In this work, the catalytic activity of calix[8]arene sulfonic acid was successfully investigated for the famous Biginelli reaction. Under ultrasonic irradiation, calix[8]arene sulfonic acid could efficiently catalyzed the three-component reaction of aldehydes with ethyl acetoacetate and urea or thiourea in ethanol to afford the corresponding 3, 4-dihydropyrimidin-2(1H)-ones/thiones in 46-93%. The advantages of this method are the easy isolated procedure, short reaction time and low cost of the catalyst.

**Key words** calix[8]arene sulfonic acid; Biginelli reaction; ultrasonic irradiation; 3, 4-dihydropyrimidine/thione
Introduction

Dihydropyrimidinones (DHPMs) and their derivatives are an important class of heterocycles that can be synthesized via Biginelli reaction. These heterocycles have gained considerable attention for their pharmacological and biological properties including antiviral, antibacterial behavior, and anticancer activities. Several derivatives have recently found to be antihypertensive agents, calcium channel blockers, neuropeptide Y (NPY) antagonists and potent HIVgp-120-CD4 inhibitors. Hence, numerous methods are known to the synthesis of dihydropyrimidin-2(1H)-ones (DHPMs), including using various Lewis acids as well as protic acids such as xanthan sulfuric acid, concentrated HCl, BF3, polyvinylsulfonic acid, Sm(OTf), BF3·OEt2/CuCl, and CeCl3·7H2O. However, these methods have several disadvantages, such as unsatisfactory yields, long reaction times, difficult handling of reagents and expensive catalysts. Therefore, chemists continue to focus more attention to find simple, mild and environmental friendly synthetic methods for the DHPMs. Ultrasound has gradually been introduced in organic synthesis as a green-synthetic approach over the last decades. Compared with traditional methods, this technique is more efficient, innocuous, convenient and easily controlled. A large number of organic reactions, including Biginelli reactions, can be efficiently carried out with high yields under ultrasonic irradiation.

Based on our research on the development of useful synthetic methodologies, we successfully prepared 4,6-diaryl-3, 4-dihydro-pyrimidin-2 (1H)-ones which were catalyzed by (CH3)3SiCl. Recently, calix[4]arene sulfonic acid has displayed potential and effective applications as catalyst in organic reactions, including Mannich-type reactions, alkylation,
esterification, nucleophilic substitution and Biginelli reaction. However, calix[8]arene sulfonic acid, which has the bigger cavity size than that of calix[4]arene sulfonic acid, has never been reported as catalyst in Biginelli reaction. To continue our interest in Lewis acid catalyst applications for DHPMs and ultrasonic irradiation-assisted synthesis, we report a three-component reaction of aldehydes with ethyl acetoacetate and urea or thiourea in ethanol catalyzed by calix[8]arene sulfonic acid under ultrasonic irradiation.

**Experimental**

**Reagents and Apparatus.** Melting points were determined with capillaries with an YRT-3 microscope apparatus and were uncorrected. $^1$H NMR spectra were recorded at 600 MHz on a Bruker AV-600 spectrometer. IR spectra were obtained on a Nicolet FT-IR 8400 spectrometer (KBr disc). All reagents and solvents were commercial reagents with analytical grade. Calix[8]arene sulfonic acid was prepared according to the published method.\(^{25}\) Reactions were monitored by TLC on 2.5 mm Merck silica gel F254 strips.

**General procedure for the synthesis of 3, 4-dihydropyrimidin-2(1H)-ones/thiones 4a-p:**

A mixture of aldehyde (1.0 mmol), ethyl acetoacetate (1.0 mmol) and urea or thiourea (1.5 mmol) in refluxing ethanol (3.0 mL) contained calix[8]arene sulfonic acid (0.2 mol %) was assisted by ultrasonic irradiation for a specified period. Reactions were monitored by TLC. Then, the mixtures were allowed to be added into cooled water, the solid was filtered, and washed with few cold water, ethanol, and dried under vacuum to give the pure product.

**Spectral Data for 4a-p:**
Ethyl 4-(4-chlorophenyl)-6-methyl-2-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (4a): white powder. $^1$H-NMR (DMSO-$d_6$) $\delta$: 1.09 (3H, t, $J = 7.2$ Hz), 2.25 (3H, s), 3.99 (2H, q, $J = 7.2$ Hz), 5.14 (1H, s), 7.25 (2H, d, $J = 8.4$ Hz), 7.39 (2H, d, $J = 8.4$ Hz), 7.73 (1H, s), 9.20 (1H, s). IR (KBr) cm$^{-1}$: 3235, 3115, 2981, 1717, 1695, 1651, 1495, 1402, 1288, 1227, 1091, 958, 788.

