Abstract
In this paper, we study the limit properties of the ratio for order statistics based on samples from an exponential distribution and obtain the expression of the density functions, the existence of the moments, the strong law of large numbers for $R_{nij}$ with $1 \leq i < j < m_n = m$. We also discuss other limit theorems such as the central limit theorem, the law of iterated logarithm, the moderate deviation principle, the almost sure central limit theorem for self-normalized sums of $R_{nij}$ with $2 \leq i < j < m_n = m$.

Keywords: exponential distribution; order statistics; strong law of large numbers; central limit theorem; law of iterated logarithm

1 Introduction and main results
Throughout this note, let $\{X_{ni}, 1 \leq i \leq m_n\}$ be a sequence of independent exponential random variable with mean $\lambda_n$, let $\{X_n, n \geq 1\} = \{(X_{ni}, 1 \leq i \leq m_n), n \geq 1\}$ be an independent random sequence, where $\{m_n \geq 2\}$ denotes the sample size. Denote the order statistics be $X_{n(1)} \leq X_{n(2)} \leq \cdots \leq X_{n(m_n)}$, and the ratios of those order statistics

$$R_{nij} = \frac{X_{n(j)}}{X_{n(i)}}, \quad 1 \leq i < j \leq m_n.$$ 

As we know, the exponential distribution can describe the lifetimes of the equipment, and the ratios $R_{nij}$ can measure the stability of equipment, it shows whether or not our system is stable. Adler [1] established the strong law of the ratio $R_{nij}$ for $j \geq 2$ with fixed sample size $m_n = m$, and the strong law of $R_{n12}$ for $m_n \to \infty$ as follows.

**Theorem A** For fixed sample size $m_n = m$ and all $\alpha > -2$, $2 \leq j \leq m$, we know

$$\lim_{N \to \infty} \frac{1}{(\log N)^{\alpha+2}} \sum_{n=1}^{N} \frac{(\log n)^{\alpha}}{n} R_{nij} = \frac{m!}{(j-2)!(m-j)!(\alpha+2)} \sum_{l=0}^{j-2} C_{l}^{-1} \frac{(-1)^{j-l-2}}{(m-l-1)^2} \quad a.s.$$ 

For $m_n \to \infty$ and all $\alpha > -2$,

$$\lim_{N \to \infty} \frac{1}{(\log N)^{\alpha+2}} \sum_{n=1}^{N} \frac{(\log n)^{\alpha}}{n} R_{n12} = \frac{1}{\alpha + 2} \quad a.s.$$
Theorem B For fixed sample size $m_n = m$,

$$\frac{1}{\eta_N} \sum_{n=1}^{N} (R_{nij} - ER_{nij}) \xrightarrow{D} N(0,1) \quad \text{as } N \to \infty,$$

$$\lim_{N \to \infty} \frac{1}{\log N} \sum_{n=1}^{N} \frac{1}{n} \left\{ \frac{1}{\eta_N} \sum_{n=1}^{N} (R_{nij} - ER_{nij}) \leq x \right\} = \Phi(x) \quad \text{a.s.}$$

for all $X \in \mathbb{R}$, where $\Phi(\cdot)$ denotes the distribution function of $N(0,1)$. $\eta_n = 1 \vee \sup\{r > 0; nL(r) \geq r^3\}$, $L(r) = ER_{nij}^2 I[|R_{nij}| \leq r]$.

In this paper, we will make a further study on the limit properties of $R_{nij}$. In the next section, firstly, we give the expression of the density functions of $R_{nij}$ for all $1 \leq i < j < m_n$, it is more interesting that the density function is free of the sample mean $\lambda_n$, this allows us to change the equipment from sample to sample as long as the underlying distribution remains an exponential. Also we discuss the existence of the moments for fixed sample size $m_n = m$. Secondly, we establish the strong law of large number for $R_{nij}$ with $1 = i < j < m$ and $2 \leq i < j < m$, respectively. At last we give some limit theorems such as the central limit theorem, the law of iterated logarithm, the moderate deviation principle, the almost sure central limit theorem for self-normalized sums of $R_{nij}$ with $2 \leq i < j < m$.

In the following, $C$ denotes a positive constant, which may take different values whenever it appears in different expressions. $a_n \sim b_n$ means that $a_n/b_n \to 1$ as $n \to \infty$.

