Abstract. The origination of innovates in UAV (Unmanned Aerial Vehicle) has been created since a numerous years back. UAV has its own particular points of interest, for example, modernizing and self-governing without an on board pilot by using electronic network and computerized control which keep view on vehicle doesn’t have. Hence, there is no risk of life and is easy to keep view on air vehicle. With the help of necessaries and improvements in innovates, UAV is far reaching and utilizing in industries, defence and common civilians work as it can be controlled remotely. Surveillance for fire fighting and continuous catastrophes, suspect monitoring and system assaults are the examples of such UAV system. This paper discusses the aerodynamics behavior of a baseline design and analysis of a UAV’s (Unmanned Aerial Vehicle Systems). Investigation is displayed in steady state 3D computational fluid elements (CFD) at Mach 0.1 and 0.19. In this technique for investigation, Lift, Drag, Lift Coefficient (CL) and Drag Coefficient (CD) are measured and looked at separate Mach numbers. Pressure forms and velocity shapes are plotted and the Turbulence zone is anticipated from streamline view, both removed from CFD examination.

Keywords: Unmanned Aerial Vehicle, Computational Fluid Dynamics, Ranger TUA V, CL, CD, ANSYS CEMCFD.

1. Introduction

UAV is abbreviated as the Unmanned Aerial vehicle, which is a flying machine with absence of pilot on control desk. UAVs remotely controlled flying machines (control done from ground control station) and can be used for various missions which include surveillance and system assault parts. For the need of this paper, and to differentiated UAV from missile, a UAV has ability of self control, sustain and driven by jet engine. Moreover, a journey rocket can be treated as a UAV, however is deal with independently the premise that the vehicle is the weapon. The abbreviate UAS (Unmanned Aerial System) shows the robust system that insists ground control system and more other parts that an actual system involves.
International Civil Aviation Organization (ICAO) characterizes this unmanned flying Machine classifies into 2 sorts:-

- Autonomous airplane – right now thought to be unacceptable for direction because of lawful and obligation issues
- Remotely guided air ship – subject to common direction under ICAO and under the important national flying power

1.1 Purpose of project

This paper discusses the aerodynamics behaviour of a baseline design and analysis of a UAV’s (Unmanned Aerial Vehicle Systems). Investigation is displayed in steady state 3D computational fluid elements (CFD) at Mach 0.1 and 0.19. In this technique for investigation, Lift, Drag, Lift Coefficient (CL) and Drag Coefficient (CD) are measured and looked at separate Mach numbers. Pressure forms and velocity shapes are plotted and the Turbulence zone is anticipated from streamline view, both removed from CFD examination.

1.2 Problem description

Computational liquid flow (CFD) investigation of an air ship assumes a critical part in giving a perfect configuration of the airplane. The subjective and quantitative portrayal of the outline gives valuable data to check the determination and configuration before the tedious creation of flying machine.

Besides the applications of the UAV domain is lacking effectiveness in manufacturability, because of design constraints and its size. It is in need that the UAVs should be energy, cost effective and it should meet the desired performance targets as well.

Hence the work is supposed to concentrate on the UAV fuselage, wings and ailerons considering designable and non design areas in it with suitable load application.

2. Geometry selections and Modelling

2.1 Geometry selections

a) Ranger Tactical UAV
RANGER is the main strategic UAV framework overall affirmed to fly in non military personnel airspace and in addition over populated zones. Its design and some of its technology is based on Scout UAV system by Israel Aerospace Industries (IAI). The RANGER UAV uses a compact hydraulic launch for takeoff. Due to a modular payload, the system can be adapted to a wide range of civilian and military missions. A skid based landing system enables UAV to land nearly anywhere, on grass or on concrete runways, on snow or ice. In reference to the manufacturer, RANGER is the only tactical UAV system worldwide certified to fly in civilian airspace as well as populated areas. The RANGER system is serviced with the Swiss Air Force under the designation ADS-95

| Table1 General and Performance attributes of RANGER UAV |
|---------------------------------------------------------|
| **TYPE:** TACTICAL UAV                                  |
| **Dimension**                                           |
| Length: 4.60m (15.13 ft)                               |
| Height: 1.13m (3.71 ft)                                |
| Wingspan: 5.70m (18.73 ft)                             |
| Weight:                                                |
| Maximum take-off weight: 285kg (628lb)                  |
| Payload: 45kg (99lb)                                   |
| **Propulsion**                                          |
| Engine type: 2cylinder 2 stroke                         |
| Performance:                                           |
| Flight Performance:                                    |
| Speed: 240 km/h max.                                   |
| Service ceiling:                                       |
| Upto 18,000 ft                                         |
| Range: Upto 180 km                                     |
| Endurance: Upto 9 hours                                 |

2.2 Mathematical model

Analysis is performed with the ANSYS CFX solver, allowing to the turbulence and Navier stroke equation approaches for 100 iterations. In this study an upstream velocity of 34.3m/s & 65.17 m/s is specified at the inlet boundary. All other boundary conditions remain the same as well. In order to determine the necessary loads, the Mach no, temperature and velocity of the UAV is to be studied and the lift and drag calculation is performed.

