A NECESSARY CONDITION FOR $H^\infty$ WELL-POSEDNESS OF $p$-EVOLUTION EQUATIONS

A. ASCANELLI, C. BOITI, AND L. ZANGHIRATI

Abstract. We consider $p$-evolution equations, for $p \geq 2$, with complex valued coefficients. We prove that a necessary condition for $H^\infty$ well-posedness of the associated Cauchy problem is that the imaginary part of the coefficient of the subprincipal part (in the sense of Petrowski) satisfies a decay estimate as $|x| \to +\infty$.

1. Introduction and main result

Given an integer $p \geq 2$, we consider in $[0,T] \times \mathbb{R}$ the linear partial differential operator $P$ of the form

$$P(t,x,D_t,D_x) = D_t + a_p(t)D_x^p + \sum_{j=0}^{p-1} a_j(t,x)D_x^j,$$

with $D = \frac{1}{i}\partial$, $a_p \in C([0,T];\mathbb{R})$ and $a_j \in C([0,T];\mathcal{B}^\infty)$ for $0 \leq j \leq p - 1$, (here $\mathcal{B}^\infty = \mathcal{B}^\infty(\mathbb{R}_x)$ is the space of complex valued functions which are bounded on $\mathbb{R}_x$ together with all their $x$-derivatives). We are dealing with a non-kowalewskian evolution operator; anisotropic evolution operators of the form (1.1) are usually called $p$-evolution operators. The condition that $a_p$ is real valued means that the principal symbol (in the sense of Petrowski) of $P$ has the real characteristic $\tau = -a_p(t)\xi^p$; by the Lax-Mizohata theorem (cf. [M]), this is a necessary condition to have a unique solution, in Sobolev spaces, of the Cauchy problem

$$\begin{cases}
P(t,x,D_t,D_x)u(t,x) = f(t,x) & (t,x) \in [0,T] \times \mathbb{R} \\
u(0,x) = g(x) & x \in \mathbb{R},
\end{cases}$$

in a neighborhood of $t = 0$. We notice that for $p = 2$ the operator is of Schrödinger type, for $p = 3$ we have the same principal part as the Korteweg-De Vries equation. Many results of well-posedness in Sobolev spaces of (1.2) are available under the assumption that all the coefficients $a_j$ of (1.1) are real (see, for instance, [A1], [A2], [AZ], [AC1], [CC2], [CHR]). On the contrary, when the coefficients $a_j(t,x)$ for $1 \leq j \leq p - 1$ are not real, the theory is well developed only in the case $p = 2$: we know from the pioneering papers [I1], [I2] that a decay condition as $|x| \to +\infty$ on $\text{Im} a_1$ is necessary and sufficient for well-posedness of the Cauchy problem (1.2) in $H^\infty$. Sufficient conditions for well-posedness in $H^\infty$ and/or Gevrey classes for 2 or 3-evolution equations have been given by many authors (see, for instance, [D], [T], [B], [KB], [ACC], [CR1], [CR2], [CC1]). The general case $p \geq 2$ has been recently considered in [ABZ1], proving $H^\infty$ well-posedness of the Cauchy problem (1.2) under suitable decay conditions, as $|x| \to +\infty$, on $\text{Im} D_x^\beta a_j$, for $j \leq p - 1$ and $|\beta/2| \leq j - 1$. These results have been extended

Key words and phrases. $p$-evolution equations, well-posedness in Sobolev spaces, pseudo-differential operators.
to the case of weighted Sobolev spaces in [ACa], to the case of first order systems of pseudo-differential operators in [AB1], to the case of higher order equations in [AB2], and to semi-linear 3-evolution equations in [ABZ2].

As far as we know, there are no results available about necessary conditions for $H^\infty$ well-posedness for $p$-evolution equations, $p \geq 3$.

In this paper we give a necessary condition for well-posedness of the Cauchy problem (1.2) in $H^\infty$, generalizing to the case $p \geq 2$ the necessary condition given by Ichinose in [I1] for $p = 2$. More precisely, in [I1] Ichinose considered, for $x \in \mathbb{R}^n$, the operator

$$\tag{1.3} P = D_t - a_2 \Delta_x + \sum_{j=1}^n a_1^{(j)}(x) D_{x_j} + c(x),$$

with $a_2 \in (0, 1]$ and $a_1^{(j)}, c \in B^\infty(\mathbb{R}^n)$. He proved that a necessary condition for $H^\infty$ well-posedness of the associated Cauchy problem is the existence of non-negative constants $M, N$ such that

$$\tag{1.4} \sup_{x \in \mathbb{R}^n, \omega \in S^{n-1}} \left| \sum_{j=1}^n \int_0^\theta \text{Im} a_1^{(j)}(x + 2a_2 \theta \omega) \omega_j d\theta \right| \leq M \log(1 + \varrho) + N \quad \forall \varrho > 0,$$

where $S^{n-1}$ is the unit sphere in $\mathbb{R}^n$. The same condition is also sufficient (cf. [I2]) only in the case of space dimension $n = 1$.

In this paper we assume that there exists a constant $m > 0$ such that

$$\tag{1.5} |a_p(t)| \geq m \quad \forall t \in [0, T]$$

and prove the following:

**Theorem 1.1.** Let $P$ be the operator in (1.1) with $a_p \in C([0, T]; \mathbb{R})$ satisfying (1.5) and $a_j \in C([0, T]; B^\infty)$ for $0 \leq j \leq p - 1$. A necessary condition for the Cauchy problem (1.2) to be well-posed in $H^\infty$ is the existence of constants $M, N > 0$ such that:

$$\tag{1.6} \sup_{x \in \mathbb{R}^n} \min_{0 \leq \tau \leq t \leq T} \int_{-\varrho}^{\theta} \text{Im} a_{p-1}(t, x + p a_p(\tau) \theta) d\theta \leq M \log(1 + \varrho) + N \quad \forall \varrho > 0.$$

**Remark 1.2.** If the coefficient $a_p(t)$ vanishes at some point of the interval $[0, T]$, the well-posedness in $H^\infty$ of the Cauchy problem (1.2) may fail to be true also if the necessary condition (1.6) is satisfied (see [CR3], [ABZ1]). In [ABZ1], for instance, a Levi-type condition of the form

$$|\text{Im} a_{p-1}(t, x)| \leq C a_p(t)/|x|$$

is needed to weaken (1.5) into $a_p(t) \geq 0$ for proving $H^\infty$ well-posedness of (1.2). Notice that condition (1.7) is consistent with (1.6). In the present paper we focus on the fact that the dependence on space of the coefficient of the subprincipal part is allowed only accompanied by a decay condition at infinity.

### 2. Idea of the proof and auxiliary tools.

We prove Theorem 1.1 by contradiction, taking $f \equiv 0$ without any loss of generality.

We assume the Cauchy problem (1.2) to be well-posed, so that for every $g \in H^\infty$, there exists a unique $u \in C([0, T]; H^\infty)$ solution of (1.2) and there exists $q \in \mathbb{N}_0 := \mathbb{N} \cup \{0\}$ and $C > 0$ such that

$$\tag{2.1} \|u(t, \cdot)\|_0 \leq C\|g\|_q \quad \forall t \in [0, T].$$
where \( \| \cdot \|_s \) stands for the norm in the Sobolev space \( H^s \) (we shall write \( \| \cdot \| := \| \cdot \|_0 \) for simplicity).

Then we assume, by contradiction, that (1.6) does not hold. This implies that, for every \( M > 0 \) and \( k \in \mathbb{N} \) there exist a sequence of points \( x_k \in \mathbb{R} \) and a sequence \( \varrho_k \to +\infty \) such that

\[
(2.2) \quad \int^\varrho_k_{-\varrho_k} \text{Im} a_{p-1}(t, x_k + pa_p(\tau)\theta) d\theta \geq M \log(1 + \varrho_k) + k \quad \forall 0 \leq \tau \leq t \leq T.
\]

We can then construct a sequence of initial data \( g_k \) localized at high frequency \( n_k := \varrho_k^a \), for suitable \( a > 0 \), so obtaining a sequence \( u_k \) of solutions of the corresponding Cauchy problem. Further localizing these solutions in the phase space along the trajectory of the hamiltonian \( a_p(t)\xi^p \), we produce a sequence of functions \( v_k^{\alpha,\beta} \) (for \( \alpha, \beta \in \mathbb{N}_0 \)) satisfying some energy estimates, because of (2.1).

Taking, finally, a suitable linear combination \( \sigma_k(t) \) of the \( L^2 \)-norms \( \| v_k^{\alpha,\beta}(t, \cdot) \| \), we obtain, in Section 3, that (2.2) implies an estimate from below of \( \sigma_k(t) \); this estimate will contradict an estimate from above for \( \sigma_k(t) \) which is stated and proved in Section 4.

In this section we discuss condition (1.6), construct the sequence \( \{ v_k^{\alpha,\beta} \} \) and collect some estimates that will be crucial in the proofs of the contradictory estimates from below and from above of \( \sigma_k(t) \).

The next section is completely devoted to the proof of the estimate from below (3.40).

In Section 4 we give the estimate from above (4.1), and finally prove Theorem 1.1.

Let us start by remarking that if condition (1.6) does not hold, then at least one of the following two conditions does not hold:

\[
(2.3) \quad \sup_{x \in \mathbb{R}} \min_{0 \leq \tau \leq t \leq T} \int^\varrho_{\varrho} \text{Im} a_{p-1}(t, x + pa_p(\tau)\theta) d\theta \leq M \log(1 + \varrho) + N, \quad \forall \varrho > 0,
\]

or

\[
(2.4) \quad \sup_{x \in \mathbb{R}} \min_{0 \leq \tau \leq t \leq T} \int_{-\varrho}^0 \text{Im} a_{p-1}(t, x + pa_p(\tau)\theta) d\theta \leq M \log(1 + \varrho) + N, \quad \forall \varrho > 0.
\]

Since

\[
\int_{-\varrho}^0 \text{Im} a_{p-1}(t, x + pa_p(\tau)\theta) d\theta = \int^\varrho_0 \text{Im} a_{p-1}(t, x - pa_p(\tau)\theta) d\theta,
\]

we can assume, without any loss of generality, that (2.3) does not hold and obtain then a contradiction (if (2.4) does not hold we argue in the same way taking \(-a_p\) instead of \(a_p\)).

