) \) be a smoothing operator in \( \Sigma R_{K,K',p_1}[r,N] \) and \( R_2(U) \) in \( \Sigma R_{K,K',p_2}[r,N] \), then the operator \( R_1(U) \circ R_2(U)[\cdot] \) belongs to \( \Sigma R_{K,K',p_1+p_2}[r,N] \), where \( p = \min(p_1, p_2) \).

The following is a subclass of the previous class made of those operators which are autonomous, i.e. they depend on the variable \( t \) only through the function \( U \).

**Definition 2.5 (Autonomous smoothing operator).** We define, according to the notation of Definition 2.2, the class of autonomous non-homogeneous smoothing operator \( R_{K,0,N}[r, \text{aut}] \) as the subspace of \( R_{K,0,N}[r] \) made of those maps \( (U, V) \mapsto R(U)V \) satisfying estimates \( \Sigma \) with \( K' = 0 \), the time dependence being only through \( U = U(t) \). In the same way, we denote by \( \Sigma R_{K,0,p}[r,N, \text{aut}] \) the space of maps \( (U, V) \mapsto R(U, V) \) of the form \( \Sigma \) with \( K' = 0 \) and where the last term belongs to \( R_{K,0,N}[r] \).

**Remark 2.6.** We remark that if \( R \) in \( \overline{R}_p^\rho \), \( p \geq N \), then \( (V, U) \mapsto R(V, \ldots, V) U \) is in \( \overline{R}_p^\rho_{K,0,N}[r, \text{aut}] \). This inclusion follows by the multi-linearity of \( \overline{R} \) in each argument, and by estimate 2.6. For further details we refer to the remark after Definition 2.2.3 in [7].

### 2.2 Spaces of Maps

In the following, sometimes, we shall treat operators without having to keep track of the number of lost derivatives in a very precise way. We introduce some further classes.
Definition 2.7 ($p$-homogeneous maps). Let $p \in \mathbb{N}$, $m \in \mathbb{R}$ with $m \geq 0$. We denote by $\mathcal{M}_p^m$ the space of $(p + 1)$-linear maps from the space $(C^\infty(T; \mathbb{C}^2))^p \times C^\infty(T; \mathbb{C})$ to the space $C^\infty(T; \mathbb{C})$ symmetric in $(U_1, \ldots, U_p)$, of the form

$$(U_1, \ldots, U_{p+1}) \rightarrow M(U_1, \ldots, U_p)U_{p+1}, \quad (2.10)$$

that satisfy the following. There is $\mu \geq 0$, $C > 0$, and for any $U = (U_1, \ldots, U_p) \in (C^\infty(T; \mathbb{C}^2))^p$, any $U_{p+1} \in C^\infty(T; \mathbb{C})$, any $n = (n_1, \ldots, n_p) \in \mathbb{N}^p$, any $n_0, n_{p+1} \in \mathbb{N}$

$$\|\Pi_{n_0} M(\Pi_0 U)\Pi_{n_{p+1}} U_{p+1}\|_{L^2} \leq C(\langle n_0 \rangle + \langle n_1 \rangle + \ldots + \langle n_{p+1} \rangle)^m \prod_{j=1}^{p+1} \|\Pi_{n_j} U_j\|_{L^2}. \quad (2.11)$$

Moreover, if

$$\Pi_{n_0} M(\Pi_{n_1} U_1, \ldots, \Pi_{n_p} U_p)\Pi_{n_{p+1}} U_{p+1} \neq 0, \quad (2.12)$$

then there is a choice of signs $\sigma_0, \ldots, \sigma_{p+1} \in \{-1, 1\}$ such that $\sum_{j=0}^{p+1} \sigma_j n_j = 0$. When $p = 0$ the conditions above mean that $M$ is a linear map on $C^\infty(T; \mathbb{C})$ into itself.

Definition 2.8 (Non-homogeneous maps). Let $K' \leq K \in \mathbb{N}$, $N \in \mathbb{N}$ with $N \geq 1$, $m \in \mathbb{R}$ with $m \geq 0$ and $r > 0$. We define the class $\mathcal{M}_K^{\infty}(K', N)[r]$ as the space of maps $(V, u) \mapsto M(V)u$ defined on $B^K_N(I, I) \times C^K_\infty(I, H^\infty(T; \mathbb{C}))$ which are linear in the variable $u$ and such that the following holds true. For any $s > s_0$ there exist a constant $C > 0$ and $r(s) \in [0, r[$ such that for any $V \in B^K_N(I, I) \cap C^K_\infty(I, H^s(T, \mathbb{C}))$, any $u \in C^K_\infty(I, H^t(T, \mathbb{C}))$, any $0 \leq k \leq K - K'$ and any $t \in I$ the following estimate holds true

$$\|\partial_t^k (M(V)u)(t, \cdot)\|_{H^{s+k'-m}} \leq \sum_{k' \leq s, n_0} C\left[\|u\|_{k'+s, s} \|V\|_{k'+K', s_0}^N + \|u\|_{k'+s, s_0} \|V\|_{k'+K', s_0} \|V\|_{k'+K', s_0} \|V\|_{k'+K', s_0} \right]. \quad (2.13)$$

Definition 2.9 (Maps). Let $p, N \in \mathbb{N}$, with $p \leq N$, $N \geq 1$, $K, K' \in \mathbb{N}$ with $K' \leq K$ and $\rho \in \mathbb{R}$, $m \geq 0$. We denote by $\Sigma \mathcal{M}_K^{\infty}(K', p)[r, N]$ the space of maps $(V, t, u) \mapsto M(V, t)u$ that may be written as

$$M(V, t)u = \sum_{q=0}^{N-1} M_q(V, \ldots, V)u + M_N(V, t)u, \quad (2.14)$$

for some $M_q \in \widetilde{\mathcal{M}}_q^m$, $q = p, \ldots, N - 1$ and $M_N$ belongs to $\mathcal{M}_K^{\infty}(K', N)[r]$. Finally we set $\widetilde{\mathcal{M}}_p := \cup_{m \geq 0} \widetilde{\mathcal{M}}_p^m$, $\mathcal{M}_{K, K', p}[r] := \cup_{m \geq 0} \mathcal{M}_{K, K', p}[r]$ and $\Sigma \mathcal{M}_{K, K', p}[r, N] := \cup_{m \geq 0} \Sigma \mathcal{M}_{K, K', p}[r, N]$.

Definition 2.10 (Autonomous maps). We define, with the notation of Definition 2.8 the class of autonomous non-homogeneous smoothing operator $\mathcal{M}^{\infty}_K[r, \text{aut}]$ as the subspace of $\mathcal{M}_K^{\infty}[r]$ made of those maps $(U, V) \mapsto M(U)V$ satisfying estimates (2.8) with $K' = 0$, the time dependence being only through $U = U(t)$. In the same way, we denote by $\Sigma \mathcal{M}^{\infty}_K[r, \text{aut}]$ the space of maps $(U, V) \mapsto M(U, V)$ of the form (2.9) with $K' = 0$ and where the last term belongs to $\mathcal{M}^{\infty}_K[r, \text{aut}]$.

Remark 2.11. We remark that if $M$ is in $\widetilde{\mathcal{M}}_p^m$, $p \geq N$, then $(V, U) \mapsto M(V, \ldots, V)U$ is in $\mathcal{M}^{\infty}_K[r, \text{aut}]$. For further details we refer to the remark after Definition 2.2.5 in [7].

2.3 Spaces of Symbols

We give the definition of a class of multilinear symbols.
Definition 2.12 (p-homogeneous symbols). Let \( m \in \mathbb{R} \), \( p \in \mathbb{N} \). We denote by \( \mathcal{I}_p^m \) the space of symmetric \( p \)-linear maps from \((C^\infty (T; C^2))^p \) to the space of \( C^\infty \) functions in \((x, \xi) \in T \times \mathbb{R}\)

\[
\mathcal{U} \to ((x, \xi) \to a(\mathcal{U}; x, \xi))
\]
satisfying the following. There is \( \mu > 0 \) and for any \( \alpha, \beta \in \mathbb{N} \) there is \( C > 0 \) such that

\[
|\partial_x^\alpha \partial_\xi^\beta a(\Pi_n \mathcal{U}; x, \xi)| \leq C (\langle i \rangle)^{\mu + \alpha} \langle \xi \rangle^{m - \beta} \prod_{j=1}^p \|\Pi_n U_j\|_{L^2}, \tag{2.15}
\]

for any \( \mathcal{U} = (U_1, \ldots, U_p) \) in \((C^\infty (T; C^2))^p \), and \( \langle i \rangle = (n_1, \ldots, n_p) \in \mathbb{N}^p \), where \( \langle i \rangle := \sqrt{1 + |n_1|^2 + \ldots + |n_p|^2} \).

Moreover we assume that, if for some \((n_0, \ldots, n_p) \in \mathbb{N}^p+1\),

\[
\Pi_n a(\Pi_n U_1, \ldots, \Pi_n U_p; \cdot) \neq 0,
\]

then there exists a choice of signs \( \sigma_0, \ldots, \sigma_p \in \{-1, 1\} \) such that \( \sum_{j=0}^p \sigma_j n_j = 0 \). For \( p = 0 \) we denote by \( \mathcal{I}_0^m \) the space of constant coefficients symbols \( \xi \to a(\xi) \) which satisfy the (2.15) with \( \alpha = 0 \) and the r.h.s. replaced by \( C \langle \xi \rangle^{m - \beta} \).

Remark 2.13. In the sequel we shall consider functions \( \mathcal{U} = (U_1, \ldots, U_p) \) which depends also on time \( t \), so that the above definition are functions of \((t, x, \xi)\) that we denote by \( a(\mathcal{U}; t, x, \xi) \).

Remark 2.14. One can easily note that, if \( a \in \mathcal{I}_p^m \) and \( b \in \mathcal{I}_p^{m'} \) then \( ab \in \mathcal{I}_p^{m+m'} \), and \( \partial_x a \in \mathcal{I}_p^{m-1} \) while \( \partial_\xi a \in \mathcal{I}_p^{m-1} \).

Remark 2.15. We have that the function

\[
p(\xi) := \sum_{k=1}^M \frac{m_k}{(\xi_{2k+1})}, \quad \xi \in \mathbb{R}, \tag{2.17}
\]

belongs to the class \( \mathcal{I}_0^m \).

We shall need also a class of non-homogeneous nonlinear symbols.

Definition 2.16 (Non-homogeneous Symbols). Let \( m \in \mathbb{R}, p \in \mathbb{N}, p \geq 1, K' \leq K \) in \( \mathbb{N}, r > 0 \). We denote by \( \Gamma_{K,K'}^m[p][r] \) the space of functions \((U; t, x, \xi) \to a(U; t, x, \xi), \) defined for \( U \in B_{\sigma_0}^m(I, r) \), for some large enough \( \sigma_0 \), with complex values such that for any \( 0 \leq k \leq K - K' \), any \( \sigma \geq \sigma_0 \), there are \( C > 0, 0 < r(\sigma) < r \) and for any \( U \in B_{\sigma_0}^m(I, r(\sigma)) \cap C_{K+K'}^m (I, H^r(T; C^2)) \) and any \( \alpha, \beta, \mathcal{I} \in \mathbb{N} \), with \( \alpha \leq \beta \), we have

\[
|\partial_t^\alpha \partial_x^\beta a(U; t, x, \xi)| \leq C \langle \xi \rangle^{m - \beta} \|a\|_{k+K', \sigma_0} \|U\|_{k+K', \sigma}, \tag{2.18}
\]

Remark 2.17. We note that if \( a \in \Gamma_{K,K',p}^{m}[r] \) with \( K' + 1 \leq K \), then \( \partial_t a \in \Gamma_{K,K'+1,p}^{m}[r] \). Moreover if \( a \in \Gamma_{K,K',p}^{m}[r] \) then \( \partial_x a \in \Gamma_{K,K',p}^{m-1}[r] \) and \( \partial_\xi a \in \Gamma_{K,K',q}^{m-1}[r] \). Finally if \( a \in \Gamma_{K,K',p}^{m}[r] \) and \( b \in \Gamma_{K,K',q}^{m}[r] \) then \( ab \in \Gamma_{K,K',p+q}[r] \).

The following is a subclass of the class defined in (2.16) made of those symbols which depend on the variable \( t \) only through the function \( U \).

Definition 2.18 (Autonomous non-homogeneous Symbols). We denote by \( \Gamma_{K,0,p}^{m}[r, \text{aut}] \) the subspace of \( \Gamma_{K,0,p}^{m}[r] \) made of the non-homogeneous symbols \((U, x, \xi) \to a(U; x, \xi)\) that satisfy estimate (2.18) with \( K' = 0 \), the time dependence being only through \( U = U(t) \).

Remark 2.19. A symbol \( a(U; \cdot) \) of \( \Gamma_{K,0,p}^{m}[r, \text{aut}] \) defines, by restriction to the diagonal, the symbol \( a(U, \ldots, U; \cdot) \) for \( \Gamma_{K,0,p}^{m}[r, \text{aut}] \) for any \( r > 0 \). For further details we refer the reader to the first remark after Definition 2.1.3 in [7].
The following is the general class of symbols we shall deal with.

**Definition 2.20 (Symbols).** Let $m \in \mathbb{R}$, $p \in \mathbb{N}$, $K, K' \in \mathbb{N}$ with $K' \leq K$, $r > 0$ and $N \in \mathbb{N}$ with $p \leq N$. One denotes by $\Sigma_{K, K', p}^m[r, N]$ the space of functions $(U, t, x, \xi) \rightarrow a(U; t, x, \xi)$ such that there are homogeneous symbols $a_q \in \tilde{\Gamma}^m_q$ for $q = p, \ldots, N - 1$ and a non-homogeneous symbol $a_N \in \Gamma_{K, K', N}^m[r]$ such that

$$a(U; t, x, \xi) = \sum_{q=p}^{N-1} a_q(U; \ldots, U; x, \xi) + a_N(U; t, x, \xi).$$

We set $\Sigma_{K, K', p}^\infty[r, N] = \cap_{m \in \mathbb{R}} \Sigma_{K, K', p}^m[r, N].$

We define the subclasses of autonomous symbols $\Sigma_{K, K', p}^m[r, N, \text{aut}]$ by (2.19) where $a_N$ is in the class $\Gamma_{K, 0, N}^m[r, \text{aut}]$ of Definition 2.18. Finally we set $\Sigma_{K, K', p}^\infty[r, N, \text{aut}] = \cap_{m \in \mathbb{R}} \Sigma_{K, K', p}^m[r, N, \text{aut}].$

We also introduce the following class of “functions”, i.e. those bounded symbols which are independent of the variable $\xi$.

**Definition 2.21 (Functions).** Fix $N \in \mathbb{N}$, $p \in \mathbb{N}$ with $p \leq N$, $K, K' \in \mathbb{N}$ with $K' \leq K$, $r > 0$. We denote by $\tilde{F}_p$ (resp. $\tilde{F}_K, K', p[r]$), $\tilde{F}_K, K', p[r, \text{aut}]$, resp. $\Sigma F_p[r, N]$, resp. $\Sigma F_K, K', p[r, N, \text{aut}]$ the subspace of $\tilde{\Gamma}_p^0$ (resp. $\Gamma_p^0[r]$, resp. $\Gamma_p^0[r, \text{aut}]$, resp. $\Sigma \Gamma_p^0[r, N]$, resp. $\Sigma \Gamma_p^0[r, N, \text{aut}]$) made of those symbols which are independent of $\xi$.

### 2.4 Quantization of symbols

Given a smooth symbol $(x, \xi) \rightarrow a(x, \xi)$, we define, for any $\sigma \in [0, 1]$, the quantization of the symbol $a$ as the operator acting on functions $u$ as

$$\text{Op}_\sigma(a)u := \frac{1}{2\pi} \int_{\mathbb{R} \times \mathbb{R}} e^{i(x-y)\xi}(1 - \sigma)y a(\sigma x + (1 - \sigma)y, \xi)u(y)dyd\xi.$$  

This definition is meaningful in particular if $u \in C^\infty(\mathbb{T})$ (identifying $u$ to a $2\pi$-periodic function). By decomposing $u$ in Fourier series as $u = \sum_{j \in \mathbb{Z}} \hat{u}(j)(1/\sqrt{2\pi})e^{ijx}$, we may calculate the oscillatory integral in (2.20) obtaining

$$\text{Op}_\sigma(a)u := \frac{1}{\sqrt{2\pi}} \sum_{k \in \mathbb{Z}} \left( \sum_{j \in \mathbb{Z}} \hat{a}(k - j, (1 - \sigma)k + \sigma j)\hat{u}(j) \right) \frac{e^{ikx}}{\sqrt{2\pi}}, \quad \forall \sigma \in [0, 1],$$

where $\hat{a}(k, \xi)$ is the $k^{th}$-Fourier coefficient of the $2\pi$-periodic function $x \mapsto a(x, \xi)$. For convenience in the paper we shall use two particular quantizations:

**Standard quantization.** We define the standard quantization by specifying formula (2.21) for $\sigma = 1$:

$$\text{Op}(a)u := \text{Op}_1(a)u = \frac{1}{\sqrt{2\pi}} \sum_{k \in \mathbb{Z}} \left( \sum_{j \in \mathbb{Z}} \hat{a}(k - j, j)\hat{u}(j) \right) \frac{e^{ikx}}{\sqrt{2\pi}}.$$  

**Weyl quantization.** We define the Weyl quantization by specifying formula (2.21) for $\sigma = \frac{1}{2}$:

$$\text{Op}_W(a)u := \text{Op}_{\frac{1}{2}}(a)u = \frac{1}{\sqrt{2\pi}} \sum_{k \in \mathbb{Z}} \left( \sum_{j \in \mathbb{Z}} \hat{a}(k - j, \frac{k + j}{2})\hat{u}(j) \right) \frac{e^{ikx}}{\sqrt{2\pi}}.$$
Moreover the above formulas allow to transform the symbols between different quantizations, in particular we have

$$\text{Op}(a) = \text{Op}^W(b), \quad \text{where} \quad \dot{b}(j, \xi) = \dot{a}(j, \xi - j/2). \quad (2.24)$$

We want to define a para-differential quantization. First we give the following definition.

**Definition 2.22 (Admissible cut-off functions).** Fix $p \in \mathbb{N}$ with $p \geq 1$. We say that $\chi_p \in C^\infty(\mathbb{R}^p \times \mathbb{R}; \mathbb{R})$ and $\chi \in C^\infty(\mathbb{R} \times \mathbb{R}; \mathbb{R})$ are admissible cut-off functions if they are even with respect to each of their arguments and there exists $\delta > 0$ such that

$$\text{supp} \chi_p \subset \{ (\xi', \xi) \in \mathbb{R}^p \times \mathbb{R}; |\xi'| \leq \delta(\xi) \}, \quad \chi_p(\xi', \xi) \equiv 1 \text{ for } |\xi'| \leq \frac{\delta}{2}(\xi),$$

$$\text{supp} \chi \subset \{ (\xi', \xi) \in \mathbb{R} \times \mathbb{R}; |\xi'| \leq \delta(\xi) \}, \quad \chi(\xi', \xi) \equiv 1 \text{ for } |\xi'| \leq \frac{\delta}{2}(\xi).$$

We assume moreover that for any derivation indices $\alpha$ and $\beta$

$$|\partial^\alpha_{\xi'} \partial^\beta_{\xi} \chi_p(\xi', \xi)| \leq C_{\alpha, \beta}(\xi) - \alpha - |\beta|, \quad \forall \alpha \in \mathbb{N}, \beta \in \mathbb{N}^p,$$

$$|\partial^\alpha_{\xi'} \partial^\beta_{\xi} \chi(\xi', \xi)| \leq C_{\alpha, \beta}(\xi) - \alpha - \beta, \quad \forall \alpha, \beta \in \mathbb{N}. \quad (2.26)$$

An example of function satisfying the condition above, and that will be extensively used in the rest of the paper, is $\chi(\xi', \xi) := \tilde{\chi}(\xi'/\xi))$, where $\tilde{\chi}$ is a function in $C^\infty_0(\mathbb{R}; \mathbb{R})$ having a small enough support and equal to one in a neighborhood of zero. For any $a \in C^\infty(\mathbb{R})$ we shall use the following notation

$$\langle \chi(D)a)(x) = \sum_{j \in \mathbb{Z}} \chi(j) \Pi_j a. \quad (2.25)$$

**Definition 2.23 (The Bony quantization).** Let $\chi$ be an admissible cut-off function according to Definition 2.22 If $a$ is a symbol in $\Gamma^m_p$ and $b$ is in $\Gamma^m_{T_K, T_{K'}}[r]$, we set, using notation (2.4),

$$a_\chi(U; x, \xi) = \sum_{\tilde{n} \in \mathbb{Z}^p} \chi_p(\tilde{n}, \xi) a(\Pi_\tilde{n} U; x, \xi),$$

$$b_\chi(U; t, x, \xi) = \frac{1}{2\pi} \int_T \chi(\eta, \xi) \dot{\theta}(U; t, \eta, \xi) e^{i\eta x} d\eta. \quad (2.26)$$

We define the Bony quantization as

$$\text{Op}^B(a(U; \cdot)) = \text{Op}(a_\chi(U; \cdot)), \quad \text{Op}^B(b(U; t, \cdot)) = \text{Op}(b_\chi(U; t, \cdot)). \quad (2.27)$$

and the Bony-Weyl quantization as

$$\text{Op}^{BW}(a(U; \cdot)) = \text{Op}^W(a_\chi(U; \cdot)), \quad \text{Op}^{BW}(b(U; t, \cdot)) = \text{Op}^W(b_\chi(U; t, \cdot)). \quad (2.28)$$

Finally, if $a$ is a symbol in the class $\Sigma \Gamma^m_{K, K', p}[r, N]$, that we decompose as in (2.19), we define its Bony quantization as

$$\text{Op}^B(a(U; t, \cdot)) = \sum_{q=p}^{N-1} \text{Op}^B(a_q(U, \ldots, U; \cdot)) + \text{Op}^B(a_N(U; t, \cdot)), \quad (2.29)$$

13
and its Bony-Weyl quantization as

\[ \text{Op}^{\text{BW}}(a(U; t, \cdot)) = \sum_{q=p}^{N-1} \text{Op}^{\text{BW}}(a_q(U, \ldots, U; \cdot)) + \text{Op}^{\text{BW}}(a_N(U; t, \cdot)). \] (2.30)

For symbols belonging to the autonomous subclass \( \Sigma_{\Gamma, 0, p}^m [r, N, \text{aut}] \) we shall not write the time dependence in (2.29) and (2.30).

**Remark 2.24.** Let \( a \in \Sigma_{\Gamma, 0, p}^m [r, N] \). We note that

\[ \text{Op}^{\text{B}}(a(U; t, x, \xi)[v] = \text{Op}^{\text{B}}(a^\vee(U(t, x, \xi))[v], \quad \text{Op}^{\text{BW}}(a(U; t, x, \xi)[v] = \text{Op}^{\text{BW}}(a^\vee(U(t, x, \xi))[v], \] (2.31)

where

\[ a^\vee(U; t, x, \xi) := a(U; t, x, -\xi). \] (2.32)

Moreover if we define the operator \( A(U, t);[\cdot] := \text{Op}^{\text{BW}}(a(U; t, x, \xi))[\cdot] \) we have that \( A^*(U, t) \), its adjoint operator w.r.t. the \( L^2(T; \mathbb{C}) \) scalar product, can be written as

\[ A^*(U, t)[v] = \text{Op}^{\text{BW}}(a(U; t, x, \xi))[v]. \] (2.33)

**Remark 2.25.** Let us define

\[ 1(\xi) := (i\xi)^2 + p(\xi), \] (2.34)

with \( p(\xi) \) defined in (2.17). By Remark 2.73 we have that \( 1(\xi) \) belongs to \( \overline{\Gamma}_0^2 \). Moreover we note that the operator \( \lambda \) defined in (1.12) can be written as

\[ \lambda[\cdot] = \text{Op}(1(\xi))[\cdot]. \] (2.35)

**Remark 2.26.** By formula (2.33) one has that a para-differential operator \( \text{Op}^{\text{BW}}(a(U; t, x, \xi))[\cdot] \) is self-adjoint, w.r.t. the \( L^2(T; \mathbb{C}) \) scalar product, if and only if the symbol \( a(U; t, x, \xi) \) is real valued for any \( x \in T, \xi \in \mathbb{R} \).

**Proposition 2.27 (Action of para-differential operator).** One has the following.

(i) Let \( m \in \mathbb{R}, p \in \mathbb{N} \). There is \( \sigma > 0 \) such that for any symbol \( a \in \Gamma_p^m \), the map

\[ (U_1, \ldots, U_{p+1}) \rightarrow \text{Op}^{\text{BW}}(a(U_1, \ldots, U_{p+1}))(U_{p+1}), \] (2.36)

extends, for any \( s \in \mathbb{R} \), as a continuous \((p + 1)\)-linear map

\[ (H^s(T; \mathbb{C}))^p \times H^s(T; \mathbb{C}) \rightarrow H^{s-m}(T; \mathbb{C}). \] (2.37)

Moreover, there is a constant \( C > 0 \), depending only on \( s \) and on (2.15) with \( \alpha = \beta = 0 \), such that

\[ \|\text{Op}^{\text{BW}}(a(U_\cdot; \cdot))U_{p+1}\|_{H^{-m}} \leq C \prod_{j=1}^{p} \|U_j\|_{H^s} \|U_{p+1}\|_{H^s}, \] (2.38)

where \( U = (U_1, \ldots, U_p) \). In the case that \( p = 0 \) the r.h.s. of (2.38) is replaced by \( C\|U_{p+1}\|_{H^s} \). Finally, if for some \( (n_0, \ldots, n_{p+1}) \in \mathbb{N}^{p+2} \),

\[ \Pi_{n_0} \text{Op}^{\text{BW}}(a(\Pi_{\bar{n}} U_\cdot))\Pi_{n_{p+1}} U_{p+1} \neq 0, \] (2.39)

with \( \bar{n} = (n_1, \ldots, n_p) \in \mathbb{N}^p \), then there is a choice of signs \( \sigma_j \in \{-1, 1\}, j = 0, \ldots, p + 1 \), such that \( \sum_{j=0}^{p+1} \sigma_j n_j = 0 \) and the indices satisfy

\[ n_0 \sim n_{p+1}, \quad n_j \leq C\delta n_0, \quad n_j \leq C\delta n_{p+1}, \quad j = 1, \ldots, p. \] (2.40)
(ii) Let \( r > 0, m \in \mathbb{R}, p \in \mathbb{N}, p \geq 1, K' \leq K \in \mathbb{N}, a \in \Gamma^m_{K,K'}[r] \). There is \( c > 0 \) such that for any \( U \in B^c_\sigma(I,r) \), the operator \( \text{Op}^\partial (a(U,t,\cdot)) \) extends, for any \( s \in \mathbb{R} \), as a bounded linear operator

\[
C^K_{\sigma} (I, H^s(T;C)) \rightarrow C^\partial (I, H^{\sigma-s} (T;C)).
\]

Moreover, there is a constant \( C > 0 \), depending only on \( s, r \) and (2.18) with \( 0 \leq \alpha \leq 2, \beta = 0 \), such that, for any \( t \in I, any \ 0 \leq k \leq K - K' \)

\[
\| \text{Op}^\partial (\partial_t^k a(U,t,\cdot)) \|_{L^\partial (H^{\sigma},H^{\sigma-k})} \leq C \| U \|_{K^{\partial},\sigma},
\]

so that

\[
\| \text{Op}^\partial (a(U,t,\cdot)) V(t) \|_{K^{\partial},s} \leq C \| U \|_{K^{\partial},\sigma} \| V \|_{K^{\partial},s}.
\]

Proof. See Proposition 2.2.4 in [7].