Ethyl 6-methyl-4-(p-tolyl)-2-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (4b): white powder. $^1$H-NMR (DMSO-$d_6$) $\delta$: 1.10 (3H, t, $J = 7.2$ Hz), 2.23 (3H, s), 2.26 (3H, s), 3.98 (2H, q, $J = 7.2$ Hz), 5.10 (1H, s), 7.11 (4H, s), 7.64 (1H, s), 9.10 (1H, s). IR (KBr) cm$^{-1}$: 3242, 3122, 2981, 1724, 1705, 1651, 1495, 1460, 1402, 1288, 1228, 1090, 787.

Ethyl 4-(4-(tert-butyl)phenyl)-6-methyl-2-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (4c): white powder. $^1$H-NMR (DMSO-$d_6$) $\delta$: 1.12 (3H, t, $J = 7.2$ Hz), 1.25 (9H, s), 2.23 (3H, s), 3.99 (2H, q, $J = 7.2$ Hz), 5.11 (1H, s), 7.15 (2H, d, $J = 7.8$ Hz), 7.33 (2H, d, $J = 8.4$ Hz), 7.64 (1H, s), 9.12 (1H, s). $^{13}$C-NMR (DMSO-d6) $\delta$: 14.6, 18.3, 31.6, 34.6, 39.4, 39.6, 40, 40.2, 40.4, 40.6, 53.9, 59.7, 100, 125.6, 126.4, 142.4, 148.6, 150.1, 152.8, 165.9. IR (KBr) cm$^{-1}$: 3354, 3219, 3111, 2961, 2879, 1724, 1693, 1643, 1495, 1456, 1402, 1227, 1097, 787, 658. ESI-HR-MS Calcd for C$_{18}$H$_{24}$N$_2$O$_3$ [M+Na]$^+$ 339.1685, Found 339.1691.

Ethyl 4-(2-methoxyphenyl)-6-methyl-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (4d): white powder. $^1$H-NMR (DMSO-$d_6$) $\delta$: 1.02 (3H, t, $J = 7.2$ Hz), 2.28 (3H, s), 3.79 (3H, s), 3.92 (2H, q, $J = 6.6$ Hz), 5.49 (1H, s), 6.87 (1H, t, $J = 7.8$ Hz), 6.98 (1H, d, $J = 8.4$ Hz), 7.05 (1H, d, $J = 7.8$ Hz), 7.21 (1H, s), 7.23 (1H, d, $J = 7.8$ Hz), 9.07 (1H, s). IR (KBr) cm$^{-1}$: 3242, 3125, 2989, 1726, 1701, 1637, 1487, 1402, 1286, 1215, 1080, 787, 763.
Ethyl 4-(4-hydroxyphenyl)-6-methyl-2-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (4e): white powder. $^1$H-NMR (DMSO-$d_6$) $\delta$: 1.10 (3H, t, $J = 7.2$ Hz), 2.23 (3H, s), 3.98 (2H, q, $J = 7.2$ Hz), 5.04 (1H, s), 6.68 (2H, d, $J = 7.8$ Hz), 7.02 (2H, d, $J = 7.8$ Hz), 7.57 (1H, s), 9.06 (1H, s), 9.28 (1H, s). IR (KBr) cm$^{-1}$: 3284, 1717, 1686, 1655, 1510, 1400, 1229, 1097, 812.

Ethyl 4-(4-fluorophenyl)-6-methyl-2-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (4f): white powder. $^1$H-NMR (DMSO-$d_6$) $\delta$: 1.09 (3H, t, $J = 7.2$ Hz), 2.25 (3H, s), 3.99 (2H, q, $J = 6.6$ Hz), 5.14 (1H, s), 7.14 (2H, t, $J = 6.6$ Hz), 7.26 (2H, t, $J = 8.4$ Hz), 7.71 (1H, s), 9.18 (1H, s). IR (KBr) cm$^{-1}$: 3223, 3113, 2981, 1717, 1685, 1653, 1599, 1514, 1448, 1288, 1227, 1169, 1097, 958, 798.

Ethyl 6-methyl-2-oxo-4-($m$-tolyl)-1,2,3,4-tetrahydropyrimidine-5-carboxylate (4g): white powder. $^1$H-NMR (DMSO-$d_6$) $\delta$: 1.10 (3H, t, $J = 7.2$ Hz), 2.24 (3H, s), 2.28 (3H, s), 3.98-4.00 (2H, m), 5.11 (1H, s), 7.04 (3H, q, $J = 7.2$ Hz), 7.20 (1H, t, $J = 7.2$ Hz), 7.65 (1H, s), 9.11 (1H, s). IR (KBr) cm$^{-1}$: 3231, 3120, 2991, 2927, 1705, 1651, 1427, 1224, 1228, 1090, 1024, 767.

