Introduction. Mental health service has gone through a radical transformation over the last century. The emergence of psychiatric care in Bukovina can be divided into two stages: the first stage - pre-scientific, the second stage - scientific or nosological. During the pre-scientific period, assistance to persons with mental disorders took place at monasteries. They were regarded as possessed, i.e. persons with demons. There were several such monasteries in the modern Chernivtsi region, where patients with mental disorders could receive help.

The pre-scientific period is a period of mystification of psychiatry. Mentally ill people were treated differently. Aggressive patients were beaten, often tortured, tied up, stoned, considered possessed, and accordingly transferred to the protectorate of monasteries. The fate of other mentally ill people who had, for example, thinking disorders (delusional ideas of witchcraft, obsession, high origin), but at the same time had calm behaviour, could have been different. Sometimes their disorders received a special interpretation. Such people were considered molfars, connoisseurs, sorcerers, which gave them a more respectful attitude from society in those days. Since the proclamation of Bukovina as the crown land of the Austro-Hungarian Empire, the provision of psychiatric care has changed. A psychiatric service appeared and helped to understand what a mental disorder really is. There was a transition to a scientific interpretation and a scientific approach to providing psychiatric care.

The main body of the article. The first department that assisted mentally ill people in Bukovina appeared in 1833 in Chernivtsi. Patients from different counties were treated. Sometimes they were refused because the hospital could not meet the needs of everyone. Patients were brought here from monasteries, from homes, most of whom were tied up or handcuffed. As of today, little information has been preserved about this institution. It is known that it accommodated about 25-30 beds for patients with mental disorders. Exactly where the department was located is now unknown. The hospital was built with donations from citizens, and the care and treatment of patients took place with the help of care and guardianship authorities. On January 21, 1879, the hospital was transferred under the protection of the regional administration of Bukovina. Every year the number of patients, both somatic and psychiatric, grew. Accordingly, there was an urgent need to build a new hospital. Between 1883 and 1886, a city hospital with 250 beds (now the regional clinical hospital) was built according to the design of Josef Liner, and its structure included beds for mentally ill patients.

In spite of opening of the second hospital, where they also treated people with mental disorders, the psychiatric service could not assist all those who needed it. The wards were overcrowded, and there was a need to expand the hospital or build another one. Many patients were sent to other crown lands of the empire for medical care. As a result, part of the Bukovinian psychiatry was received by Vienna.

The Central Medical Department of the Austro-Hungarian Empire, which monitored the situation of medical care for the population of the region, appealed to the Bukovina administration with an order to build a new psychiatric hospital. In 1897 a decision was made to establish a separate psychiatric hospital in Chernivtsi. The decision was made by the regional administration of Bukovina.

Leading specialists in the field of medical construction of the empire were involved in the development of the project, and several public hearings were held among the residents of the city. Professor Kolbengayer developed a master plan for the new building and submitted it to the Executive Committee of the Sejm on January 24, 1898. The regional president of Bukovina, Bourguignon, also took part in the discussion of the project. The draft was subject to a thorough review, after which it was generally approved and unanimously recommended for consideration at the session of the Seimas. It is known that the model of the regional psychiatric hospital in Chernivtsi was developed by the latest requirements for the construction of mental health facilities in Austria and other European countries of the time. At the beginning of the 20th century, the Bukovinan psychiatric hospital was extremely modern, equipped with all the necessary equipment and the location of the wards in accordance with the standard of the time. Leading doctors were involved, as well as local ones, who had the opportunity to train at the University of Vienna and psychiatric hospitals. 15 hectares of land were allocated for the territory of the hospital, which was located outside the city on the territory of the former Strazagasse (Storozha) and Maisgasses (Kukurdziana) streets, now Mussorgsky Street.

In 1900, the project of a psychiatric hospital was approved, the executor of which was the architect Erich Kolbenhayer. Speaking on the occasion of the celebration of the construction of the regional psychiatric hospital, he thanked everyone involved and ended his speech with the words: “May fate be friendly to this institution of mercy and love of neighbour. The institution itself must strive to fully and completely meet its lofty task - to work for the benefit of suffering people and the glory of the Bukovyna region and its generous residents.”