Remark 2.28. We have the following inclusions.

- Let \( a \in \Sigma^m_{K,K'}[r, N] \) for \( p \geq 1 \). By Proposition 2.2.7 we have that the map \( (V, U) \rightarrow \text{Op}^\partial (a(V,t,\cdot)) U \) defined by (2.30) is in \( \Sigma M^m_{K,K'}[r, N] \) for some \( m' \geq m \).

- If \( a \in \Sigma^m_{K,K'}[r, N] \) with \( m' \leq 0 \) and \( p \geq 1 \), then the map \( (V, U) \rightarrow \text{Op}^\partial (a(V,t,\cdot)) U \) is in \( \Sigma R^m_{K,K'}[r, N] \).

- Any smoothing operator \( R \in \Sigma R^m_{K,K'}[r, N] \) defines an element of \( \Sigma M^m_{K,K'}[r, N] \) for some \( m \geq 0 \).

In the following we shall deal with operators defined on the product space \( H^s \times H^s \).

Remark 2.29. From Proposition 2.2.7 we deduce that the Bony-Weyl quantization of a symbol is unique up to smoothing remainders. More precisely consider two admissible cut off functions \( \chi^{(1)}_p \) and \( \chi^{(2)}_p \) according to Def. 2.22 with \( \delta_1 > 0 \) and \( \delta_2 > 0 \). Define \( \chi_p := \chi^{(1)}_p - \chi^{(2)}_p \) and for \( a \) in \( \Gamma^m_p \) set

\[
R(U) := \text{Op}^W \left( \sum_{n \in \mathbb{N}^p} \chi_p(n, \xi) a(\Pi_n U, \cdot) \right).
\]

Then, by applying (2.38) with \( s = m \), we get

\[
\| \Pi_{n_0} R(\Pi_n U) \Pi_{n_{p+1}} U_{p+1} \|_{L^2} \leq C n_0 \cdots n_p n_{p+1} \prod_{j=1}^{p+1} \| \Pi_{n_j} U_j \|_{L^2}.
\]

The l.h.s. of the equation above is non zero only if \( \delta_1 (n_{p+1}) \leq \| \xi \| \leq \delta_2 (n_{p+1}) \). As a consequence we the equivalence

\[
\max(\| n_{p+1} \|, \| \xi \|) \sim \max(\| n_{p+1} \|, \| \xi \|) \quad \text{and hence the operator } R \text{ belongs to } \tilde{R}^p_{\rho}.
\]

A similar statement holds for the non homogeneous case.

We have the following definition.

Definition 2.30 (Matrices of operators). Let \( \rho, m \in \mathbb{R}, \rho \geq 0, K' \leq K \in \mathbb{N}, r > 0, N \in \mathbb{N}, p \in \mathbb{N} \) with \( p \geq 1 \). We denote by \( \Sigma M^m_{K,K'}[r, N] \otimes M_2(C) \) the space of \( 2 \times 2 \) matrices whose entries are smoothing operators in the class \( \Sigma M^m_{K,K'}[r, N] \). Analogously we denote by \( \Sigma M^m_{K,K'}[r, N] \otimes M_2(C) \) the space of \( 2 \times 2 \) matrices whose entries are operators in the class \( \Sigma M^m_{K,K'}[r, N] \). We also set \( \Sigma M_{K,K'}[r, N] \otimes M_2(C) = \cup_{m \in \mathbb{R}} \Sigma M^m_{K,K'}[r, N] \otimes M_2(C) \).

Definition 2.31 (Matrices of symbols). Let \( m \in \mathbb{R}, K' \leq K \in \mathbb{N}, p, N \in \mathbb{N} \). We denote by \( \Sigma \Gamma^m_{K,K'}[r, N] \otimes M_2(C) \) the space \( 2 \times 2 \) matrices whose entries are symbols in the class \( \Sigma \Gamma^m_{K,K'}[r, N] \).
We have the following result.

**Lemma 2.32.** Let $\rho, m \in \mathbb{R}$, $\rho \geq 0$, $K' \leq K \in \mathbb{N}$, $r > 0$, $N \in \mathbb{N}$, $p \in \mathbb{N}$, $p \geq 1$ and consider $R \in \Sigma^{R}_{K,K',p}[r,N] \otimes \mathcal{M}_{2}(\mathbb{C})$, $M \in \Sigma^{M}_{K,K',p}[r,N] \otimes \mathcal{M}_{2}(\mathbb{C})$ and $A \in \Sigma^{A}_{K,K',q}[r,N] \otimes \mathcal{M}_{2}(\mathbb{C})$. There is $\sigma > 0$ such that

\begin{align}
R : B^{K}_{\sigma}(I,r) \times C^{K-K'}_{s}(I,H^{s}(\mathbb{T};\mathbb{C}^{2})) &\rightarrow C^{K-K'}_{s}(I,H^{s+\rho}(\mathbb{T};\mathbb{C}^{2})), \\
M : B^{K}_{\sigma}(I,r) \times C^{K-K'}_{s}(I,H^{s}(\mathbb{T};\mathbb{C}^{2})) &\rightarrow C^{K-K'}_{s}(I,H^{s-m}(\mathbb{T};\mathbb{C}^{2})).
\end{align}

and

\begin{equation}
\text{Op}^{BW}(A(U; t, \cdot)) : B^{K}_{\sigma}(I,r) \times C^{K-K'}_{s}(I,H^{s}(\mathbb{T};\mathbb{C}^{2})) \rightarrow C^{K-K'}_{s}(I,H^{s-m}(\mathbb{T};\mathbb{C}^{2})).
\end{equation}

**Proof.** The \((2.45)\) follows by Definition \ref{def:2.33} (see bound \((2.8)\)). The \((2.46)\) follows by Definition \ref{def:2.34} (see bound \((2.13)\)). The \((2.47)\) follows by Proposition \ref{prop:2.35}. \qed

### 2.5 Symbolic calculus and Compositions theorems

We define the following differential operator

\begin{equation}
\sigma(D_{x}, D_{\xi}, D_{y}, D_{\eta}) = D_{\xi}D_{y} - D_{x}D_{\eta},
\end{equation}

where $D_{x} := \frac{1}{i} \partial_{x}$ and $D_{\xi}, D_{y}, D_{\eta}$ are similarly defined.

Let $K' \leq K, \rho, p, q$ be in $\mathbb{N}$, $m, m' \in \mathbb{R}$, $r > 0$ and consider $a \in \tilde{\Gamma}_{K}^{m}$ and $b \in \tilde{\Gamma}_{q}^{m'}$. Set

\begin{equation}
\mathcal{U} := (\mathcal{U}', \mathcal{U}''), \quad \mathcal{U}' := (U_{1}, \ldots, U_{p}), \quad \mathcal{U}'' := (U_{p+1}, \ldots, U_{p+1}), \quad \mathcal{U}_{j} \in H^{s}(\mathbb{T};\mathbb{C}^{2}), \quad j = 1, \ldots, p + q.
\end{equation}

We define the asymptotic expansion (up to order $\rho$) of the composition symbol as follows:

\begin{equation}
(a \# b)_{\rho}([\mathcal{U}; x, \xi]) := \sum_{k=0}^{\rho} \frac{1}{k!} \left( \frac{1}{2} \sigma(D_{x}, D_{\xi}, D_{y}, D_{\eta}) \right)^{k} \left[ a([\mathcal{U}'; x, \xi])b([\mathcal{U}'']; y, \eta) \right]_{x=y \atop \xi=\eta}
\end{equation}

modulo symbols in $\tilde{\Gamma}_{p+q}^{m+m' - \rho}$.

Consider $a \in \Gamma_{K,K',p}[r]$ and $b \in \Gamma_{K,K',q}^{m'}[r]$. For $U$ in $B_{\sigma}^{K}(I,r)$ we define, for $\rho < \sigma - \sigma_{0}$,

\begin{equation}
(a \# b)_{\rho}(U; t, x, \xi) := \sum_{k=0}^{\rho} \frac{1}{k!} \left( \frac{1}{2} \sigma(D_{x}, D_{\xi}, D_{y}, D_{\eta}) \right)^{k} \left[ a(U; t, x, \xi)b(U; t, y, \eta) \right]_{x=y \atop \xi=\eta},
\end{equation}

modulo symbols in $\Gamma_{K,K',p+q}[r]$.

**Remark 2.33.** By Remark \ref{rem:2.74} one can note that the symbol $(a \# b)_{\rho}$ in \((2.50)\) belongs to the class $\tilde{\Gamma}_{p+q}^{m+m'}$ (with the exponent $\mu$ in \((2.15)\) large as function of $\rho$). Similarly by Remark \ref{rem:2.75} one can note that the symbol $(a \# b)_{\rho}$ in \((2.51)\) belongs to the class $\Gamma_{p+q}^{m+m'}[r]$ (with $\sigma$ in Def. \ref{def:2.16} large as function of $\rho$).

We need a result which ensures that $(a \# b)_{\rho}$ is the symbol of the composition up to smoothing remainders. We have the following proposition.

**Proposition 2.34 (Composition of Bony-Weyl operators).** Let $K' \leq K, \rho, p, q$ be in $\mathbb{N}$, $m, m' \in \mathbb{R}$, $r > 0$.

(i) Consider $a \in \Gamma_{p}^{m}$ and $b \in \Gamma_{q}^{m'}$. Then (recalling the notation in \((2.49)\)) one has that

\begin{equation}
\text{Op}^{BW}(a([\mathcal{U}; x, \xi])) \circ \text{Op}^{BW}(b([\mathcal{U}'']; x, \xi)) - \text{Op}^{BW}((a \# b)_{\rho}([\mathcal{U}; x, \xi]))
\end{equation}
belongs to the class of smoothing remainder $R_{p+q}^{-\rho+m+m'}$.

(ii) Consider $a \in \Gamma_{K,K',p}^{m}[r,N]$ and $b \in \Gamma_{K,K',q}^{m'}[r]$. Then one has that

$$\text{Op}^{\text{BW}}(a(U; t, x, \xi)) \circ \text{Op}^{\text{BW}}(b(U; t, x, \xi)) = \text{Op}^{\text{BW}}((a \# b)_\rho(U; t, x, \xi))$$

(2.53)

belongs to the class of non-homogeneous smoothing remainders $R_{K,K',p+q}^{-\rho+m+m'}[r]$. If $a$ and $b$ are symbols in the autonomous classes of Definition 2.18 then $(a \# b)_\rho(U; t, x, \xi)$ belongs to $\Gamma_{K,K',p+q}^{m+m'}[r, \text{aut}]$ and (2.53) is an autonomous smoothing remainder in $R_{K,K',p+q}^{-\rho+m+m'}[r, \text{aut}]$.

**Proof.** See the proof of Proposition 2.3.2 in [7].

Consider now symbols $a \in \Sigma_{K,K',p}^{m}[r,N]$, $b \in \Sigma_{K,K',q}^{m'}[r,N]$. By definition (see Def. 2.20) we have

$$a(U; t, x, \xi) = \sum_{k=p}^{N-1} a_k(U, \ldots, U; x, \xi) + a_N(U; t, x, \xi),$$

$$b(U; t, x, \xi) = \sum_{k'=p}^{N-1} b_{k'}(U, \ldots, U; x, \xi) + b_N(U; t, x, \xi),$$

$$a_k \in \Gamma_k^{m}, \quad a_N \in \Gamma_{K,K',N}^{m}[r], \quad b_{k'} \in \Gamma_{K,K'}^{m'}[r], \quad b_N \in \Gamma_{K,K',N}^{m'}[r].$$

We set also

$$c_{k'}(U; x, \xi) := \sum_{k+k'=N} (a_k \# b_{k'})_\rho(U; t, x, \xi), \quad k' = p + q, \ldots, N - 1,$$

$$c_N(U; t, x, \xi) := \sum_{k+k' \geq N} (a_k \# b_{k'})_\rho(U; t, x, \xi),$$

(2.55)

where the factors $a_k$ and $b_{k'}$, for $k, k' \leq N - 1$, have to be considered as elements of $\Gamma_{K,K',r}^{m}[r,N]$ and $\Gamma_{K,0,k}^{m}[r]$ respectively according to Remark 2.19. We define the composition symbol $(a \# b)_{\rho,N}(U; t, x, \xi)$ as

$$(a \# b)_{\rho,N}(U; t, x, \xi) := (a \# b)_\rho(U; t, x, \xi) := \sum_{k' \geq N} c_{k'}(U; \ldots, U; x, \xi) + c_N(U; t, x, \xi).$$

(2.56)

The following proposition collects the results contained in Section 2.4 in [7] concerning compositions between Bony-Weyl operators, smoothing remainders and maps.

**Proposition 2.35 (Compositions).** Let $m, m', m'' \in \mathbb{R}$, $K, K', M, N, p_1, p_2, p_3, p_4, r \in \mathbb{N}$ with $K' \leq K$, $p_1 + p_2 < N$, $p \geq 0$ and $r > 0$. Let $a \in \Sigma_{K,K',p_1}^{m}[r,N]$, $b \in \Sigma_{K,K',p_2}^{m'}[r,N]$, $R \in \Sigma_{K,K',p_3}^{m'}[r,N]$ and $M \in \Sigma_{K,K',p_4}^{m'}[r,N]$. Then the following holds.

(i) There exists a smoothing operator $R_1$ in the class $\Sigma R_{K,K',p_1+p_2+p_3}^{m,m'}[r,N]$ such that

$$\text{Op}^{\text{BW}}(a(U; t, x, \xi)) \circ \text{Op}^{\text{BW}}(b(U; t, x, \xi)) = \text{Op}^{\text{BW}}((a \# b)_{\rho,N}(U; t, x, \xi)) + R_1(U; t)$$

(2.57)

(ii) One has that the compositions operators

$$R(U; t) \circ \text{Op}^{\text{BW}}(a(U; t, x, \xi)), \quad \text{Op}^{\text{BW}}(a(U; t, x, \xi)) \circ R(U; t),$$

(2.58)

are smoothing operators in the class $\Sigma R_{K,K',p_1+p_3}^{m,m'}[r,N]$. 

(iii) One has that the compositions operators
\[ R(U; t) \circ M(U; t), \quad M(U; t) \circ R(U; t), \] (2.59)
are smoothing operators in the class \( \Sigma^{r+p+m'}_{K, K', p, p_2, p_4} [r, N] \).

(iv) Let \( R_2(U, W; t)[\cdot] \) be a smoothing operator of \( \Sigma^{r}_{K, K', p, p_2} [r, N] \) depending linearly on \( W \), i.e.
\[ R(U, W; t)[\cdot] = \sum_{q=p_4}^{N-1} R_q(U, \ldots, U, W)[\cdot] + R_N(U, W; t)[\cdot], \]
where \( R_q \in \tilde{R}^q_{r} \) and \( R_N \) satisfies for any \( 0 \leq k \leq K - K' \) (instead of (2.38)) the following
\[ \| \partial^k_t R_N (U, W; t) V(t, \cdot) \|_{H^{a-2k}} \leq C \sum_{k'= k'+k''= k} (\| U \|^{N-1}_{k'+K'} \| W \|_{k'+K', \sigma} \| V \|_{k'', \sigma} + \| U \|^{N-2}_{k'+K', \sigma} \| W \|_{k'+K', \sigma} \| V \|_{k'', \sigma}). \]

Then one has that \( R(U, M(U; t)W; t) \) belongs to \( \Sigma^{r+p+m'}_{K, K', p, p_2, p_4} [r, N] \).

(v) Let \( c \) be in \( \Gamma^m_{K, K', p, p_4} [r, N] \). If the symbol \( c \) is independent of \( \xi \) (i.e. \( c \) is in \( \tilde{F}_p \)), so is the symbol in (2.60) (thus it is a function in \( \Sigma^{m}_{K, K', p, p_4} [r, N] \)). Moreover if \( c \) is a symbol in \( \Gamma^m_{K, K', N} [r] \) then the symbol in (2.60) is in \( \Gamma^m_{K, K', N} [r] \).

All the statements of the proposition have their counterpart for autonomous classes.

We omit the proof of the proposition above. We refer the reader to Propositions 2.4.1, 2.4.2, 2.4.3 in Section 2.4 of [7].

2.6 Parity and Reversibility properties

In this Section we analyse the parity and the reversibility structure for para-differential and smoothing operators. Denote by \( S \) the linear involution, i.e. \( S^2 = 1 \),
\[ S : \mathbb{C}^2 \to \mathbb{C}^2, \quad S := \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}. \] (2.61)

For any \( U \in B^K_\sigma (I, r) \) we set
\[ U_S(t) := (SU)(-t). \] (2.62)

Note that \( U \in L^2(T; \mathbb{C}^2) \) belongs to the subspace \( \mathfrak{H} \) (see (1.9)) if and only if
\[ (SU)(x) = \overline{U}(x). \] (2.63)

We have the following definitions.

**Definition 2.36.** Let \( p, N, K, K' \in \mathbb{N} \) with \( p \leq N \), \( K' \leq K \) and \( r > 0, \rho \geq 0 \). Let \( M \in \Sigma \mathcal{M}_{K, K', p} [r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) (or \( \Sigma \mathcal{R}^{r}_{K, K', p} [r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) respectively) with \( U \) satisfying (2.63).

- **Reality preserving maps.** We say that the map \( M(U; t) \) is reality preserving if
\[ \overline{M(U; t)[V]} = SM(U; t)[S\overline{V}]. \] (2.64)
Given a smoothing operator $Q$ we have the following lemmata.

- **Anti-reality condition.** We say that the map $M(U; t)$ satisfies the anti-reality condition if
  \[
  M(U; t)[V] = -SM(U; t)[S\bar{V}].
  \]  
  \[(2.65)\]

- **Reversible maps.** We say that the map $M(U; t)$ is reversible w.r.t. the involution \[(2.61)\] if one has
  \[ -SM(U; t) = M(U_S; t)S. \]
  \[(2.66)\]

- **Reversibility preserving maps.** We say that the map $M(U; t)$ is reversibility preserving if
  \[ SM(U; t) = M(U_S; t)S. \]
  \[(2.67)\]

- **Parity preserving maps.** We say that $M(U; t)$ is parity preserving if maps $H^e_r(T; C^2)$ into $H^{e-m}_r(T; C^2)$ for some $m \geq 0$ (or $H^e_r(T; C^2)$ into $H^{e+p}_r(T; C^2)$ respectively).

- **(R,R,P)-maps/ operators.** We say that $M(U; t)$ is a $(R,R,P)$-map (resp. $(R,R,P)$-operator) if it is a reality, reversibility and parity preserving map (resp. operator).

**Remark 2.37.** Given a smoothing operator $R \in \Sigma R_{K,K',p}[r, N] \otimes \mathcal{M}_2(C)$ (resp. a map in $\Sigma \mathcal{M}_{K,K',p}[r, N] \otimes \mathcal{M}_2(C)$) then the following holds true. If $R(U; t)$ is reality preserving, i.e. satisfies \[(2.64)\], then it maps $H^e_r(T; C^2)$ into $H^{e+p}_r(T; C^2)$ (resp. $H^e_r(T; C^2)$ into $H^{e-m}_r(T; C^2)$ for some $m \geq 0$). Moreover, for any $V \in C_{*}^{K,K'}(I, H^e_r(T; C^2))$ and any smoothing remainder $Q(U; t) \in \Sigma R_{K,K',p}[r, N]$ (resp. any map in $\Sigma \mathcal{M}_{K,K',p}[r, N]$), we set
  \[
  \overline{Q(U; t)}[V] := \overline{Q(U; t)[V]}.
  \]  
  \[(2.68)\]

One can easily check that a matrix of smoothing operators $R(U; t) \in \Sigma R_{K,K',p}[r, N] \otimes \mathcal{M}_2(C)$ (resp. a matrix of maps in $\Sigma \mathcal{M}_{K,K',p}[r, N] \otimes \mathcal{M}_2(C)$) is reality preserving according to Definition \[(2.36)\] if and only if can be written as
  \[
  R(U; t)[\cdot] := \left( \frac{R_1(U; t)[\cdot]}{R_2(U; t)[\cdot]} \right) = \left( \frac{R_1(U; t)[\cdot]}{R_1(U; t)[\cdot]} \right),
  \]  
  \[(2.69)\]

for suitable scalar smoothing operators $R_1(U; t)$ and $R_2(U; t)$ in the class $\Sigma R_{K,K',p}[r, N]$ (resp. $\Sigma \mathcal{M}_{K,K',p}[r, N]$).

We have the following lemmata.

**Lemma 2.38.** Let $p, N, K, K' \in \mathbb{N}$ with $p \leq N$, $K' \leq K$ and $r > 0$, $\rho \geq 0$. Let $M \in \Sigma \mathcal{M}_{K,K',p}[r, N]$. If $M$ is decomposed as in \[(2.14)\] as a sum
  \[
  M(V; t) = \sum_{q=p}^{N-1} M_q(V, \ldots, V)U + M(N)(V; t)U,
  \]  
  \[(2.70)\]

in terms of homogeneous operators $M_q$, $q = p, \ldots, N - 1$, and if $M$ satisfies the reversibility condition \[(2.66)\] respectively reversibility preserving \[(2.67)\], we may assume that $M_q$, $q = p, \ldots, N - 1$ satisfy the reversibility property
  \[
  M_q(SU_1, \ldots, SU_q)S = -SM_q(U_1, \ldots, U_q),
  \]  
  \[(2.71)\]

respectively the reversibility preserving property
  \[
  M_q(SU_1, \ldots, SU_q)S = SM_q(U_1, \ldots, U_q).
  \]  
  \[(2.72)\]

**Proof.** See Lemma 3.1.5 in [7].
We gave the definitions of reality, parity and reversibility preserving and reversible map in the case of $M$ belonging to the class $\Sigma \mathcal{M}_{K,K',p}[r,N]$. An important subclass of maps we shall use in the following have the form

$$M(U; t)[\cdot] := \text{Op}^{BW}(A(U; t, x, \xi))[\cdot], \quad A \in \Sigma \Gamma_{K,K',p}[r,N] \otimes \mathcal{M}_2(\mathbb{C}),$$

for some $m \in \mathbb{R}$. In this case we give the properties of being reality preserving, parity preserving or reversible, directly on the matrix of symbols $A$.

**Definition 2.39.** Let $m \in \mathbb{R}$, $p, N, K, K' \in \mathbb{N}$ with $p \leq N$, $K' \leq K$ and $r > 0$, $\rho \geq 0$ and consider a matrix $A(U; t, x, \xi) \in \Sigma \Gamma_{R,K',p}[r,N] \otimes \mathcal{M}_2(\mathbb{C})$ where $U$ satisfies (2.63).

- **Reality preserving matrices of symbols.** We say that a matrix $A(U; t, x, \xi)$ is reality preserving if
  
  $$
  A(U; t, x, -\xi) = SA(U; t, x, \xi)S. \tag{2.73}
  $$

- **Anti-reality preserving matrices of symbols.** We say that a matrix $A(U; t, x, \xi)$ is anti-reality preserving if
  
  $$
  A(U; t, x, -\xi) = -SA(U; t, x, \xi)S. \tag{2.74}
  $$

- **Reversible and reversibility preserving matrices of symbols.** We say that $A(U; t, x, \xi)$ is reversible if
  
  $$
  -SA(U; -t, x, \xi) = A(U_S; t, x, \xi)S. \tag{2.75}
  $$

  We say that $A(U; t, x, \xi)$ is reversibility preserving if
  
  $$
  SA(U; -t, x, \xi) = A(U_S; t, x, \xi)S. \tag{2.76}
  $$

- **Parity preserving matrices of symbols.** We say that $A(U; t, x, \xi)$ is parity preserving if
  
  $$
  A(U; t, x, \xi) = A(U; -t, -x, -\xi). \tag{2.77}
  $$

- **(R,R,P)-matrices.** We say that $A(U; t, x, \xi)$ is a $(R,R,P)$-matrix if it is a reality, reversibility and parity preserving map of symbols.

**Remark 2.40.** Consider $A(U; t, x, \xi) \in \Sigma \Gamma_{R,K',p}[r,N] \otimes \mathcal{M}_2(\mathbb{C})$ and $R(U; t) \in \Sigma \mathcal{R}_{R,K',p}[r,N] \otimes \mathcal{M}_2(\mathbb{C})$. If $A(U; t, x, \xi)$ is reality preserving, i.e. satisfies (2.75), then it has the form

$$
A(U; t) = A(U; t, x, \xi) := \begin{pmatrix}
  a(U; t, x, \xi) & b(U; t, x, \xi) \\
  b(U; t, x, -\xi) & a(U; t, x, -\xi)
\end{pmatrix}.
$$

(2.78)

We note the following facts:

- if $A(U; t, x, \xi)$ satisfy one among the properties (2.73), (2.74), (2.75) and it is invertible, then $A(U; t, x, \xi)^{-1}$ satisfies the same property;

- if the matrix $A(U; t, x, \xi)$ is reversibility preserving (resp. if $R(U; t)$ is reversibility preserving) then the matrix
  
  $\text{i}EA(U; t, x, \xi)$ (resp. the operator $\text{i}ER(U; t)$) is reversible.

- if the matrix $A(U; t, x, \xi)$ is reality preserving (resp. if $R(U; t)$ is reality preserving) then the matrix of symbols $\text{i}EA(U; t, x, \xi)$ (resp. the operator $\text{i}ER(U; t)$) is anti-reality.

- if $A(U; t, x, \xi)$ is a reality, reversibility and parity preserving (resp. reversible, reality and parity preserving) matrix of symbols, then the operator $\text{Op}^{BW}(A(U; t, x, \xi))[\cdot]$ is a reality, reversibility and parity preserving (resp. reversible, reality and parity preserving) map.
• the matrix $A(U; t, x, \xi)$ is reversibility preserving if and only if its symbols verify the following

$$
\begin{align*}
\bar{b}(U; -t, x, \xi) &= b(U_S; t, x, \xi), \\
\bar{a}(U; -t, x, \xi) &= a(U_S; t, x, \xi);
\end{align*}
$$

(2.79)

furthermore note that in the case that the symbols are autonomous (i.e. when the dependence of time is through the function $U(t, x)$) the conditions above reads

$$
\begin{align*}
\bar{b}(U; x, \xi) &= b(SU; x, \xi), \\
\bar{a}(U; x, \xi) &= a(SU; x, \xi);
\end{align*}
$$

(2.80)

Remark 2.41. Recalling (1.14) and Remark 2.25 we write

$$
\Lambda[\cdot] := \left( \begin{array}{c} \text{Op}^{SW}(1(\xi)[\cdot]) \\ \text{Op}^{SW}(1(\xi)[\cdot]) \end{array} \right). \tag{2.81}
$$

In particular, since the symbol $1(\xi)$ is real and even in $\xi$ one has that the operator $\Lambda$ is reality, parity and reversibility preserving.