The following lemma will be the key to obtain the desired estimate from below (3.40):

**Lemma 2.1.** If (2.3) does not hold, then for every \( M > 0 \) and \( k \in \mathbb{N} \) there exist \( x_k \in \mathbb{R} \) and \( \varrho_k > 0 \) such that:

1. \( \varrho_k \to +\infty \);
2. \( \int_{\varrho_k}^\varrho \text{Im} a_{p-1}(t, x_k + pa_p(\tau)\theta) d\theta \geq M \log(1 + \varrho_k) + k \quad \forall 0 \leq \tau \leq t \leq T \);
3. \( \int_0^\varrho \text{Im} a_{p-1}(t, x_k + pa_p(\tau)\theta) d\theta \geq 0 \quad \forall \varrho \in [0, \varrho_k], 0 \leq \tau \leq t \leq T \).

**Proof.** If (2.3) fails to be true, then for every \( M > 0, k \in \mathbb{N} \) there exist \( y_k \in \mathbb{R} \) and \( \delta_k > 0 \) such that for all \( 0 \leq \tau \leq t \leq T \)

\[
(2.5) \quad \int_{\varrho}^{\delta} \text{Im} a_{p-1}(t, y_k + pa_p(\tau)) d\theta \geq M \log(1 + \delta_k) + k.
\]
Let us set, for \( s \in [0, \delta_k] \),
\[
F_k(s) := \int_0^s \text{Im} \ a_{p-1}(t, y_k + p\theta a_p(\tau))d\theta
\]
and let \( s_k \) be point of minimum of \( F_k \) on \([0, \delta_k]\). Define then
\[
x_k := y_k + ps_k a_p(\tau), \quad \varrho_k := \delta_k - s_k.
\]
Remark that all \( y_k, \delta_k, s_k, x_k, \varrho_k \) depend also on \( M \).
For all \( s \in [0, \varrho_k] \subseteq [0, \delta_k] \):
\[
\int_0^s \text{Im} \ a_{p-1}(t, x_k + pa_p(\tau)\theta)d\theta = \int_{s_k}^{s+s_k} \text{Im} \ a_{p-1}(t, y_k + pa_p(\tau)\theta')d\theta' = F_k(s + s_k) - F_k(s_k) \geq 0
\]
by definition of \( s_k \). This proves (iii).
Moreover, \( F_k(s_k) \leq F_k(0) = 0 \) and hence, from (2.6) and (2.5):
\[
\int_0^{\varrho_k} \text{Im} \ a_{p-1}(t, x_k + pa_p(\tau)\theta)d\theta = \int_0^{\delta_k-s_k} \text{Im} \ a_{p-1}(t, x_k + pa_p(\tau)\theta)d\theta = F_k(\delta_k) - F_k(s_k) \geq F_k(\delta_k) \geq M \log(1 + \delta_k) + k \geq M \log(1 + \varrho_k) + k,
\]
proving (ii).
Finally, the last inequality implies, for \( k \to +\infty \),
\[
\int_0^{\varrho_k} \text{Im} \ a_{p-1}(t, x_k + pa_p(\tau)\theta)d\theta \geq k \to +\infty
\]
and hence \( \varrho_k \to +\infty \), because \( a_{p-1} \in \mathcal{B}^\infty \).

2.1. Solutions with high frequency initial data. Let us fix, here and throughout all the paper, a cut-off function \( h \in C^\infty(\mathbb{R}) \), such that
\[
h(y) = \begin{cases} 
1 & |y| \leq 1/4 \\
0 & |y| \geq 1/2,
\end{cases}
\]
and a rapidly decreasing function \( \psi \) such that \( \psi(0) = 2 \) and
\[
\text{supp} \hat{\psi} \subseteq \{\xi \in \mathbb{R} : h(\xi) = 1\}.
\]
Define then
\[
g_k(x) = e^{i(x-x_k)n} \psi(x - x_k),
\]
where
\[
n := \varrho_k^a
\]
for some \( a > 0 \) to be chosen later on (see (3.31)), and \( x_k, \varrho_k \) as in Lemma 2.1. Note that
\[
\hat{g}_k(\xi) = e^{-ix_k\xi} \hat{\psi}(\xi - n),
\]
so \( g_k \) is localized in the phase space around the point \((x_k, n)\).
Denote by \( u_k \in C([0, T]; H^\infty) \) the solution of the Cauchy problem
\[
\begin{cases}
P(t, x, D_t, D_x)u_k(t, x) = 0 & (t, x) \in [0, T] \times \mathbb{R} \\
u_k(0, x) = g_k(x) & x \in \mathbb{R}.
\end{cases}
\]
Then, by (2.1) and (2.10) we have, for all \( t \in [0, T] \):

\[
\|u_k(t, \cdot)\| \leq C\|g_k\| = C(2\pi)^{-1/2}\left(\int_\mathbb{R} \langle \xi \rangle^2 |\hat{g}_k(\xi)|^2 d\xi\right)^{1/2}
\leq C_q(2\pi)^{-1/2}(n)^q \left(\int_\mathbb{R} \langle \theta \rangle^2 |\hat{\psi}(\theta)|^2 d\theta\right)^{1/2}
\leq C'_q n^q,
\]

(2.12)

for some \( C_q, C'_q > 0 \).

### 2.2. A localizing operator.

In this subsection we define, by giving its symbol \( w_{n,k}(t, x, \xi) \), a pseudo-differential operator \( W_{n,k}(t, x, D_x) \) which localizes the solutions of (1.2) in the phase space along the trajectory of the Hamiltonian \( a_p(t)\xi^p \).

Let \( w_{n,k}(t, x, \xi) \) be the solution of the Hamilton’s equation of motion

\[
\begin{align*}
\partial_t w_{n,k} &= \{w_{n,k}, -a_p(t)\xi^p\} \\
w_{n,k}(0, x, \xi) &= w_{0,n,k}(x, \xi) := \varrho_k^{1/2} h(\varrho_k(x - x_k)) h(\varrho_k'((\xi/n - 1)),
\end{align*}
\]

(2.13)

with \( \mu > 0 \) to be chosen later (see (3.31)), where \( \{\cdot, \cdot\} \) denotes the Poisson brackets defined by

\[
\{p(x, \xi), q(x, \xi)\} = \partial_x p(x, \xi) \partial_\xi q(x, \xi) - \partial_\xi p(x, \xi) \partial_x q(x, \xi).
\]

Computing the Poisson brackets, equation (2.13) reduces to

\[
\begin{align*}
\left(\partial_t + p a_p(t)\xi^{p-1} \partial_x\right) w_{n,k} &= 0 \\
w_{n,k}(0, x, \xi) &= w_{0,n,k}(x, \xi),
\end{align*}
\]

(2.14)

which admits the solution

\[
w_{n,k}(t, x, \xi) = w_{0,n,k}(x - pA_p(t)\xi^{p-1}, \xi), \quad A_p(t) = \int_0^t a_p(\tau) d\tau.
\]

We thus obtain

\[
w_{n,k}(t, x, \xi) := \varrho_k^{1/2} h(\varrho_k(x - x_k - pA_p(t)\xi^{p-1})) h(\varrho_k'((\xi/n - 1)).
\]

(2.15)

The following lemma shows that the symbol \( w_{n,k}(t, x, \xi) \) is supported in a neighborhood of the solution \((x_k + pA_p(t)n^{p-1}, n)\) of the Hamilton’s canonical equation with initial data \((x, n)\); moreover it introduces the sequence of symbols \( w_{n,k}^{\alpha, \beta} \) which naturally appear in the computation of \( \partial_\xi^\alpha D_x^\beta w_{n,k} \).

**Lemma 2.2.** Let us define, for \( \alpha, \beta \in \mathbb{N}_0 \), \( \mu \geq 2 \) and \( n \) as in (2.9), the symbols

\[
w_{n,k}^{\alpha, \beta}(t, x, \xi) := \varrho_k^{1/2}(\partial_\xi^\alpha h(x) (\partial_\xi^\beta h)(\xi)) \Big|_{x = \varrho_k(x - x_k - pA_p(t)\xi^{p-1})} \Big|_{\xi = \varrho_k'((\xi/n - 1))}.
\]

(2.16)

Then, for every \( t \in \left[0, \frac{\varrho_k}{n^{p-1}}\right] \) we have that

\[
\text{supp } w_{n,k}^{\alpha, \beta}(t) \subseteq \left\{ (x, \xi) : |x - (x_k + pA_p(t)n^{p-1})| \leq \frac{c_p}{\varrho_k}, |\xi/n - 1| \leq \frac{1}{2\varrho_k'} \right\},
\]

for \( c_p = \max\{1, p2^{p-1} \sup_{[0, T]} |a_p|\} \), if \( k \) is large enough.
Proof. The estimate \(|\xi/n - 1| \leq 1/(2\xi_k^n)\) trivially follows by definition (2.16) and by (2.7). Moreover, (2.7) implies, for \(t \in [0, \xi_k/n^{p-1}], \mu \geq 2\) and \((x, \xi) \in \text{supp } w^{\alpha,\beta}_{n,k}\):

\[
\left| x - (x_k + pA_p(t)n^{p-1}) \right| \leq \left| x - (x_k + pA_p(t)\xi^{p-1}) + p|A_p(t)|n^{p-1} \right| \left( \frac{\xi}{n} \right)^{p-1} - 1 \\
\leq \frac{1}{2\xi_k} + p\sup_{[0,T]} |a_p|n^{p-1} \cdot \left| \frac{\xi}{n} - 1 \right| \left( \frac{\xi}{n} \right)^{p-2} + \left( \frac{\xi}{n} \right)^{p-3} + \ldots + 1 \\
\leq \frac{1}{2\xi_k} + p\sup_{[0,T]} |a_p|\frac{\xi_k}{2\xi_k} [2p^{p-2} + 2p^{p-3} + \ldots + 1] \\
\leq \frac{1}{2\xi_k} + p\sup_{[0,T]} |a_p|\frac{1}{2\xi_k} [2p^{p-1} - 1] \leq \frac{c_p}{\xi_k},
\]

for \(c_p = \max\{1, p2^{p-1}\sup_{[0,T]} |a_p|\}\), since \(\xi/n \leq |\xi/n - 1| + 1 \leq 1/(2\xi_k) + 1 \leq 2\) for \(k\) large enough.

As a consequence of Lemma 2.2, we localize, in the phase space, the solution of (2.11)

\[
(2.18)
\]

where \(W^{\alpha,\beta}_{n,k}(t, x, D_x)\) is the pseudo-differential operator with symbol \(w^{\alpha,\beta}_{n,k}(t, x, \xi)\). We shall denote, throughout the paper, \(W_{n,k} := W^{0,0}_{0,k}(t, x, D_x)\) and \(v_k := v^{0,0}_k\) for simplicity.

