Fig. S1. Flow chart of study population
Fig. S2 Quantification of ccf DNA after double centrifugation at 16,000 g. (A) Both mtDNA and nDNA were quantified in pellet (dark grey) and supernatent (white) obtained after centrifugation. (B) Efficiency of extraction kits (blood mini kit vs circulating nucleic acid kit) was compared by known amount of DNA spiked in plasma samples and DNA yield was quantified after ccf DNA extraction by each kit.