Definition 2.42. Fix $\rho > 0$, $m \in \mathbb{R}$, $p \in \mathbb{N}$ and let $A_p \in \tilde{\Gamma}^m_p \otimes M_2(\mathbb{C})$ and let $U_j$, with $j = 1, \ldots, p$, be functions satisfying $SU_j = U_j$ (see (2.61)). We say that $A_p$ is reversibility preserving if

$$
A_q(SU_1, \ldots, SU_p; x, \xi) S = SA_q(U_1, \ldots, U_p; x, \xi). \tag{2.82}
$$

We say that $A_p$ is reversible if

$$
A_q(SU_1, \ldots, SU_p; x, \xi) S = -SA_q(U_1, \ldots, U_p; x, \xi). \tag{2.83}
$$

We have the following Lemma.

Lemma 2.43. Let $A \in \Sigma_{K, K', p}^m[r, N] \otimes M_2(\mathbb{C})$ and write

$$
A(U; t, x, \xi) = \sum_{q=p}^{N-1} A_q(U, \ldots, U; x, \xi) + A_N(U; t, x, \xi),
$$

with $A_q \in \tilde{\Gamma}^m_q$, $q = p, \ldots, N - 1$ and $A_N \in \Sigma_{K, K', N}^m[r, N] \otimes M_2(\mathbb{C})$.

(i) If $A_q$ satisfies (2.82) (resp. (2.83)), for $q = p, \ldots, N - 1$ and $A_N$ satisfies (2.76) (resp. (2.75)), then $A$ satisfies (2.76) (resp. (2.75)).

(ii) If $A$ satisfies (2.76) (resp. (2.75)) then there are symbols $A'_q \in \tilde{\Gamma}^m_q$, satisfying (2.82) (resp. (2.83)), such that for any $U$ we have

$$
A(U; t, x, \xi) = \sum_{q=p}^{N-1} A'_q(U, \ldots, U; x, \xi) + A_N(U; t, x, \xi).
$$

Proof. See Lemma 3.1.3 in [7].

The following Lemma is the counterpart of Lemma 3.1.6 in [7].

Lemma 2.44. Composition of an operator satisfying the anti-reality property (2.65) (resp. the reversibility property (2.66)) with one or several operators satisfying the reality property (2.64) (resp. the reversibility preserving property (2.67)) still satisfies the reality property (2.65) (resp. reversibility preserving property (2.66)). Composition of operators which are parity preserving is as well the parity preserving. Composition of operators satisfying the reality property (2.64) satisfy the reality property (2.64) as well.
Lemma 2.45. Let \( C(U; t, \cdot) \in \Sigma_{K, K', p}^{m}[r, N] \otimes \mathcal{M}_2(C) \) for some \( m \in \mathbb{R}, \ K' \leq K - 1, \ 0 \leq p \leq N \) and assume that \( U \) is a solution of an equation
\[
\partial_t U = iE\tilde{M}(U; t)U, \tag{2.84}
\]
for some \( \tilde{M} \in \Sigma_{K,1,0}[r, N] \otimes \mathcal{M}_2(C) \). Then the following hold:

1. The symbol \( \partial_t C(U; t, \cdot) \) belongs to \( \Sigma_{K, K', p+1}[r, N] \otimes \mathcal{M}_2(C) \);
2. If \( \tilde{M}(U; t) \) is a (R,R,P) map (see Def. 2.36) and \( C(U; t, x, \xi) \) is a (R,R,P) symbol (see Def. 2.39) then the symbol \( \partial_t C(U; t, \cdot) \) is reality preserving, parity preserving and reversible, i.e. satisfies respectively the (2.73), (2.74) and (2.75).

Proof. Item (i) follows by Lemma 2.2.6 in [7]. Let us check item (ii). Assume that \( C(U; t, x, \xi) \) is a non-homogeneous symbol in \( \Gamma_{K, K', p}^{m}[r] \). By differentiating in \( t \) the relation
\[
SC(U; -t, x, \xi) = C(U; t, x, \xi)
\]
one gets that \( (\partial_t C)(U; t, x, \xi) \) is reversible. Assume now that \( C \in \tilde{\Gamma}_p \). Since \( C(U; x, \xi) \) is reversibility preserving then
\[
C(U_S, \ldots, U_S; t, x, \xi)S = SC(U, \ldots, U; -t, x, \xi).
\tag{2.85}
\]
Hence differentiating in \( t \) we get
\[
\sum_{j=1}^{p} C(U_S, \ldots, (\partial_t U)_S, \ldots, U_S; t, x, \xi)S = -\sum_{j=1}^{p} SC(U, \ldots, iE\tilde{M}(U(t)) \ldots, U; -t, x, \xi).
\tag{2.86}
\]
Using that \( \tilde{M}(U; t) \) is reversibility preserving we have
\[
(\partial_t U)_S = S(iE\tilde{M}(U; t))(-t) = -iES\tilde{M}(U; t)U(-t) = -iE\tilde{M}(U_S(t))U_S(t),
\]
which implies, together with (2.86) the (2.75) for \( (\partial_t C)(U; t, x, \xi) \). The (2.73) and (2.74) follows by using the definitions.

We prove a lemma which asserts that a (R,R,P) operator which is the sum of a para-differential operator and a smoothing remainder may be rewritten as the sum of a (R,R,P) para-differential operator and a (R,R,P) smoothing remainder.

Lemma 2.46. Fix \( \rho, r > 0, K \geq K' > 0 \) in \( \mathbb{N} \), \( m', m'' \) in \( \mathbb{N} \). Let \( A(U; t, x, \xi) = \sum_{j=-m'}^{m''} A_j(U; t, x, \xi) \) be a matrix of symbols such that \( A_j(U; t, x, \xi) \) is in \( \Sigma_{K, K', p}[r, N] \) for any \( j = -m', \ldots, m'' \) and \( R(U; t) \) a matrix of operators in \( \Sigma_{K, K', p}[r, N] \). If the sum \( \text{Op}^{BW}(A(U; t, x, \xi)) + R(U; t) \) is a (R,R,P) operator, then there exist (R,R,P) matrices \( \tilde{A}_j(U; t, x, \xi) \) in \( \Sigma_{K, K', p}[r, N] \) for any \( j = -m', \ldots, m'' \) and a (R,R,P) smoothing remainder \( \tilde{R}(U; t) \) such that
\[
\text{Op}^{BW}(A(U; t, x, \xi)) + R(U; t) = \text{Op}^{BW}(\tilde{A}(U; t, x, \xi)) + \tilde{R}(U; t),
\]
with \( \tilde{A}(U; t, x, \xi) = \sum_{j=-m'}^{m''} \tilde{A}_j(U; t, x, \xi) \).

Proof. We show how to construct the reversibility preserving operator associated to the one of the hypothesis, the parity and reality preserving construction is similar. Since the sum \( \text{Op}^{BW}(A(U; t, x, \xi)) + R(U; t) \) is a (R,R,P) operator we obtain
\[
\text{Op}^{BW}(A(U; t, x, \xi)) + R(U; t) = \frac{1}{2} \left( \text{Op}^{BW}(A(U; t, x, \xi)) + R(U; t) - \text{Op}^{BW}(SA(U_S; -t, x, \xi)S) - SR(U_S; t)S \right), \tag{2.87}
\]
therefore it is sufficient to define \( \tilde{A}(U; t, x, \xi) := \frac{1}{2}(A(U; t, x, \xi) - SA(U_S; -t, x, \xi)S) \) and \( \frac{1}{2}(\tilde{R}(U; t) := R(U; t) - SR(U_S; t)) \). Consequently each term \( \tilde{A}_j(U; t, x, \xi) \) may be chosen equal to \( \frac{1}{2}(A_j(U; t, x, \xi) - SA_j(U_S; -t, x, \xi)) \) for \( j = -m', \ldots, m'' \).\( \square \)
3 Paralinearization of NLS

The main result of this section is the following.

**Theorem 3.1 (Para-linearization of NLS).** Consider the system \( \text{(1.15)} \) under the Hypothesis \( \text{(1.11)} \). For any \( N \in \mathbb{N} \), \( K \in \mathbb{N} \), \( r > 0 \) and any \( \rho > 0 \) there exists a \((R,R,P)\)-matrix of symbols (see Def. 2.39) \( A(U; t, x, \xi) \) belonging to \( \Sigma_{(r,K,0.2)} \) and a \((R,R,P)\)-operator (see Def. 2.36) \( R(U) \) such that \( \Sigma_{(r,K,0.2)}^{\rho} \) belonging to \( \Sigma_{(r,K,0.2)}^{\rho} \) \( \otimes \mathcal{M}_2(\mathbb{C}) \) and \( \otimes \mathcal{M}_2(\mathbb{C}) \) such that the system \( \text{(1.15)} \) can be written as

\[
\partial_t U = iE \left[ AU + \text{Op}^{\text{BW}}(A(U; t, x, \xi))[U] + R(U)[U] \right],
\]

where \( E \) and \( \Lambda \) are defined respectively in \( \text{(1.13)} \) and \( \text{(1.14)} \). Moreover \( A(U; t, x, \xi) \) has the form

\[
A(U; t, x, \xi) := A_2(U; t, x)(i\xi)^2 + A_1(U; t, x)(i\xi) + A_0(U; t, x),
\]

\[
A_i(U; t, x) := \frac{a_i(U; t, x)}{b_i(U; t, x)} \quad \text{for } i = 0, 1, 2;
\]

where \( a_j(U; t, x), b_j(U; t, x) \in \Sigma_{(r,K,0.1)} \) for \( j = 0, 1, 2; \) \( a_2(U; t, x) \) is real for any \( x \in \mathbb{T} \).

In order to prove Theorem \( \text{[3.1]} \) we need to study the para-product of Bony.

For fixed \( p \in \mathbb{N}, p \geq 2 \) for any \( u_1, \ldots, u_p \), even in \( x, \) in \( C^\infty(\mathbb{T}; \mathbb{C}) \), define the map \( M \) as

\[
M : (u_1, \ldots, u_p) \mapsto M(u_1, \ldots, u_p) := \prod_{i=1}^p \partial_{x_i} u_i = \sum_{n_1, \ldots, n_p \in \mathbb{N}} \prod_{i=1}^p (i \xi_i)^{\kappa_i} \Pi_{n_i} u_i
\]

where \( \kappa_i \in \mathbb{N} \) for \( i = 1, \ldots, p \). Notice that we can also write

\[
M(u_1, \ldots, u_p) = \sum_{n_0 \in \mathbb{N}} \sum_{n_1, \ldots, n_p \in \mathbb{N}} \Pi_{n_0} M(\Pi_{n_1} u_1, \ldots, \Pi_{n_p} u_p).
\]

We remark that the term \( \Pi_{n_0} M(\Pi_{n_1} u_1, \ldots, \Pi_{n_p} u_p) \) is different from zero only if there exists a choice of signs \( \sigma_j \in \{ \pm 1 \} \) such that

\[
\sum_{j=0}^p \sigma_j n_j = 0,
\]

since the map \( M \) is just a product of functions.

Fix \( 0 < \delta < 1 \) and consider an admissible cut-off function \( \chi_{p-1} : \mathbb{R}^{p-1} \times \mathbb{R} \rightarrow \mathbb{R} \) (see Def. 2.22). We define a new cut-off function \( \theta : \mathbb{N}^p \rightarrow [0, 1] \) in the following way: given any \( \vec{n} := (n_1, \ldots, n_p) \in \mathbb{N}^p \) we set

\[
\theta(n_1, \ldots, n_p) := 1 - \sum_{i=1}^p \chi_{p-1}^{(i)}(\vec{n}) = \chi_{p-1}(\xi', n_1), \quad \xi' := (n_1, \ldots, n_{i-1}, n_{i+1}, \ldots, n_p).
\]

We use the following notation: for any \( u_1, \ldots, u_p \in C^\infty(\mathbb{T}; \mathbb{C}) \) we shall write

\[
(u_1, \ldots, \partial_{x_i}, \ldots, u_p) = (u_1, \ldots, u_{i-1}, u_{i+1}, \ldots, u_p), \quad i = 1, \ldots, p,
\]

similarly for any \( U_1, \ldots, U_p \in C^\infty(\mathbb{T}; \mathbb{C}^2) \) we shall write

\[
(U_1, \ldots, \partial_{x_i}, \ldots, U_p) = (U_1, \ldots, U_{i-1}, U_{i+1}, \ldots, U_p), \quad i = 1, \ldots, p.
\]
Using the splitting in (3.6) we shall write
\[
M(u_1, \ldots, u_p) = \sum_{i=1}^{p} M_i(u_1, \ldots, u_p) + M^\Theta(u_1, \ldots, u_p),
\]
\[
M^\Theta(u_1, \ldots, u_p) := A^\Theta(u_1, \ldots, u_p-1)[u_p] := \sum_{n_1, \ldots, n_p \in \mathbb{N}} \Theta(n_1, \ldots, n_p) \prod_{j=1}^{p} ((in_j)^{\kappa_j} \Pi_{n_j} u_j),
\]
\[
M_i(u_1, \ldots, u_p) := A^{(i)}(u_1, \ldots, u_i, \ldots, u_p)[u_i] := \sum_{n_1, \ldots, n_p \in \mathbb{N}} \chi^{(i)}_{p-1}(n) \prod_{j=1, j \neq i}^{p} ((in_j)^{\kappa_j} \Pi_{n_j} u_j) (in_i)^{\kappa_i} \Pi_{n_i} u_i.
\]

In the following lemma we prove that the multilinear operator \(A^\Theta\) in (3.9) is a smoothing operator.

**Lemma 3.2 (Remainders).** There is \(Q\) in \(\tilde{\mathcal{R}}_{\rho}^{-p}\), for any \(\rho \geq 0\), such that for any \(U_i \in C^\infty(\mathbb{T}; C^2)\), \(U_p \in C^\infty(\mathbb{T}; C)\), for \(i = 1, \ldots, p - 1\), we have
\[
Q(U_1, \ldots, U_{p-1})[U_p] \equiv A^\Theta(u_1, \ldots, u_{p-1})[U_p],
\]
where \(U_i = (u_i, z_i)^T\), \(z_i \in C^\infty(\mathbb{T}; C)\), for \(i = 1, \ldots, p - 1\), and where \(A^\Theta\) is defined in (3.9).

**Proof.** Let \(U_i \in C^\infty(\mathbb{T}; C^2)\) be of the form \(U_i = (u_i, z_i)^T\) for \(i = 1, \ldots, p - 1\), consider also \(U_p \in C^\infty(\mathbb{T}; C)\). In order to obtain (3.10) it is enough to choose
\[
Q(U_1, \ldots, U_{p-1})[U_p] = \sum_{n_1, \ldots, n_p \in \mathbb{N}} \theta(n_1, \ldots, n_p) \left[ \begin{array}{cc} 1 & 0 \\ 0 & 0 \end{array} \right] \left( \prod_{j=1}^{p-1} (in_j)^{\kappa_j} \Pi_{n_j} u_j \right) (in_p)^{\kappa_p} U_p.
\]

The “autonomous” condition in (2.7) for \(Q\) follows from the following fact: from (3.9) we have
\[
\Pi_{n_0} Q(\Pi_{n_1} U_1, \ldots, \Pi_{n_{p-1}} U_{p-1})[\Pi_{n_p} U_p] = \Pi_{n_0} M^\Theta(\Pi_{n_1} u_1, \ldots, \Pi_{n_p} u_p),
\]
which is different from zero only if (3.5) holds true for a suitable choice of signs \(\sigma_j \in \{\pm 1\}\). In order to prove (2.6) we need estimate, for any \(n_0 \in \mathbb{N}\), the term
\[
||\Pi_{n_0} Q(\Pi_{n_1} U_1, \ldots, \Pi_{n_{p-1}} U_{p-1})[\Pi_{n_p} U_p]||_{L^2} = ||\Pi_{n_0} A^\Theta(\Pi_{n_1} u_1, \ldots, \Pi_{n_{p-1}} u_{p-1})[\Pi_{n_p} U_p]||_{L^2}
\]
for \(\sum_{j=1}^{p} \sigma_j n_j = 0\) for some choice of signs \(\sigma_j \in \{\pm 1\}\). We note that, if there exists \(i = 1, \ldots, p\) such that \(\chi^{(i)}_{p-1} \equiv 1\), i.e. \(\sum_{j \neq i} |n_j| \leq (\delta/2) |n_i|\), then we have \(\theta(n_1, \ldots, n_p) \equiv 0\). Hence we have the following inclusion:
\[
\{ (n_1, \ldots, n_p) \in \mathbb{N}^p : \theta(n_1, \ldots, n_p) \neq 0 \} \subseteq \bigcap_{i=1}^{p} \left\{ (n_1, \ldots, n_p) \in \mathbb{N}^p : \delta/2 n_i < \sum_{j \neq i} n_j \right\}.
\]

This implies that there exists constants \(0 < c \leq C\) such that
\[
c \max\{ \langle n_1 \rangle, \ldots, \langle n_p \rangle \} \leq \max_2\{ \langle n_1 \rangle, \ldots, \langle n_p \rangle \} \leq \max\{ \langle n_1 \rangle, \ldots, \langle n_p \rangle \}.
\]

Without loss of generality we can assume \(n_1 \leq \ldots \leq n_p\). There exists a constant \(K > 0\), depending on \(p\), such that we can bound (3.12) by
\[
K \prod_{j=1}^{p} ||(in_j)^{\kappa_j} \Pi_{n_j} u_j||_{L^2} \leq K \frac{\max_2\{ \langle n_1 \rangle, \ldots, \langle n_p \rangle \}^{p+\mu}}{\max\{ \langle n_1 \rangle, \ldots, \langle n_p \rangle \}^p} \prod_{j=1}^{p} ||\Pi_{n_j} u_j||_{L^2},
\]
with \(\mu := \sum_{i=1}^{p} \kappa_i\). This is the (2.5).
Lemma 3.3 (Para-differential operators). For any \( i = 1, \ldots, p \) there are symbols \( b^{(i)}(U_1, \ldots, \hat{U}_i, \ldots, U_p; x, \xi) \) belonging to \( \Gamma_{p-1}^{\kappa_i} \) such that (recalling Definition 2.23)

\[
A^{(i)}(u_1, \ldots, \hat{u}_i, \ldots, u_p)[u_i] = \text{Op}^{B}(b^{(i)}(U_1, \ldots, \hat{U}_i, \ldots, U_p; x, \xi))\left[\begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}\right] U_i,
\]  

(3.16)

where \( U_i = (u_i, z_i)^T, z_i \in C^\infty(T; \mathbb{C}), \) for \( i = 1, \ldots, p, \) \( A^{(i)} \) are defined in (3.9).

Proof. We introduce the function

\[
a^{(i)}(u_1, \ldots, \hat{u}_i, \ldots, u_p; x, \xi) := \left(\prod_{j \neq i} (\partial_{x}^{\kappa_j}/u_j)\right)(i\xi)^{\kappa_i}.
\]

(3.17)

By (3.9) and Definition 2.23 we can note that

\[
A^{(i)}(u_1, \ldots, \hat{u}_i, \ldots, u_p)[u_i] = \text{Op}^{B}(a^{(i)}(u_1, \ldots, \hat{u}_i, \ldots, u_p; x, \xi))[u_i].
\]

(3.18)

For \( i = 1, \ldots, p \) we set

\[
b^{(i)}(U_1, \ldots, \hat{U}_i, \ldots, U_p; x, \xi) := \left[\begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}\left(\prod_{j \neq i} \partial_{x}^{\kappa_j}/u_j\right)\right](i\xi)^{\kappa_i}.
\]

(3.19)

We show that \( b^{(i)} \) belongs to the class \( \Gamma_{p-1}^{\kappa_i} \). Let us check condition (4.15). By symmetry we study the case \( i = p \). We have that

\[
|\partial_{x}^{\alpha} \partial_{\xi}^{\beta} b^{(p)}(\Pi_{n_1} U_1, \ldots, \Pi_{n_{p-1}} U_{p-1}; x, \xi)| \leq C(\alpha, \beta) \sum_{s_j \in \mathbb{N}} \prod_{j=1}^{p-1} |n_j|^{s_j+2} |\Pi_{n_j} u_j||\xi|^{2p-\beta}
\]

(3.20)

\[
\leq C(\alpha, \beta)\langle\xi\rangle^{2p-\beta} \max\{\langle n_1 \rangle, \ldots, \langle n_{p-1} \rangle\}^{\mu+\alpha} \prod_{j=1}^{p-1} \|\Pi_{n_j} u_j\|_{L^2},
\]

with \( \mu := \sum_{i=1}^{p} \kappa_i \).

\[\square\]

Proof of Theorem 3.1. Recalling the form of the non linearity \( f \) in (1.2) we prove the thesis by studying the contribution to the system coming from the generic monomial

\[
C_{\alpha, \beta}(z_0)^{\alpha_0}(z_1)^{\beta_0}(z_1)^{\alpha_1}(z_2)^{\beta_1}(z_2)^{\alpha_2}(z_2)^{\beta_2}, \quad C_{\alpha, \beta} \in \mathbb{R},
\]

with \( (\alpha, \beta) := (\alpha_0, \beta_0, \alpha_1, \beta_1, \alpha_2, \beta_2) \in \mathbb{N}^6 \) and \( \sum_{i=0}^{2}(\alpha_i + \beta_i) = p \) for a fixed \( 2 \leq p \leq q \). More precisely we show that we can write

\[
\left(C_{\alpha, \beta} u^{\alpha_0} u^{\beta_0} \partial_{x}^{\alpha_1} \partial_{x}^{\beta_1} u^{\alpha_2} \partial_{x}^{\beta_2} \right) = \text{Op}^{BW}(A(U; t, x, \xi))[U] + R(U)[U],
\]

(3.21)

where \( A \) is a \((R, R, P)\)-matrix of symbols and \( R \) a \((R, R, P)\)-operator. By the first item of Hypothesis 1.1 we note that we must have \( \alpha_1 + \beta_1 = 2k \) for some \( k \in \mathbb{N} \). For any \( (\alpha, \beta) \in A_p \) (see (1.3)) let \( M \) be the multilinear operator defined in (3.3) with

\[
\kappa_i = 0, \quad i = 1, \ldots, \alpha_0 + \beta_0,
\]

(3.22)

\[
\kappa_i = 1, \quad i = \alpha_0 + \beta_0 + 1, \ldots, \alpha_0 + \beta_0 + \alpha_1 + \beta_1,
\]

(3.22)

\[
\kappa_i = 2, \quad i = \alpha_0 + \beta_0 + \alpha_1 + \beta_1 + 1, \ldots, p.
\]

25
The key result of this section is the following.

Furthermore the matrix of symbols

\[ A_0 u_0 \cdots u_n u_{20} \cdots u_{n0} = A_0 \mathcal{M}(u_0, \ldots, u_n, u_{20}, \ldots, u_{n0}) \]

\[ a_0 \text{ - times } \beta_0 \text{ - times } \alpha_1 \text{ - times } \beta_1 \text{ - times } \alpha_2 \text{ - times } \beta_2 \text{ - times} \]  

Lemma 3.2 - 3.3 guarantees that there are multilinear functions \( b_j, c_j \in \mathcal{F}_{p-1} \), \( j = 0, 1, 2 \) and a multilinear remainder \( \tilde{Q} \in \mathcal{R}_{p-1}^\rho \) such that the r.h.s. of (3.23) is equal to

\[
\sum_{j=0}^{2} \text{Op}^{BW}(b_j(U; x)(i\xi)^j)u + \sum_{j=0}^{2} \text{Op}^{BW}(c_j(U; x)(i\xi)^j)\tilde{u} + Q(U)[u],
\]

where \( b_j(U; x) := \tilde{b}_j(U, \ldots, U; x), c_j(U; x) := \tilde{c}_j(U, \ldots, U; x) \) and \( Q(U)[\cdot] := \tilde{Q}(U, \ldots, U)[\cdot] \). Therefore

\[
\left( C_{\alpha,\beta} u_0^{\alpha_0} u_0^{\beta_0} u_1^{\alpha_1} u_1^{\beta_1} u_2^{\alpha_2} u_2^{\beta_2} \right) = \text{Op}^{BW}(B(U; x, \xi))[U] + Q_1(U)[U],
\]

where \( B(U; x, \xi) \) is in \( \Sigma_{K,0,1}^2[r,N,\text{aut}] \otimes \mathcal{M}_2(\mathbb{C}), Q_1 \in \Sigma_{R_{K,0,1}^\rho}[r,N,\text{aut}] \otimes \mathcal{M}_2(\mathbb{C}) \) for any \( N > 0 \) and \( \rho > 0 \). Furthermore the matrix of symbols \( B(U; x, \xi) \) has the form

\[
B(U; x, \xi) := B_2(U; x)(i\xi)^2 + B_1(U; x)(i\xi) + B_0(U; x),
\]

\[
B_j(U; x) := \left( \begin{array}{c} b_j(U; x) \\ c_j(U; x) \\ b_j(U; x) \end{array} \right), \quad j = 0, 1, 2.
\]

By using the formula (3.24) one constructs a matrix of symbols \( A(U; x, \xi) \in \Sigma_{K,0,1}^2[r,N,\text{aut}] \otimes \mathcal{M}_2(\mathbb{C}) \) such that

\[
\text{Op}^{BW}(A(U; x, \xi))[\cdot] = \text{Op}^{BW}(B(U; x, \xi))[\cdot],
\]

up to smoothing remainders in \( \Sigma_{R_{K,0,1}^\rho}[r,N,\text{aut}] \otimes \mathcal{M}_2(\mathbb{C}) \). Hence we have obtained

\[
\left( C_{\alpha,\beta} u_0^{\alpha_0} u_0^{\beta_0} u_1^{\alpha_1} u_1^{\beta_1} u_2^{\alpha_2} u_2^{\beta_2} \right) = \text{Op}^{BW}(A(U; x, \xi))[U] + R(U)[U],
\]

for some \( R \in \Sigma_{R_{K,0,1}^\rho}[r,N,\text{aut}] \otimes \mathcal{M}_2(\mathbb{C}) \), therefore Lemma 2.46 guarantees that we may assume that both \( A(U; x, \xi) \) and \( R(U) \) are respectively (R,R,P)-matrix of symbols and (R,R,P)-operator, since we can write

\[
\left( C_{\alpha,\beta} u_0^{\alpha_0} u_0^{\beta_0} u_1^{\alpha_1} u_1^{\beta_1} u_2^{\alpha_2} u_2^{\beta_2} \right) = M(U, \ldots, U)[U],
\]

for some (R,R,P)-map \( M \in \Sigma_{\mathcal{M}_{K,0,1}}[r,N,\text{aut}] \otimes \mathcal{M}_2(\mathbb{C}) \). The fact that, after applying Lemma 2.46, the new matrix \( A(U; x, \xi) \) has still the form (3.2) can be easily deduced from Lemma 2.87 of the proof of such a lemma.

\[
\square
\]

### 4 Regularization

We proved in Theorem 3.1 that for any \( N \in \mathbb{N} \) and any \( \rho > 0 \) the equation (1.1) is equivalent to the system (3.1).