2.3. Useful estimates. In the next sections we need estimates of the \(L^2\)-norms of the functions \(v^{\alpha,\beta}_k\) and of both operators \(W^{\alpha,\beta}_{n,k}\) and \([a_j, W_{n,k}]\) acting on \(u_k\). In this subsection we state and prove all these estimates. Proofs are quite technical, and the main tools for obtaining them, collected in Appendix A, are the Calderon-Vaillancourt’s Theorem [A.3] and a skillful use of the expansion formula of the symbol of the product of two pseudo-differential operators (Theorems [A.1] and [A.2]). To avoid losing his train of thought, the reader can skip these estimates at a first reading, passing directly to Section 3 and coming back to the estimates at the moment of their application.

To estimate the \(L^2\)-norms of \(v_k\) and of \(v^{\alpha,\beta}_k\) we first need estimates of the semi-norms \(\| \cdot \|_{0,\ell,\ell} \) of the symbols \(w^{\alpha,\beta}_{n,k} \in S_{0,0}^0\), defined in formula (A.2) of the Appendix.

Lemma 2.3. Let \(n = \xi_k^a\) with \(a \geq \mu \geq 2\), and \(t \in [0, \xi_k/n^{p-1}]\). Then, for every \(\alpha, \beta \in \mathbb{N}_0\) we have, for \(k\) large enough:

(i) for every \(\gamma, \sigma \in \mathbb{N}_0\) there exists a constant \(C_{\alpha,\beta,\gamma,\sigma} > 0\) such that, for all \((t, x, \xi) \in [0, \xi_k/n^{p-1}] \times \mathbb{R}^2\):

\[
|\partial_{\xi}^\gamma \partial_{x}^\sigma w^{\alpha,\beta}_{n,k}(t, x, \xi)| \leq C_{\alpha,\beta,\gamma,\sigma} \xi_k^{\frac{1}{\mu} + \sigma} \left( \frac{\xi_k}{n} \right)^{\gamma};
\]

(ii) for every \(\ell \in \mathbb{N}\) there exists \(C_{\alpha,\beta,\ell} > 0\) such that

\[
\| w^{\alpha,\beta}_{n,k} \|_{0,\ell,\ell} \leq C_{\alpha,\beta,\ell} \xi_k^{\frac{1}{\mu} + \ell};
\]

(iii) for every \(h \in \mathbb{N}_0\) and \(\nu, \ell \in \mathbb{N}\) there exists \(C_{\alpha,\beta,\nu,\ell} > 0\) such that

\[
(2.18)
\]
Proof. Let us write
\[
\partial_x^\gamma w_{n,k}(t,x) = \partial_x^\gamma w_{n,k}^{\alpha + \sigma}(t,x) \\
(2.19)
\]
Since \(|\xi| \leq 2n\) on supp \(w_{n,k}^{\alpha,\beta}\), by Lemma 2.2 we have that
\[
|\partial_x^\gamma h^{(\alpha + \sigma)}(\varrho_k(x - x_k - pA_p(t)\xi^{p-1}))| \leq C_{\alpha,\sigma,\gamma_1}(A_p(t)|\xi|^{p-2}\varrho_k)^{\gamma_1} \\
\leq C_{\alpha,\sigma,\gamma_1}\left(\sup_{[0,T]}a_p \cdot t \cdot |\xi|^{p-2}\varrho_k\right)^{\gamma_1} \leq C'_{\alpha,\sigma,\gamma_1}\left(\varrho_k^{2\gamma_2}\right)^{\gamma_1}
\]
for \(t \in [0, \varrho_k/n^{p-1}]\). Moreover,
\[
|\partial_x^{\gamma_2} h^{(\beta)}(\varrho_k^{\gamma}(|\xi|/n - 1))| \leq C_{\gamma_2,\beta}\left(\varrho_k^\gamma\right)^{\gamma_2}.
\]
Substituting in (2.19) we thus obtain (i), since \(\mu \geq 2\).

From (i) and \(a \geq \mu\) we get
\[
|u_{n,k}^{\alpha,\beta}|_{\ell,\ell}^{0} = \sup_{\gamma,\sigma,\ell \in \mathbb{R}} |\partial_x^\gamma \partial_x^\sigma u_{n,k}(t,x)| \leq \sup_{\gamma,\sigma,\ell \in \mathbb{R}} C_{\alpha,\beta,\gamma,\sigma} \varrho_k^{2\gamma + \sigma}(\varrho_k^\mu)^{\gamma} \leq C_{\alpha,\beta,\ell} \varrho_k^{\gamma + \ell}
\]
i.e. also (ii) is satisfied.

Finally, (iii) follows from (i), since \(|\xi| \leq 2n\) on supp \(w_{n,k}^{\alpha,\beta}\) and \(a \geq \mu\).

We are now ready to estimate \(\|v_k\|\). By Calderon-Vaillantcourt’s Theorem A.3 (ii) of Lemma 2.3 and (2.12), we have that for all \(t \in [0, \varrho_k/n^{p-1}]\)
\[
(2.20) \quad \|v_k(t,\cdot)\| = \|W_{n,k}^{0,0}(t,\cdot, D_x) u_k(t,\cdot)\| \leq C \|w_{n,k}(t,x,\cdot)\|_0^{0} \|u_k(t,\cdot)\| \leq C' \varrho_k^{\frac{1}{2} + q} n^q
\]
for some \(C, C' > 0\); similarly, for every \(\alpha, \beta \in \mathbb{N}_0\), it follows that
\[
(2.21) \quad \|v_k^{\alpha,\beta}(t,\cdot)\| \leq C_{\alpha,\beta} \varrho_k^{\frac{1}{2} + \alpha + 2 + q} n^q = C_{\alpha,\beta} \varrho_k^{\frac{1}{2} + 2 + q} \quad \forall t \in [0, \varrho_k/n^{p-1}]
\]
for some \(C_{\alpha,\beta} > 0\). To estimate also the derivatives of \(v_k^{\alpha,\beta}\) we need the following:

Lemma 2.4. Let \(n = \varrho_k^2\) with \(a \geq \mu\). For every \(\nu, r \in \mathbb{N}\) and \(\alpha, \beta \in \mathbb{N}_0\) there exists \(C_{\alpha,\beta,\nu,\nu} > 0\) such that for all \(t \in [0, \varrho_k/n^{p-1}]\) with \(k\) large enough:
\[
\|D_x^n v_k^{\alpha,\beta}(t,\cdot)\| \leq c_1 n^r \|v_k^{\alpha,\beta}\| + C_{\alpha,\beta,\nu,\nu} \varrho_k^{4 + \frac{1}{2}} \left(\varrho_k^{\mu+1}\right)^\nu n^{r+q},
\]
for a fixed constant \(c_1 > 0\).

Proof. We define the function
\[
(2.22) \quad \chi_{1,k}(\xi) = h\left(\frac{\varrho_k^\mu}{3}\left(\frac{\xi}{n} - 1\right)\right).
\]
By definition (2.7), we have that
\[
(2.23) \quad \text{supp} \chi_{1,k} \subseteq \left\{\xi : \left|\frac{\xi}{n} - 1\right| \leq \frac{3}{2\varrho_k}\right\} \subseteq \left\{\xi : |\xi| \leq 3n\right\},
\]
and
\[
(2.24) \quad \text{supp} (1 - \chi_{1,k}) \subseteq \left\{\xi : \left|\frac{\xi}{n} - 1\right| \geq \frac{3}{4\varrho_k}\right\}.
\]
This implies, by Lemma 2.2, that

$$\text{(2.25)} \quad \text{supp}(1 - \chi_{1,k}) \cap \text{supp} u_{n,k}^{\alpha,\beta} = \emptyset.$$ 

Localizing now at frequency $n$

$$D_x^r v_{k}^{\alpha,\beta} = \chi_{1,k}(D_x) D_x^r v_{k}^{\alpha,\beta} + (1 - \chi_{1,k}(D_x)) D_x^r v_{k}^{\alpha,\beta}$$

$$= \chi_{1,k}(D_x) D_x^r v_{k}^{\alpha,\beta} + \sum_{j=0}^{r} \binom{r}{j} (1 - \chi_{1,k}(D_x)) (D_x^j W_{n,k}^{\alpha,\beta} D_x^{r-j} u_k,$$

and applying Calderón-Vaillancourt’s Theorem A.3 we come to:

$$\|D_x^r v_{k}^{\alpha,\beta}(t, \cdot)\| \leq |\chi_{1,k}(\xi)\xi^r|_{L^2,2} \cdot \|v_{k}^{\alpha,\beta}\|$$

$$\text{(2.26)} \quad + \sum_{j=0}^{r} \binom{r}{j} \sigma \left( (1 - \chi_{1,k}(D_x)) W_{n,k}^{\alpha+j,\beta} D_x^{r-j} \right) |\xi|_{L^2,2} \cdot \|u_k\|.$$ 

Note that $|\chi_{1,k}(\xi)\xi^r|_{L^2,2} \leq c_1 n^r$ for some $c_1 > 0$, because of (2.23); to estimate the second term of (2.26), by Theorem A.1 and (2.25) we write, for every integer $\nu \geq 1$:

$$\sigma \left( (1 - \chi_{1,k}(D_x)) W_{n,k}^{\alpha+j,\beta} D_x^{r-j} \right) = \sum_{0 \leq \gamma \leq \nu - 1} \frac{1}{\gamma!} \partial_{\xi}^\gamma (1 - \chi_{1,k}(\xi)) D_x^\gamma (u_{n,k}^{\alpha+j,\beta})$$

$$\int_0^1 \frac{(1 - \theta)^{\nu-1}}{(\nu - 1)!} \int \int e^{-i\eta} \partial_{\xi}^\nu (1 - \chi_{1,k}(\xi + \theta \eta)) D_x^\nu (u_{n,k}^{\alpha+j,\beta}) (t, x + y; \xi) d\eta d\theta$$

$$\text{(2.27)} \quad = \int_0^1 \frac{(1 - \theta)^{\nu-1}}{(\nu - 1)!} \mathcal{O}_\nu(t, \theta, x, \xi) d\theta,$$

where

$$\mathcal{O}_\nu(t, \theta, x, \xi) := \int \int e^{-i\eta} \partial_{\xi}^\nu (1 - \chi_{1,k}(\xi + \theta \eta)) D_x^\nu (u_{n,k}^{\alpha+j,\beta}) (t, x + y; \xi) d\eta d\theta.$$ 