For temporary assistance in making detailed plans, he invited architect Moritz Jasner. To implement the construction work, the competition was won by a local developer - Julius Bochner and other companies. Heating and water supply were provided by Kretting (Vienna) and Gulmer & Schwabe (Blitz) implemented the hospital's power supply. Pittel Brauzevettter (Chernivtsi) has implemented a sewerage system. Several locally-produced shops were also set up to supply the psychiatric hospital with furniture, textiles and other necessary raw materials. Karl Gabenicht's company (Vienna) created sewage treatment plants. The construction of the hospital was financed by the Franz Josef Foundation and voluntary contributions from citizens.

The opening of the regional psychiatric hospital in Bukovina took place on May 1, 1902. The structure of the psychiatric hospital included 6 buildings, as well as the administration building and other technical facilities. Each branch was two-story. On the first floor, there were mostly medical offices, and on the second floor, there were wards and a space for rest. The wards were differentiated: 25 beds for primary care patients, 30 beds for patients in need of constant care, and 45 beds for restless patients who were dangerous to themselves and others. All buildings of the psychiatric hospital were connected by underground passages. The hospital grounds were planted with cultivated trees and equipped with benches, footpaths and gardens for recreation of patients and walks with relatives. The treatment was carried out mainly at the patient's own expense, as well as from the Foundation of Emperor Franz Joseph, which paid for the treatment of patients who could not pay for themselves. Another way for such patients is the help of patrons. An interesting fact is that the health care system of the Austro-Hungarian Empire provided that landowners who employed employees must pay for treatment in the event of a worker's illness.

Carl Tsurcan became the first director of the psychiatric hospital. Under his supervision, two more buildings of the psychiatric hospital were completed.

Leon Kobylansky became the next director of the psychiatric hospital. During his tenure, new hospital buildings were built in 1912. The number of beds is also increasing by another 240. Accordingly, the hospital administration is buying the surrounding plots of land where vegetables and fruits were harvested to feed patients. Farms were set up to keep domestic animals. The area of the hospital covered the modern boundaries of the Formarket, the Regional Psychiatric Hospital, the City Children's Polyclinic, the surrounding residential buildings, the Chernivtsi Regional Center for Emergency Care and Disaster Medicine and Zhotnevy Park, including the lakes.

During Bukovina's stay in Romania, the psychiatric hospital declined. There was a lack of funding for the maintenance of the hospital and patients. Accordingly, the main funding of the hospital was received with the help of donors, food was provided by the work of patients on the land of the hospital, where crops were grown.

During the Soviet period, the psychiatric hospital underwent many changes from ups and downs. It is worth mentioning that in 1945 the Department of Psychiatry of the Chernivtsi State Medical Institute was opened on the territory of the hospital, which was headed by Doctor of Medical

and level of development of contemporary science. We can observe changes from mystification to the formation of psychiatry, as real modern neuroscience with an evidence-based approach and humane treatment of patients. Through the ages, different countries and changes in the understanding of the etiology and pathogenesis of mental disorders, Chernivtsi remains the centre of mental health in Bukovina.

Gerasym’evych Irina, Grinio Natalia, Sumariuk Bogdan. From mystification to psychiatry: The history of the emergence of psychiatric services and the transformation of mental care from the worldview and level of knowledge corresponding to the conditions of the time. The psychiatric hospital served not only patients within the modern Chernivtsi region but also those with chronic mental illness, where there were two departments (the Chortory psychoneurological boarding house).

During the Soviet period, the hospital flourished under the leadership of Natalia Chubynets (a chief physician from 1949 to 1963) who substantiated methods of treatment in psychiatry, as well as recognizing rehabilitation and occupational therapy. Several labour and production workshops were opened based on the psychiatric hospital, including a greenhouse, sculpting and wickerwork workshops, a sewing shop, workshops for making hats, shoes, brooms and textiles.

It is known that flowers from the greenhouse of the psychiatric hospital were often used during celebrations and as gifts for the holidays. As a result of the sale of goods of its own production, the psychiatric hospital receives significant profits. The hospital used the saved funds to open a water treatment facility in the city.

The history of the emergence of psychiatric services in Bukovina significantly changed. Zaryadzhalo psychiatry and its development in the modern world.