The key result of this section is the following.
Theorem 4.1 (Regularization). Fix $N > 0$, $\rho > N$ and $K > \rho$. There exist $s_0 > 0$ and $r_0 > 0$ such that for any $s \geq s_0$, $0 < r \leq r_0$ and any $U \in B_+^K(1, r)$ solution even in $x \in T$ of (3.1) the following holds. There exist two $(R, R, P)$-maps

$$
\Phi(U)[\cdot], \Psi(U)[\cdot] : C_{sR}^{K-\rho}(I, H^s(T; C^2)) \to C_{sR}^{K-\rho}(I, H^s(T; C^2))
$$

with $K' := 2\rho + 4$ satisfying the following:

(i) there exists a constant $C$ depending on $s$, $r$ and $K$ such that

$$
\|\Phi(U)V\|_{K-K', s} \leq \|V\|_{K-K', s} (1 + C \|U\|_{K,s_0})
$$

$$
\|\Psi(U)V\|_{K-K', s} \leq \|V\|_{K-K', s} (1 + C \|U\|_{K,s_0})
$$

for any $V$ in $C_{sR}^{K-1}(I, H^s)$;

(ii) $\Phi(U)[\cdot] - 1$ and $\Psi(U)[\cdot] - 1$ belong to the class $\Sigma \mathcal{M}_{K,K',1}[r, N] \otimes \mathcal{M}_2(C)$; moreover $\Psi(U)[\Phi(U)[\cdot]] - 1$ is a smoothing operator in the class $\Sigma \mathcal{R}_{K,K',1}[r, N] \otimes \mathcal{M}_2(C)$;

(iii) the function $V = \Phi(U)U$ solves the system

$$
\partial_t V = i E(AV + \text{Op}^{BW}(L(U; t, \xi))V + Q_1(U)V + Q_2(U)U),
$$

where $\Lambda$ is defined in (1.14), the operators $Q_1(U)[\cdot]$ and $Q_2(U)[\cdot]$ are $(R, R, P)$ smoothing operators in the class $\Sigma \mathcal{R}_{K,K',1}[r, N] \otimes \mathcal{M}_2(C)$ for some $m > 0$ depending on $N$, $L(U; t, \xi)$ is a $(R, R, P)$-matrix in $\Sigma \mathcal{R}_{K,K',1}[r, N] \otimes \mathcal{M}_2(C)$ and has the form

$$
L(U; t, \xi) := \begin{pmatrix}
\bar{m}(U; t, \xi) & 0 \\
0 & \bar{m}(U; t, -\xi)
\end{pmatrix}, \quad \bar{m}(U; t, \xi) = m_2(U; t)(i\xi)^2 + m_0(U; t, \xi),
$$

where $m_2(U; t)$ is a real symbol in $\Sigma \mathcal{F}_{K,K',1}[r, N]$, $m_0(U; t, \xi)$ is in $\Sigma \mathcal{F}_{K,K',1}[r, N]$ and both of them are constant in $x \in T$.

During this section we shall use the following notation.

**Definition 4.2.** We define the commutator between the operators $A$ and $B$ as $[A, B]_+ = A \circ B - B \circ A$ and the anti-commutator as $[A, B]_- = A \circ B + B \circ A$.

### 4.1 Diagonalization of the second order operator

The goal of this subsection is to transform the matrix of symbols $E(1 + A_2(U; t, x))(i\xi)^2$ (where $A_2(U; t, x)$ is defined in (4.2)) into a diagonal one up to a smoothing term.

**Proposition 4.3.** Fix $N > 0$, $\rho > N$ and $K > \rho$, then there exist $s_0 > 0$, $r_0 > 0$, such that for any $s \geq s_0$, any $0 < r \leq r_0$ and any $U \in B_+^K(1, r)$ solution even in $x \in T$ of (3.1) the following holds. There exist two $(R, R, P)$-maps

$$
\Phi_1(U)[\cdot], \Psi_1(U)[\cdot] : C_{sR}^{K-1}(I, H^s) \to C_{sR}^{K-1}(I, H^s),
$$

satisfying the following:

(i) there exists a constant $C$ depending on $s$, $r$ and $K$ such that

$$
\|\Phi_1(U)V\|_{K-1, s} \leq \|V\|_{K-1, s} (1 + C \|U\|_{K,s_0})
$$

$$
\|\Psi_1(U)V\|_{K-1, s} \leq \|V\|_{K-1, s} (1 + C \|U\|_{K,s_0})
$$

for any $V$ in $C_{sR}^{K-1}(I, H^s)$.
(ii) \( \Phi_1(U)[\cdot] - \mathbb{1} \) and \( \Psi_1(U)[\cdot] - \mathbb{1} \) belong to the class \( \Sigma M_{K,1,1}[r, N] \otimes M_2(\mathbb{C}) \): \( \Phi_1(U)[\Phi_1(U)[\cdot]] - \mathbb{1} \) is a smoothing operator in the class \( \Sigma R_{K,1,1}[r, N] \otimes M_2(\mathbb{C}) \);

(iii) the function \( V_1 = \Phi_1(U)U \) solves the system

\[
\partial_t V_1 = i E (AV_1 + \text{Op}^{BW} (A^{(1)}(U; t, x, \xi))V_1 + R_1^{(1)}(U)V_1 + R_2^{(1)}(U)U),
\]

where \( \Lambda \) is defined in (3.14), \( A^{(1)}(U; t, x, \xi) = A_1^{(1)}(U; t, x)(i\xi)^2 + A_1^{(1)}(U; t, x)(i\xi) + A_0^{(1)}(U; t, x) \) is a \((R,R,P)\) matrix in the class \( \Sigma M_{K,1,1}[r, N] \otimes M_2(\mathbb{C}) \) with \( A_j^{(1)}(U; t, x) \) in \( \Sigma F_{K,1,1}[r, N] \otimes M_2(\mathbb{C}) \) for \( j = 0, 1, 2 \) and

\[
A_2^{(1)}(U; t, x) = \begin{pmatrix}
a_2^{(1)}(U; t, x) & 0 \\
0 & a_2^{(1)}(U; t, x)
\end{pmatrix},
\]

with \( a_2^{(1)}(U; t, x) \) real valued, the operators \( R_1^{(1)}(U)[\cdot] \) and \( R_2^{(1)}(U)[\cdot] \) are \((R,R,P)\) smoothing operators in the class \( \Sigma R_{K,1,1}^{-\mu+2}[r, N] \otimes M_2(\mathbb{C}) \).

**Proof.** The matrix \( E(1 + A_2(U; t, x)) \) in (3.1) and (3.2) has eigenvalues

\[
\lambda^\pm(U; t, x) = \pm \sqrt{(1 + a_2(U; t, x))^2 - |b_2(U; t, x)|^2},
\]

which are real and well defined since \( U \) is, by assumption, in \( B^R_0(I, r) \) with \( r \) small enough. The matrix of eigenfunctions is

\[
M(U; t, x) = \frac{1}{2} \begin{pmatrix}
1 + a_2(U; t, x) + \lambda^+(U; t, x) & -b_2(U; t, x) \\
-b_2(U; t, x) & 1 + a_2(U; t, x) + \lambda^+(U; t, x)
\end{pmatrix},
\]

it is invertible with inverse

\[
M(U; t, x)^{-1} = \frac{1}{\det(M(U; t, x))} \begin{pmatrix}
1 + a_2(U; t, x) + \lambda^+(U; t, x) & b_2(U; t, x) \\
-b_2(U; t, x) & 1 + a_2(U; t, x) + \lambda^+(U; t, x)
\end{pmatrix}
\]

\[
= 2 \begin{pmatrix}
\frac{1}{b_2(U; t, x)} & \frac{1}{\lambda^+(U; t, x)} \\
\frac{1}{\lambda^+(U; t, x) + a_2(U; t, x)} & \frac{1}{\lambda^+(U; t, x) + a_2(U; t, x)}
\end{pmatrix}.
\]

Therefore one has

\[
M(U; t, x)^{-1}E(1 + A_2(U; t, x))M(U; t, x) = \begin{pmatrix}
\lambda^+(U; t, x) & 0 \\
0 & \lambda^-(U; t, x)
\end{pmatrix} = E\begin{pmatrix}
\lambda^+(U; t, x) & 0 \\
0 & \lambda^-(U; t, x)
\end{pmatrix}.
\]

By using the last item in Remark 2.40, since the matrix \( E(1 + A_2(U; x)) \) is reversibility preserving, we have that the matrix \( M(U; t, x) \) (and therefore the matrix \( M^{-1}(U; t, x) \) by the first item in Remark 2.40) is reversibility preserving. Arguing in the same way one deduces that both the matrices are \((R,R,P)\). In particular the matrix in (4.7) is \((R,R,P)\).

Note that by Taylor expanding the function \( \sqrt{1 + x} \) at \( x = 0 \) one can prove that the matrices \( M(U; t, x) - \mathbb{1}, M(U; t, x)^{-1} - \mathbb{1} \) and \( M(U; t, x)^{-1}E(1 + A_2(U; t, x))M(U; t, x) - \mathbb{1} \) belong to the space \( \Sigma F_{K,0,1}[r, N] \otimes M_2(\mathbb{C}) \).

We set

\[
\Phi_1(U; t, x)[\cdot] := \text{Op}^{BW} (M(U; t, x)^{-1})[\cdot],
\]

\[
\Psi_1(U; t, x)[\cdot] := \text{Op}^{BW} (M(U; t, x))[\cdot],
\]

these are \((R,R,P)\) maps according Definition 2.36 moreover by using Propositions 2.35, 2.27 and the discussion above one proves items (i) and (ii) of the statement. The function \( V_1 := \Phi_1(U)U \) solves the equation

\[
\partial_t V_1 = \text{Op}^{BW} (\partial_t(M(U; t, x)^{-1}))U + \text{Op}^{BW} (M(U; t, x)^{-1}) \partial_t U
\]

\[
= \text{Op}^{BW} (\partial_t(M(U; t, x)^{-1}))U + \text{Op}^{BW} (M(U; t, x)^{-1})iE(\Lambda U + \text{Op}^{BW} (A(U; t, x, \xi)U + R(U)U)).
\]
We know by previous discussions that $U = \Psi_1(U)V_1 + \tilde{R}(U)U$ for a (R,R,P) smoothing operator $\tilde{R}(U)$ belonging to $\Sigma R_{K,1}^0[r,N] \otimes \mathcal{M}_2(\mathbb{C})$; plugging this identity in the equation (4.9) we get

$$\partial_t V_1 = \text{Op}^{BW} (\partial_t (M(U; t, x)^{-1})) \text{Op}^{BW} (M(U; t, x)) V_1 + \text{Op}^{BW} (M(U; t, x)^{-1}) i E ((\Lambda + \text{Op}^{BW} (A(U; t, x, \xi))) \text{Op}^{BW} (M(U; t, x)) V_1) \tag{4.9}$$

where $\partial_t (M(U; t, x)^{-1})$ is a realizable, parity and reality preserving matrix of symbols in the class $\Sigma G_{K,1,1}^0[r,N] \otimes \mathcal{M}_2(\mathbb{C})$ thanks to Lemma 2.35 and

$$\tilde{R}(U)[U] = \left( \text{Op}^{BW} (\partial_t (M(U; t, x)^{-1}) + \text{Op}^{BW} (M(U; t, x)^{-1}) \circ \text{Op}^{BW} (i E (\Lambda + A(U; t, x, \xi))) \right) \left[ \tilde{R}(U)U \right] + \text{Op}^{BW} (M(U; t, x)^{-1}) i E R(U)U$$

is a reality preserving and reversible smoothing operator (according to Def. 2.36) in the class $\Sigma G_{K,1,1}^0[r,N] \otimes \mathcal{M}_2(\mathbb{C})$. Therefore the theorem is proved by setting $Q_1(U) := \text{Op}^{BW} (\partial_t (M(U; t, x)^{-1}) (M(U; t, x)) V_1 + Q_1(U) V_1,$

where $Q_1(U) [\cdot]$ is a reversible, parity and reality preserving smoothing operator in the class $\Sigma R_{K,1,1}^0[r,N] \otimes \mathcal{M}_2(\mathbb{C})$ and $\partial_t (M(U; t, x)^{-1}) (M(U; t, x))$ is in $\Sigma G_{K,1,1}^0[r,N] \otimes \mathcal{M}_2(\mathbb{C})$. Recalling that $A(U; t, x, \xi)$ has the form $\Lambda + A(U; t, x, \xi)$ we expand the second summand in the r.h.s. of (4.9) as follows

$$i E \Lambda V_1 + i E \text{Op}^{BW} \left( \begin{array}{cc}
\rho(U; t, x) - 1 & 0 \\
0 & \rho(U; t, x) - 1 \end{array} \right) (i \xi)^2 \right) V_1 + i E \text{Op}^{BW} \left( A^{(1)}(U; t, x) (i \xi) \right) V_1 + Q_2(U) V_1$$

where $Q_2(U) [\cdot]$ is a smoothing operator in the class $\Sigma R_{K,1,1}^0[r,N] \otimes \mathcal{M}_2(\mathbb{C})$, $\tilde{A}_{0}^{(1)}(U; t, x)$ and $A^{(1)}(U; t, x)$ are matrices of functions in the class $\Sigma F_{K,1,1}^0[r,N] \otimes \mathcal{M}_2(\mathbb{C})$. Moreover, by Lemmata 2.46 and 2.44 each matrix $\tilde{A}_{0}^{(1)}(U; t, x)$, $A^{(1)}(U; t, x)[i \xi]$ and $A^{(1)}(U; t, x)[i \xi]^2$ is (R,R,P) according to Definition 2.39 and the operator $Q_2(U)$ is reversible, reality and parity preserving according to Definition 2.36. Therefore the theorem is proved by setting

$$\tilde{a}_{2}^{(1)}(U; t, x) := \rho(U; t, x) - 1,$n_{\tilde{a}_{0}^{(1)}(U; t, x)} := \tilde{a}_{0}^{(1)}(U; t, x) - i E (\partial_t (M(U; t, x)^{-1}) (M(U; t, x))),$$

$$R_{2}^{(1)}(U) := -i E \tilde{R}(U)U,$n_{R_{1}^{(1)}(U)} := -i E (Q_1(U) + Q_2(U)).$$

### 4.2 Diagonalization of lower order operators

**Proposition 4.4.** There exist $s_0 > 0$, $r_0 > 0$, such that for any $s \geq s_0$, any $0 < r \leq r_0$ and any $U \in B^s_r(I, r)$ solution of (3.1) the following holds. There exist two (R,R,P)-maps

$$\Phi_2(U) [\cdot], \Psi_2(U) [\cdot] : C^{K-\rho-2}_{s+1}(I, H^s) \rightarrow C^{K-\rho-2}_{s+1}(I, H^s),$$

satisfying the following

---

29
(i) there exists a constant $C$ depending on $s$, $r$ and $K$ such that
\[
\|\Phi_2(U)V\|_{K_{\rho-2,s}} \leq \|V\|_{K_{\rho-2,s}} (1 + C \|U\|_{K,s_0})
\]
for any $V$ in $C^R_{4R^2}(I, H^s)$;

(ii) $\Phi_2(U)[\cdot] - 1$ and $\Psi_2(U)[\cdot] - 1$ belong to the class $\Sigma M_{K, r+2,1}[r, N] \otimes M_2(C)$; $\Psi_2(U)[\Phi_2(U)[\cdot]] - 1$ is a smoothing operator in the class $\Sigma R_{K, r+2,1}[r, N] \otimes M_2(C)$;

(iii) the function $V_2 = \Phi_2(U)V_1$ (where $V_1$ is the solution of (4.5)) solves the system
\[
\partial_t V_2 = iE(AV_2 + Op^{BW}(A^{(2)}(U;t,x,\xi))V_2 + R_1^{(2)}(U)V_2 + R_2^{(2)}(U)U),
\]
where $\Lambda$ is defined in (1.14), $A^{(2)}(U;t,x,\xi) = \sum_{j=-(\rho-1)}^{2} A_j^{(2)}(U;t,x,\xi)$ is a $(R,R,P)$ matrix in the class $\Sigma^{2}_{K, r+2,1}[r, N] \otimes M_2(C)$ with $A_j^{(2)}(U;t,x,\xi)$ diagonal matrices in $\Sigma^{2}_{K, r+2,1}[r, N] \otimes M_2(C)$ for $j = -(\rho - 1), \ldots, 2$ and
\[
A_j^{(2)}(U;t,x,\xi) = \begin{pmatrix}
  a_j^{(2)}(U;t,x)(i\xi) & 0 \\
  0 & a_j^{(2)}(U;t,x)(i\xi)
\end{pmatrix},
A_j^{(2)}(U;t,x) \in \Sigma F_{K, r+2,1}[r, N]
\]
\[
A_j^{(2)}(U;t,x,\xi) = \begin{pmatrix}
  a_j^{(2)}(U;t,x)(i\xi) & 0 \\
  0 & a_j^{(2)}(U;t,x)(i\xi)
\end{pmatrix},
A_j^{(2)}(U;t,x) \in \Sigma F_{K, r+2,1}[r, N]
\]

with $a_j^{(2)}(U;t,x)$ equals to $a_j^{(1)}(U;t,x)$ in (1.6) real valued, the operators $R_1^{(2)}(U)[\cdot]$ and $R_2^{(2)}(U)[\cdot]$ are $(R,R,P)$ smoothing operators in the class $\Sigma R_{K, r+2,1}[r, N] \otimes M_2(C)$.

**Proof.** Consider the following matrix
\[
D_1(U;t,x,\xi) := \begin{pmatrix}
  0 & d_1(U;t,x,\xi) \\
-\frac{d_1(U;t,x,\xi)}{d_1(U;t,x,\xi)} & 0
\end{pmatrix},
\]
where the symbol $d_1(U;t,x,\xi)$ is in the class $\Sigma_{K,1,1}^{-1}[r, N]$. Note that $(1 + D_1(U;t,x,\xi))(1 - D_1(U;t,x,\xi))$ is equal to the identity modulo a matrix of symbols in $\Sigma_{K,1,1}^{-2}[r, N] \otimes M_2(C)$. Define the following matrices of symbols in $\Sigma_{K,1,1}^{-2}[r, N] \otimes M_2(C)$
\[
G_1(U;t,x,\xi) := 1 - (1 + D_1(U;t,x,\xi))\cdot(1 - D_1(U;t,x,\xi))
\]
\[
Q_1(U;t,x,\xi) := (1 - D_1) + ((1 - D_1)\cdot G_1\cdot + \ldots + ((1 - D_1)\cdot G_1\cdot)^{\rho-times})
\]
where in the right hand side of the latter equation we omitted, with abuse of notation, the dependence on $U$, $x$ and $\xi$. Then one has
\[
((1 + D_1)\cdot Q_1)_\rho = ((1 + D_1)\cdot (1 - D_1))_\rho + \ldots + ((1 + D_1)\cdot (1 - D_1)\cdot G_1\cdot + \ldots + ((1 + D_1)\cdot (1 - D_1)\cdot G_1\cdot)^{\rho-times})
\]
\[
= (1 - G_1) + ((1 - G_1)\cdot G_1\cdot + \ldots + ((1 - G_1)\cdot G_1\cdot)^{\rho-times})
\]
\[
= 1 - (G_1\cdot + \ldots + G_1\cdot)_\rho.
\]
moreover the matrix of symbols \((G_1; \ldots; G_1)_\rho\) is in the class \(\Sigma \Gamma_{K,1,1}^{-2\rho}[r, N] \otimes M_2(\mathbb{C})\). We set

\[
\Phi_{2,1}(U)[\cdot] := \text{Op}^{BW}(1 + D_1(U; t, x, \xi))[\cdot], \quad \Psi_{2,1}(U)[\cdot] := \text{Op}^{BW}(Q_1(U; t, x, \xi)).
\]  

(4.16)

The previous discussion proves that the maps \(\Phi_{2,1}(U)\) and \(\Psi_{2,1}(U)\) satisfy the estimates \(\text{Prop. 2.35}\) and \(\text{Remark 2.35}\), there exists a smoothing remainder \(R(U)\) in the class \(\Sigma \Gamma_{K,1,1}^{-2\rho}[r, N] \otimes M_2(\mathbb{C})\) such that \((\Psi_{2,1}(U) \circ \Phi_{2,1}(U))V = V + R(U)U\).

The function \(V_{2,1} := \Phi_{2,1}(U) \Psi_{2,1}(U)\) solves the equation

\[
\partial_t V_{2,1} = \text{Op}^{BW}\left(\partial_t D_1(U; t, x, \xi)\right) V_{2,1} + \Phi_{2,1}(U) \left[i E \text{Op}^{BW}\left(A(1)^{(1)}(U; t, x, \xi)\right) \Psi_{2,1}(U) V_{2,1} + \right.
\]

\[
\left. + i E A \Psi_{2,1}(U) V_{2,1} + i E R_{2,1}^{(1)}(U) \Psi_{2,1}(U) V_{2,1} + i E R_{2,1}^{(1)}(U) \right] +
\]

\[
+ \left[\text{Op}^{BW}\left(\partial_t D_1(U; t, x, \xi)\right) + i E \left(A + \text{Op}^{BW}(1)(U; t, x, \xi)\right) + R_{1,1}^{(1)}(U)\right] R(U)U.
\]

(4.17)

Owing to Lemma 2.45, the matrix of symbols \(\partial_t D_1(U; t, x, \xi)\) is in the class \(\Sigma \Gamma_{K,2,1}^{-1}[r, N] \otimes M_2(\mathbb{C})\). The last summand in the r.h.s. of (4.17) is a (R,R,P) smoothing remainder in the class \(\Sigma \Gamma_{K,2,1}^{-2\rho+2}[r, N] \otimes M_2(\mathbb{C})\) thanks to Lemmata 2.45, 2.44, 2.46 and Proposition 2.35. Recalling that \(A(1)^{(1)}(U; t, x, \xi) = A_2^{(1)}(U; t, x)(i \xi)^2 + A_1^{(1)}(U; t, x)(i \xi) + A_0^{(1)}(U; t, x)\), we have, up to a (R,R,P) smoothing operator in the class \(\Sigma \Gamma_{K,2,1}^{-\rho}[r, N] \otimes M_2(\mathbb{C})\), that

\[
i \Phi_{2,1}(U) \text{Op}^{BW}\left(E(1 + A_2^{(1)}(U; t, x)(i \xi)^2)\right) \Psi_{2,1}(U) = i \text{Op}^{BW}\left(E(1 + A_2^{(1)}(U; t, x)(i \xi)^2)\right) +
\]

\[
+ i \left[\text{Op}^{BW}(D_1(U; t, x, \xi)), \text{Op}^{BW}\left(E(1 + A_2^{(1)}(U; t, x)(i \xi)^2)\right)\right] + \text{Op}^{BW}(M_1(U; t, x, \xi)),
\]

where \(M_1(U; t, x, \xi)\) is a (R,R,P) matrix of symbols in \(\Sigma \Gamma_{K,2,1}^{0}[r, N] \otimes M_2(\mathbb{C})\), here the commutator \([\cdot, \cdot]_\cdot\) is defined in Definition 4.3 (actually \(M_1(U; t, x, \xi)\) belongs to \(\Sigma \Gamma_{K,2,1}^{0}[r, N] \otimes M_2(\mathbb{C})\), but we preferred to embed it in the above larger class in order to simplify the notation; we shall do this simplification systematically). The conjugation of \(A_1^{(1)}(U; t, x)(i \xi)\) is, up to a (R,R,P) smoothing operator in \(\Sigma \Gamma_{K,2,1}^{-\rho}[r, N] \otimes M_2(\mathbb{C})\),

\[
i \Phi_{2,1}(U) \text{Op}^{BW}\left(E A_1^{(1)}(U; t, x)(i \xi)\right) \Psi_{2,1}(U) = i \text{Op}^{BW}\left(E A_1^{(1)}(U; t, x)(i \xi)\right) + \text{Op}^{BW}\left(M_2(U; t, x, \xi)\right)
\]

for a (R,R,P) matrix of symbols \(M_2(U; t, x, \xi)\) in \(\Sigma \Gamma_{K,2,1}^{0}[r, N] \otimes M_2(\mathbb{C})\). Therefore the matrix of operators of order one is given by

\[
i \left[\text{Op}^{BW}(D_1(U; t, x, \xi)), \text{Op}^{BW}\left(E(1 + A_2^{(1)}(U; t, x)(i \xi)^2)\right)\right] + i E A_1^{(1)}(U; t, x)(i \xi) =
\]

\[
i E \left(\text{Op}^{BW}(a_1^{(1)}(U; t, x)(i \xi)) \frac{M_+}{\text{Op}^{BW}(a_1^{(1)}(U; t, x)(i \xi))}\right)
\]

where \(M_+ := \text{Op}^{BW}(b_1^{(1)}(U; t, x)(i \xi)) - \left[\text{Op}^{BW}(D_1(U; t, x, \xi)), \text{Op}^{BW}(1 + a_2^{(1)}(U; t, x)(i \xi)^2)\right]_+\), thus our aim is to choose the symbol \(d_1(U; t, x, \xi)\) in such a way that \(M_+\) at the principal order is 0. Developing the compositions by means of Proposition 2.35, we obtain that, at the level of principal symbol, we need to solve the equation

\[
2d_1(U; t, x, \xi) + a_2^{(1)}(U; t, x)(i \xi)^2 = b_1^{(1)}(U; t, x)(i \xi).
\]

(4.18)

We choose the symbol \(d_1(U; t, x, \xi)\) as follows

\[
d_1(U; t, x, \xi) := \left(\frac{b_1^{(1)}(U; t, x)}{2(1 + a_2^{(1)}(U; t, x))}\right) \cdot \gamma(\xi),
\]

\[
\gamma(\xi) := \begin{cases} 
\frac{1}{\xi} & |\xi| \geq 1/2, \\
\text{odd continuation of class } C^\infty & |\xi| \in [0, 1/2].
\end{cases}
\]