2 Main results and proofs

2.1 Density functions and moments of $R_{nij}$

The first theorem gives the expression of the density functions.

**Theorem 2.1** For $1 \leq i < j \leq m_n$, the density function of the ratios $R_{nij}$ is

$$f_{nij}(r) = \frac{m_n!}{(i-1)!(j-i-1)!(m_n-j)!} \sum_{k=0}^{i-1} \sum_{l=0}^{j-i-1} \frac{(-1)^{k+l-2} C_k^i C_l^j}{[i-k+l+r(m_n-i-l)]^2} I[r > 1]. \quad (2.1)$$

**Proof** It is easy to check that the joint density function of $X_{n(i)}$ and $X_{n(j)}$ is

$$f(x_i, x_j) = \frac{m_n!}{(i-1)!(j-i-1)!(m_n-j)!} \frac{1}{\lambda_n^2} \left[ 1 - e^{-x_i/\lambda_n} \right]^{i-1} \left[ 1 - e^{-x_j/\lambda_n} \right]^{j-1} \left[ e^{-x_i/\lambda_n} - e^{-x_j/\lambda_n} \right]^{i-1} \cdot e^{-x_i/\lambda_n} e^{-x_j/\lambda_n} I[0 < x_i < x_j].$$

Let $w = x_i, r = x_j/x_i$, then the Jacobian is $w$, so the joint density function of $w$ and $r$ is

$$f(w, r) = \frac{m_n!}{(i-1)!(j-i-1)!(m_n-j)!} \frac{w}{\lambda_n^2} \left[ 1 - e^{-w/\lambda_n} \right]^{i-1} \left[ e^{-w/\lambda_n} - e^{-rw/\lambda_n} \right]^{i-1} \cdot e^{-w/\lambda_n} e^{-w(m_n-i+1)/\lambda_n} I[w > 0, r > 1].$$
Therefore the density function of $R_{nij}$ is

$$f_{nij}(r) = \int_0^\infty f(w, r) \, dw$$

$$= \frac{m^n!}{(j-1)![(j-1)!{(m_n-j)!}]^{1/2}} \sum_{k=0}^{j-1} \sum_{l=0}^{j-1} (-1)^{j-k-l} C^k_{i-1} C^l_{j-i-1} \cdot \int_0^\infty \exp(-[(i-k+l)r(m_n-i-l)]^2) \, dw$$

$$= \frac{m^n!}{(j-1)![(j-1)!{(m_n-j)!}]^{1/2}} \sum_{k=0}^{j-1} \sum_{l=0}^{j-1} (-1)^{j-k-l} C^k_{i-1} C^l_{j-i-1} \cdot \int_0^\infty \exp(-[(i-k+l)r(m_n-i-l)]^2) \, dw$$

The next theorem treats the moments of $R_{nij}$ with fixed sample size $m_n = m$.

**Theorem 2.2** For fixed sample size $m_n = m$ and $1 = i < j \leq m$, we know

$$E R^\gamma_{nij} = \begin{cases} < \infty, & 0 < \gamma < 1, \\ = \infty, & \gamma \geq 1, \end{cases}$$

and with $2 \leq i < j \leq m$,

$$E R^\gamma_{nij} = \begin{cases} < \infty, & 0 < \gamma < 2, \\ = \infty, & \gamma \geq 2. \end{cases}$$

Let $L(r) = E(R_{nij} - E R_{nij})^2I\{ |R_{nij} - E R_{nij}| \leq r \}$, $2 \leq i < j \leq m$, then $L(r)$ is a slowly varying function at $\infty$.

**Proof** For $1 = i < j \leq m$, by (2.1), it is easy to check that

$$f_{nij}(r) = \frac{m!}{(j-2)!(m-j)!} \sum_{l=0}^{j-2} \binom{j-2}{l} C^l_{j-2} \frac{1}{[1 + l + r(m-l-1)]^2}$$

$$\sim \frac{c_{m,j}}{r^2} \quad \text{as} \quad r \to \infty,$$

where $c_{m,j}$ is a constant depend only on $m$ and $j$. Obviously the $\gamma$-order moment is finite for $0 < \gamma < 1$ and is infinite for $\gamma \geq 1$.

For $2 \leq i < j \leq m$, similarly we can obtain $f_{nij}(r) \sim \frac{d_{m,i,j}}{r^2}$, where $d_{m,i,j}$ is a constant depend only on $m$, $i$ and $j$, so the $\gamma$-order moment is finite for $0 < \gamma < 2$ and is infinite for $\gamma \geq 2$.