Mach number: The Mach number (M or Ma) is a dimensionless quantity gives the ratio off-low velocity past over the boundary in the domain to the speed of the sound.

\[ M = \frac{V}{a} \]

Where

\[ M = \text{Mach number} \]
\[ V = \text{Flow velocity over boundaries} \]
\[ a = \gamma RT = 340 m/s \]

Where

\[ \gamma = \text{density of air} \]
\[ R = \text{gas consistent} \]
\[ T = \text{temperature of air (25°C) in K} \]

The drag force acting on a body in fluid flow can be expressed as

\[ D = \frac{1}{2} C D p V^2 A \]

Where,

\[ D = \text{drag force (N)}, \quad C D = \text{drag co-efficient}, \quad p = \text{density of fluid (kg/m3)}, \quad V = \text{flow velocity (m/s)}, \quad A = \text{body area (m2)} \]

Lifting Force

The lifting force acting on a body in fluid flow can be expressed as

\[ L = \frac{1}{2} C L p V^2 A \]
Where, \( L = \) lifting force (N), \( CL = \) lifting co-efficient, \( \rho = \) density of fluid (kg/m\(^3\)), \( V = \) flow velocity (m/s), \( A = \) body area (m\(^2\))

**Calculation for co-efficient of Drag & Lift**

For fuselage with velocity-34.3 m/s at Mach no 0.1

\[
\text{Drag Co-efficient (C_D)} = \frac{2 \times F_D}{\rho \times V^2 \times A} = \frac{2 \times 14.41}{1.4 \times 34.3^2 \times 1.04}
\]

\[
\text{Drag co-efficient (C_D) = 0.0168}
\]

\[
\text{Lift Co-efficient (C_L)} = \frac{2 \times F_L}{\rho \times V^2 \times A} = \frac{2 \times 16.76}{1.4 \times 34.3^2 \times 1.04}
\]

\[
\text{Lift co-efficient (C_L) = 0.0195}
\]

**Table 2** forces on different parts at Mach No 0.1

| Location   | Drag Force N(X) | Side Force N(Y) | Lift Force N(Z) | Area m\(^2\) | Velocity m/s | Densit y kg/m\(^3\) | Drag Co-efficient(X) | Lift Co-efficient(Z) |
|------------|-----------------|-----------------|-----------------|--------------|--------------|---------------------|----------------------|----------------------|
| Fuselage   | 14.41           | 0.39            | 16.76           | 1.04         | 34.30        | 1.40                | 0.0168               | 0.0195               |
| Left Aileron | 3.00            | -2.00           | -23.45          | 0.1414       | 34.30        | 1.40                | 0.0257               | -0.2013              |
| Left wing  | 19.39           | 7.87            | 118.49          | 1.38         | 34.30        | 1.40                | 0.0170               | 0.1042               |
| Propeller  | 14.75           | -0.01           | -0.27           | 0.07         | 34.30        | 1.40                | 0.2558               | -4.6835              |
| Right Aileron | 12.52          | -2.28           | 33.61           | 0.1414       | 34.30        | 1.40                | 0.1075               | 0.2886               |
| Right wing | 20.02           | -23.22          | 306.80          | 1.3809       | 34.30        | 1.40                | 0.0176               | 0.9780               |

**Graph 1.** Mach no 0.1 v/s force on different parts

For Drag & Lift co-efficient on fuselage with velocity-65.17 m/s at Mach no 0.19

\[
\text{Drag co-efficient (C_D)} = \frac{2 \times F_D}{\rho \times V^2 \times A}
\]
Drag co-efficient \( (C_D) = 0.0163 \)

Lift Co-efficient \( (C_L) = \frac{2 \times F_L}{\rho \times V^2 \times A} \)

\[ \frac{2 \times 50.69}{1.4 \times 65.17^2 \times 1.04} \]

Lift co-efficient \( (C_L) = 0.0196 \)

### Table 3 Forces on different parts at a Mach no 0.19

| Location     | Drag Force N(X) | Side Force N(Y) | Lift Force N(Z) | Area m² | Velocity m/s | Density kg/m³ | Drag Co-efficient (X) | Lift Co-efficient (Z) |
|--------------|-----------------|-----------------|-----------------|---------|--------------|---------------|-----------------------|-----------------------|
| Fuselage     | 50.69           | 1.49            | 60.88           | 1.04    | 65.17        | 1.40          | 0.0163                | 0.0196                |
| Left Aileron | 10.92           | -7.35           | -86.35          | 0.1414  | 65.17        | 1.40          | 0.0259                | -0.2054               |
| Left wing    | 66.72           | 28.58           | 430.38          | 1.38    | 65.17        | 1.40          | 0.0162                | 0.1049                |
| Propeller    | 53.66           | -0.05           | -1.02           | 0.07    | 65.17        | 1.40          | 0.2578                | -0.0049               |
| Right Aileron| 45.57           | -8.44           | 123.70          | 0.1414  | 65.17        | 1.40          | 0.1084                | 0.2942                |
| Right wing   | 69.09           | -84.91          | 1121.70         | 1.3809  | 65.17        | 1.40          | 0.0168                | 0.2732                |