31
Note that by Taylor expanding the function $x \mapsto (1 + x)^{-1}$ one gets that $d_1(U; t, x, \xi)$ in (4.18) is a symbol in the class \( \Sigma_{K,2}^{-1} \) [r, N], therefore by symbolic calculus (Prop. 2.35) one has that $M_+$ is equal to $\operatorname{Op}^\mathbb{R} (\tilde{b}_0(U; t, x, \xi)) + R(U)$ for a symbol $\tilde{b}_0(U; t, x, \xi)$ in $\Sigma_{K,2}^{-0}$ [r, N] and a smoothing operator $R(U)$ in $\Sigma_{K,2}^{-0}$ [r, N]. The symbol $d_1(U; t, x, \xi)$ defined in (4.18) satisfies the equation $d_1(U; t, x, \xi) = d_1(U; t, x, \xi)$ since both the symbols $a_2^{(1)}(t, x)$ and $b_1^{(1)}(U; t, x)$ fulfil the same condition, therefore by Remark 2.40 (see the last item) we deduce that the matrix $D_1(U; t, x, \xi)$ is reversibility preserving. By hypothesis the symbol $b_1^{(1)}(U; t, x)$ is odd in $x$, $a_2^{(1)}(U; t, x)$ is even and then, since $\gamma(\xi)$ is odd in $\xi$, we have $d_1(U; t, x, \xi) = d_1(U; t, -x, -\xi)$, which means that the matrix $D_1(U; t, x, \xi)$ is parity preserving. Furthermore $D_1(U; t, x, \xi)$ is reality preserving by construction, therefore we can deduce that such a matrix is a (R,R,P) matrix of symbols. Therefore the function $V_{2.1}$ solves the system

\[
\frac{\partial}{\partial t} V_{2.1} = iE (\operatorname{Op}^{\mathbb{R}} (A^{(2,1)}(U; t, x, \xi)) V_{2.1} + R_1^{(2,1)}(U) V_{2.1} + R_2^{(2,1)}(U)) \]

\[
A^{(2,1)}(U; t, x, \xi) = \begin{pmatrix}
\frac{a_2^{(1)}(U; t, x)}{a_2^{(1)}(U; t, x)} & 0 \\
0 & \frac{a_2^{(1)}(U; t, x)}{a_2^{(1)}(U; t, x)}
\end{pmatrix} + \frac{b_0^{(1)}(U; t, x, \xi)}{a_1^{(1)}(U; t, x, -\xi)}.
\]

Suppose now that there exist $j \geq 1$ (R,R,P) maps $\Phi_{2j}(U), \ldots, \Phi_{2j}(U)$ such that $V_{2,j} := \Phi_{2j}(U) \circ \ldots \circ \Phi_{2j}(U)$ solves the problem

\[
\frac{\partial}{\partial t} V_{2,j} = iE (\operatorname{Av}_{2,j} + \operatorname{Op}^{\mathbb{R}} (A^{(2,j)}(U; t, x, \xi)) V_{2,j} + R_1^{(2,j)}(U) V_{2,j} + R_2^{(2,j)}(U)) \]

where $R_1^{(2,j)}(U)$ and $R_2^{(2,j)}(U)$ are in the class $\Sigma_{K,j+1,2}[r, N] \otimes M_2(\mathbb{C})$ and

\[
A^{(2,j)}(U; t, x, \xi) = \sum_{j'=j}^{2} A^{(2,j)}(U; t, x, \xi),
\]

\[
A^{(2,j)}(U; t, x, \xi) = \begin{pmatrix}
\frac{a_j^{(2,j)}(U; t, x, \xi)}{a_j^{(2,j)}(U; t, x, -\xi)} & 0 \\
0 & \frac{a_j^{(2,j)}(U; t, x, -\xi)}{a_j^{(2,j)}(U; t, x, -\xi)}
\end{pmatrix} \in \Sigma_{K,j+1,2}[r, N] \otimes M_2(\mathbb{C}),
\]

\[
a_2^{(2,j)}(U; t, x, \xi) = a_2^{(2,j)}(U; t, x)(i\xi)^2 \in \mathbb{R}
\]

\[
A_{-j}^{(2,j)}(U; t, x, \xi) = \begin{pmatrix}
\frac{a_{-j}^{(2,j)}(U; t, x, \xi)}{a_{-j}^{(2,j)}(U; t, x, -\xi)} & b_{-j}^{(2,j)}(U; t, x, \xi) \\
0 & \frac{a_{-j}^{(2,j)}(U; t, x, -\xi)}{a_{-j}^{(2,j)}(U; t, x, -\xi)}
\end{pmatrix} \in \Sigma_{K,j+1,2}[r, N] \otimes M_2(\mathbb{C}).
\]

We now explain how to construct a map $\Phi_{j+1}(U)$ which diagonalize the matrix $A_{-j}^{(2,j)}(U; t, x, \xi)$ up to lower order terms. Define

\[
\Phi_{2j+1}(U) := 1 + \operatorname{Op}^{\mathbb{R}} (D_{j+1}(U; t, x, \xi)), \quad D_{j+1}(U; t, x, \xi) := \begin{pmatrix}
0 & d_{j+1}(U; t, x, \xi) \\
0 & 0
\end{pmatrix},
\]

with $d_{j+1}(U; t, x, \xi)$ a symbol in $\Sigma_{K,j+2,2}^{-2}[r, N]$. An approximate inverse $\Psi_{2j+1}(U) := \operatorname{Op}^{\mathbb{R}} (Q_{j+1}(U))$ can be constructed exactly as done in (4.14) and (4.15). Reasoning as done above one can prove that the function $V_{2,j+1} := \Phi_{2j+1}(U) V_{2,j}$ solves the problem

\[
\frac{\partial}{\partial t} V_{2,j+1} = iE (\operatorname{Av}_{2,j+1} + \sum_{j'=j+1}^{2} A_{-j}^{(2,j)}(U; t, x, \xi) V_{2,j+1} + R_1^{(2,j+1)}(U) V_{2,j+1} + R_2^{(2,j+1)}(U)) \]

\[
+ i \left[ \operatorname{Op}^{\mathbb{R}} (D_{j+1}(U; t, x, \xi)), E \operatorname{Op}^{\mathbb{R}} (1 + A^{(2,j)}(U; t, x, \xi)) \right] + E \operatorname{Op}^{\mathbb{R}} (A_{-j}^{(2,j)}(U; t, x, \xi)).
\]

(4.19)
Developing the commutator above one obtains that the sum of the last two terms in (4.19) is equal to

\[ iE \begin{pmatrix} \text{Op}^{BW}(a_{-j}^{(2,j)}(U; t, x, \xi)) & M_{j,+} \\ M_{j,+} & \text{Op}^{BW}(a_{-j}^{(2,j)}(U; t, x, \xi)) \end{pmatrix} \]

where \( M_{j,+} := \text{Op}^{BW}(b_{-j}^{(2,j)}(U; t, x, \xi)) - \left[ \text{Op}^{BW}(d_{j+1}(U; t, x, \xi)), \text{Op}^{BW}((1 + a_{-1}^{(1)}(U; t, x))(i\xi)^2) \right] \), therefore, repeating the same argument used in the case of the symbol of order one, one has to choose

\[ d_{j+1}(U; t, x, \xi) := \left( \frac{b_{-j}^{(2,j)}(U; t, x, \xi)}{2(1 + a_{-1}^{(1)}(U; t, x))} \right) \cdot \gamma(\xi), \]

\[ \gamma(\xi) := \begin{cases} \frac{1}{(i\xi)^j} & |\xi| \geq 1/2, \\ \text{odd continuation of class } C^\infty & |\xi| \in [0, 1/2). \end{cases} \]

Therefore we obtain the thesis of the theorem by setting \( \Phi_2(U) := \Phi_{2,1}(U) \circ \ldots \circ \Phi_{2,\rho-1}(U) \) and \( \Psi_2(U) := \Psi_{2,\rho-1}(U) \circ \ldots \circ \Psi_{2,1}(U) \).

**4.3 Reduction to constant coefficients: paracomposition**

In this section we shall reduce the operator \( \text{Op}^{BW}(A^{(2)}(U; t, x, \xi)) \), given in terms of the diagonal matrix (4.12), to a constant coefficients one up to smoothing remainders. We shall conjugate the system (4.11) under the paracomposition operator \( \Phi_U := \Omega_{B(U)}(1) \cdot \mathbb{1} \), induced by a diffeomorphism of \( \mathbb{T}^1 \), \( \Phi_U : x \mapsto x + \beta(U; t, x) \), for a small periodic real valued function \( \beta(U; t, x) \) to be chosen. Indeed in Lemma 2.5.2 of [7] it is shown that if \( \beta(U; t, x) \) is a real valued function in \( \Sigma F_{K,K'}[r,N] \) with \( r \) small enough, then for any \( K' \leq K \) the map \( \Phi_U \) is a diffeomorphism of the torus into itself, whose inverse may be written as \( \Phi_U^{-1} : y \mapsto y + \gamma(U; t, y) \) for some small and real valued function \( \gamma(U; t, y) \) in \( \Sigma F_{K,K'}[r,N] \). We recall below the alternative construction of \( \Phi_U^{-1} \) given in [7]. Set \( \beta(t, x) := \beta(U; t, x) \) and we define the following quantities

\[ B(\tau; t, x, \xi) = B(\tau, U; t, x, \xi) := -ib(\tau; t, x)(i\xi), \]

\[ b(\tau; t, x) := \frac{\beta(t, x)}{(1 + i\tau \beta_x(t, x))}. \] (4.20)

Then one defines the paracomposition operator associated to the diffeomorphism \( \Phi_U \) as \( \Phi_U := \Omega_{B(U)}(1) \cdot \mathbb{1} \), where \( \Omega_{B(U)}(\tau) \) is the flow of the linear para-differential equation

\[ \begin{align*}
\frac{d}{d\tau} \Omega_{B(U)}(\tau) &= i\text{Op}^{BW}(B(\tau; t, x, \xi))\Omega_{B(U)}(\tau), \\
\Omega_{B(U)}(0) &= \text{id}. \end{align*} \] (4.21)

The well-posedness issues of the problem (4.21) are studied in Lemma 2.5.3 of [7]. The goal is to conjugate the system (4.11) under the paracomposition operator \( \Phi_U^{-1} \). Therefore it is necessary to study the conjugate of the differential operator \( \partial_t \). This has been already done in Proposition 2.5.9 in [7], we restate below such a proposition being slightly more precise on the thesis. In other words we emphasize an algebraic property that could be deduced from the proof therein. Such a property was not crucial in their context, however will be very useful for our purposes.

**Proposition 4.5.** Let \( \rho > 0, K \gg \rho, r \ll 1 \) and a symbol \( \beta(U; t, x) \) in \( \Sigma F_{K,p+2,1}[r,N] \). If, according to notation (4.20), \( \Omega_{B(U)}(\tau) \) is the flow of (4.21), then

\[ \Omega_{B(U)}(\tau) \circ \partial_t \circ \Omega_{B(U)}^{-1} = \partial_t + \Omega_{B(U)}(\tau) \circ (\partial_t \Omega_{B(U)}^{-1}(\tau)) = \partial_t + \text{Op}^{BW}(e(U; t, x, \xi)) + R(U; t), \] (4.22)
where
\[ e(U; t, x, \xi) = e_1(U; t, x)(i\xi) + e_0(U; t, x, \xi), \]
with \( e_1(U; t, x) \in \mathcal{S}\mathcal{F}_{K,\rho+3,1}[r, N] \), \( e_0(U; t, x, \xi) \) is in \( \Sigma^1_{K,\rho+3,1}[r, N] \) and \( R(U; t) \) is a smoothing remainder belonging to \( \Sigma R_{K,\rho+3,1}[r, N] \). Moreover \( \text{Re}(e) \in \Sigma^1_{K,\rho+3,1}[r, N] \).

**Proof.** The difference between our thesis and the one of Prop. 2.5.9 in [7] is that we have the additional information that, at the highest order, the symbol \( e(U; t, x, \xi) \) is homogeneous in the variable \( \xi \). This properties follows by equations (2.5.49), (2.5.50) in [7] and the fact that the symbol \( B(U; t, x, \xi) \) in (4.20) is homogeneous in \( \xi \). \( \square \)

**Proposition 4.6.** In the notation of Prop. 4.5 there exists a real valued function \( \beta(U; t, x) \in \mathcal{S}\mathcal{F}_{K,\rho+2,1}[r, N] \) such that the function \( V_3 := \Phi_U^* V_2 \) (where \( V_2 \) is a solution of (4.11)) solves the following problem
\[ \partial_t V_3 = iE(A V_3 + \text{Op}^BW(A^3(U; t, x, \xi))V_3 + R^{(3)}_1(U)V_3 + R^{(3)}_2(U)U), \]
(4.24)
where \( A^{(3)}(U; t, x, \xi) = \sum_{j=-(\rho-1)}^{2} A_j^{(3)}(U; t, x, \xi) \) is a \((R,R,P)\) matrix in the class \( \Sigma^1_{K,\rho+3,1}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) with \( A_j^{(3)}(U; t, x, \xi) \) diagonal matrices in \( \Sigma^1_{K,\rho+3,1}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) for \( j = -(\rho-1), \ldots, 2 \) and
\[
\begin{align*}
A_2^{(3)}(U; t, x, \xi) &= \begin{pmatrix} a_2^{(3)}(U; t)(i\xi)^2 & 0 \\
0 & a_2^{(3)}(U; t)(i\xi)^2 \end{pmatrix}, \\
A_1^{(3)}(U; t, x, \xi) &= \begin{pmatrix} a_1^{(3)}(U; t,x)(i\xi) & 0 \\
0 & a_1^{(3)}(U; t,x)(i\xi) \end{pmatrix},
\end{align*}
\]
(4.25)
with \( a_2^{(3)}(U; t) \) real valued and independent of \( x \), the operators \( R^{(3)}_1(U)[\cdot] \) and \( R^{(3)}_2(U)[\cdot] \) are \((R,R,P)\) smoothing operators in the class \( \Sigma R_{K,\rho+3,1}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) for some \( m = m(N) > 0 \).

**Proof.** The function \( V_3 := \Phi_U^* V_2 \) solves the following problem
\[ \partial_t V_3 = (\partial_t \Phi_U^*)(\Phi_U^*)^{-1} V_3 + \Phi_U^* \left( iE(A + \text{Op}^BW(A^{(2)}(U; t, x, \xi))) \right)(\Phi_U^*)^{-1} V_3 \]
\[ + \Phi_U^* \left( iE R^{(2)}_1(U) \right)(\Phi_U^*)^{-1} V_3 + \Phi_U^* \left( iE R^{(2)}_2(U) \right). \]
(4.26)
Our aim is to choose \( \beta(U; t, x) \) in such a way that the coefficient in front of \( (i\xi)^2 \) in the new symbol is constant in \( x \in T \). Recalling that \( A^{(2)}(U; t, x, \xi) \) has the form (4.12), we have, by Theorem 2.5.8 in [7], that the term
\[ \Phi_U^* \left( iE\left(A + \text{Op}^BW(A^{(2)}(U; t, x, \xi))\right) \right)(\Phi_U^*)^{-1} V_3 \]
(4.27)
in (4.26) is equal to
\[ iE \begin{pmatrix} A + \text{Op}^BW & 0 \\
0 & r(U; t, x)(i\xi)^2 \end{pmatrix} V_3 + \text{Op}^BW(A_1^+(U; t, x))(i\xi)V_3 + \text{Op}^BW(A_0^+(U; t, x, \xi))V_3 \]
(4.28)
up to smoothing remainders in \( \Sigma R_{K,\rho+3,1}^{-\rho}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \), where
\[ r(U; t, x) = (1 + a_2^{(2)}(U; t, y)(1 + \gamma(U; t, y))^2)_{|y=x+\rho(U; t, x)} - 1, \]
\[ A_1^+(U; t, x) \in \mathcal{S}\mathcal{F}_{K,\rho+3,1}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \text{ and } A_0^+(U; t, x, \xi) \in \Sigma^1_{K,\rho+3,1}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \text{ are diagonal matrices of symbols.} \]
Moreover we remark that the paracomposition operator may be written as
\[ R \Phi M \]
where
\[ \Phi M \]

The term of the equation (4.28) (together with the omitted smoothing remainder) is a parity and reality preserving and reversible vector field, therefore owing to Lemma 2.46 each term
\[ \text{Therefore we can also assume that both the matrix of symbols } \Phi \]

We are left to study the term
\[ \text{4.5 Reduction to constant coefficients: elimination of the term of order one} \]

We define
\[ \gamma(U; t, y) = \partial_y^{-1} \left( \frac{1 + a_2^{(3)}(U; t)}{1 + a_2^{(2)}(U; t, y)} - 1 \right) , \quad (4.29) \]
where
\[ a_2^{(3)}(U; t) := 2 \pi \left( \int_{\mathbb{T}} \frac{1}{\sqrt{1 + a_2^{(2)}(U; y)}} dy \right)^{-1} - 1. \quad (4.30) \]

Thanks to this choice we have
\[ r(U; t, x) \equiv a_2^{(3)}(U; t), \]
moreover the paracomposition operator \( \Phi_U^* \) is parity and reversibility preserving, satisfies the anti-reality condition for the following reasons. The real valued function \( \gamma(U; t, x) \) in (4.29) satisfies \( \gamma(U; -t, x) = \gamma(U; t, x) \) since \( a_2^{(2)}(U; t, x) \) satisfies the same equation, moreover \( \gamma(U; t, x) \) is an odd function since is defined as a primitive of the even function \( a_2^{(2)}(U; t, x) \). It follows that also the function \( \beta(U; t, x) \) satisfies the same properties, therefore the matrix of symbols
\[ B(r, U; t, x, \xi) = \beta(U; t, x) \frac{\beta(U; t, x)}{1 + \beta(U; t, x)} \xi \]
is a \((R, R, P)\) matrix in \( \Sigma_{K, \rho+3}^1 [r, N] \). Therefore the operator \( \Omega_{B(U)}(1) \) generated by \( \text{Op}^\text{BW} (iB(U; t, x, \xi)) \) is parity and reversibility preserving and it satisfies the anti-reality condition (2.65) by Lemma 4.2.2 in [7]. Thanks to this the term in (4.27) is a parity and reality preserving and reversible vector field, therefore owing to Lemma 2.46 each term of the equation (4.28) (together with the omitted smoothing remainder) is a parity and reality preserving and reversible vector field.

The term \( \Phi_U^* (iE R_1^{(2)}(U)) (\Phi_U^*)^{-1} V_3 + \Phi_U^* (iE R_2^{(2)}(U)) U \) in (4.26) is analysed as follows. First of all both the operators \( \Phi_U^* (iE R_1^{(2)}(U)) (\Phi_U^*)^{-1} \) and \( \Phi_U^* (iE R_2^{(2)}(U)) \) are reversible, parity and reality preserving thanks to Lemma 4.4. Moreover we remark that the paracomposition operator may be written as
\[ \Phi_U^* = \Omega_{B(U)}(1) = U + \sum_{p=2}^{N-1} M_p(U, \ldots, U) U + M_N(U; t) U, \quad (4.32) \]
where \( M_p \in \tilde{M}^m_{K, \rho+3} [r] \). This is a consequence of Theorem 2.5.8 in [7]. Therefore as a consequence of Prop. 4.3.5 the operators \( \Phi_U^* (iE R_1^{(2)}(U)) (\Phi_U^*)^{-1} \) and \( \Phi_U^* (iE R_2^{(2)}(U)) \) belong to the class \( \Sigma R_{K, \rho+2}^m [r, N] \otimes M_2(C) \).

We are left to study the term \( \partial_t (\Phi_U^* (\Phi_U^*)^{-1} V_3 \). This is nothing but \( -\Phi_U^* (\partial_t (\Phi_U^*)^{-1} V_3 \), therefore by Prop. 4.4 it is equal to \( \partial_t + \text{Op}^\text{BW} (e(U; t, x, \xi) \cdot 1) + R(U; t) \) with \( e(U; t, x, \xi) \) and \( R(U; t) \) given by Prop. 4.5. Since the map \( \Phi_U^* \) satisfies the anti-reality condition (2.65) its derivative \( \partial \Phi_U^* \) is reality preserving, therefore by Lemma 2.44 the maps \( -\Phi_U^* (\partial_t (\Phi_U^*)^{-1} \) is reality preserving. Since the map \( \Phi_U^* \) is reversibility preserving and parity preserving, one reasons in the same way as above to prove that its derivative with respect to \( t \) is parity preserving and reversible. Therefore thanks to Lemma 2.46 we can also assume that both the matrix of symbols \( e(U; t, x, \xi) \cdot 1 \) and the operator \( R(U; t) \) above are reality and parity preserving and reversible.

4.4 Reduction to constant coefficients: elimination of the term of order one

In this section we shall eliminate the matrix of order one by conjugating the system through a multiplication operator.
Proposition 4.7. There exist $s_0 > 0$, $r_0 > 0$ such that for any $s \geq s_0$, $r \leq r_0$ and any $U \in B^K(I, r)$ solution of (3.1) the following holds. There exist two $(R,R,P)$ maps

$$\Phi_4(U), \quad \Psi_4(U) : C^K_{s+R}(I; \mathbb{H}^s(\mathbb{T})) \to C^K_{s+R}(I; \mathbb{H}^s(\mathbb{T}))$$

(i) there exists a constant $C$ depending on $s$, $r$ and $K$ such that

$$\|\Phi_4(U)V\|_{K-(\rho+4),s} \leq \|V\|_{K-(\rho+4),s} \left(1 + C \|U\|_{K,s_0}\right)$$

$$\|\Psi_4(U)V\|_{K-(\rho+4),s} \leq \|V\|_{K-(\rho+4),s} \left(1 + C \|U\|_{K,s_0}\right)$$

(4.33)

(ii) $\Phi_4(U) - 1, \Psi_4(U) - 1$ belong to $\Sigma M_{K,(\rho+4,1)[r, N]} \otimes M_2(\mathbb{C})$, moreover $\Phi_4(U) \circ \Psi_4(U) = 1 + R(U)U$ with $R(U)$ is in $\Sigma R_{K,(\rho+4,1,r,N)} \otimes M_2(\mathbb{C})$ and it is reversible, parity and reality preserving.

(iii) The function $V_4 = \Phi_4(U)V_3$ (where $V_3$ solves (4.24)) solves the problem

$$\partial_t V_4 = iE(\Lambda V_4 + \text{Op}^{\text{BW}}(A^{(4)}(U; t, x, \xi))V_4 + R_1^{(4)}(U)V_4 + R_2^{(4)}(U)U),$$

(4.34)

where $A^{(4)}(U; t, x, \xi)$ is a $(R,R,P)$ matrix of symbols in $\Sigma \Gamma^3_{K,(\rho+4,1)[r, N]} \otimes M_2(\mathbb{C})$ and it has the form

$$A^{(4)}(U; t, x, \xi) = A_2^{(3)}(U; t)(i\xi)^2 + \sum_{j=-(\rho-1)}^0 A_j^{(4)}(U; t, x, \xi)$$

(4.35)

where the diagonal matrix $A_2^{(3)}(U; t)$ is $x$-independent and it is defined in (4.25). $A_j^{(4)}(U; t, x, \xi)$ are diagonal matrices belonging to the class $\Sigma \Gamma^{3}_{K,(\rho+4,1)[r, N]} \otimes M_2(\mathbb{C})$ for $j = -(\rho-1), \ldots, 0$. The operators $R_1^{(4)}(U)$ and $R_2^{(4)}(U)$ are $(R,R,P)$ and belong to the class $\Sigma R_{K,(\rho+4,1)[r, N]} \otimes M_2(\mathbb{C})$ for some $m \in \mathbb{N}$ depending on $N$.

**Proof.** Let $s(U; t, x)$ be a function in $\Sigma \mathcal{F}_{K,(\rho+3,1),r,N}$ to be chosen later, define the map

$$\Phi_4(U)[\cdot] := \text{Op}^{\text{BW}}\left(\begin{array}{cc}
\frac{e^{s(U; t, x)}}{0} \\
0 & \frac{e^{-s(U; t, x)}}
\end{array}\right)[\cdot].$$

(4.36)

Suppose moreover that $\Phi_4(U)$ in (4.36) is a $(R,R,P)$ map. Since $s(U; t, x)$ is in $\Sigma \mathcal{F}_{K,(\rho+3,1),r,N}$ then by Taylor expanding the exponential function one gets that the symbol $e^{s(U; t, x)} - 1$ is in $\Sigma \mathcal{F}_{K,(\rho+3,1),r,N}$. In particular the map $\Phi_4(U)$ satisfies items (i) and (ii) in the statement. The matrix in (4.36) is invertible, therefore the map

$$\Psi_4(U)[\cdot] := \text{Op}^{\text{BW}}\left(\begin{array}{cc}
\frac{e^{-s(U; t, x)}}{0} \\
0 & \frac{e^{s(U; t, x)}}
\end{array}\right)[\cdot].$$

(4.37)

is an approximate inverse $\Psi_4(U)$ for the map $\Phi_4(U)$ (i.e. satisfying the conditions in the items (i) and (ii) of the statement). To prove this last claim one has to argue exactly as done in the proof of Prop. 4.3.

The function $V_4 := \Phi_4(U)V_3$ solves the equation

$$\partial_t V_4 = (\partial_t \Phi_4(U))[\Psi_4(U)V_4]$$

$$+ \Phi_4(U)iE[\Lambda V_4 + A^{(3)}(U; t, x, \xi)\Psi_4(U)V_4 + R_1^{(3)}(U)\Psi_4(U)V_4 + R_2^{(3)}(U)U] + \tilde{R}(U)U,$$

(4.38)

where $\tilde{R}(U)U$ is equal to

$$(\partial_t \Phi_4(U))R(U)U + \Phi_4(U)iE \left([\Lambda + \text{Op}^{\text{BW}}(A^{(3)}(U; t, x, \xi))]R(U)U + R_1^{(3)}(U)R(U)U\right),$$
where \( R(U) \) is the \((R,R,P)\) smoothing operator in \( \sum R_{K,\rho+4,1}^\rho [r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) such that \( \Psi_4(U) \circ \Phi_4(U) V_4 = V_4 + R(U)U \) and the matrix \( A^{(3)}(U;t,x,\xi) = \sum_{j=-(\rho-1)}^2 A_j^{(3)}(U;t,x,\xi) \) is defined in the statement of Prop. 4.6. Therefore \( \tilde{R}(U) \) is a \((R,R,P)\) smoothing remainder in the class \( \sum R_{K,\rho+4,1}^\rho [r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) thanks to Lemma 2.44, Prop. 2.35 and to the fact that \( R(U) \) is a \((R,R,P)\) smoothing remainder.

The term \( (\partial_t \Phi_4(U)) \Psi_4(U) \) is of order 0 thanks to Lemma 2.45 and Prop. 2.35; moreover it is reversible, parity and reality preserving thanks to Lemma 2.44 since \( \Psi_4(U) \) is \((R,R,P)\) and \((\partial_t \Phi_4(U)) \) is reversible, parity and reality preserving.

The term \( \Phi_4(U) i Er_{2}^{(3)}(U) \) is reversible, reality and parity preserving thanks to Lemma 2.44.