Ethyl 4-(4-bromophenyl)-6-methyl-2-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (4h): white powder. $^1$H-NMR (DMSO-$d_6$) $\delta$: 1.10 (3H, t, $J = 7.2$ Hz), 2.25 (3H, s), 3.99 (2H, q, $J = 7.2$ Hz), 5.12 (1H, s), 7.19 (2H, d, $J = 7.8$ Hz), 7.52 (2H, d, $J = 8.4$ Hz), 7.73 (1H, s), 9.20 (1H, s). IR (KBr) cm$^{-1}$: 3124, 2989, 1726, 1701, 1637, 1487, 1402, 1286, 1242, 1080, 968, 764.

Ethyl 6-methyl-4-(3-nitrophenyl)-2-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (4i): pale yellow powder. $^1$H-NMR (DMSO-$d_6$) $\delta$: 1.13 (3H, t, $J = 7.2$ Hz), 2.25 (3H, s), 3.99
(1H, q, $J = 7.2$ Hz), 5.05 (1H, s), 7.77 (1H, s), 8.06-8.25 (4H, m), 9.35 (1H, s). IR (KBr) cm$^{-1}$: 3458, 3308, 3244, 3121, 1728, 1647, 1607, 1520, 1350, 1217, 1088, 1026, 956, 872, 783.

**Ethyl 6-methyl-4-(4-nitrophenyl)-2-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (4j):** pale yellow powder. $^1$H-NMR (DMSO-$d_6$) $\delta$: 1.17 (3H, t, $J = 7.2$ Hz), 2.27 (3H, s), 3.99 (2H, q, $J = 7.2$ Hz), 5.28 (1H, s), 7.86 (1H, s), 8.16-8.23 (4H, m), 9.32 (1H, s). IR (KBr) cm$^{-1}$: 3441, 3337, 3296, 1727, 1666, 1610, 1477, 1282, 1093, 923, 734.

**Ethyl 4-ethyl-6-methyl-2-oxo-1,2,3,4-tetrahydropyrimidine-5-carboxylate (4k):** white powder. $^1$H-NMR (DMSO-$d_6$) $\delta$: 0.81 (3H, t, $J = 7.2$ Hz), 1.20 (3H, t, $J = 7.2$ Hz), 1.41-1.47 (2H, m), 2.19 (3H, s), 4.02-4.14 (3H, m), 7.28 (1H, s), 8.91 (1H, s). white powder. $^1$H-NMR (DMSO-$d_6$) $\delta$: 1.20 (3H, t, $J = 7.2$ Hz), 2.25 (3H, s), 4.04-4.17(2H,m), 4.76-4.78 (1H, m), 6.18 (1H, dd, $J = 6.4$ Hz), 6.36 (1H, d, $J = 6.4$ Hz), 7.23-7.43 (5H, m), 9.48 (1H, s), 10.31(1H, s). IR (KBr) cm$^{-1}$: 3404, 3159, 1707, 1680, 1650, 1593, 1466, 1194, 1109, 968, 754.

**Results and Discussion**

The synthetic route and the molecular structure of calix[8]arene sulfonic acid were depicted in Chart 1.
To the best of our knowledge, ultrasonic irradiation plays an important role in the acceleration of the organic reaction rate. Thus, we initially investigated the effect of ultrasonic irradiation on the model reaction of 4-chlorobenzaldehyde, ethyl acetoacetate and urea in refluxing ethanol. The experimental results (Table 1) showed that the traditional heating reaction can be finished in eight hours, whereas the reaction time was reduced to 25 min under ultrasonic irradiation condition and the yield of the product 4a are higher. Based on the result of this study, ultrasonic irradiation condition was selected. To determine the catalytic efficiency difference between calix[n]arene sulfonic acids and p-toluenesulfonic acid, we examined this model reaction using different sulfonic acids which contained an equimolar amount of "acid". To our satisfaction, calix[n]arenes were more efficient than p-toluene sulfonic acid (Table 1), which indicated that the sulfonyl and phenolic groups in calixarene structures were responsible for the good yields. Overall, calix[8]arene sulfonic acid was the most efficient catalyst, which was attributed to the presence of more sulfonic acid groups in its structure compared with the other acids.