Graph 2: Mach no 0.19 v/s force on different parts

3. CFD approach
Computational fluid dynamics is the branch of fluid dynamics that utilizes numerical strategies and calculations to examine the issues. It is a PC based instrument for reproducing the conduct of frameworks including liquid stream, heat exchange, and other related physical procedures. It works by explaining the conditions of liquid stream (in an exceptional structure) over a locale of enthusiasm, with determined conditions on the limit of that area.

3.1 Methodology of using CFD

The liquid continuum is discretized: i.e., field variables are approximated by their qualities at a limited number of hubs. The condition of movements is discretized: i.e., approximated regarding values at the hubs. Differential or Integral Equation → Algebraic Equation

The arrangement of Algebraic conditions is understood to give values at the hubs.

3.2 Steps involved in CFD process

The procedure of playing out a solitary CFD reproduction is part into 4-segments:
1. Creating the Geometry of a model/Mesh involves geometry parameters and domain shape and size.
2. Defining the Physics of Model includes flow properties, heat transfer and boundary condition.
3. Solving the CFD Problem involves iterations and numerical scheme.
4. Visualizing the Results in the Post-processor involves contours and streamlines.

4. External flow analysis using CFD

In order to calculate the pressure distributions on the aircraft, a CFD model of the UAV was developed. This was done simply by model to ICEM CFD platform which is the pre-process or for the flow analysis.

4.1 ANSYS ICEM CFD

ANSYS ICEM CFD is a popular proprietary software package used for CAD and mesh generation. It can create structured, unstructured, multi-block, and hybrid grids with different cell geometries. ANSYS ICEM CFD is meant to mesh a geometry already created using other dedicated CAD packages. Therefore, the geometry modelling features are primarily meant to 'clean-up' an imported CAD model.

4.2 Creating Geometry and Flow Domain

The ANSYS workbench stage gives better bi-directional associations than all significant CAD frameworks, capable geometry change and creation instruments with ANSYS Design modeler, propelled fitting advancements in ANSYS coinciding, and simple move and customize exchange of information and results to share between applications.
4.3 Mesh Generation

The UAV is meshed at its leading edges like wing, fuselage, horizontal and vertical tail for fine surface mesh size of 2 and mesh scale factor 0.1. And then complete mesh of size 12 and mesh scale factor of 1. The extent of the stream area depends on prior studies in which the space size was progressively expanded until there was no more a discernible impact on the airplane's lift and drag. A limited volume and thickness cross section is produced utilizing unstructured tetrahedral cells as a part of the zone nearly encompassing the flying machine, to take into account the complexities of the geometry, alongside a kaleidoscopic limit layer network 6 cells thick on the airplane's wetted surface. Organized hexahedral cells are then used to characterize the remaining stream Space.

5. Results and Discussion

With initial conditions 34.3 m/s and 65.17 m/s free stream velocity in the x-direction, a temperature of 298K, and a pressure of 1 atm. At different Mach numbers of 0.1 & 0.19 the results of plots and stream lines are shown below.

5.1 At Mach 0.1
Figure 7. Pressure Contour at Mach 0.1

Figure 8. Velocity Contour at Mach 0.1

Figure 9. Sectional view of pressure counter

Figure 10. Sectional view Velocity counter

5.2 At Mach 0.19

Figure 11: Pressure Contour at Mach 0.19

Figure 12: Velocity Contour at Mach 0.19
Figure 7 to 16 shows the pressure and velocity counters at different Mach numbers.

6. Conclusion and Scope for future work

6.1 Conclusion

In this study, the computational investigations of the streamlined qualities of RANGER, TUAV were completed utilizing CFD. The fundamental goal of this examination was to assess the most proper outline that will enhance the streamlined execution of RANGER, TUAV.

The essential points of this anticipate has been to research the potential burdens on various parts of a structure of an air ship. A survey of the writing in this field uncovered that not very many such studies have been distributed to date. For this a normal and testing configuration was considered and preparatory stream examination was done for the determination of the heaps following up on the distinctive parts.

From results the accompanying focuses can be derived:
- Material distribution is more where stress is high and material is made void where stress is considerably low.
- All design aspects can be met with minimal material.

6.2 Scope for future work

There is a degree to extend this work as to changes. Any sort of alteration can be fused into the model and can be investigated comparative path as specified in the examination. In current venture the work completed for UAV's.
In spite of the advances coming about because of the work contained in this work, a few issues stay to be tended to.

- Work can be extend with the different velocity in the sense of Mach no.
- Using different UAV’s may be a HALE or MALE.