Using symbolic calculus (Prop. 2.35) one can prove that the term of order one in (4.38) is the following

\[
(2s_{x}(U;t,x)(1 + a_2(U;t)) + a_1(U;t,x))(i\xi),
\]

therefore we have to choose the function \( s(U;t,x) \) as

\[
s(U;t,x) = -\partial_x^{-1} \left( \frac{a_1^{(3)}(U;t,x)}{2(1 + a_2(U;t))} \right).
\]

Note that the function \( s(U;t,x) \) is well defined since \( a_1^{(3)}(U;t,x) \) is an odd function in \( x \) (therefore its mean is zero) and the denominator stays far away from zero since \( r_0 \) is small enough. With this choice the map \( \Phi_4(U) \) defined in (4.36) is \((R,R,P)\) and therefore the ansatz made at the beginning of the proof is correct. Furthermore the term \( \Phi_4(U)iE[\Lambda V_4 + A^{(3)}(U;t,x,\xi) \Psi_4(U)V_4] \) in (4.38) is equal to \( iE[\Lambda V_4 + Op^{B\mathcal{V}}(\tilde{A}(U;t,x,\xi)V_4 + Q(U)V_4)] \), where \( Q(U) \) is a \((R,R,P)\) smoothing remainder in \( \sum R_{K,\rho+4,1}^\rho [r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) and

\[
\tilde{A}(U;t,x,\xi) = A_2^{(3)}(U;t)(i\xi)^2 + \sum_{j=-(\rho-1)}^0 \tilde{A}_j(U;t,x\xi),
\]

is a \((R,R,P)\) diagonal matrix of symbols such that \( \tilde{A}_j(U;t,x,\xi) \) is in \( \sum \Gamma^j_{K,\rho+4,1}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) thanks to Prop. 2.35 and Lemma 2.46.

### 4.5 Reduction to constant coefficients: lower order terms

Here we reduce to constant coefficients all the symbols from the order 0 to the order \( \rho - 1 \) of the matrix \( A^{(4)}(U;t,x,\xi) \) in (4.38).

**Proposition 4.8.** There exist \( s_0 > 0, r_0 > 0 \), such that for any \( s \geq s_0 \), any \( 0 < r \leq r_0 \) and any \( U \in B^K_s (I, r) \) solution of (3.1) the following holds. There exist two \((R,R,P)\)-maps

\[
\Phi_5(U)[\cdot], \; \Psi_5(U)[\cdot] : C_s^{K-2\rho-4} (I, H^s) \to C_s^{K-2\rho-4} (I, H^s),
\]

satisfying the following

(i) there exists a constant \( C \) depending on \( s \), \( r \) and \( K \) such that

\[
\|\Phi_5(U)V\|_{K-2\rho-4,s} \leq \|V\|_{K-2\rho-4,s} \left( 1 + C \|U\|_{K,s_0} \right)
\]

\[
\|\Psi_5(U)V\|_{K-2\rho-4,s} \leq \|V\|_{K-2\rho-4,s} \left( 1 + C \|U\|_{K,s_0} \right)
\]

for any \( V \) in \( C_s^{K-2\rho-4} (I, H^s) \);
(ii) $\Phi_5(U)[\cdot] - 1$ and $\Psi_5(U)[\cdot] - 1$ belong to the class $\Sigma M_{K,2p+4,1}[r,N] \otimes M_2(\mathbb{C})$; $\Psi_5(U)(\Phi_5(U)[\cdot]) - 1$ is a smoothing operator in the class $\Sigma R_{K,2p+4,1}[r,N] \otimes M_2(\mathbb{C})$;

(iii) the function $V_5 = \Phi_5(U)V_4$ (where $V_4$ is the solution of (4.34)) solves the system

$$
\partial_t V_5 = i E \left( \Lambda V_5 + \text{Op}^{BW}(A(5)(U; t, \xi))V_5 + R^{(5)}_1(U) V_5 + R^{(5)}_2(U) U \right),
$$

where $E$ is defined in (4.44). $A^{(5)}(U; t, \xi)$ is a $(R,R,P)$ diagonal and constant coefficient in $x$ matrix in $\Sigma \Gamma^2_{K,2p+4,1}[r,N] \otimes M_2(\mathbb{C})$ of the form

$$
A^{(5)}(U; t, \xi) = A^{(3)}_2(U; t)(i\xi)^2 + A^{(5)}_0(U; t, \xi),
$$

with $A^{(3)}_2(U; t)$ of Prop. 4.6 and $A^{(5)}_0(U; t, \xi)$ in $\Sigma \Gamma^0_{K,2p+4,1}[r,N] \otimes M_2(\mathbb{C})$; the operators $R^{(5)}_1(U)$ and $R^{(5)}_2(U)$ are $(R,R,P)$ smoothing remainders in the class $\Sigma R_{K,2p+4,1}[r,N] \otimes M_2(\mathbb{C})$ for some $m$ in $\mathbb{N}$ depending on $N$.

Proof. We first construct a map which conjugates to constant coefficient the term of order 0 in (4.34) and (4.35). Consider a symbol $n_0(U; t, x, \xi)$ in $\Sigma \Gamma^{-1}_{K,p+4,1}[r,N]$ to be determined later and define

$$
\Phi_{5,0}(U) := 1 + \text{Op}^{BW}(N_0(U; t, x, \xi)) := 1 + \text{Op}^{BW} \left( \begin{array}{c} n_0(U; t, x, \xi) \\ 0 \end{array} \right).
$$

Suppose moreover that the map $\Phi_{5,0}(U)$ defined above is $(R,R,P)$. It is possible to construct an approximate inverse of the map above (i.e. satisfying items (i) and (ii) of the statement) of the form

$$
\Psi_{5,0}(U) = 1 - \text{Op}^{BW}(N_0(U; t, x, \xi)) + \text{Op}^{BW}((N_0(U; t, x, \xi))^2) + \text{Op}^{BW}(\tilde{N}_0(U; t, x, \xi))
$$

proceeding as done in the proof of Prop. 4.4 by choosing a suitable matrix of symbols $\tilde{N}_0(U; t, x, \xi)$ in the class $\Sigma \Gamma^{-3}_{K,p+4,1}[r,N] \otimes M_2(\mathbb{C})$. Let $R(U)$ in $\Sigma R_{K,2p+4,1}[r,N] \otimes M_2(\mathbb{C})$ be the smoothing remainder such that one has $\Psi_5(U)(\Phi_5(U)[\cdot]) - 1 = R(U)$. Then the function $V_{5,0} = \Phi_{5,0}(U)V_4$ solves the following problem

$$
\partial_t V_{5,0} = (\partial_t \Phi_{5,0}(U))\Psi_{5,0} V_5,
$$

$$
\partial_t \Phi_{5,0}(U) = E \left( \Lambda + \text{Op}^{BW}(A^{(4)}(U; t, x, \xi)) \right) \Psi_{5,0}(U),
$$

$$
\partial_t \Phi_{5,0}(U) = E R^{(4)}_1(U) \Psi_{5,0}(U),
$$

$$
\partial_t \Phi_{5,0}(U) = E R^{(4)}_2(U) U + R(U),
$$

where $A^{(4)}(U; t, x, \xi)$, $R^{(4)}_1(U)$ and $R^{(4)}_2(U)$ are the ones of equation (4.34), while $R(U)$ is the operator

$$
\left[ (\partial_t \Phi_{5,0}(U)) + \Phi_{5,0}(U) E \left( \Lambda + \text{Op}^{BW}(A^{(4)}(U; t, x, \xi)) \right) \Phi_{5,0}(U) E R^{(1)}_4(U) \right] R(U).
$$

The operator $R(U)$ belongs to the class $\Sigma R_{K,2p+4,1}[r,N] \otimes M_2(\mathbb{C})$ for some $m'$ in $\mathbb{N}$ thanks to Prop. 2.33 moreover it is reversible, parity and reality preserving by Lemma 2.44. The first summand in the r.h.s. of (4.42) is equal to $\text{Op}^{BW}(\partial_t N_0(U; t, x, \xi)) \circ \text{Op}^{BW}(1 - N_0(U; t, x, \xi) + N_0(U; t, x, \xi))$ therefore by Lemmata 2.45 and Prop. 2.35 can be decomposed as the sum of a para-differential operator of order $-1$ and a smoothing remainder, both of them reversible, parity and reality preserving. The third and the fourth summands in (4.42) are $(R,R,P)$ remainders in the class $\Sigma R_{K,2p+4,1}[r,N] \otimes M_2(\mathbb{C})$ by Lemma 2.44 and Prop. 2.35.
The remaining term \( \Phi_{5,0}(U) i E (\Lambda + \text{Op}^{BW}(A^{(4)}(U; t, x, \xi))) \Psi_{5,0}(U) V_{5,0} \) is equal to
\[
\begin{align*}
&i E (\Lambda + \text{Op}^{BW}(A^{(3)}(U; t)(i \xi)^2)) V_{5,0} + \left[ \text{Op}^{BW}(N(U; t, x, \xi)), i E \text{Op}^{BW}(1 + A_{2}(U; t))(i \xi)^2) \right]_\sigma V_{0,5} \\
&+ i E \text{Op}^{BW}(A^{(0)}(U; t, x, \xi)) \\
&- \text{Op}^{BW}(N_{0}(U; t, x, \xi)) \circ \text{Op}^{BW}(i E (1 + A_{2}(U; t))(i \xi)^2) \circ \text{Op}^{BW}(N_{0}(U; t, x, \xi)) \\
&+ \text{Op}^{BW}(i E (1 + A_{2}(U; t))(i \xi)^2) \circ \text{Op}^{BW}(N_{0}(U; t, x, \xi)^2)
\end{align*}
\] (4.43)
up to operators of order \(-1\) coming from the compositions with \( \text{Op}^{BW}(N(U; t, x, \xi)) \). Every operator here can be assumed to be reversible, parity and reality preserving thanks to Lemmata 2.44 and 2.46. The last two summands in (4.43) cancel out up to a \((R,R,P)\) operator of order \(-1\) thanks to Prop. 4.4. In order to reduce to constant coefficient the term of order 0 in (4.43) we develop the commutator \([\cdot, \cdot]_\sigma\) and we choose \( n_{0}(U; t, x, \xi) \) in such a way that the following equation is satisfied
\[
2(n_{0}(U; t, x, \xi))_{x}(1 + a_{2}^{(3)}(U; t)(i \xi)) + a_{0}^{(4)}(U; t, x, \xi) = \frac{1}{2\pi} \int_{T} a_{0}^{(4)}(U; t, x, \xi) dx;
\] (4.44)
proceeding as done in the proof of Prop. 4.4 we choose the symbol \( n_{0}(U; t, x, \xi) \) as follows:
\[
n_{0}(U; t, x, \xi) = \frac{\partial_{x}^{-1} \left( \frac{1}{2\pi} \int_{T} a_{0}^{(4)}(U; t, x, \xi) dx - a_{0}^{(4)}(U; t, x, \xi) \right)}{2(1 + a_{2}^{(3)}(U; t))} \gamma(\xi);
\]
\[
\gamma(\xi) = \begin{cases} \\
\frac{1}{\xi} & |\xi| \geq 1/2, \\
\text{odd continuation of class } C^{\infty} & |\xi| \in (0, 1/2).
\end{cases}
\]
The symbol above is well defined since the denominator stays far away from zero since the function \( U \) is small, the numerator is well defined too since it is the periodic primitive of a zero mean function; moreover it is parity preserving and reversibility preserving, therefore the ansatz made at the beginning of the proof is satisfied. Therefore we have reduced the system to the following
\[
\partial_{t} V_{5,0} = i E (\Lambda + \text{Op}^{BW}(A^{(5,0)}(U; x, \xi))) V_{5,0} + R_{1}^{(5,0)}(U) V_{5,0} + R_{2}^{(5,0)}(U) U,
\]
where \( R_{1}^{(5,0)}(U) \) and \( R_{2}^{(5,0)}(U) \) are \((R,R,P)\) smoothing remainder in the class \( \Sigma R^{-p+m}_{K,p+4,1}[r, N] \otimes M_{2}(\mathbb{C}) \), the matrix of symbols \( A^{(5,0)}(U; t, x, \xi) \) is in \( \Sigma^{2}_{K,p,5,1}[r, N] \otimes M_{2}(\mathbb{C}) \) and it has the form
\[
A^{(5,0)}(U; t, x, \xi) = A_{2}^{(3)}(U; t)(i \xi)^2 + A_{0}^{(5,0)}(U; t, x, \xi) + A_{-1}^{(5,0)}(U; t, x, \xi),
\]
with \( A_{2}^{(3)}(U; t) \) coming from Prop. (4.6) \( A_{0}^{(5,0)}(U; t, \xi) \) is equal to \( (\frac{1}{2\pi} \int A_{0}^{(4)}(U; t, x, \xi) dx) \gamma(\xi) \) and \( A_{-1}^{(5,0)}(U; t, x, \xi) \) is a matrix of symbols in \( \Sigma^{-1}_{K,p,5,1}[r, N] \otimes M_{2}(\mathbb{C}) \).
Suppose now that there exist \( j + 1, j \geq 0 \), \((R,R,P)\) maps \( \Phi_{5,0}(U), \ldots, \Phi_{5,j}(U) \) maps such that the function \( V_{5,j} := \Phi_{5,0}(U) \circ \cdots \circ \Phi_{5,j}(U) V_{4} \) solves the problem
\[
\partial_{t} V_{5,j} = i E (\Lambda V_{5,j} + \text{Op}^{BW}(A^{(5,j)}(U; t, x, \xi))) V_{5,j} + R_{1}^{(5,j)}(U) V_{5,j} + R_{2}^{(5,j)}(U) U
\] (4.45)
where \( R_{1}^{(5,j)}(U), R_{2}^{(5,j)}(U) \) are \((R,R,P)\) smoothing remainders in the class \( \Sigma R^{-p+m}_{K,p+5+j,1}[r, N] \otimes M_{2}(\mathbb{C}) \) and where \( A^{(5,j)}(U; t, x, \xi) \) is a \((R,R,P)\) diagonal matrix of symbols in \( \Sigma^{2}_{K,p,5+j,1}[r, N] \otimes M_{2}(\mathbb{C}) \) of the form
\[
A^{(5,j)}(U; t, x, \xi) = A_{2}^{(3)}(U; t)(i \xi)^2 + \sum_{\ell = -j}^{0} A_{\ell}^{(5,j)}(U; t, \xi) + A_{-j}^{(5,j)}(U; t, x, \xi),
\]
with \( A^{(5,j)}(U; t, \xi) \) in \( \Sigma^{\ell}_{K, \rho + 5+j, 1}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) and constant in \( x \) for \( \ell = -j, \ldots, 0 \), while \( A^{(5,j)}(U; t, x, \xi) \) is in \( \Sigma^{\ell-1}_{K, \rho + 5+j, 1}[r, N] \) and may depend on \( x \). We explain how to construct a map \( \Phi_{5,j+1}(U) \) which put to coefficient in \( x \) the term of order \( -j - 1 \). Let \( n_{j+1}(U; t, x, \xi) \) be a symbol in \( \Sigma^{\ell-2}_{K, \rho + 5+j, 1}[r, N] \) and consider the map

\[
\Phi_{5,j+1}(U) := \mathbb{1} + \text{Op}^{BW}(N_{j+1}(U; t, x, \xi)) := \mathbb{1} + \text{Op}^{BW} \left( \begin{array}{cc}
n_{j+1}(U; t, x, \xi) \\
0
\end{array} \right)
\]

Arguing as done in the proof of Prop. 4.4 one obtains the approximate inverse of the map above \( \Psi_{5,j}(U) = \mathbb{1} - \text{Op}^{BW}(N_{j+1}(U; t, x, \xi)) \) modulo lower order terms. The same discussion made at the beginning of the proof, concerning the conjugation through the map \( \Phi_{5,0}(U) \), shows that the function \( V_{5,j+1} := \Phi_{5,j+1}(U)V_{5,j} \) solves the problem

\[
\partial_t V_{5,j+1} = iE(\Lambda V_{5,j+1} + \text{Op}^{BW}(A^{(5,j+1)}(U; t, x, \xi))V_{5,j+1} + R_1^{(5,j+1)}(U)V_{5,j+1} + R_2^{(5,j+1)}(U)U),
\]

(4.46)

where \( R_1^{(5,j+1)}(U) \) and \( R_2^{(5,j+1)}(U) \) are smoothing remainders in the class \( \Sigma^{\rho+m'} \mathcal{R}_{K, \rho + 5+j, 2}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) and where \( A^{(5,j+1)}(U; t, x, \xi) \) has the form

\[
A_2^{(5,j+1)}(U; t) |(\xi)|^2 + \sum_{\ell = -j}^0 A^{(5,j)}_\ell(U; t, x, \xi) + \sum_{\ell = -j}^0 A^{(5,j)}_{-\ell}(U; t, x, \xi) + 2 \langle N_{j+1}(U; t, x, \xi) \rangle_x (1 + A_2^{(3)}(U; t)(\xi)).
\]

The equation we need to solve is

\[
2\langle n_{j+1}(U; t, x, \xi) \rangle_x (1 + A_2^{(3)}(U; t)(\xi)) + a^{(5,j)}_{-\ell}(U; t, x, \xi) = \frac{1}{2\pi} \int \partial^{(5,j)}_{\ell}(U; t, x, \xi) dx,
\]

which has the same structure of (4.44) and hence one can define the symbol \( n_{j+1}(U; t, x, \xi) \) as done above.

To conclude the proof we define the maps \( \Phi_5(U) := \Phi_{5,0}(U) \circ \cdots \circ \Phi_{5,\rho-1}(U) \) and \( \Psi_5(U) := \Psi_{5,\rho-1}(U) \circ \cdots \circ \Psi_{5,0}(U) \).

At this point we can prove Theorem 4.1.

**Proof of Theorem 4.1.** It is enough to define \( \Phi(U) := \Phi_5(U) \circ \Phi_4(U) \circ \Phi_3^1 \circ \Phi_2(U) \circ \Phi_1(U) \) and \( \Psi(U) := \Psi_1(U) \circ \Psi_2(U) \circ (\Phi_3^1)^{-1} \circ \Psi_4(U) \circ \Psi_5(U) \).

\section{Proof of the main theorem}

The aim of this section is to prove the following Theorem which, together with Theorem 3.1 implies Theorem 1.1.

**Theorem 5.1.** Fix \( N > 0 \) and assume \( M \geq N \) (see (1.4)), \( K \in \mathbb{N}, \rho \in \mathbb{N} \) such that \( K \gg \rho \gg N \) and consider system (3.1). There is a zero measure set \( \mathcal{N} \subseteq \mathcal{O} \) such that for any \( \tilde{m} \) outside the set \( \mathcal{N} \) and if \( \rho > 0 \) is large enough there is \( s_0 > 0 \) such that for any \( s \geq s_0 \) there are \( r_0, c, C > 0 \) such that for any \( 0 \leq r \leq r_0 \) the following holds. For all \( U_0 \in H^s_{\mathcal{E}} \) with \( \|U_0\|_{H^s} \leq r \), there is a unique solution \( U(t, x) \) of (3.1) with

\[
U \in \bigcap_{k=0}^K C^k([-T_r, T_r]; H^s_{\mathcal{E}}^{-2k}(T, \mathbb{C}^2)),
\]

(5.1)

with \( T_r \geq cr^{-N} \). Moreover one has

\[
\sup_{t \in [-T_r, T_r]} \|\partial^k_{\ell} U(t, \cdot)\|_{H^s_{\mathcal{E}}^{-2k}} \leq Cr, \quad 0 \leq k \leq K.
\]

(5.2)
The proof of the result above is divided into two main steps. We need some further notation. For any \( n \in \mathbb{N} \), we define

\[
\Pi_n^+ := \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} \Pi_n, \quad \Pi_n^- := \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix} \Pi_n
\]

(5.3)

the composition of the spectral projector \( \Pi_n \), defined in (2.3), with the projector from \( \mathbb{C}^2 \) to \( \mathbb{C} \times \{0\} \) (resp. \( \{0\} \times \mathbb{C} \)).

For a function \( U \) satisfying (2.63), i.e. of the form \( U = (u, \tilde{u})^T \), the projectors \( \Pi_{n,\ell}^\pm \) act as follows. Let \( \varphi_n(x) = 1/\sqrt{n} \cos(nx) \) be the Hilbert basis of the space of even \( L^2(\mathbb{T}; \mathbb{C}) \) functions, then, if \( \tilde{u}(n) = \int_T u(x) \varphi_n(x)dx \), one has

\[
\Pi_n U = \left( \frac{\tilde{u}(n)}{\tilde{u}(n)} \right) \varphi_n(x), \quad \Pi_n^+ U = \tilde{u}(n)e_+ \varphi_n(x), \quad \Pi_n^- U = \tilde{u}(n)e_- \varphi_n(x), \quad e_+ = \begin{pmatrix} 1 \\ 0 \end{pmatrix}, \quad e_- = \begin{pmatrix} 0 \\ 1 \end{pmatrix}.
\]

(5.4)

We now give the following definition.

**Definition 5.2 (Kernel of the Adjoint Action).** Fix \( p \in \mathbb{N}^* \), \( \rho > 0 \) and consider a symbol \( \alpha \in \tilde{\Gamma}_p^2 \).

(i) We denote by \( [\alpha](U; t, x, \xi) \) the symbol in \( \tilde{\Gamma}_p^2 \) the symbol defined, for \( n_1, \ldots, n_p \in \mathbb{N} \), as

\[
[\alpha] \left( \Pi_{n_1}^+ U, \ldots, \Pi_{n_p}^+ U, \Pi_{n_{\ell+1}}^- U, \ldots, \Pi_{n_p}^- U; t, x, \xi \right) = a \left( \Pi_{n_1}^+ U, \ldots, \Pi_{n_p}^+ U, \Pi_{n_{\ell+1}}^- U, \ldots, \Pi_{n_p}^- U; t, x, \xi \right),
\]

for \( p \) even, \( \ell = p/2 \) and

\[
\{n_1, \ldots, n_\ell\} = \{n_{\ell+1}, \ldots, n_p\},
\]

(5.5)

while for \( p \) odd and \( 0 \leq \ell \leq p \), or \( p \) even and \( 0 \leq \ell < p \) with \( \ell \neq p/2 \) we set

\[
[\alpha] \left( \Pi_{n_1}^+ U, \ldots, \Pi_{n_\ell}^+ U, \Pi_{n_{\ell+1}}^- U, \ldots, \Pi_{n_p}^- U; t, x, \xi \right) = 0.
\]

(ii) Let \( \alpha \in \Sigma_{K, K'}^0[r, N] \) of the form

\[
a(U; t, x, \xi) = \sum_{k=1}^{N-1} a_k(U; t, x, \xi) + a_N(U; t, x, \xi), \quad a_k \in \tilde{\Gamma}_k, \quad a_N \in \Sigma_{K, K'}^0[r, N],
\]

we define the symbol \( [[\alpha]](U; t, x, \xi) \) as

\[
[[\alpha]](U; t, x, \xi) := \sum_{k=1}^{N-1} [[a_k]](U; t, x, \xi) + a_N(U; t, x, \xi).
\]

(5.6)

(iii) For a diagonal matrix of symbols \( A \in \Sigma_{K, K'}^0[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) of the form

\[
A(U; t, x, \xi) = \begin{pmatrix} a(U; t, x, \xi) & 0 \\ 0 & \overline{a}(U; t, x, -\xi) \end{pmatrix},
\]

we define

\[
[[A]](U; t, x, \xi) := \begin{pmatrix} [[\alpha]](U; t, x, \xi) & 0 \\ 0 & \overline{[[\alpha]]}(U; t, x, -\xi) \end{pmatrix}.
\]

In the following lemma we consider the problem

\[
\begin{cases}
\partial_t Z = iE \left( \Lambda Z + \text{Op}^{\text{BW}}(m_2(U)(i\xi)^2)Z + \text{Op}^{\text{BW}}([[A]](U; t, \xi))Z \right), \\
Z(0, x) = Z_0 \in H^2_x
\end{cases}
\]

(5.7)
with \( m_2(U) \) in (4.3), \( A \) being a diagonal \((R,R,P)\) matrix of bounded symbols independent of \( x \) in \( \Sigma_{K,K'}^{[r,N]} \otimes \mathcal{M}_2(\mathbb{C}) \) and \( U \in C^\infty_\sigma(I, \mathcal{H}_x(\mathbb{T}; \mathbb{C}^2)) \cap B^s_{p,K}(I, r) \). We prove that the \((R,R,P)\) structure of the matrix \( A(U; t, \xi) \) (together with the fact that it is constant in \( x \)) guarantees a symmetry which produces a key cancellation in the energy estimates for the problem (5.7), more precisely we show that the multilinear part of the matrix \( [A](U; t, \xi) \) does not contribute to the energy estimates.