Writing $\xi^{r-j} = \sum_{h=0}^{r-j} \binom{r-j}{h} (\xi + \theta \eta)^h (-\theta)^{r-j-h}$ and $e^{-i\eta (-\eta)^{r-j-h}} = D_y^{r-j-h} e^{-i\eta}$, we have, integrating by parts:

$$\mathcal{O}_\nu = - \sum_{h=0}^{r-j} \binom{r-j}{h} \theta^{r-j-h} \int \int \partial_{\xi}^\nu \chi_{1,k}(\xi + \theta \eta) \cdot (\xi + \theta \eta)^h D_x^h (u_{n,k}^{\alpha+j,\beta}) (t, x + y; \xi)$$

$\cdot D_y^{r-j-h} e^{-i\eta} d\eta d\theta$

$$= \sum_{h=0}^{r-j} (-1)^{r-j-h+1} \binom{r-j}{h} \theta^{r-j-h} \int \int e^{-i\eta} \partial_{\xi}^\nu \chi_{1,k}(\xi + \theta \eta) \cdot (\xi + \theta \eta)^h$$

$\cdot D_y^{r-j-h} (u_{n,k}^{\alpha+j,\beta}) (t, x + y; \xi) d\eta d\theta$

$$= \sum_{h=0}^{r-j} (-1)^{r-j-h+1} \binom{r-j}{h} \theta^{r-j-h} \int \int e^{-i\eta} \partial_{\xi}^\nu \chi_{1,k}(\xi + \theta \eta) \cdot (\xi + \theta \eta)^h$$

$\cdot w_{n,k}^{\alpha+j,\beta} (t, x + y; \xi) d\eta d\theta.$
By Theorem A.2, (2.22), (2.23) and Lemma 2.3 for \( \theta \in [0, 1] \) we have that

\[
|O_\nu(t, \theta)|_{2,2}^0 \leq \sum_{h=0}^{r-j} c_h \overline{D}_{\n,\k}^{\nu+r-j-h} \overline{\partial}_x^{\nu} \chi_1, k(\xi) \xi_h \big|_{4,4}^0 \cdot \left| w_{n, k}^{\alpha + \nu + r - h, \beta} (t, x; \xi) \right|_{4,4}^0
\]

\[
\leq \sum_{h=0}^{r-j} C_{\alpha, \nu, r, h, \beta} \overline{D}_{\n,\k}^{\nu+r-j-h} \left( \frac{\theta_k^\nu}{n^h} \right) \overline{\partial}_x^{\nu + r - j + \frac{1}{4} + 4} \leq \sum_{h=0}^{r-j} C'_{\alpha, \beta, \nu, r, h} \left( \frac{\theta_k^\nu}{n} \right) \overline{\partial}_x^{\nu + r - j + \frac{1}{4} + 4}
\]

\[
= C_{\alpha, \beta, \nu, r, j} \theta_k^{\nu + \frac{1}{4} + 4} \left( \frac{\theta_k^\nu}{n} \right) n^{r-j}
\]

for some \( c_h, C_{\alpha, \nu, r, h, \beta}, C'_{\alpha, \beta, \nu, r, j}, C_{\alpha, \beta, \nu, r, j} > 0 \), since \((n/\theta_k)^h \leq (n/\theta_k)^{r-j}\) for \( 0 \leq h \leq r-j \).

Substituting in (2.27) and integrating with respect to \( \theta \) we thus have that

\[
(2.28) \quad \left| \sigma \left( (1 - \chi_1, k(D_x)) W_{n, k}^{\alpha + j, \beta} D_x^{r-j} \right) \right|_{2,2}^0 \leq |O_\nu|_{2,2}^0 \leq C_{\alpha, \beta, \nu, r, j} \theta_k^{\nu + \frac{1}{2} + 4} \left( \frac{\theta_k^\nu}{n} \right) n^{r-j}.
\]

Substituting in (2.26), and taking into account (2.12), we have that

\[
\left\| D_x^r v_{\k}^{\alpha, \beta} (t, \cdot) \right\| \leq c_1 n^{r} \left| v_{\k}^{\alpha, \beta} \right| + \sum_{j=0}^{r} C'_{\alpha, \beta, \nu, r, j} \theta_k^{\nu + r - j + \frac{j}{4} + 4} \left( \frac{\theta_k^\nu}{n} \right) n^{r-j+q}
\]

\[
\leq c_1 n^{r} \left| v_{\k}^{\alpha, \beta} \right| + C_{\alpha, \beta, \nu, r} \theta_k^{\nu + r - j + \frac{j}{4} + 4} \left( \frac{\theta_k^\nu}{n} \right) n^{r+q}
\]

for some \( C'_{\alpha, \beta, \nu, r, j}, C_{\alpha, \beta, \nu, r} > 0 \), since \((\theta_k/n)^j \leq 1\) for every \( j \). \( \square \)

The following two lemmas give estimates of some pseudo-differential operators acting on the functions \( u_k \).

**Lemma 2.5.** Let \( n = \theta_k^a \) with \( a \geq \mu \). Then for every \( \sigma, \gamma, \lambda \in \mathbb{N}_0 \) the operators \( W_{n, k}^{\sigma, \gamma} (t, x, D_x) \) satisfy

\[
(2.29) \quad W_{n, k}^{\sigma, \gamma} D_x^\lambda = \sum_{j=0}^{\lambda} c_j \theta_k^j D_x^{\lambda-j} W_{n, k}^{\sigma+j, \gamma},
\]

for some \( c_0, \ldots, c_\lambda > 0 \). Moreover, there are constants \( C_\lambda > 0 \) and, for all \( \nu \in \mathbb{N}_0 \), \( C_{\sigma, \gamma, \lambda, \nu} > 0 \) such that for all \( t \in [0, \theta_k/n^{p-1}] \) with \( k \) large enough:

\[
(2.30) \quad \left\| W_{n, k}^{\sigma, \gamma} (t, \cdot, D_x) D_x^\lambda u_k (t, \cdot) \right\| \leq C_\lambda \sum_{j=0}^{\lambda} \theta_k^j n^{\lambda-j} \left\| v_{\k}^{\sigma+j, \gamma} \right\| + C_{\sigma, \gamma, \lambda, \nu} \theta_k^{4+\frac{j}{2}} \left( \frac{\theta_k^{\nu}}{n} \right) n^{\lambda+q}.
\]

**Proof.** Let us first prove (2.29) by induction on \( \lambda \in \mathbb{N} \).

For \( \lambda = 1 \) we clearly have \( W_{n, k}^{\sigma, \gamma} D_x = D_x W_{n, k}^{\sigma, \gamma} - \theta_k W_{n, k}^{\sigma, \gamma} \).
Let us assume (2.29) to be true for every \( \lambda' < \lambda \) and let us prove it for \( \lambda \). By Theorem \ref{thm:inductive_assumption}

\[
W_{n,k}^{\sigma,\gamma} D_x^\lambda = D_x^\lambda W_{n,k}^{\sigma,\gamma} + [W_{n,k}^{\sigma,\gamma}, D_x^\lambda]
\]

\[
= D_x^\lambda W_{n,k}^{\sigma,\gamma} - \text{op} \left( \sum_{\alpha=1}^\lambda \frac{1}{\alpha!} \partial_{\xi}^\alpha \cdot D_x^\alpha W_{n,k}^{\sigma,\gamma} \right)
\]

\[
= D_x^\lambda W_{n,k}^{\sigma,\gamma} - \sum_{\alpha=1}^\lambda \left( \frac{\lambda}{\alpha} \right) \partial_{\xi}^\alpha W_{n,k}^{\sigma+\alpha,\gamma} D_x^{\lambda-\alpha}.
\]

By the inductive assumption, we thus have that

\[
W_{n,k}^{\sigma,\gamma} D_x^\lambda = D_x^\lambda W_{n,k}^{\sigma,\gamma} - \sum_{\alpha=1}^\lambda \left( \frac{\lambda}{\alpha} \right) \partial_{\xi}^\alpha \left( W_{n,k}^{\sigma+\alpha,\gamma} D_x^{\lambda-\alpha} \right).
\]

Therefore (2.29) is proved and, applying Lemma \ref{lem:lemma_2.4} for \( j \leq \lambda - 1 \), we have that for every \( \nu \in \mathbb{N} \):

\[
\| W_{n,k}^{\sigma,\gamma}(t, \cdot, D_x) D_x^\lambda u_k(t, \cdot) \| \leq \sum_{j=0}^\lambda c_j \partial_{\xi}^\lambda \| D_x^{\lambda-j} v_k^{\sigma+j,\gamma} \|
\]

\[
\leq \sum_{j=0}^{\lambda-1} c_j \partial_{\xi}^\lambda \left( c_1 n^{\lambda-j} \| v_k^{\sigma+j,\gamma} \| + C_{\sigma,j,\gamma,\nu} 2^{4+\frac{1}{2}} \left( \frac{\partial_{\xi}^{\mu+1}}{n} \right)^\nu n^{\lambda-j+q} \right)
\]

\[
+ c_\lambda \partial_{\xi}^\lambda \| v_k^{\sigma+\lambda,\gamma} \|
\]

\[
\leq C' \sum_{j=0}^\lambda \partial_{\xi}^j n^{\lambda-j} \| v_k^{\sigma+j,\gamma} \| + C_{\sigma,\nu} 2^{4+\frac{1}{2}} \left( \frac{\partial_{\xi}^{\mu+1}}{n} \right)^\nu n^{\lambda+q},
\]

for some \( C', C_{\sigma,\gamma,\nu} > 0 \). This proves (2.30). \( \square \)

**Lemma 2.6.** Let \( a_j = a_j(t, x) \), for \( 0 \leq j \leq p-1 \), be the coefficients of the operator (1.1), and let \( n = \delta_k^\alpha \) with \( \alpha \geq \mu + 1 \geq 2 \). Then, for every \( \nu \in \mathbb{N} \) there exists \( C_\nu > 0 \) such that

\[
\|[a_j, W_{n,k}] D_x^j u_k(t, \cdot)\| \leq C_\nu n^j \sum_{1 \leq \alpha_1, \alpha_2 \leq (\nu-1)(p-1)+j} \left( \frac{\partial_{\xi}^{\alpha_1+\alpha_2}}{n} \right)^{\alpha_1,\alpha_2} \| v_k^{\alpha_1,\alpha_2} \| + C_\nu \partial_{\xi}^{4+\frac{1}{2}} \left( \frac{\partial_{\xi}^{\mu+1}}{n} \right)^\nu n^{q+j}
\]

for all \( t \in [0, \delta_k/n^p] \) with \( k \) large enough.