Furthermore it is not difficult to verify that $L_1(r) = E R^2_{nij}I\{ |R_{nij}| \leq r \}$ varies slowly at $\infty$, then by the fact that if $L(x) = E|X|^2I\{|X| \leq x \}$ is a slowly varying function at $\infty$, then $L_1(x) = E|X-a|^2I\{|X-a| \leq x \}$ also varies slowly at $\infty$ for any $a \in R$, the proof is completed. \qed
Remark 2.3 Miao et al. [2] obtained the density function for $R_{nij}$ for fixed sample size $m_n = m$, they also proved that the expectation of $R_{nij}$ is finite and the truncated second moment is slowly varying at $\infty$. Adler [1] also claimed that all the $R_{nij}$ have infinite expectations for fixed sample size, so our theorems extended their results.

2.2 Strong law of large numbers of $R_{nij}$

From our assumptions, we know that $\{R_{nij}, n \geq 1\}$ is an independent sequence with the same distribution for fixed sample size $m_n = m$. As Theorem 2.2 states that the $R_{nij}$ do not have the expectation, so the strong law of large numbers with them is not typical. Here we give the weighted strong law of large number as follows. At first, we list the following lemma, that is, Theorem 2.4 from De la Peña et al. [3], which will be used in the proof.

Lemma 2.4 Let $\{X_n, n \geq 1\}$ be a sequence of independent random variables, denote $S_n = \sum_{i=1}^{n} X_i$, if $b_n \nearrow \infty$, and $\sum_{i=1}^{n} \text{Var}(X_i)/b_i^2 < \infty$, then $(S_n - ES_n)/b_n \rightarrow 0$ a.s.

Theorem 2.5 Let $\{a_n, n \geq 1\}$ be a sequence of positive real numbers and $\{b_n, n \geq 1\}$ be a sequence of nondecreasing positive real numbers with $\lim_{n \rightarrow \infty} b_n = \infty$ and

$$\sum_{n=1}^{\infty} \frac{a_n}{b_n} < \infty,$$  \hspace{1cm} (2.2)

$$\lim_{n \rightarrow \infty} \frac{1}{b_n} \sum_{n=1}^{N} a_n \log \left( \frac{b_n}{a_n} \right) = \lambda \in [0, \infty).$$  \hspace{1cm} (2.3)

Then, for the fixed sample size $m_n = m$ and $2 \leq j \leq m$, we have

$$\lim_{n \rightarrow \infty} \frac{1}{b_n} \sum_{n=1}^{N} a_n R_{nij} = \frac{\lambda m!}{(j-2)!(m-j)!} \sum_{l=0}^{j-2} \left( -1 \right)^{j-l-2} \frac{(m-j-1)^{l+2}}{(m-j-1)^{l+2}} \text{ a.s.}$$  \hspace{1cm} (2.4)

For $m_n \rightarrow \infty$,

$$\lim_{n \rightarrow \infty} \frac{1}{b_n} \sum_{n=1}^{N} a_n R_{nij} = \lambda \text{ a.s.}$$  \hspace{1cm} (2.5)

Proof By (2.2) we get $c_n = b_n/a_n \rightarrow \infty$, so without loss of generality we assume that $c_n \geq 1$ for any $n \geq 1$. Notice that

$$I_1 = \frac{1}{b_n} \sum_{n=1}^{N} a_n R_{nij} = \frac{1}{b_n} \sum_{n=1}^{N} a_n \left[ R_{nij} I[1 \leq R_{nij} \leq c_n] - ER_{nij} I[1 \leq R_{nij} \leq c_n] \right]$$