**Lemma 5.3.** Let \( N \in \mathbb{N}, r > 0, K' \leq K \in \mathbb{N} \). Using the notation above consider \( Z = Z(t, x) \) the solution of the problem (5.7). Then one has

\[
\frac{d}{dt} \|Z(t, \cdot)\|_{H^r}^2 \leq C \|U(t, \cdot)\|_{H^r}^2 \|Z(t, \cdot)\|_{H^r}^2.
\]  

(5.8)

**Proof.** Consider the Fourier multipliers \( \langle D \rangle^s := \text{Op}(\langle \xi \rangle^s) \). We have that

\[
\frac{d}{dt} \|Z\|_{H^r}^2 = \left( \langle D \rangle^s \left[ iE(\Delta Z + \text{Op}^{BW}(m_2(U)(i\xi)^2) + \text{Op}^{BW}([A](U; t, \xi))[Z]) \right] \langle D \rangle^s Z \right)_{H^0} + \left( \langle D \rangle^s Z, \langle D \rangle^s \left[ iE(\Delta Z + \text{Op}^{BW}(m_2(U)(i\xi)^2) + \text{Op}^{BW}([A](U; t, \xi))[Z]) \right] \right)_{H^0}
\]

(5.9)

where \( \langle \cdot, \cdot \rangle_{H^0} \) is defined in (1.10). The contribution given by \( \Lambda \) and \( \text{Op}^{BW}(m_0(U)(i\xi)^2) \) is zero since they are independent of \( x \) (therefore they commute with \( \langle D \rangle^s \)) and their symbols are real valued (hence they are self-adjoint on \( H^0 \) thanks to Remark 2.26). Let us consider the symbol \( [A](U; t, \xi) \). By definition we have that

\[
[A](U; t, \xi) = \sum_{p=1}^{N-1} [A_p](U, \ldots, U; t, \xi) + A_N(U; t, \xi)
\]

with \( A_p \in \mathcal{P}_p^0, p = 1, \ldots, N - 1, \) and \( A_N \in \mathcal{P}_N^{[r,N]} \). The contribution of \( \text{Op}^{BW}(A_N(U; t, \xi))[Z] \) in the r.h.s. of (5.9) is bounded by the r.h.s. of (5.8). We show that \( [A_p] \) are real valued for \( p = 1, \ldots, N - 1 \), this implies that, since they do not depend on \( x \), they do not contribute to the sum in (5.9). By hypothesis the matrix of symbols \( A(U; t, \xi) \) is reversibility preserving, i.e. satisfies (2.76), therefore, by Lemma 2.43, we may assume that \( A_p \) satisfy condition (2.82) for any \( p = 1, \ldots, N - 1 \). Since \( A_p \) is reality preserving then we can write (see Remark 2.40)

\[
A_p(U; t, \xi) = \begin{pmatrix} \tilde{a}_p(U; t, \xi) & 0 \\ 0 & \tilde{a}_p(U; t, -\xi) \end{pmatrix},
\]

(5.10)

for some symbol \( \tilde{a}_p \in \mathcal{P}_p^m \) independent of \( x \). Recalling Def. 5.2 since \( A_p \) is a symmetric function of its arguments, we have, for \( \ell, p, n_1, \ldots, n_p \) satisfying the conditions in (5.5), that

\[
[A_p] \left( \Pi_{n_1}^+ S U, \ldots, \Pi_{n_i}^+ S U, \Pi_{n_j}^- S U, \ldots, \Pi_{n_p}^- S U; t, \xi \right) S = S [A_p] \left( \Pi_{n_1}^+ U, \ldots, \Pi_{n_i}^+ U, \Pi_{n_j}^- U, \ldots, \Pi_{n_p}^- U; t, \xi \right).
\]

(5.11)

We recall that \( \Pi_{n_i}^+ S U = \Pi_{n_i}^- U \) using (5.4). On the component \( [\tilde{a}_p] \) the condition (5.11) reads

\[
[\tilde{a}_p] \left( \Pi_{n_1}^- U, \ldots, \Pi_{n_j}^- U, \Pi_{n_i}^+ U, \ldots, \Pi_{n_p}^+ U; \xi \right) = [\tilde{a}_p] \left( \Pi_{n_1}^+ U, \ldots, \Pi_{n_i}^+ U, \Pi_{n_j}^- U, \ldots, \Pi_{n_p}^- U; -\xi \right).
\]

(5.12)

The condition (2.77) (which holds since \( A_p \) is parity preserving) implies that \( \tilde{a}_p(U, \ldots, U; t, \xi) \) is even in \( \xi \) since it does not depend on \( x \). Therefore by symmetry we deduce that

\[
[\tilde{a}_p] \left( \Pi_{n_1}^+ U, \ldots, \Pi_{n_i}^+ U, \Pi_{n_j}^- U, \ldots, \Pi_{n_p}^- U; t, \xi \right)
\]

is real valued. This concludes the proof. \( \square \)
Theorem 5.4 (Normal form 1). Let \( N, \rho, K > 0 \) as in Theorem 4.7. There exists \( N \subset \mathcal{O} \) with zero measure such that for any \( \vec{m} \in \mathcal{O} \setminus N \) the following holds. There exist \( K'' > 0 \) such that \( K'' := 2\rho + 4 < K'' \ll K, s_0 > 0, r_0 > 0 \) (possibly different from the ones given by Theorem 4.7) such that, for any \( s \geq s_0, 0 < r \leq r_0 \) and any \( U \in B^s_r(I, r) \) solution even in \( T \) of \( \Theta(U)[\cdot] : C_{s+R}^{K''}(I, H^s(T; \mathbb{C}^2)) \to C_{s+R}^{K''}(I, H^s(T; \mathbb{C}^2)) \), satisfying the following:

(i) there exists a constant \( C \) depending \( n, s, r \) and \( K \) such that

\[
\|\Theta(U)[V]\|_{K - K'', s} \leq \|V\|_{K - K'', s}(1 + C\|U\|_{K, s_0}),
\]

\[
\|((\Theta(U))^{-1}[V]\|_{K - K'', s} \leq \|V\|_{K - K'', s}(1 + C\|U\|_{K, s_0}),
\]

for any \( V \in C_{s+R}^{K''}(I, H^s(T; \mathbb{C}^2)) \);

(ii) \( \Theta(U) - 1 \) and \( (\Theta(U))^{-1} - 1 \) belong to the class \( \Sigma\mathcal{M}_{K, K''}^{1}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \);

(iii) the function \( W = \Theta(U)[V] \), where \( V \) solves \( 1.2 \), satisfies

\[
\partial_t W = iE(\Lambda W + \text{Op}^B(L_1(U; t, \xi))W) + Q_1^{(1)}(U; t)[W] + Q_2^{(1)}(U; t)[U]
\]

where \( Q_1^{(1)}, Q_2^{(1)} \in \Sigma\mathcal{R}^{r+1}_{{K, K''}^{1}}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \), for some \( m_1 > 0 \) depending on \( N \) (larger than \( m \) in Theorem 4.7), are \((R,R,P)\)-operators and \( L_1(U; t, \xi) \) is a \((R,R,P)\)-matrix in \( \Sigma\mathcal{R}^{2}_{{K, K''}^{1}}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) with constant coefficients in \( t \in T \) and which has the form (recalling Def 5.2)

\[
L_1(U; t, \xi) := \begin{pmatrix} m^{(1)}(U; t, \xi) & 0 \\ 0 & m^{(1)}(U; -\xi) \end{pmatrix}, \quad m^{(1)}(U; t, \xi) = m_2(U)(i\xi) + [m^{(1)}_0](U; t, \xi),
\]

where \( m_2(U) \) is given in \( 4.4 \) and \( m^{(1)}_0(U; t, \xi) \in \Sigma\mathcal{R}^{0}_{{K, K''}^{1}}[r, N] \).

5.1 Non-resonance conditions

For \( M \in \mathbb{N} \) and \( \vec{m} = (m_1, \ldots, m_M) \in \mathcal{O} := [-1/2, 1/2]^M \) we define, recalling \( 1.4, 1.12 \), for any \( N \leq M \) and \( 0 \leq \ell \leq \) the function

\[
\psi_N^\ell(\vec{m}, \vec{n}) = \lambda_{n_1} + \ldots + \lambda_{n_\ell} - \lambda_{n_{\ell+1}} - \ldots - \lambda_{n_N} = \sum_{j=1}^{\ell} (in_j)^2 - \sum_{j=\ell+1}^{N} (in_j)^2 + \sum_{k=1}^{M} m_k \left( \sum_{j=1}^{\ell} \frac{1}{\langle n_j \rangle^{2k+1}} - \sum_{j=\ell+1}^{N} \frac{1}{\langle n_j \rangle^{2k+1}} \right),
\]

where \( \vec{n} = (n_1, \ldots, n_N) \in \mathbb{N}^N \) with the convention that \( \sum_{j=m}^{m'} a_j = 0 \) when \( m > m' \). We have the following lemma.

Proposition 5.5 (Non resonance condition). There exists \( N \subset \mathcal{O} \) with zero Lebesgue measure such that, for any \( \vec{m} \in \mathcal{O} \setminus N \), there exist \( \gamma, N_0 > 0 \) such that the inequality

\[
|\psi_N^\ell(\vec{m}, \vec{n})| \geq \gamma \max(\langle n_1 \rangle, \ldots, \langle n_N \rangle)^{-N_0},
\]

holds true for any \( \vec{n} = (n_1, \ldots, n_N) \in \mathbb{N}^N \) if \( N \) is odd. In the case that \( N \) is even the \( 5.17 \) holds true if \( \ell \neq N/2 \) and for any \( \vec{n} \in \mathbb{N}^N \) such that

\[
\{n_1, \ldots, n_{\ell}\} \neq \{n_{\ell+1}, \ldots, n_N\}.
\]
Proof. First of all we show that, if \( N, \ell, \vec{n} \) are as in the statement of the proposition, the function \( \psi_N^{\ell}(\vec{m}, \vec{n}) \) is not identically zero as function of \( \vec{n} \). We can write

\[
\psi_N^{\ell}(\vec{m}, \vec{n}) = a_0^{(\ell)}(\vec{n}) + \sum_{k=1}^{N} m_k a_k^{(\ell)}(\vec{n}) + \sum_{k=N+1}^{M} m_k a_k^{(\ell)}(\vec{n}),
\]

where

\[
a_0^{(\ell)}(\vec{n}) := \sum_{j=1}^{\ell} (in_j)^2 - \sum_{j=\ell+1}^{N} (in_j)^2; \quad a_k^{(\ell)}(\vec{n}) := \sum_{j=1}^{\ell} \frac{1}{(n_j)^{2k+1}} - \sum_{j=\ell+1}^{N} \frac{1}{(n_j)^{2k+1}}, \quad k \geq 1 \tag{5.19}
\]

for \( 0 \leq \ell \leq N \). We show that there exists at least one non zero coefficient \( a_k^{(\ell)}(\vec{n}) \) for \( 1 \leq k \leq N \).

Let \( q \in \mathbb{N}^* \) such that there are \( N_1, \ldots, N_q \) in \( \mathbb{N}^* \) satisfying \( N_1 + \ldots + N_q = N \) and

\[
\{ n_1, \ldots, n_N \} = \{ n_{1,1}, \ldots, n_{1,N_1}, \ldots, n_{q,1} \ldots, n_{q,N_q} \}
\]

where

\[
\begin{cases}
  n_{j,i_1} = n_{j,i_2} \forall i_1, i_2 \in \{1, \ldots, N_j\}, \forall j \in \{1, \ldots, q\}, \\
  n_{j,1} \neq n_{i,1} \forall i \neq j.
\end{cases}
\]

Note that, since \( \langle x \rangle = \sqrt{1+x^2} \) for \( x \in \mathbb{R} \), then \( \langle n_{j,1} \rangle \neq \langle n_{i,1} \rangle \) for any \( i \neq j \). According to this notation the element in (5.19) can be rewritten as

\[
a_k^{(\ell)}(\vec{n}) = \sum_{j=1}^{q} \frac{1}{\langle n_{j,1} \rangle^{2k+1}} (N_j^+ - N_j^-), \tag{5.20}
\]

where \( N_j^+ \), resp. \( N_j^- \), is the number of times that the term \( \langle n_{j,1} \rangle^{2k+1} \) appears in the sum in equation (5.19) with sign +, resp. with sign −, and hence \( N_j^+ + N_j^- = N_j \). Note that if \( N_j^+ - N_j^- = 0 \) for any \( j = 1, \ldots, q \), then the condition (5.18) is violated.

Define the \((N \times q)\)-matrix

\[
A_q(\vec{n}) := \begin{pmatrix}
\frac{1}{\langle n_{1,1} \rangle^3} & \cdots & \frac{1}{\langle n_{1,1} \rangle^2} \\
\frac{1}{\langle n_{2,1} \rangle^3} & \cdots & \frac{1}{\langle n_{2,1} \rangle^2} \\
\vdots & \ddots & \vdots \\
\frac{1}{\langle n_{N,1} \rangle^3} & \cdots & \frac{1}{\langle n_{N,1} \rangle^2}
\end{pmatrix},
\]

We have

\[
\sum_{k=1}^{N} m_k a_k^{(\ell)}(\vec{n}) = \left( A_q(\vec{n}) \vec{\sigma}^{(\ell)}_q \right) \cdot \vec{m}_N, \quad \vec{\sigma}^{(\ell)}_q := \left( (N_1^+ - N_1^-), \ldots, (N_q^+ - N_q^-) \right)^T, \tag{5.21}
\]

where \( \vec{m}_N := (m_1, \ldots, m_N) \) and “\( \cdot \)” denotes the standard scalar product on \( \mathbb{R}^N \). By the above reasoning the vector \( \vec{\sigma}^{(\ell)}_q \) is different from \( \vec{0} \). We claim that the vector \( \vec{\psi} := A_q(\vec{n}) \vec{\sigma}^{(\ell)}_q \) has at least one component different from zero.

Denote by \( A_q^k(\vec{n}) \) the \((q \times q)\)-sub-matrix of \( A_q(\vec{n}) \) made of its firsts \( q \) rows.

The matrix \( A_q^k(\vec{n}) \) is, up to rescaling the \( k \)-th column by the factor \( \langle n_{1,k} \rangle^3 \), a Vandermonde matrix, therefore

\[
\det(A_q^k(\vec{n})) = \left( \prod_{j=1}^{q} \frac{1}{\langle n_{j,1} \rangle^3} \right) \prod_{1 \leq i < k \leq q} \left( \frac{1}{\langle n_{i,1} \rangle} - \frac{1}{\langle n_{k,1} \rangle} \right), \tag{5.22}
\]

which is different from zero since \( n_{i,1} \neq n_{k,1} \) for any \( 1 \leq i < k \leq q \); this implies that \( \text{Rank}(A_q(\vec{n})) = q \), hence the claim follows since \( \vec{\sigma}^{(\ell)}_q \neq \vec{0} \).
Fix $\gamma > 0$, $N \leq M \in \mathbb{N}$, $N_0 \in \mathbb{N}$ and $0 \leq \ell \leq N$; we introduce the following “bad” set
\[
B_{N,N_0}(\vec{m}, \gamma, \ell) := \left\{ \vec{m} \in \mathcal{O} : |\psi_N^\ell(\vec{m}, \vec{n})| < \gamma \max (\langle n_1 \rangle, \ldots, \langle n_N \rangle)^{-N_0} \right\}.
\] (5.23)
We give an estimate of the sub-levels of the function $\psi_N^\ell(\vec{m}, \vec{n})$. By the discussion above there exists $1 \leq k' \leq q$ such that $a_k^{(t)}(\vec{m}) \neq 0$, set $k_\infty \in \{1, \ldots, q\}$ the index such that $a_k^{(t)}(\vec{m}) = (A_q^k(\vec{m})\varphi_q^{(t)})_{k_\infty} \geq \|A_q^k(\vec{m})\varphi_q^{(t)}\|_\infty > 0$. We start by proving that there exist constants $c \ll 1$ and $b \gg 1$, both depending only on $q$ (and hence only on $N$), such that
\[
|\partial_{m_{k_\infty}} \psi_N^\ell(\vec{m}, \vec{n})| \geq \frac{c}{\max (\langle n_1 \rangle, \ldots, \langle n_N \rangle)^b}.
\] (5.24)
We have
\[
|\partial_{m_{k_\infty}} \psi_N^\ell(\vec{m}, \vec{n})| = |a_k^{(t)}(\vec{m})| \geq |(A_q^k(\vec{m})\varphi_q^{(t)})_{k_\infty}| \geq K(\det A_q^k(\vec{m})),
\] (5.25)
where $1 \gg K = K(N) > 0$ depends only on $N$. The last inequality in (5.25) follows by the fact that $A_q^k(\vec{m})$ is invertible, hence
\[
1 \leq \|(A_q^k(\vec{m}))^{-1}A_q^k(\vec{m})\varphi_q^{(t)}\| \leq (\det A_q^k(\vec{m}))^{-1}N^2C_N \|A_q^k(\vec{m})\varphi_q^{(t)}\|_\infty,
\]
with $C_N > 0$ and we have used $q \leq N$. By formula (5.22) one can deduce that
\[
|\det A_q^k(\vec{m})| \geq 
\]
where $b$ and $\tilde{K}$ depend only on $N$. The latter inequality, together with (5.26), implies the (5.24). Estimate (5.24) implies that
\[
\max (\langle n_1 \rangle, \ldots, \langle n_N \rangle)^{N_0-b}.
\]
Hence, for $N_0 \geq b + 2 + N$, one obtains
\[
\min \left( \gamma \to 0 \right) \frac{\gamma}{c \max (\langle n_1 \rangle, \ldots, \langle n_N \rangle)^{N_0-b}} = 0.
\]
By setting
\[
\mathcal{N} := \bigcup_{0 \leq N \leq M} \bigcap_{\gamma > 0} \bigcup_{\vec{n} \in \mathbb{N}^N} B_{N,N_0}(\vec{m}, \gamma, \ell),
\]
one gets the thesis. 

\[\blacksquare\]

### 5.2 Normal forms

In this Section we prove Theorem 5.4. The proof will be based on an iterative use of the following lemma.

**Lemma 5.6.** Fix $p$, $K$, $N \in \mathbb{N}$, $r, p > 0$, $1 \leq p \leq N - 1$ and $K' \leq K$. For $U \in B_{N_0}^K(I, r) \cap C_{K'}^R(I; \mathcal{H}_u^p)$ be a solution of (3.1) consider the system
\[
\partial_t V = iE(\Lambda V + \text{Op}_{BW}(\tilde{L}^{(p)}(U, t, \xi))[V] + G_1^{(p)}(U; t)[V] + G_2^{(p)}(U; t)[U]),
\] (5.26)
where $G_1^{(p)}(U; t), G_2^{(p)}(U; t) \in \Sigma R^p_{K,K',1} \supseteq M_2(C)$ are $(R,R,P)$-operator and $\tilde{L}^{(p)}(U, t, \xi)$ is a diagonal and constant coefficients in $x$ $(R,R,P)$-matrix of the form
\[
\tilde{L}^{(p)}(U, t, \xi) := \begin{pmatrix} m^{(p)}(U); t, \xi & 0 \\ 0 & m^{(p)}(U); t, -\xi \end{pmatrix}, \quad m^{(p)}(U; t, \xi) = m_2(U; t)(i\xi)^2 + m_0^p(U; t, \xi),
\] (5.27)
where \( m_2(U; t) \) is the real symbol in \( \Sigma \mathcal{F}_{K,K',1}[r, N] \) given in (4.3), while \( m_0^{(p)}(U; t, \xi) \in \Sigma \Gamma_{K,K',1}^0[r, N] \) is such that (recalling Def. 5.2)

\[
\begin{align*}
    m_0^{(1)}(U; t, \xi) &= \sum_{j=1}^{N-1} m_j^{(1)}(U, \ldots, U; t, \xi) + m_N^{(1)}(U; t, \xi), \\
    m_0^{(p)}(U; t, \xi) &= \sum_{j=1}^{p-1} [m_j^{(p)}(U, \ldots, U; t, \xi)] + \sum_{j=p}^{N-1} m_j^{(p)}(U, \ldots, U; t, \xi) + m_N^{(p)}(U; t, \xi),
\end{align*}
\]

where

\[
m_j^{(p)} \in \Gamma_j^0, \quad j = 1, \ldots, N - 1, \quad m_N^{(p)} \in \Sigma \Gamma_{K,K',1}^0[r, N].
\]

For \( r \) small enough and \( \vec{m} \) outside the subset \( \mathcal{N}' \) given by Proposition 5.5, the following holds. There is \( s_0 > 0 \) such that for \( s \geq s_0 \), there is an invertible \((R,R,P)\)-map

\[
\Theta_{p}(U)[\cdot] : C_{s+\mathbb{R}}^{K'-K'}(I, \mathcal{H}'(\mathbb{T}; \mathbb{C}^2)) \to C_{s+\mathbb{R}}^{K'-K'}(I, \mathcal{H}'(\mathbb{T}; \mathbb{C}^2)),
\]

satisfying the following:

(i) there exist \( C \) depending on \( s, r, K \) such that

\[
\| \Theta_{p}(U)[V] \|_{K'-K', s} \leq \| V \|_{K'-K', s}(1 + C \| U \|_{K,s_0}),
\]

\[
\left\| \left( \Theta_{p}(U) \right)^{-1}[V] \right\|_{K'-K', s} \leq \| V \|_{K'-K', s}(1 + C \| U \|_{K,s_0}),
\]

for any \( V \in C_{s+\mathbb{R}}^{K'-K'}(I, \mathcal{H}'(\mathbb{T}; \mathbb{C}^2)) \);

(ii) \( \Theta_{p}(U) - 1 \) and \( (\Theta_{p}(U))^{-1} - 1 \) belong to the class \( \Sigma \mathcal{M}_{K,K',1}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \);

(iii) the function \( W = \Theta_{p}(U)[V] \) satisfies

\[
\partial_t W = iE(\partial W + \text{Op}^{BW}(\tilde{I}^{(p+1)}(U; t, \xi))[W] + G_1^{(p+1)}(U; t)[W] + G_2^{(p+1)}(U; t)[U]),
\]

where \( V \) satisfies (5.26). The operators \( G_1^{(p+1)}(U; t), G_2^{(p+1)}(U; t) \) are \((R,R,P)\)-operators in the class \( \Sigma \mathcal{R}_{K,K'+1,1}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) for some \( \vec{m} > 0 \). \( \tilde{I}^{(p+1)}(U; t, \xi) \) is a \((R,R,P)\)-matrix in \( \Sigma \Gamma_{K,K'+1,1}^2[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \) with constant coefficients in \( x \in \mathbb{T} \) and it has the form

\[
\tilde{I}^{(p+1)}(U; t, \xi) := \begin{pmatrix} m^{(p+1)}(U; t, \xi) & 0 \\ 0 & m^{(p+1)}(U; t, -\xi) \end{pmatrix},
\]

\[
m^{(p+1)}(U; t, \xi) = m_2(U; t)(i\xi)^2 + m_0^{(p+1)}(U; t, \xi),
\]

where \( m_2(U; t) \) is given in (4.3), the symbol \( m_0^{(p+1)}(U; t, \xi) \) is in \( \Sigma \Gamma_{K,K'+1,1}^0[r, N] \) and it has the form

\[
m_0^{(p+1)}(U; t, \xi) = \sum_{j=1}^{p-1} [m_j^{(p)}(U, \ldots, U; t, \xi)] + \sum_{j=p}^{N-1} m_j^{(p+1)}(U, \ldots, U; t, \xi) + m_N^{(p+1)}(U; t, \xi),
\]

where \( m_j^{(p)} \in \Gamma_j^0, \ j = 1, \ldots, p \) are given in (5.29) and

\[
m_j^{(p+1)} \in \Gamma_j^0, \quad j = p + 1, \ldots, N - 1, \quad m_N^{(p+1)} \in \Gamma_{K,K'+1,1,N}^0[r].
\]
Proof. Let \( f(U; t, \xi) \) be a symbol in \( \Gamma_0^0 \) which has constant coefficients in \( x \in \mathbb{T} \). Consider the system
\[
\partial_t W(\tau) = \text{Op}^B_w (\tilde{F}^{(p)}(U; t, \xi)) [W(\tau)], \quad \tilde{F}^{(p)}(U; t, \xi) := \begin{pmatrix} f(U; t, \xi) \\ 0 \end{pmatrix} / f(U; t, -\xi).
\] (5.36)

Suppose moreover that the matrix \( \tilde{F}^{(p)}(U; t, \xi) \) is a (R,R,P)-matrix of symbols. By standard theory of ODEs on Banach spaces the flow \( \Theta^\tau_p(U)[\cdot] \) of (5.36) is well defined for \( \tau \in [0, 1] \). We set \( \Theta^\tau_p(U)[\cdot] := \Theta^\tau_p(U)[\cdot]_{|_{t=0}} \). Estimates (5.31) hold by direct computation. Item (ii) follows by Taylor expanding \( \Theta^\tau_p(U)[\cdot] \) at \( \tau = 0 \) and by using Remark 2.28 and item (i) of Lemma 2.35. The same argument implies the following further properties of the map \( \Theta^\tau_p(U)[\cdot] \):
\[
\Theta_p(U)[\cdot] = 1 + \text{Op}^B_w (\tilde{F}^{(p)}(U; t, \xi)) + \text{Op}^B_w (C^+(U; t, \xi))[\cdot] + R^+(U; t)[\cdot],
\] (5.37)

\[
(\Theta_p(U))^{-1}[\cdot] = 1 - \text{Op}^B_w (\tilde{F}^{(p)}(U; t, \xi)) + \text{Op}^B_w (C^-(U; t, \xi))[\cdot] + R^-(U; t)[\cdot],
\] (5.38)

for some (R,R,P)-matrices of symbols \( C^+(U; t, \xi), C^-(U; t, \xi) \) independent of \( x \) belonging to \( \Sigma_{K, K^*, p+1} [r, N] \otimes M_2(\mathbb{C}) \) and some (R,R,P)-operators \( R^+(U; t)[\cdot], R^-(U; t)[\cdot] \) belonging to \( \Sigma^p_{K, K^*, 1} [r, N] \otimes M_2(\mathbb{C}) \) (actually the homogeneity of these remainders is bigger than \( p \) but, at this level, we do not emphasize this property and we embed them in the remainders of homogeneity 1).

Finally, since \( \tilde{F}^{(p)}(U, \ldots, U; t, \xi) \) is a (R,R,P)-matrix of symbols then the flow \( \Theta^\tau_p(U)[\cdot] \) is reversibility preserving. Indeed, by setting \( G^\tau = S \Theta^\tau_p(U; -t) - \Theta^\tau_p(SU; t)S \), one can note that
\[
\partial_t G^\tau = \tilde{F}^{(p)}(SU; t)G^\tau,
\]
with \( G^0 = 0 \), where we used that \( S \tilde{F}^{(p)}(U; t) = \tilde{F}^{(p)}(SU; t) \) (which is (2.67)). This implies that \( G^\tau \equiv 0 \) for \( \tau = [0, 1] \), which means that \( \Theta_p(U; t) \) is reversibility preserving.

Since \( U \) solves (5.1), there is a (R,R,P)-map \( M \in \Sigma M^0_{K, 0, 1} [r, N] \otimes M_2(\mathbb{C}) \), for some \( \hat{m} > 0 \), such that
\[
\partial_t U = iEALU + iEM(U; t)[U].
\] (5.39)

Hence, by taking the derivative w.r.t. the variable \( t \) in (5.37), we have
\[
\partial_t (\Theta_p(U))[\cdot] = \sum_{j=1}^p \partial_j \text{Op}^B_w (\tilde{F}^{(p)}(U, \ldots, \partial_j U, U, \ldots, U; t, \xi))
+ \text{Op}^B_w (\partial_j C^+(U; t, \xi))[\cdot] + (\partial_j R^+(U; t))[\cdot]
= \sum_{j=1}^p \text{Op}^B_w (\tilde{F}^{(p)}(U, \ldots, iEALU, U, \ldots, U; t, \xi)) + (\partial_j C^+(U; t, \xi))[\cdot]
+ \text{Op}^B_w (B(U; t, \xi))[\cdot] + \tilde{R}^+(U; t)[\cdot],
\] (5.40)

for some \( B(U; t, \xi) \in \Sigma\Gamma^0_{K, K^*, 1, p+1} [r, N] \otimes M_2(\mathbb{C}) \), and \( \tilde{R}^+(U; t) \in \Sigma\Gamma^p_{K, K^*, 1} [r, N] \otimes M_2(\mathbb{C}) \), where we used Proposition 2.35 (in particular items (iii), (v)) and \( \hat{m} \) is the loss given by \( M \) in (5.39). We fix \( 0 < \rho' = \rho - \hat{m} \) which is possible since \( \rho \gg 1 \). Now if \( W = \Theta_p(U)[W] \) one has that
\[
\partial_t W = \Theta_p(U)[iE(AL + \text{Op}^B_w (\tilde{F}^{(p)}(U; t, \xi)) + C^{(p)}_1(U; t, \xi))] \Theta_p(U)^{-1}[W]
+ \Theta_p(U)G^{(p)}_2(U; t)U + (\partial_t \Theta_p(U))(\Theta_p(U))^{-1}[W]
= iE(AL + \text{Op}^B_w (\tilde{F}^{(p)}(U; t, \xi)))[W]
+ \sum_{j=1}^p \text{Op}^B_w (\tilde{F}^{(p)}(U, \ldots, iEALU, U, \ldots, U; t, \xi))[W] + iE\text{Op}^B_w (C_1(U; t, \xi))[W] + iEG_3(U; t)[W] + iEG_4(U; t)[U],
\] (5.41)
for some (R,R,P)-matrix of symbols $C_1(U; t, \xi)$ independent of $x$ belonging to $\Sigma^q_{K,K'+1, p+1}[r, N] \otimes \mathcal{M}_2(\mathbb{C})$ and some (R,R,P)-operators $G_3(U; t)[\cdot], G_4(U; t)[\cdot]$ belonging to $\Sigma^{q^{'}}_{K,K'+1}[r, N] \otimes \mathcal{M}_2(\mathbb{C})$. In the previous computation we used Proposition 2.35, (5.37), (5.38) and (5.40). In the notation of item (iii) of the statement we look for $\hat{F}^{(p)}(U, \ldots, U; t, \xi)$ such that

$$\sum_{j=1}^{p} f(U, \ldots, \hat{\Psi}_{j}^{(p)} U, \ldots, U; t, \xi) + \text{im}_{p}^{(p)}(U, \ldots, U; t, \xi) = i\text{m}_{p}^{(p)}[(U, \ldots, U; t, \xi). \tag{5.42}$$

Recalling the definition of the operator $\hat{G}$ for some (R,R,P)-matrix of symbols $\hat{G}$ in the notation of item (iii) of the statement we look for $\hat{G}^{(p)}(U, \ldots, U; t, \xi)$ such that

$$\sum_{j=1}^{p} f(U, \ldots, \hat{\Psi}_{j}^{(p)} U, \ldots, U; t, \xi) + \text{im}_{p}^{(p)}(U, \ldots, U; t, \xi) = i\text{m}_{p}^{(p)}[(U, \ldots, U; t, \xi). \tag{5.42}$$

in the following cases:

- $p$ is odd, $0 \leq \ell \leq p$ and for any $\tilde{n} = (n_1, \ldots, n_p) \in \mathbb{N}^p$;
- $p$ is even, $0 \leq \ell \leq p$ with $\ell \neq p/2$ and for any $\tilde{n} = (n_1, \ldots, n_p) \in \mathbb{N}^p$;
- $p$ is even, $\ell = p/2$ and for any $\tilde{n} = (n_1, \ldots, n_p) \in \mathbb{N}^p$ such that

$$\{n_1, \ldots, n_{\ell}\} \neq \{n_{\ell+1}, \ldots, n_p\}.$$

By estimate (5.17) on $\psi_p^{(p)}(m, \tilde{n})$, we get that $f(U, \ldots, U; t, \xi)$ is a symbol in $\hat{T}^{0}_{\rho}$ and does not depend on $x$ since so does $m_{p}^{(p)}$. Furthermore, since $\hat{L}(p)$ in (5.27) is a (R,R,P)-matrix of symbols, one has that $\hat{F}^{(p)}(U, \ldots, U; t, \xi)$ in (5.39) is even in $N$ and reality preserving (i.e. satisfies resp. (2.77) and (2.78)). Finally, since $m_{p}^{(p)}(U, \ldots, U; t, \xi)$ satisfies (2.82) and the function $\psi_p^{(p)}(m, \tilde{n})$ in (5.16) is real and even in each component of $\tilde{n}$, one has that the symbol $\hat{F}^{(p)}(U, \ldots, U; t, \xi)$ satisfies (2.82). Finally since $\hat{F}^{(p)}(U, \ldots, U; t, \xi)$ above the equation (5.41) has the form (5.32) for a suitable (R,R,P)-matrix of symbols $\hat{G}^{(p+1)}$ of the form (5.33).