**Proof.** By Theorem \ref{thm:inductive_assumption} for all \( \nu \in \mathbb{N} \)

\[
\sigma \left( [a_j(t, x), W_{n,k}(t, x, D_x)] D_x^j \right) = \sigma([a_j, W_{n,k}]) \cdot \xi^j
\]

(2.31)

\[
= - \sum_{1 \leq \alpha \leq \nu-1} \frac{1}{\alpha!} \partial_{\xi}^\alpha w_{n,k} \cdot D_x^\alpha a_j \xi^j - \int_0^1 \frac{(1-\theta)^{\nu-1}}{(\nu-1)!} \tilde{\sigma}_\nu(t, \theta, x, \xi) d\theta,
\]

where

\[
\tilde{\sigma}_\nu(t, \theta, x, \xi) := \int e^{-i\eta x} \xi y w_{n,k}(t, x, \xi + \theta \eta) D_x^\nu a_j(t, x + y) \cdot \xi^j dy d\eta.
\]
Arguing as in the proof of Lemma \[2.4\] we can estimate, by Theorem \[A.2\] and Lemma \[2.3\]

\[
|\bar{\partial}_\nu|^0_{2,2} \leq \sum_{h=0}^j \left( \frac{j}{h} \right) \theta^{j-h} \int \int \partial_w^\nu w_{n,k}(t, x; \xi + \theta \eta) \cdot (\xi + \theta \eta)^h D_x^\nu a_j(t, x + y) D_y^j e^{-i\eta y} dy \eta \right|_{2,2}^0 \\
\leq \sum_{h=0}^j \left( \frac{j}{h} \right) \int \int e^{-i\eta y} \partial_w^\nu w_{n,k}(t, x; \xi + \theta \eta) \cdot (\xi + \theta \eta)^h D_x^{\nu+j-h} a_j(t, x + y) dy \eta \right|_{2,2}^0 \\
\leq \sum_{h=0}^j C_j \left| \int \partial_w^\nu w_{n,k}(t, x; \xi) \right|_{4,4}^0 \cdot \left| D_x^{\nu+j-h} a_j(t, x) \right|_{4,4}^0 \\
(2.32) \leq C_\nu n^\nu \sum_{j=0}^{4+\nu} \left( \frac{\bar{\partial}_k}{n} \right) \nu
\]
and hence
\[
\| \text{op} \left[ \sum_{1 \leq \alpha \leq \nu - 1} \frac{1}{\alpha!} \partial_{\xi}^{\alpha} w_{n,k} \cdot D_{x}^{\alpha} a_{j} \right] u_{k} \| \\
\leq \sum_{1 \leq \alpha \leq \nu - 1} C_{\alpha,j} \left( \frac{\partial_{y}^{\alpha}}{n} \right) \| W_{n,k}^{0,\alpha} D_{x}^{j} u_{k} \| \\
+ \sum_{1 \leq \alpha \leq \nu - 1} \sum_{\alpha_{1} + \alpha_{2} = \alpha} C_{\alpha,j} \sup_{[0, \varrho_{k}/n^{p-1}]} |A_{p}(t)| \| \varrho_{\varrho}^{\alpha_{1}} \left( \frac{\partial_{y}^{\alpha}}{n} \right)^{\alpha_{2}} \sum_{s=1}^{\alpha_{1}} \| W_{n,k}^{s,\alpha_{2}} D_{x}^{s(p-1)-\alpha_{1}+j} u_{k} \|.
\]

Applying (2.30), since \( s \leq \alpha_{1}, \mu \geq 2 \) and \( 0 \leq j \leq p - 1 \), we thus obtain, for \( t \in [0, \varrho_{k}/n^{p-1}] \):
\[
\| \text{op} \left[ \sum_{1 \leq \alpha \leq \nu - 1} \frac{1}{\alpha!} \partial_{\xi}^{\alpha} w_{n,k} \cdot D_{x}^{\alpha} a_{j} \right] u_{k} \| \\
\leq \sum_{1 \leq \alpha \leq \nu - 1} C_{\alpha,j} \left( \frac{\partial_{y}^{\alpha}}{n} \right) \left[ \sum_{h=0}^{j} \varrho_{k}^{h} n^{j-h} \| v_{k}^{h,\alpha} \| + C_{\alpha,j} \varrho_{k}^{4+\frac{1}{2}} \left( \frac{\partial_{y}^{\alpha+1}}{n} \right)^{\nu} n^{j+q} \right] \\
+ \sum_{1 \leq \alpha \leq \nu - 1} \sum_{\alpha_{1} + \alpha_{2} = \alpha} C_{\alpha,j} \left( \frac{\partial_{y}^{\alpha}}{n} \right)^{\alpha_{1}} \left( \frac{\partial_{y}^{\alpha}}{n} \right)^{\alpha_{2}} \sum_{s=1}^{\alpha_{1}} \varrho_{k}^{h} n^{s(p-1)-\alpha_{1}+j} \| v_{k}^{s+h,\alpha_{2}} \| \\
+ C_{\nu} \sum_{1 \leq \alpha \leq \nu - 1} \sum_{\alpha_{1} + \alpha_{2} = \alpha} \left( \frac{\partial_{y}^{\alpha}}{n} \right)^{\alpha_{1}+\alpha_{2}} \frac{1}{n^{\alpha_{1}(p-2)}} \sum_{s=1}^{\alpha_{1}} \sum_{h=0}^{s(p-1)-\alpha_{1}+j} \varrho_{k}^{h} n^{s(p-1)-\alpha_{1}+j} \| v_{k}^{s+h,\alpha_{2}} \| + C_{\nu} \varrho_{k}^{4+\frac{1}{2}} \left( \frac{\partial_{y}^{\alpha+1}}{n} \right)^{\nu} n^{\alpha_{1}(p-2)+j+q} \\
\leq C_{\nu} n^{j} \sum_{1 \leq \alpha \leq \nu - 1} \sum_{h=0}^{j} \left( \frac{\partial_{y}^{\alpha}}{n} \right)^{h+\alpha_{2}} \| v_{k}^{h,\alpha_{2}} \| + C_{\nu} \varrho_{k}^{4+\frac{1}{2}} \left( \frac{\partial_{y}^{\alpha+1}}{n} \right)^{\nu} n^{\alpha_{1}(p-2)+j+q} \\
+ C_{\nu} n^{j} \sum_{1 \leq \alpha_{1} + \alpha_{2} \leq \nu - 1} \sum_{s=1}^{\alpha_{1}} \sum_{h=0}^{s(p-1)-\alpha_{1}+j} \left( \frac{\partial_{y}^{\alpha}}{n} \right)^{s+h+\alpha_{2}} \| v_{k}^{s+h,\alpha_{2}} \| \\
\leq C_{\nu} n^{j} \sum_{1 \leq \alpha_{1} + \alpha_{2} \leq (\nu-1)(p-1)+j} \left( \frac{\partial_{y}^{\alpha_{1}+\alpha_{2}}}{n} \right) \| v_{k}^{\alpha_{1},\alpha_{2}} \| + C_{\nu} \varrho_{k}^{4+\frac{1}{2}} \left( \frac{\partial_{y}^{\alpha+1}}{n} \right)^{\nu} n^{\alpha_{1}(p-2)+j+q}
\]

for some \( C_{\alpha,j}, C_{\alpha,j}, C_{\alpha,j}, C_{\alpha,j}, C_{\alpha,j}, C_{\alpha,j}, C_{\alpha,j} > 0 \).
By the Calderón-Vaillancourt’s Theorem A.3 by (2.31), (2.32) and (2.33) we get:

\[
\|a_j, W_{n,k}D_x^j u_k\| \leq C|\tilde{\Omega}\|_{\nu}^0 \cdot \|u_k\| + \|\text{op}\left[\sum_{1 \leq \alpha \leq \nu - 1} \frac{1}{\alpha!} \partial_\xi^\alpha w_{n,k} \cdot D_x^\alpha a_j\right] \xi^j\| u_k\|
\]

\[
\leq C' \varrho_k^{4+\frac{1}{2}} \left(\frac{\varrho_k^{\mu+1}}{n}\right) \nu \eta^j + C\nu n^j \sum_{1 \leq \alpha_1 + \alpha_2 \leq (\nu - 1)(\nu - 1) + j} \left(\frac{\varrho_k^\mu}{n}\right) \|v_k^{\alpha_1, \alpha_2}\|
\]

for some \(C, C', C'_\nu > 0\).

3. Estimates from below

In this section we want to produce estimates from below of the \(L^2\)-norms of the functions \(v_k\) and \(v_k^{\alpha, \beta}\), and then of a linear combination \(\sigma_k(t)\) of the \(L^2\)-norms of \(v_k^{\alpha, \beta}\), \(\alpha + \beta \geq 0\).

We start with the estimate of \(\|v_k(0, \cdot)\|\). For \(n\) as in (2.9) and \(k\) large enough, from (2.10) we have that

\[
(3.1) \quad \text{supp } \hat{\psi}_k = \text{supp } \hat{\psi}(\xi - n) \subseteq \{\xi \in \mathbb{R} : h(\varrho_k(\xi/n - 1)) = 1\}.
\]

Therefore

\[
v_k(0, x) = W_{n,k}u_k(0, x) = \int e^{ix\xi} w_{n,k}(0, x, \xi) \hat{\psi}_k(\xi) d\xi
\]

\[
= \int e^{ix\xi} \varrho_k^{1/2} h(\varrho_k(x - x_k)) h(\varrho_k(\xi/n - 1)) \varrho_k(\xi/n - 1) e^{-ix\xi} \hat{\psi}(\xi - n) d\xi
\]

\[
= \varrho_k^{1/2} h(\varrho_k(x - x_k)) e^{i(x - x_k)n} \hat{\psi}(x - x_k)
\]

and

\[
(3.2) \quad \|v_k(0, \cdot)\|^2 = \int \varrho_k|h(\varrho_k(x - x_k))|^2|\hat{\psi}(x - x_k)|^2 dx = \int |h(y)|^2|\psi(y/\varrho_k)|^2 dy
\]

\[
\geq \int |h(y)|^2 dy = \|h\|^2 > 0
\]

if \(k\) is large enough, since \(\psi(0) = 2\) and \(\varrho_k \to +\infty\).