$$+ \frac{1}{b_n} \sum_{n=1}^{N} a_n R_{nij} I[R_{nij} > c_n]$$

$$+ \frac{1}{b_n} \sum_{n=1}^{N} a_n ER_{nij} I[1 \leq R_{nij} \leq c_n]$$

$$= I_1 + I_2 + I_3.$$  \hspace{1cm} (2.6)
By (2.1) and (2.2), it is easy to show
\[
\sum_{n=1}^{\infty} \text{Var} \left( \frac{1}{c_n} (R_{nij} I(1 \leq R_{nij} \leq c_n) - ER_{nij} I(1 \leq R_{nij} \leq c_n)) \right)
\leq \sum_{n=1}^{\infty} \frac{1}{c_n^2} \text{ER}_{nij}^2 I(1 \leq R_{nij} \leq c_n)
\]
\[
= \sum_{n=1}^{\infty} \frac{m!}{c_n^2 (j-2)! (m-j)!} \sum_{l=0}^{j-2} (-1)^{j-l-2} C_{j-2}^l \int_1^{c_n} \frac{r^2}{[l+1+r(m-l-1)]^2} \, dr
\]
\[
\leq C \sum_{n=1}^{\infty} \frac{1}{c_n} \sum_{l=0}^{j-2} \int_1^{c_n} 1 \, dr \leq C \sum_{n=1}^{\infty} \frac{1}{c_n} = C \sum_{n=1}^{\infty} \frac{a_n}{b_n} < \infty,
\]
then by Lemma 2.4, we have
\[
I_1 \to 0 \quad \text{a.s. } n \to \infty. \quad (2.7)
\]
For any \(0 < \varepsilon < 1\),
\[
\sum_{n=1}^{\infty} P\{R_{nij} I(R_{nij} > c_n) > \varepsilon \}
\]
\[
= \sum_{n=1}^{\infty} P\{R_{nij} > c_n\} = \sum_{n=1}^{\infty} \frac{m!}{(j-2)! (m-j)!} \sum_{l=0}^{j-2} (-1)^{j-l-2} C_{j-2}^l \int_1^{c_n} \frac{1}{[l+1+r(m-l-1)]^2} \, dr
\]
\[
\leq C \sum_{n=1}^{\infty} \frac{1}{c_n} \sum_{l=0}^{j-2} \int_1^{c_n} \frac{1}{r^2} \, dr \leq C \sum_{n=1}^{\infty} \frac{1}{c_n} = C \sum_{n=1}^{\infty} \frac{a_n}{b_n} < \infty.
\]
Then by the Borel-Cantelli lemma, we get
\[
R_{nij} I(R_{nij} > c_n) \to 0 \quad \text{a.s. } n \to \infty. \quad (2.8)
\]
By (2.2) and (2.3), we can obtain
\[
\limsup_{N \to \infty} \frac{1}{b_N} \sum_{n=1}^{N} a_n \leq \lambda. \quad (2.9)
\]
Therefore combining (2.8) with (2.9), we can easily conclude
\[
I_2 \to 0 \quad \text{a.s. } n \to \infty. \quad (2.10)
\]
For \(I_3\), by (2.1) and noting \(c_n \to \infty\), we get
\[
\text{ER}_{nij} I(1 \leq R_{nij} \leq c_n)
\]
\[
= \frac{m!}{(j-2)! (m-j)!} \sum_{l=0}^{j-2} (-1)^{j-l-2} C_{j-2}^l \int_1^{c_n} \frac{r}{[l+1+r(m-l-1)]^2} \, dr
\]
then combining with (2.3), we show

\[ I_3 \to \frac{\lambda m!}{(j - 2)! (m - j)!} \sum_{l=0}^{j-2} (-1)^{j-l-2} \binom{m}{j-2} \frac{1}{(m - l - 1)^2} \int_m^{l+1+c_m(m-l-1)} \left[ \frac{1}{y^2} - \frac{i+1}{y} \right] dy, \quad n \to \infty. \]

(2.11)

So the proof of (2.4) is completed by combining (2.6), (2.7), (2.10), and (2.11).

By the same argument as in the proof of (2.4), we can get (2.5), so we omit it here. \( \square \)

**Remark 2.6** If we take \( a_n = \frac{(\log n)^\alpha}{n}, \quad b_n = (\log n)^{\alpha+2}, \quad \alpha > -2, \) it is easy to check that conditions (2.2) and (2.3) hold with \( \lambda = \frac{1}{1+\alpha}, \) so Theorems 2.1 and 2.2 and 4.1 from Adler [1] are special cases of our Theorem 2.5. There are some other sequences satisfying conditions (2.2) and (2.3), such as (a) \( a_n = 1, \quad b_n = n^\beta, \quad \beta > 1, \quad \lambda = 0; \) (b) \( a_n = 1, \quad b_n = n(\log n)^\gamma, \quad \gamma > 1, \quad \lambda = 0; \) (c) \( a_n = 1, \quad b_n = n(\log n)(\log \log n)^\delta, \quad \delta > 1, \quad \lambda = 0; \) (d) \( a_n = \frac{(\log \log n)^\theta}{n}, \quad b_n = (\log n)^2 (\log \log n)^\theta, \quad \theta \in R, \quad \lambda = \frac{1}{2}, \) so the conditions (2.2) and (2.3) are mild conditions. At the end of this remark, we point out that only when \( a_n = L(n)/n, \) where \( L(n) \) is a slowly varying function, the limit value \( \lambda \) will be \( \lambda > 0, \) this is known as an exact strong law, one can refer to Adler [4] for more details. For the weak law, i.e., convergence in probability, one can see Feller [5] for full details.