Table 1 Comparison of efficiency of various sulfonic acid catalysts on the yields of 4a under certain conditions

| No. | catalyst               | Catalyst (mol %) | Time      | Yield of 4a (%) |
|-----|------------------------|------------------|-----------|-----------------|
| 1   | calix [8] arene sulfonic acid | 0.5              | 8h<sup>b</sup> | 56              |
| 2   | calix [8] arene sulfonic acid | 0.5              | 25 min<sup>c</sup> | 76              |
| 3   | calix [6] arene sulfonic acid | 0.67             | 28 min<sup>c</sup> | 45              |
| 4   | calix [4] arene sulfonic acid | 1                | 30 min<sup>c</sup> | 37              |
| 5   | p-toluenesulfonic acid     | 4                | 60 min<sup>c</sup> | 28              |

<sup>a</sup> Reaction conditions: 4-chlorobenzaldehyde (1.0 mmol), ethyl acetoacetate (1.2 mmol), urea (1.5 mmol) in refluxing ethanol (3.0 mL).
To optimize reaction conditions, we discuss the effects of catalyst and molar ratio of reagents. The model reactions of 4-chloro benzaldehyde, ethyl acetoacetate and urea with various amounts of calix[8]arene sulfonic acid were investigated (Table 2). To determine the role of a catalyst, we conducted a blank reaction test in the absence of calix[8]arene sulfonic acid. The results showed that no desired product was afforded in the absence of catalyst. When 0.1 mol% calix[8]arene sulfonic acid was selected to catalyze the model reaction, the desired 3,4-dihydropyrimidine 4a was obtained in 35% yield. When the catalyst amount was increased to 0.2 mol%, the yield improved by 90%. However, large amount of catalyst (1.0 mol%) did not significantly improve the yield. This behavior is explained by the changes in polarity and pH of the reaction system. Thus, 0.2 mol% calix[8]arene sulfonic acid was selected for all the reactions.

| No. | Catalyst (mol %) | Reaction time (min) | Yield of 4a (%) |
|-----|------------------|---------------------|---------------|
| 1   | 0                | 60                  | trance        |
| 2   | 0.1              | 40                  | 35            |
| 3   | 0.15             | 35                  | 60            |
| 4   | 0.2              | 20                  | 90            |
| 5   | 0.3              | 20                  | 88            |
| 6   | 0.5              | 22                  | 87            |
| 7   | 1                | 20                  | 85            |

*Table 2 Effect of amount of calix[8]arene sulfonic acid on the yield of 4a under certain conditions*
The same model reaction in the presence of 0.2 mol% calix[8]arene sulfonic acid was carried out using different molar ratio of reagents. The best results were obtained with a 1:1:1.5 ratio of 4-chlorobenzaldehyde to ethyl acetoacetate and urea.

Encouraged by the results obtained from the model reaction, the methodology was extended to a variety of aldehydes (aromatic, aliphatic, α, β-unsaturated) with ethyl acetoacetate and urea in the presence of 0.2 mol % calix[8]arene sulfonic acid for the condensation reaction to give the products 4a-m. Thiourea has been used with similar success to provide corresponding 3,4-dihydropyrimidine-2(1H)-thiones 4n-p. In Table 3, the reaction proceeded smoothly with aromatic aldehydes carrying either electron-donating or electron-withdrawing groups in the ortho-, meta-, and para-positions in moderate to high yields of 67%-93%. However, the condensation reaction of aliphatic aldehydes (entries 4k, 4l) exhibited lower yields (of 46%-57%) and longer reaction time compared with aromatic aldehydes, which was due to the decomposition or polymerization of aliphatic aldehydes under acidic conditions.
Table 3  Calix[8]arene sulfonic acid catalyzed synthesis of 3,4-dihydropyrimidin-2(1H)-ones 4a-p under optimized conditions

<sup>a</sup> Reaction conditions: aromatic aldehydes (1.0 mmol), ethyl acetoacetate (1.0 mmol), urea (1.5 mmol), calix[8]arenesulfonic acid (0.2 mol%), in refluxing ethanol (3.0 mL) under ultrasonic irradiation.

On the basis of the experimental results and reported acid catalyzed Biginelli reactions, a plausible mechanism has been concisely shown in Chart 2. Firstly, the nucleophilic addition of urea or thiourea to aldehyde gives adduct (A). Subsequently, an enol to acyl iminium intermediate (B) is formed by dehydration of acyl imine catalyzed by calix[8]arene sulfonic acid. Further condensation of iminium ion (B) with ethyl acetoacetate, presumably through its enol tautomer affords the intermediate (C), followed by the final acid-catalyzed cyclization of the intermediate (C) with the elimination of water to produce the corresponding 3,4-dihydropyrimidin-2(1H)-one/thione. In this process, calix[8]arene sulfonic acid exerts an important function on assisting the accomplishment of several steps mostly due to its strong hydrogen bonding ability.
Conclusions

In summary, we successfully developed a simple and efficient method for the synthesis of dihydropyrimidiones/thiones by using calix[8]arene sulfonic acid to catalyze three-component reaction under ultrasonic irradiation. The advantages of the reactions contain not only the easy isolated procedure, short reaction time and the catalyst’s very low cost, but also fewer byproducts. In addition to this, this work also provides a new example of potential application of functionalized calixarenes in organic synthesis.