Now, to produce an estimate from below of \(\|v_k(t, \cdot)\|\), our idea is to follow the energy method, producing a ”reverse energy estimate”. To this aim, denoting by \(\langle \cdot, \cdot \rangle\) the scalar product on \(L^2\), we consider

\[
\frac{d}{dt}\|v_k(t, \cdot)\|^2 = 2 \text{Re}\langle \partial_t v_k, v_k \rangle
\]

\[
(3.3) \quad = 2 \text{Re} i\langle P v_k, v_k \rangle - 2 \text{Re} i a_p(t) \langle D_x^p v_k, v_k \rangle - 2 \text{Re} i \sum_{j=0}^{p-1} \langle (a_j(t, x)) D_x^j v_k, v_k \rangle.
\]

We compute separately estimates from below of each term in formula (3.3). By definition of \(v_k\) we have that

\[
P v_k = PW_{n,k} u_k = W_{n,k} P u_k + [P, W_{n,k}] u_k = 0 + [D_t + a_p(t) D_x^p, W_{n,k}] u_k + \sum_{j=0}^{p-1} [a_j(t, x) D_x^j, W_{n,k}] u_k,
\]

since \(P u_k = 0\).
Developing the symbol of the commutator \([D_t + a_p(t)D^p_t, W_{n,k}]\) and using the fact that \(w_{n,k}\) is the solution of Hamilton’s equation (2.14) we obtain, by Theorem A.1

\[
\sigma([D_t + a_p(t)D^p_t, W_{n,k}]) (t, x, \xi) = D_t w_{n,k} + a_p(t) \sigma([D^p_t, W_{n,k}])
\]

\[
= D_t w_{n,k} + a_p(t) \sum_{\alpha=1}^p \frac{1}{\alpha!} \partial^\alpha_x (\xi^p \cdot D^\alpha_x w_{n,k})
\]

\[
= (D_t + p a_p(t) \xi^{p-1} D_x) w_{n,k} + a_p(t) \sum_{\alpha=2}^p \left( \frac{p}{\alpha} \right) \xi^{\alpha-1} D_x^\alpha w_{n,k}
\]

\[
= a_p(t) \sum_{\alpha=2}^p \left( \frac{p}{\alpha} \right) \xi^{\alpha-1} D_x^\alpha w_{n,k}.
\]

Defining then

\[
f_k := \text{op} \left( a_p(t) \sum_{\alpha=2}^p \left( \frac{p}{\alpha} \right) \xi^{\alpha-1} D_x^\alpha w_{n,k} \right) u_k + \sum_{j=0}^{p-1} [a_j(t, x) D^j_x, W_{n,k}] u_k,
\]

we have that

\[P v_k = f_k\]

and hence from (3.3) we get

\[
\frac{d}{dt} \|v_k(t, \cdot)\|^2 = 2 \text{Re} \langle f_k, v_k \rangle - 2 \text{Re} i a_p(t) \langle D^p_x v_k, v_k \rangle - \sum_{j=0}^{p-1} 2 \text{Re} i \langle a_j D^j_x v_k, v_k \rangle
\]

(3.5)

\[
= 2 \text{Re} \langle f_k, v_k \rangle - \sum_{j=0}^{p-1} \langle (i a_j D^j_x + (i a_j D^j_x)^*) v_k, v_k \rangle
\]

since \(\text{Re} i \langle D^p_x v_k, v_k \rangle = 0\). Now,

\[
\sigma(i a_j(t, x) D^j_x)^* = \sum_{\alpha \geq 0} \frac{1}{\alpha!} \partial^\alpha_x (i a_j(t, x) \xi^j)^* = \sum_{\alpha=0}^j \left( \frac{j}{\alpha} \right) D^\alpha_x (-i \text{Re} a_j - \text{Im} a_j(t, x)) \xi^{j-\alpha},
\]

and hence

\[
\sum_{j=0}^{p-1} \sigma[(i a_j D^j_x) + (i a_j D^j_x)^*] = \sum_{j=0}^{p-1} \left[ -2 \text{Im} a_j \xi^j + \sum_{\alpha=1}^j \left( \frac{j}{\alpha} \right) D^\alpha_x (-i \text{Re} a_j - \text{Im} a_j) \xi^{j-\alpha} \right]
\]

\[
= -2 \sum_{j=0}^{p-1} \text{Im} a_j \xi^j + \sum_{h=0}^{p-2} \sum_{j=h+1}^{p-1} \left( \frac{j}{h} \right) D^{j-h}_x (-i \text{Re} a_j - \text{Im} a_j) \xi^h
\]

\[
= -2 \text{Im} a_{p-1} \xi^{p-1}
\]

\[
+ \sum_{h=0}^{p-2} \left[ -2 \text{Im} a_h + \sum_{j=h+1}^{p-1} \left( \frac{j}{h} \right) D^{j-h}_x (-i \text{Re} a_j - \text{Im} a_j) \right] \xi^h.
\]
Substituting in (3.5), we have that there exist positive constants $A_1, c'$ such that

$$\frac{d}{dt} \|v_k(t, \cdot)\|^2 \geq -2 \|f_k\| \|v_k\| + 2 \langle \text{Im} a_{p-1} D_x^{n-1} v_k, v_k \rangle - A_1 \|v_k\|^2$$

$$+ \sum_{h=1}^{p-2} \left[ 2 \langle \text{Im} a_h D_x^h v_k, v_k \rangle + \sum_{j=h+1}^{p-1} \left( \langle (D_x^{j-h})(i \text{ Re } a_j + \text{ Im } a_j) D_x^h v_k, v_k \rangle \right) \right]$$

$$\geq 2 \langle \text{Im} a_{p-1} D_x^{p-1} v_k, v_k \rangle - 2 \|f_k\| \|v_k\| - A_1 \|v_k\|^2 - c' \frac{n^{p-1}}{\varrho_k} \|v_k\|^2,$$

which is (3.6).

Now we want to give estimates of the terms in (3.6). This is done in the following Propositions 3.1 and 3.2.

**Proposition 3.1.** Let $n = \varrho_k^a$ with $a \geq \mu \geq 2$. Then, for all $\nu \in \mathbb{N}$ there exists $C_\nu > 0$ such that, for every $t \in \left[ 0, \varrho_k \frac{1}{n^{p-1}} \right]$ with $k$ large enough:

$$\langle \text{Im} a_{p-1}(t, x) D_x^{p-1} v_k, v_k \rangle \geq \left( \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1})n^{p-1} - C \frac{n^{p-1}}{\varrho_k} \right) \|v_k\|^2$$

$$- C_\nu \varrho_k^{4 + \frac{1}{2}} \left( \frac{\varrho_k^{\mu+1}}{n} \right)^{\nu} n^{p+1} \|v_k\|,$$

for some fixed $C > 0$.

**Proof.** We split

$$\text{Im} a_{p-1}(t, x) D_x^{p-1} = \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1})n^{p-1}$$

$$+ \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1})(D_x^{p-1} - n^{p-1})$$

$$+ \left( \text{Im} a_{p-1}(t, x) - \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1}) \right) D_x^{p-1},$$

and set

$$I_1 := \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1})n^{p-1},$$

$$I_2 := \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1})(D_x^{p-1} - n^{p-1})$$

$$I_3 := \left( \text{Im} a_{p-1}(t, x) - \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1}) \right) D_x^{p-1}.$$

We have

$$\langle I_1 v_k, v_k \rangle = \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1})n^{p-1} \|v_k\|^2.$$
so, denoting by 

\[ J_1 := \| \chi_{1,k}(D_x)(D_x^{p-1} - n^{p-1})u_k \|, \]

\[ J_2 := \| (1 - \chi_{1,k}(D_x)) (D_x^{p-1} - n^{p-1})u_k \|, \]

we have 

\[ \| I_2 u_k \| \leq | \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1})| (J_1 + J_2). \]

By Calderon-Vaillantcourt’s Theorem A.3

\[ J_1 \leq C|\chi_{1,k}(\xi)(\xi^{p-1} - n^{p-1})|_{2,2}^{0} \| v_k \| \leq C' \frac{n^{p-1}}{\xi_k} \| v_k \| \]

for some \( C, C' > 0 \), since by (2.23):

\[
|\chi_{1,k}(\xi)(\xi^{p-1} - n^{p-1})| = |\chi_{1,k}(\xi - n)(\xi^{p-2} + n\xi^{p-3} + n^2\xi^{p-4} + \ldots + n^{p-2})| \\
\leq c \frac{n}{\xi_k} (p - 1)n^{p-2} = c \frac{n^{p-1}}{\xi_k},
\]

for some \( c, c' > 0 \), and for all \( |\gamma| \leq 2 \) there are constants \( C_{\gamma_1}, C_{\gamma} > 0 \) such that:

\[
|\partial_{\xi}^{\gamma_1} \chi_{1,k}(\xi)\partial_{\xi}^{\gamma_2}(\xi^{p-1} - n^{p-1})| \leq \begin{cases} 
C_{\gamma_1} \frac{n^{p-1}}{\xi_k^{\mu}} & \gamma_2 = 0 \\
C_{\gamma} n^{p-1-\gamma_2} \leq C_{\gamma} \frac{n^{p-1}}{\xi_k^{\mu}} & \gamma_2 \geq 1.
\end{cases}
\]

As it concerns (3.11), by definition of \( v_k \) we write

\[ (D_x^{p-1} - n^{p-1})v_k = (W_{n,k}(D_x^{p-1} - n^{p-1}) + [D_x^{p-1} - n^{p-1}, W_{n,k}]) u_k. \]

Since \( \sigma([D_x^{p-1} - n^{p-1}, W_{n,k}]) = \sum_{\alpha=1}^{p-1} \left( \frac{p-1}{\alpha} \right) \xi^{p-1-\alpha} \xi_k^{\alpha} W_{n,k}^{\alpha,0} \), we have that

\[ [D_x^{p-1} - n^{p-1}, W_{n,k}] = \sum_{\alpha=1}^{p-1} \left( \frac{p-1}{\alpha} \right) \xi_k^{\alpha} W_{n,k}^{\alpha,0} D_x^{p-1-\alpha} \]

and therefore, by (3.11), (3.14), (3.15), the Calderon-Vaillantcourt’s Theorem A.3 and (2.28), for every \( \nu \in \mathbb{N} \) there are constants \( C, C'_n, C''_n > 0 \) such that:

\[
J_2 \leq \| (1 - \chi_{1,k}(D_x)) W_{n,k}(D_x^{p-1} - n^{p-1})u_k \| \\
\quad + \sum_{\alpha=1}^{p-1} \left( \frac{p-1}{\alpha} \right) \xi_k^{\alpha} \| (1 - \chi_{1,k}(D_x)) W_{n,k}^{\alpha,0} D_x^{p-1-\alpha}u_k \| \\
\leq C \left( |\sigma ((1 - \chi_{1,k}(D_x)) W_{n,k}(D_x^{p-1} - n^{p-1}))|^{0}_{2,2} \\
\quad + \sum_{\alpha=1}^{p-1} \xi_k^{\alpha} |\sigma ((1 - \chi_{1,k}(D_x)) W_{n,k}^{\alpha,0} D_x^{p-1-\alpha})|^{0}_{2,2} \right) \| u_k \| \\
\leq C'_n \xi_k^{4+\frac{1}{2}} \left( \frac{\xi_k^{\mu+1}}{n} \right)^{\nu} (n^{p-1} + \xi_k n^{p-2} + \ldots + \xi_k^{p-1} n^{q} \\
\quad \leq C''_n \xi_k^{4+\frac{1}{2}} \left( \frac{\xi_k^{\mu+1}}{n} \right)^{\nu} n^{q+p-1}.
\]
We now claim that

\[ (3.17) \quad \|I_2 v_k\| \leq C \frac{n^{p-1}}{q_k} \|v_k\| + C \nu q_k^{4+\frac{1}{2}} \left( \frac{\theta_k^{\mu+1}}{n} \right)^\nu n^{q+p-1} \]

for some \( C, C_\nu > 0 \), and hence

\[ (3.18) \quad \langle I_2 v_k, v_k \rangle \geq -C \frac{n^{p-1}}{q_k} \|v_k\|^2 - C \nu q_k^{4+\frac{1}{2}} \left( \frac{\theta_k^{\mu+1}}{n} \right)^\nu n^{q+p-1} \|v_k\|. \]