For \( R_{nij}, \quad i \geq 2, \) since the expectation is finite, by the classical strong law of large numbers, we have the following.

**Theorem 2.7** For fixed \( m_n = m, \) we have for \( 2 \leq i < j \leq m, \)

\[ \lim_{N \to \infty} \frac{1}{N} \sum_{n=1}^{N} (R_{nij} - E R_{nij}) = 0 \quad \text{a.s.} \]

(2.12)

### 2.3 Other limit properties for \( R_{nij}, \quad 2 \leq i < j \leq m \)

By the above discussion, we know that, for fixed sample size \( m_n = m \) and \( 2 \leq i < j \leq m, \)

\( \{R_{nij}, \quad n \geq 1\} \) is a sequence of independent and identically distributed random variables with finite mean, and \( L(r) = E(R_{nij} - ER_{nij})^2 I(|R_{nij} - ER_{nij}| \leq r) \) is a slowly varying function at \( \infty. \)

Therefore the limit properties of \( R_{nij} \) for fixed sample size can easily be established by those of the self-normalized sums. We list some of them, such as the central limit theorem (CLT), the law of iterated logarithm (LIL), the moderate deviation principle (MDP), the almost sure central limit theorem (ASCLT). Denote \( S_N = \sum_{n=1}^{N} (R_{nij} - ER_{nij}), \quad V_N^2 = \sum_{n=1}^{N} (R_{nij} - ER_{nij})^2. \)
Theorem 2.8 (CLT) For fixed sample size $m_n = m$, we know
\[ \frac{S_N}{V_N} \xrightarrow{D} N(0,1). \] (2.13)

Proof By Theorem 3.3 from Giné et al. [6], we can obtain the CLT for $R_{nij}$. \Box

Theorem 2.9 (LIL) For fixed sample size $m_n = m$, we get
\[ \limsup_{N \to \infty} \frac{S_N}{V_N \sqrt{2 \log \log N}} = 1 \quad \text{a.s.} \] (2.14)

Proof By Theorem 1 from Griffin and Kuelbs [7], the LIL for $R_{nij}$ holds. \Box

Theorem 2.10 (MDP) Let $\{x_n, n \geq 1\}$ be a sequence of positive numbers with $x_n \to \infty$ and $x_n = o(\sqrt{n})$, as $n \to \infty$, then, for fixed sample size $m_n = m$, we conclude
\[ \lim_{N \to \infty} \frac{1}{x_N^2} \mathbb{P} \left\{ \frac{S_N}{V_N} \geq x \right\} = \frac{1}{2}. \] (2.15)

Proof By Theorem 3.1 from Shao [8], we can prove the MDP for $R_{nij}$. \Box

Theorem 2.11 (ASCLT) Suppose that $0 \leq \alpha < 1/2$ and set $d_k = \exp\{\log k\}^\alpha / k$ and $D_n = \sum_{k=1}^{m} d_k$. Then, for fixed sample size $m_n = m$ and any $x \in \mathbb{R}$,
\[ \lim_{k \to \infty} \frac{1}{D_k} \sum_{n=1}^{k} d_n I \left\{ \frac{S_N}{V_N} \leq x \right\} = \Phi(x) \quad \text{a.s.,} \] (2.16)
where $\Phi(\cdot)$ is the distribution function of the standard normal random variable.

Proof By Corollary 1 from Zhang [9], we know ASCLT for $R_{nij}$ holds. \Box

Remark 2.12 It is easy to check that $\eta_N / V_N \xrightarrow{p} 1$, then by the Slutsky lemma and Theorem 2.8, we can get Theorem 2.1 from Miao et al. [2].