**Proof of Theorem 5.4** Let $\mathcal{N}$ be the set of parameters $\tilde{m} \in [-1/2, 1/2]^M$ given in Proposition 5.5. We apply Lemma 5.6 to the system (4.2) since it has the form (5.26) with $p = 1$, $\hat{L}(1) \sim L$ in (4.3), $G_1^{(1)}, G_2^{(1)} \sim Q_1, Q_2$, and $\rho \sim \rho - m$ (with $m$ given by Theorem 4.1). The lemma guarantees the existence of a map $\Theta_1(U)[\cdot]$ (see (5.30)) such that the function $W_1 = \Theta_1(U)[\cdot]$ satisfies a system of the form (5.32) with $\hat{L}(2)^{n}$ in (5.33) with $p = 1$ and where $G_1^{(2)}, G_2^{(2)}$ are some operators in $\Sigma^{q}_{K,K'+1}[r, N] \otimes \mathcal{M}_2(\mathbb{C})$. Here $\rho^{(1)} = \rho - m - \tilde{m}$ where $\tilde{m}$ is the loss of derivatives produced by the map $M(U; t)$ given in (5.39). This new system still satisfies the hypotheses of Lemma 5.6 hence we may apply it iteratively. We obtain a sequence of maps $\Theta_j(U)[\cdot]$ for $j = 1, \ldots, N - 1$ such that $W_j := \Theta_j(U)[W_{j-1}]$ satisfies a system of the form (5.32) for suitable matrices of symbols $\hat{G}^{(j+1)}$ given in (5.33) with $p = j$ and where the remainders $G_1^{(j+1)}, G_2^{(j+1)}$ belong to $\Sigma^{q}_{K,K'+1}[r, N] \otimes \mathcal{M}_2(\mathbb{C})$ where $\rho^{(j)} \sim \rho - m - j\tilde{m}$, which is positive since $\rho \gg N$ in Theorem 4.1. We set

$$\Theta(U)[\cdot] := \Theta_{N-1}(U) \circ \cdots \circ \Theta_1(U)[\cdot],$$

which satisfies items (i), (ii) because each map $\Theta_j, j = 1, \ldots, N - 1$ has similar properties by Lemma 5.6. With this choice, the constant coefficients in $x$ matrix of symbols $L_1(U; t, \xi)$ in (5.14) is transformed into $\hat{L}^{(N-1)}(U; t, \xi)$ (given in (5.33), (4.3) and (5.34) with $p = N - 1$), which satisfies (5.15). The smoothing remainders $Q_1^{(1)}(U; t), Q_2^{(2)}(U; t)$ belong to the class $\Sigma^{q}_{K,K'+1}[r, N] \otimes \mathcal{M}_2(\mathbb{C})$ where $K'' \sim K' + N$ and $m_{1} = m + (N - 1)\tilde{m}$. \qed
5.3 Modified energies

In this subsection we give the proof of Theorem 5.1. We introduce the classes of multilinear forms which will be used to construct modified energies for a system of the form \((5.14)\). The following definition is Definition 4.4.1 in [7].

**Definition 5.7.** Let \(\rho, s \in \mathbb{R}\) with \(\rho, s \geq 0\) and \(p \in \mathbb{N}\). One denotes by \(\mathcal{L}^{s, -\rho}_{p, \pm}\) the space of symmetric \((p + 2)\)-linear forms

\[
(U_0, \ldots, U_{p+1}) \rightarrow L(U_0, \ldots, U_{p+1})
\]

defined on \(C^\infty(\mathbb{T}; \mathbb{C}^2)\) and satisfying for some \(\mu \in \mathbb{R}_+\) and any \((n_0, \ldots, n_{p+1}) \in \mathbb{N}^{p+2}\) and any \((U_0, \ldots, U_{p+1}) \in (C^\infty(\mathbb{T}; \mathbb{C}^2))^{p+2}\),

\[
|L(\Pi_{n_0}U_0, \ldots, \Pi_{n_{p+1}}U_{p+1})| \leq C \max(|\langle n_0 \rangle|, \ldots, |\langle n_{p+1} \rangle|)^{2s-\rho} \times \max(|\langle n_0 \rangle|, \ldots, |\langle n_{p+1} \rangle|)^{\mu+\rho} \prod_{j=0}^{p+1} \|\Pi_{n_j}U_j\|_{L^2}^{p+1}
\]

(5.43)

where \(\max_3(|\langle n_0 \rangle|, \ldots, |\langle n_{p+1} \rangle|)\) is the third largest value among \(|\langle n_0 \rangle|, \ldots, |\langle n_{p+1} \rangle|\), and such that

\[
L(\Pi_{n_0}U_0, \ldots, \Pi_{n_{p+1}}U_{p+1}) \neq 0 \Rightarrow \sum_{j=0}^{p+1} \sigma_j n_j = 0,
\]

(5.44)

for some choice of the signs \(\sigma_j \in \{+1, -1\}\) for \(j = 0, \ldots, p + 1\), and for any \(U_0, \ldots, U_{p+1}\) satisfying \((2.63)\),

\[
L(SU_0, \ldots, SU_{p+1}) = \pm L(U_0, \ldots, U_{p+1}).
\]

(5.45)

The following lemma collects some properties of the class \(\mathcal{L}^{s, -\rho}_{p, \pm}\) which are proved in Section 4.4 of [7].

**Lemma 5.8.** The following facts hold true.

(i) Fix \(\rho \geq 0\), \(p \in \mathbb{N}^*\) and consider \(R \in \tilde{R}^{s, -\rho}_{p, \pm}\) satisfying \((2.62)\) (resp. \((2.71)\)). One has that the \(L(U_0, \ldots, U_{p+1})\) defined as the symmetrization of

\[
(U_0, \ldots, U_{p+1}) \rightarrow \int_{\mathbb{T}} \langle (D)^s SU_0 \rangle \langle (D)^s R(U_1, \ldots, U_p)U_{p+1} \rangle dx
\]

(5.46)

belongs to \(\mathcal{L}^{s, -\rho}_{p, \pm}\) (resp. \(\mathcal{L}^{s, -\rho}_{p, \pm}\)).

(ii) Let \(L \in \mathcal{L}^{s, -\rho}_{p, \pm}\). Then for any \(m \geq 0\) such that \(\rho > m + 1/2\) and any \(s > \rho + \mu + m + 1/2\), \(L\) extends as a continuous \((p + 2)\)-linear form on \(H^s(\mathbb{T}; \mathbb{C}^2) \times \cdots \times H^s(\mathbb{T}; \mathbb{C}^2) \times H^{s-m}(\mathbb{T}; \mathbb{C}^2) \times \cdots \times H^{s}(\mathbb{T}; \mathbb{C}^2)\).

(iii) Let \(p = 2\ell\) with \(\ell \in \mathbb{N}^*\) and \(L \in \mathcal{L}^{s, -\rho}_{p, \pm}\). For \(U\) even in \(x\) satisfying \((2.63)\) one has, for \(n_0, \ldots, n_{\ell} \in \mathbb{N}^*\),

\[
L(\Pi_{n_0}^+ U, \ldots, \Pi_{n_{\ell}}^+ U, \Pi_{n_0}^- U, \ldots, \Pi_{n_{\ell}}^- U) = 0.
\]

(5.47)

(iv) Let \(\tilde{m}\) be outside the subset \(\mathcal{N}\) and \(N_0\) given by Proposition 5.5. The for any \(L \in \mathcal{L}^{s, -\rho}_{p, \pm}\) there is \(\tilde{L} \in \mathcal{L}^{s, -\rho + N_0}_{p, \pm}\) such that

\[
\sum_{j=0}^{p+1} \tilde{L}(U, \ldots, E_A U, \ldots, U) = iL(U, \ldots, U),
\]

(5.48)

where \(E\) and \(A\) are defined in \((1.13)\) and \((1.14)\) respectively.

(v) Let \(L \in \mathcal{L}^{s, -\rho}_{p, \pm}\) and \(M \in \sum M_{r, r'}^{[r, N]} \otimes \mathcal{M}_2(\mathbb{C})\) (see Def. 2.9) which is reality preserving and reversible (resp. reversibility preserving) according to Def. 2.30 Then

\[
U \rightarrow L(U, \ldots, U, M(U; t)U, \ldots, U)
\]

(5.49)
can be written as the sum \( \sum_{q=0}^{N-2-p-q} L_q \), for some \( L_q \in \tilde{L}_q^{s,-\rho^+\mu} \) (resp. \( \tilde{L}_q^{s,-\rho^+\mu} \)), plus a term that, at any time \( t \), is
\[
O\left( \|U(t,\cdot)\|_{H^{k+1}} + \|U(t,\cdot)\|_{K^{s}} \right) + O\left( \|U(t,\cdot)\|_{H^{k+1}} + \|U(t,\cdot)\|_{K^{s}} \right)
\]
(5.50)
if \( s > \sigma > \rho \) and if \( \|U(t,\cdot)\|_{K^{s},\sigma} \) is bounded.

**Lemma 5.9 (First energy inequality).** Let \( U(t,x) \in B^s(I,r) \) be the solution of (3.1) with \( r \) small enough. If \( \rho > 0 \) is large enough there are constants \( s \geq s_0 \gg K \gg \rho'' \gg N \) and multilinear forms \( L_p \in \tilde{L}_p^{s,-\rho''} \), \( p = 1, \ldots, N-1 \), such that for \( s \geq s_0 \) the following holds.

Consider the functions \( V = \Phi(U)[U] \), given by Theorem 4.7 and \( W = \Theta(U)[V] \) given by Theorem 5.4. Then, for any \( s \geq s_0 \), one has
\[
\frac{d}{dt} \int \langle D \rangle^s W(t,x) \, dx = \sum_{p=1}^{N-1} L_p(U,\ldots,U) + O(\|U(t,\cdot)\|_{H^{k+2}}^2)
\]
for \( t \in I \). Moreover
\[
C^{-1}_s \|W\|_{H^s} \leq \|U\|_{H^s} \leq C_s \|W\|_{H^s},
\]
(5.52)
for some constant \( C_s > 0 \).

Before giving the proof of Lemma 5.9, we need to prove the following.

**Lemma 5.10.** Let \( U(t,\cdot) \) be the solution of (3.1) defined on some interval \( I \subset R \) and belonging to \( C^0(I; H^s(T; C^2)) \).

For any \( 0 \leq k \leq K \) there is a constant \( C_k \) such that, as long as \( \|U(t,\cdot)\|_{H^s} \leq 1 \) with \( s \gg K \), one has
\[
\|\partial_t^k U(t,\cdot)\|_{H^{k-2s}} \leq C_k \|U(t,\cdot)\|_{H^s}.
\]
(5.53)

**Proof.** We argue by induction. Clearly (5.53) holds for \( k = 0 \). Assume (5.53) holds for \( k = 0, \ldots, k' \leq K-1 \). Since by assumption \( \|U(t,\cdot)\|_{H^s} \leq 1 \), then
\[
\sum_{k=0}^{k'} \|\partial_t^k U(t,\cdot)\|_{H^{k-2s}} \leq C_{k'},
\]
for some \( C_{k'} \) uniformly for \( t \in I \). In order to get (5.53) it is sufficient to show \( \|\partial_t^{k'+1} U(t,\cdot)\|_{H^{k'-2s+1}} \leq C \|U(t,\cdot)\|_{H^s} \).

Using (3.1) we have that
\[
\partial_t^{k'+1} U = iE(\Lambda^k U + \partial_t^k (Op^{BW}(A(U; t, x, \xi))[U]) + \partial_t^k (R(U; t)[U])
\]
\[
= iE\Lambda^k U + iE \sum_{j_1+j_2=k'} Op^{BW}(\partial_t^{j_1} A(U; t, x, \xi))[\partial_t^{j_2} U]
\]
\[
+ iE \sum_{j_1+j_2=k'} (\partial_t^{j_1} R(U; t))[\partial_t^{j_2} U].
\]
(5.54)
By (2.42) in Proposition 2.27 and (2.8) with \( K' = 0 \) (recalling Remark 2.6), the inductive hypothesis and using that \( \|U(t,\cdot)\|_{H^s} \leq 1 \), we get
\[
\|\partial_t^{k'+1} U(t,\cdot)\|_{H^{k'-2s+2}} \leq C \|U(t,\cdot)\|_{H^s}.
\]
(5.55)
This concludes the proof.

**Proof of Lemma 5.9.** Since the maps \( \Phi, \Theta \) are (R,R,P)-maps, then the function \( W = \Theta(U)[\Phi(U)[U]] \) is even in \( x \) and satisfies (2.63). In particular, by items (ii) of Theorems 4.1 and 5.4, we have that
\[
W = U + \sum_{p=1}^{N-1} M_p(U,\ldots,U[U] + M_N(U; t)[U],
\]
(5.56)
for some (R,R,P) maps $M_p \in \tilde{\mathcal{M}}_p \otimes \mathcal{M}_2(\mathbb{C})$, $p = 1, \ldots, N - 1$ and $M_N \in \Sigma \mathcal{M}_{K,K',N}[r,N] \otimes \mathcal{M}_2(\mathbb{C})$. We remark also that, by Lemma 5.10 and (2.1), we have $\|U(X,\cdot)\|_{K,N} \leq C_{s,K}\|U(X,\cdot)\|_{H^s}$ for some $C_{s,K} > 0$. According to system (5.14), recalling (5.15), Remark 2.41 and Definition 5.2 we get

$$
\frac{d}{dt} \int_T \langle (D)^s W(t,x) \rangle^2 dx = 2\text{Re} i \int_T \langle (D)^s W \rangle [\text{Op}^B W(1(\xi) + m_2(U(t);i(\xi)^2))E(D)^s W] dx
$$

$$+ 2\text{Re} i \int_T \langle (D)^s W \rangle [\text{Op}^B (\mathcal{O}_{0}(1))](U(t,x,\xi)(i(\xi)^2))E(D)^s W] dx
$$

$$+ 2\text{Re} i \int_T \langle (D)^s W \rangle (D)^s EQ_1(U(t);t)[W]) dx
$$

$$+ 2\text{Re} i \int_T \langle (D)^s W \rangle (D)^s EQ_2(U(t);t)[U]) dx.
$$

(5.57)

The contribution of the first integral is zero since the symbol $1(\xi) + m_2(U(t);i(\xi)^2)$ is real. By using Lemma 5.3 we have that the contribution of the second integral is bounded by

$$O(||U(t,\cdot)||^{N}_{H^s}||W||^{2}_{H^s}).
$$

Let us consider the fourth integral term in (5.57). By definition we have that

$$Q_2(U;t)[U] = \sum_{p=1}^{N-1} Q_{2,p}(U,\ldots,U)[U] + Q_{2,N}(U(t);t)[U]
$$

where $Q_{2,p}^{(1)} \in \tilde{\mathcal{R}}_{\rho'}^p \otimes \mathcal{M}_2(\mathbb{C})$, $p = 1, \ldots, N - 1$ and $Q_{2,N}^{(1)} \in \mathcal{R}_{K,K',N}[r] \otimes \mathcal{M}_2(\mathbb{C})$ are (R,R,P)-operators and with $\rho' \gg \rho' \gg N$ given in Theorem 5.4. The contribution given by the term $Q_{2,N}(U(t);t)$ is bounded by

$$O(||U(t,\cdot)||^{N+2}_{H^s}).
$$

Furthermore the operators $Q_{2,p}(U,\ldots,U)$ satisfy (2.72) by Lemma 2.38 (iEQ_{2,p}^{(1)} satisfies (2.71)) by Remark 2.40. Hence the contribution to the fourth integral in (5.57) coming from the terms $Q_{2,p}(U,\ldots,U)$ can be written as in (5.46). By item (i) of Lemma 5.3 such contributions can be written as $L_p(U,\ldots,U)$ for some multilinear form $L_p(U_0,\ldots,U_{p+1})$ belonging to $\tilde{C}_{\rho'}^{-\rho'}$. Consider now the operator $Q_1(U;U)$ in the third integral in (5.57). If $\rho' \gg \rho''$ is large enough, then, by (5.56) and item (iii) of Proposition 2.35 we get

$$Q_1(U;t)[W] = \sum_{p=1}^{N-1} \tilde{Q}_p(U,\ldots,U)[U] + \tilde{Q}_N(U;U)[U],
$$

for some $\tilde{Q}_p \in \tilde{\mathcal{R}}_{\rho''}^p \otimes \mathcal{M}_2(\mathbb{C})$, $p = 1, \ldots, N - 1$ and $\tilde{Q}_N \in \mathcal{R}_{K,K''}[r] \otimes \mathcal{M}_2(\mathbb{C})$ which are (R,R,P)-operators. Hence the contribution of the third integral can be studied as done for the term coming from $Q_2(U;t)$. This concludes the proof.

Proof of Theorem 5.1 Let $s > 0$ large and $r > 0$ small enough. By Theorem 1.2 in [16] for any $u_0 \in H^s(\mathbb{T}; \mathbb{C})$ with $\|u_0\|_{H^s} \leq r$, there is a unique solution $u(t,x)$ of (1.1) with initial condition $u(0,x) = u_0(x)$ belonging to $C^1(I;H^{s-2}(\mathbb{T}; \mathbb{C})) \cap C^0(I;H^s(\mathbb{T}; \mathbb{C}))$ with $I = (T_-,T_+).$ Furthermore by Theorem 3.1 the function $U = (u,\bar{u})$ solves the problem (3.1) with initial condition $U_0 = (u_0,\bar{u}_0)$, furthermore by Lemma 5.10 such a solution belongs to the ball $B^s_{\mathbb{K}}(I,r)$.  

51
We now prove that \( T_r \geq cr^{-N} \) for some \( c > 0 \) depending on \( s \). By applying to the system (3.1) Theorems 4.1 and 5.4 we have that \( U(t, x) \) solves (3.1) if and only if the function \( W(t, x) \) given in Theorem 5.4 solves (5.14). By Lemma 5.9 we have that

\[
\|U\|_{H^s} \sim \|W\|_{H^s}, \tag{5.58}
\]

and that (5.51) holds.

We claim that there are multilinear forms \( F_p \in \mathcal{L}_{p-\tilde{\rho},+}^{s_\rho} \) for \( p = 1, \ldots, N - 1 \), for some \( \tilde{\rho} < \rho'' \) (the constant \( \rho'' \) is given in Lemma 5.9), such that, by setting

\[
G(U, W) := \int_T |(D)^s W(t, x)|^2 dx + \sum_{p=1}^{N-1} F_p(U, \ldots, U), \tag{5.59}
\]

the following conditions hold:

\[
\frac{d}{dt} G(U, W) \leq K_1 \|U(t, \cdot)\|_{H^s}^{N+2}, \quad t \in [-T_r, T_r],
\]

for some \( K_1 > 0 \) depending on \( s, N \). To prove this fact we reason as follows. Note that system (3.1) can be written, by Remark 2.28 as

\[
\partial_t U = iE \partial U + M(U; t)[U],
\]

for some \( M \in \Sigma M_{0,1}^{m}[r, N] \otimes \mathcal{M}_2(\mathbb{C}) \), \( m \geq 0 \). We show that it is possible to find recursively multilinear forms

\[
\tilde{L}_p \in \mathcal{L}_{p-\tilde{\rho},+}^{s_\rho} \quad \text{for} \quad 1 \leq p \leq N - 1,
\]

\[
L_p(q) \in \mathcal{L}_{q-\rho''}^{s+2}(N_0, m) \quad \text{for} \quad q + 1 \leq p \leq N - 1,
\]

such that, for \( q = 1, \ldots, N - 1 \),

\[
\frac{d}{dt} \left[ \int_T |(D)^s W(t, x)|^2 dx + \sum_{p=1}^{q} \tilde{L}_p(U(t, \cdot), \ldots, U(t, \cdot)) \right] = \sum_{p=q+1}^{N-1} L_p(q) (U(t, \cdot), \ldots, U(t, \cdot)) + O(\|U(t, \cdot)\|_{H^s}^{N+2}). \tag{5.64}
\]

Here \( m > 2 \) is the loss coming form \( M(U; t) \) in (5.62), the constant \( N_0 \) is in (5.17) of Proposition 5.5. This loss is compensated by the fact that \( \rho > 0 \) in Theorem 1.1 is arbitrary large, and hence also \( \rho'' \) can be taken large enough. We argue by induction on \( q \). For \( q = 0 \) the (5.64) follows by (5.51). Assume inductively that (5.64) holds for \( q - 1 \). Let us define \( \tilde{L}_q \in \mathcal{L}_{q-\rho''}^{s+2}(N_0, m) \) as the multilinear form given by item (iv) of Lemma 5.8 applied to \( L = L_q^{(q-1)} \). We get

\[
\frac{d}{dt} \tilde{L}_q(U(t, \cdot), \ldots, U(t, \cdot)) = i \sum_{j=0}^{q+1} \tilde{L}_j(U, \ldots, U, M(U; t)[U], U, \ldots, U).
\]

Using items (iv) and (v) of Lemma 5.8 we have that

\[
\frac{d}{dt} \tilde{L}_q(U(t, \cdot), \ldots, U(t, \cdot)) = L_q^{(q-1)}(U, \ldots, U)
\]

\[
+ \sum_{j=0}^{N-q-3} L_j(U, \ldots, U) + O(\|U\|_{H^s}^{N+2}), \tag{5.66}
\]
for some $L_j^i \in \tilde{L}_{p+2+j,N}$. Thus we get (5.64) at rank $q$. We conclude by setting $F_p$ in (5.59) equals to $\tilde{L}_p$. Since $r$ is small enough, then, thanks to item $(ii)$ of Lemma 5.10, equation (5.58) and Lemma 5.10 we get
\[
\mathcal{G}(U, W) \leq C_s(\|U(t, \cdot)\|_{H^s}^2 + \|U\|_{W^s}^2),
\]
as long as $\|U(t, \cdot)\|_{H^s} \leq C r$, therefore (5.60) holds. The (5.61) follows by (5.64) for $q = N - 1$.

The thesis follows by using the following bootstrap argument. The integral form of (5.61) is
\[
\mathcal{G}(U(t, \cdot), W(t, \cdot)) \leq \mathcal{G}(U(0, \cdot), W(0, \cdot)) + K_1 \int_0^t \|U(\tau, \cdot)\|_{H^s}^{N+2} d\tau,
\]
and by (5.60) we have that
\[
\mathcal{G}(U(0, \cdot), W(0, \cdot)) \leq c_0 r^2,
\]
for some $c_0$ depending on $s$. Fix $K_2 = K_2(s, N) > 1$ and let $\tilde{T}$ the supremum of those $T$ such that
\[
\sup_{t \in [-T, T]} \mathcal{G}(U(t, \cdot), W(t, \cdot)) \leq K_2 r^2.
\]
Assume, by contradiction, that $\tilde{T} < \tilde{c} r^{-N}$. Then, if $K_1$ is the constant appearing in the r.h.s. of (5.67), we have
\[
\mathcal{G}(U(t, \cdot), W(t, \cdot)) \leq c_0 r^2 + K_1 \int_0^t \|U(\tau, \cdot)\|_{H^s}^{N+2} d\tau
\]
\[
\leq c_0 r^2 + K_1 K_2^{N+2} r^N \tilde{T}
\]
\[
\leq c_0 r^2 + K_1 K_2^{N+2} r^N \tilde{c} r^{-N} r^2
\]
\[
\leq r^2 (c_0 + K_1 K_2^{N+2} \tilde{c}) \leq K_2 r^2 \frac{3}{4},
\]
for $\tilde{c} > 0$ small enough and $K_2 \gg c_0$ large enough hence the contradiction. By (5.60) the reasoning above implies also that
\[
\sup_{t \in [-T, T]} \|U(t, \cdot)\|_{H^s} \leq C r, \quad T \geq \tilde{c} r^{-N},
\]
for some fixed $C > 0$ depending on $s, N$. This is (5.2) for $k = 0$. Moreover by Lemma 5.10 we also obtain that $\partial_t^k U(t, \cdot)$ satisfies
\[
\sup_{t \in [-T, T]} \|\partial_t^k U(t, \cdot)\|_{H^{s-2k}} \leq C r, \quad T \geq \tilde{c} r^{-N},
\]
if $r$ is small, $s \gg K$ and where $C$ is a large enough constant depending on $K$.