Finally, to estimate \( \langle I_3 v_k, v_k \rangle \), we localize in a neighborhood of \( x_k + pA_p(t)\xi^{p-1} \) by defining, for \( h \) as in (2.7), the function

\[ (3.19) \quad \chi_{2,k}(x) := h \left( \frac{x - x_k - pA_p(t)\xi^{p-1}}{4pc_p} \right), \]

where \( c_p \) is the constant defined in Lemma 2.2. We have that

\[ (3.20) \quad \text{supp} \chi_{2,k} \subseteq \left\{ x : |x - x_k - pA_p(t)\xi^{p-1}| \leq \frac{2pc_p}{q_k} \right\} \]

and

\[ (3.21) \quad \text{supp} (1 - \chi_{2,k}) \subseteq \left\{ x : |x - x_k - pA_p(t)\xi^{p-1}| \geq \frac{pc_p}{q_k} \right\}. \]

We now claim that

\[ (3.22) \quad \text{supp}(1 - \chi_{2,k}) \cap \text{supp} W^{\alpha,\beta}_{n,k} = \emptyset \quad \forall t \in \left[ 0, \frac{\theta_k}{np-1} \right]. \]

This holds true because on the support of \( W^{\alpha,\beta}_{n,k} \), given by Lemma 2.2, we have that, for all \( t \in \left[ 0, \frac{\theta_k}{np-1} \right] \),

\[
|x - x_k - pA_p(t)\xi^{p-1}| \leq |x - x_k - pA_p(t)np^{-1}| + p|A_p(t)||\xi^{p-1} - np^{-1}| \leq \frac{c_p}{q_k} + p \sup_{[0,T]} |a_p| \cdot t \cdot |\xi - n| \cdot |\xi^{p-2} + n\xi^{p-3} + \ldots + np^{-2}| \leq \frac{c_p}{q_k} + c_p \frac{q_k}{n^{p-1}} \frac{n}{2q_k} (p-1)n^{p-2} \leq c_p \frac{q_k}{n^{p-1}} \]

by the definition of \( c_p \). Therefore (3.22) is proved and

\[ I_3 v_k = (1 - \chi_{2,k}(x)) I_3 v_k + \chi_{2,k}(x) I_3 v_k = \chi_{2,k}(x) I_3 v_k. \]

Then, by Lemma 2.4

\[
||I_3 v_k|| = ||\chi_{2,k}(x) I_3 v_k|| = \left| \text{Im} a_{p-1}(t, x) - \text{Im} a_{p-1}(t, x_k + pA_p(t)np^{-1}) \right| \cdot \|\chi_{2,k}(x) D_x^{p-1} v_k\| \leq \left( \sup_{[0,T] \times R} \left| \text{Im} \partial_x a_{p-1}(x, t) \right| \right) \cdot \|x - x_k - pA_p(t)np^{-1}\| \cdot \|\chi_{2,k}(x) D_x^{p-1} v_k\| \leq \frac{c}{q_k} \|D_x^{p-1} v_k\| \leq \frac{C'}{q_k} \left( c_1 n^{p-1} \|v_k\| + C \nu q_k^{4+\frac{1}{2}} \left( \frac{\theta_k^{\mu+1}}{n} \right)^\nu n^{q+p-1} \right) \leq C' \frac{n^{p-1}}{q_k} \|v_k\| + C' \nu q_k^{3+\frac{1}{2}} \left( \frac{\theta_k^{\mu+1}}{n} \right)^\nu n^{q+p-1}, \]

for some \( c, C', C'_\nu > 0 \), and so

\[ (3.23) \quad \langle I_3 v_k, v_k \rangle \geq -C' \frac{n^{p-1}}{q_k} \|v_k\|^2 - C' \nu q_k^{3+\frac{1}{2}} \left( \frac{\theta_k^{\mu+1}}{n} \right)^\nu n^{q+p-1} \|v_k\|. \]
Summing up (3.9), (3.18) and (3.23) we finally get the desired estimate (3.7).

Proposition 3.2. Let $n = q_k^a$ with $a > \mu + 1$. Then for all $\nu \in \mathbb{N}$ there exists $C_\nu > 0$ such that the function $f_k$ defined in (3.4) satisfies

$$
\|f_k(t, \cdot)\| \leq C q_k^{2n-2} \sum_{j=1}^p \|v_k^j\| + C_\nu n^{p-1} \sum_{1 \leq \alpha_1 + \alpha_2 \leq \nu(p-1)} \left( \frac{q_k^\mu}{n} \right)^{\alpha_1 + \alpha_2} \|v_k^{\alpha_1, \alpha_2}\|
$$

$$
+C_\nu n^{q+p-1} \, 4^{\frac{q+1}{p}} \left( \frac{q_k^\mu}{n} \right)^{\nu}
$$

for some fixed $C > 0$ and for every $t \in [0, q_k/n^{p-1}]$ with $k$ large enough.

Proof. Let us recall that

$$
f_k = \text{op} \left( a_p(t) \sum_{\alpha=2}^p \left( \frac{p}{\alpha} \right) \xi^{p-\alpha} D_x^\alpha w_{n,k} \right) u_k + \sum_{j=0}^{p-1} [a_j(t, x) D_x^j, W_{n,k}] u_k,
$$

and estimate the above terms separately. For $\alpha = p$

$$
\text{op}(a_p(t) D_x^p w_{n,k}) u_k = \int e^{ix\xi} a_p(t) D_x^p w_{n,k}(t, x; \xi) \hat{u}_k(t, \xi) d\xi
$$

$$
= a_p(t) q_k^p \int e^{ix\xi} w_{n,k}^{p,0}(t, x; \xi) \hat{u}_k(t, \xi) d\xi
$$

$$
= a_p(t) q_k^p W_{n,k}^{p,0}(t, x; D_x) u_k(t, x) = a_p(t) q_k^p v_k^{p,0}(t, x)
$$

and hence

$$
\|\text{op}(a_p(t) D_x^p w_{n,k}) u_k\| \leq C q_k^p \|v_k^{p,0}\|
$$

for some $C > 0$.

For $2 \leq \alpha \leq p - 1$, by (2.30) we have:

$$
\|\text{op}(a_p(t) \xi^{p-\alpha} D_x^{\alpha} w_{n,k}) u_k(t, \cdot)\| \leq C q_k^{\alpha} \| W_{n,k}^{\alpha,0} D_x^{p-\alpha} u_k \|
$$

$$
\leq C' q_k^{\alpha} \left( n^{p-\alpha} \sum_{j=0}^{p-\alpha} \|v_k^{\alpha+j,0}\| + C_\nu q_k^{4+\frac{1}{2}} \left( \frac{q_k^\mu}{n} \right)^{\nu} n^{q+p-\alpha} \right)
$$

$$
\leq C'' q_k^{2n-2} \sum_{s=2}^p \|v_k^s\| + C'' q_k^{4+\frac{1}{2}} \left( \frac{q_k^\mu}{n} \right)^{\nu} n^{q+p-1}
$$

(3.26)

for some $C, C', C'', C_\nu, C'_\nu > 0$, since $(q_k/n)^{\alpha} \leq (q_k/n)^2$ and $q_k^2/n^2 \leq 1/n = q_k^a$ for $2 \leq \alpha \leq p-1$ and $a \geq 2$.

In order to estimate the second addend of (3.24) we compute, for $0 \leq j \leq p - 1$:

$$
[a_j D_x^j, W_{n,k}] u_k = a_j \sum_{h=0}^{j} \left( \begin{array}{c} j \\ h \end{array} \right) (D_x^{j-h} W_{n,k}) D_x^h u_k - W_{n,k} a_j D_x^j u_k
$$

$$
= a_j \sum_{h=0}^{j-1} \left( \begin{array}{c} j \\ h \end{array} \right) q_k^{j-h} W_{n,k}^{j-h,0} D_x^h u_k + [a_j, W_{n,k}] D_x^j u_k.
$$
Then, by Lemmas 2.5 and 2.6 for $0 \leq j \leq p - 1$, we have that:

$$
\| [a_j D_x^j, W_n] u_k \| \leq C \sum_{h=0}^{j-1} \| g_k^{j-h} \| W_n^{j-h,0} D_x^h u_k \| + \| [a_j, W_n] D_x^j u_k \| 
$$

$$
\leq \sum_{h=0}^{j-1} C h g_k^{j-h} n^h \sum_{s=0}^{h} \| v_k^{j-h+s,0} \| + C \nu g_k^{4+\frac{1}{2}} \left( \frac{\nu}{n} \right)^{\alpha_1+\alpha_2} n^q+j
$$

$$
+ C \nu n^j \sum_{1 \leq \alpha_1+\alpha_2 \leq (\nu-1)(p-1)+j} \| v_k^{\alpha_1,\alpha_2} \| 
$$

$$
(3.27)
$$

$$
\leq C g_k n^{j-1} \sum_{s=1}^{j} \| v_k^{s,0} \| + C \nu g_k^{4+\frac{1}{2}} \left( \frac{\nu}{n} \right)^{\alpha_1+\alpha_2} n^q+j
$$

$$
+ C \nu n^j \sum_{1 \leq \alpha_1+\alpha_2 \leq (\nu-1)(p-1)+j} \| v_k^{\alpha_1,\alpha_2} \| 
$$

for some $C, C_\nu > 0$.

By (3.24), (3.25), (3.26) and (3.27):

$$
\| f_k(t, \cdot) \| \leq C g_k^{p} \| v_k^{p,0} \| + C^{\nu} g_k^{2} n^{p-2} \sum_{s=2}^{p} \| v_k^{s,0} \| + C \nu g_k^{4+\frac{1}{2}} \left( \frac{\nu}{n} \right)^{\alpha_1+\alpha_2} n^{q+p-1}
$$

$$
+ \sum_{j=0}^{p-1} \left[ C g_k n^{j-1} \sum_{s=1}^{j} \| v_k^{s,0} \| + C \nu n^j \sum_{1 \leq \alpha_1+\alpha_2 \leq (\nu-1)(p-1)+j} \| v_k^{\alpha_1,\alpha_2} \| 
$$

$$
+ C' \nu g_k^{4+\frac{1}{2}} \left( \frac{\nu}{n} \right)^{\alpha_1+\alpha_2} n^{q+j} \right] 
$$

$$
\leq \tilde{C} g_k^{2} n^{p-2} \sum_{s=1}^{p} \| v_k^{s,0} \| + \tilde{C} \nu n^{p-1} \sum_{1 \leq \alpha_1+\alpha_2 \leq (p-1)} \| v_k^{\alpha_1,\alpha_2} \| 
$$

$$
+ \tilde{C} \nu g_k^{4+\frac{1}{2}} \left( \frac{\nu}{n} \right)^{\alpha_1+\alpha_2} n^{q+p-1}
$$

for some $\tilde{C}, \tilde{C}_\nu > 0$.

Summing up, from (3.6), by Propositions 3.1 and 3.2 for every $\nu \in \mathbb{N}$ we come to the estimate:

$$
\frac{1}{2} \frac{d}{dt} \| v_k(t, \cdot) \|^2 \geq \left( \text{Im} \ a_{p-1}(t, x_k + p A_p(t) n^{p-1}) n^{p-1} - A \left( 1 + \frac{n^{p-1}}{\theta_k} \right) \right) \| v_k \|^2
$$

$$
- C \nu g_k^{4+\frac{1}{2}} \left( \frac{\nu}{n} \right)^{\alpha_1+\alpha_2} n^{q+p-1} \| v_k \| - C g_k^{2} n^{p-2} \sum_{j=1}^{p} \| v_k^{j,0} \| \cdot \| v_k \|
$$

$$
- C \nu n^{p-1} \sum_{1 \leq \alpha_1+\alpha_2 \leq (p-1)} \| v_k^{\alpha_1,\alpha_2} \| \cdot \| v_k \|
$$

for some $A, C, C_\nu > 0$. Now, for $a > \mu + 1$, it is possible to take $\nu \in \mathbb{N}$ sufficiently large so that

$$
(3.29)
$$

$$
\sup_{\| g_k \|^2} \| v_k^{4+\frac{1}{2}} \left( \frac{\nu}{n} \right)^{\alpha_1+\alpha_2} n^{q+p-1} \leq M_\nu
$$
for some $M_\nu > 0$. After substituting (3.29) in (3.28), we finally choose $a$ and $\mu$ such that

\[
\frac{d}{dt}\|v_k(t, \cdot)\| \geq \left( \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1})n^{p-1} - A \left( 1 + \frac{n^{p-1}}{\varrho_k} \right) \right) \|v_k\| - M'_\nu
\]

\[-C'_\nu n^{p-1} \sum_{1 \leq \alpha_1 + \alpha_2 \leq \nu(p-1)} \left( \frac{\varrho_k^{\alpha_1 + \alpha_2}}{n} \right) \|v_k^{\alpha_1, \alpha_2}\|,
\]

for some $M'_\nu, C'_\nu > 0$; this can be done for

\[
\begin{cases}
\mu > p + 1 \\
\mu + 1 < a \leq \frac{p\mu - 2}{p - 1} = \mu + 1 + \frac{\mu - p - 1}{p - 1},
\end{cases}
\]

since $\varrho_k^2 n^{p-2} \leq n^{p-1} \left( \frac{\varrho_k^n}{n} \right)^j$ for all $1 \leq j \leq p$ if $2 \leq p\mu - a(p - 1)$, and this implies, together with $a > \mu + 1$, that we must take $\mu > p + 1$.

Using now $\varrho_k \left( \frac{\varrho_k^n}{n} \right)^{\alpha_1 + \alpha_2} \leq \left( \frac{\varrho_k^{\mu+1}}{n} \right)^{\alpha_1 + \alpha_2}$, we come to

\[
\frac{d}{dt}\|v_k(t, \cdot)\| \geq \left( \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1})n^{p-1} - A \left( 1 + \frac{n^{p-1}}{\varrho_k} \right) \right) \|v_k\| - M' \\
-C'_\nu \frac{n^{p-1}}{\varrho_k} \sum_{1 \leq \alpha_1 + \alpha_2 \leq \nu(p-1)} \left( \frac{\varrho_k^{\mu+1}}{n} \right)^{\alpha_1 + \alpha_2} \|v_k^{\alpha_1, \alpha_2}\|
\]

for some constants $M', C' > 0$, since $\nu$ has been fixed in (3.29).

Arguing in the same way for the functions $v_k^{\alpha_1, \alpha_2}$ instead of $v_k$, we finally get:

**Proposition 3.3.** Let $n$ be as in (2.9), $a, \mu$ as in (3.31), $\nu \in \mathbb{N}$ sufficiently large so that (3.29) is satisfied. Then, for every $\alpha, \beta \in \mathbb{N}_0$ there exists $C_{\alpha, \beta} > 0$ such that for all $t \in [0, \varrho_k/n^{p-1}]$ with $k$ large enough:

\[
\frac{d}{dt}\|v_k^{\alpha_1, \alpha_2}(t, \cdot)\| \geq \left( \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1})n^{p-1} - A \left( 1 + \frac{n^{p-1}}{\varrho_k} \right) \right) \|v_k^{\alpha_1, \alpha_2}\| - C_{\alpha, \beta} \\
-C_{\alpha, \beta} \frac{n^{p-1}}{\varrho_k} \sum_{1 \leq \alpha_1 + \alpha_2 \leq \nu(p-1)} \left( \frac{\varrho_k^{\mu+1}}{n} \right)^{\alpha_1 + \alpha_2} \|v_k^{\alpha_1, \alpha_2}\|.
\]

From Proposition 3.3 it follows that:

\[
\frac{d}{dt} \left( \frac{\varrho_k^{\mu+1}}{n} \right)^{\alpha_1 + \beta} \|v_k^{\alpha_1, \beta}\| \geq \left( \text{Im} a_{p-1}(t, x_k + pA_p(t)n^{p-1})n^{p-1} - A \left( 1 + \frac{n^{p-1}}{\varrho_k} \right) \right) \|v_k^{\alpha_1, \beta}\| - C_{\alpha, \beta} \\
-C_{\alpha, \beta} \frac{n^{p-1}}{\varrho_k} \sum_{1 \leq \alpha_1 + \beta \leq \nu(p-1)} \left( \frac{\varrho_k^{\mu+1}}{n} \right)^{\alpha_1 + \alpha_1 + \beta} \|v_k^{\alpha_1, \alpha_1 + \beta}\|.
\]

We now choose $s \in \mathbb{N}$ sufficiently large so that, for all $\bar{\alpha} + \bar{\beta} \geq s + 1$, using (2.21) and $a > \mu + 1$, we have

\[
\frac{n^{p-1}}{\varrho_k} \left( \frac{\varrho_k^{\mu+1}}{n} \right)^{\bar{\alpha} + \beta} \|v_k^{\bar{\alpha}, \beta}\| \leq c_s \frac{n^{p-1}}{\varrho_k} \left( \frac{\varrho_k^{\mu+1}}{n} \right)^{s+1} \|v_k^{\bar{\alpha}, \beta}\| \leq c_s'
\]
for some \( c_s, c'_s > 0 \). In order to satisfy (3.34) it's enough to take \( s \) such that
\[
a(q + p - 1) + \frac{1}{2} + 1 + (s + 1)(\mu + 1 - a) \leq 0,
\]
i.e.
\[
(3.35)\quad s \geq \frac{a(q + p - 2) + \mu + \frac{5}{2}}{a - \mu - 1}.
\]

With this choice of \( s \) we define:
\[
(3.36)\quad \sigma_k(t) := \sum_{0 \leq \alpha + \beta \leq s} \left( \frac{g_{k}^{\mu+1}}{n} \right)^{\alpha + \beta} \| v_{k}^{\alpha,\beta} \|.
\]

From (3.33) we have that:
\[
(3.37)\quad \frac{d}{dt} \sigma_k(t) \leq \sum_{0 \leq \alpha + \beta \leq s} \frac{d}{dt} \left[ \left( \frac{g_{k}^{\mu+1}}{n} \right)^{\alpha + \beta} \| v_{k}^{\alpha,\beta} \| \right]
\]
\[
\geq \sum_{0 \leq \alpha + \beta \leq s} \left( \text{Im} \ a_{p-1}(t, x_k + pA_p(t)n^{p-1})n^{p-1} - A_s \left( 1 + \frac{n^{p-1}}{\vartheta_k} \right) \right) \left( \frac{g_{k}^{\mu+1}}{n} \right)^{\alpha + \beta} \| v_{k}^{\alpha,\beta} \| - C_s
\]
\[
- C_s \sum_{1 \leq \alpha + \beta \leq s} \frac{n^{p-1}}{\vartheta_k} \left( \frac{g_{k}^{\mu+1}}{n} \right)^{\alpha + \beta} \| v_{k}^{\alpha,\beta} \| - C_s
\]
\[
\geq \left( \text{Im} \ a_{p-1}(t, x_k + pA_p(t)n^{p-1})n^{p-1} - A_s \left( 1 + \frac{n^{p-1}}{\vartheta_k} \right) \right) \sigma_k(t) - C_s
\]
for some \( C_s, A_s > 0 \), because of (3.34).

We have thus obtained for the function \( \sigma_k \) the following differential inequality:
\[
\sigma'_k(t) - B_k(t)\sigma_k(t) + C_s \geq 0 \quad t \in \left[ 0, \frac{\vartheta_k}{n^{p-1}} \right], \quad k \gg 1,
\]
\[
B_k(t) := \text{Im} \ a_{p-1}(t, x_k + pA_p(t)n^{p-1})n^{p-1} - A_s \left( 1 + \frac{n^{p-1}}{\vartheta_k} \right),
\]
which clearly implies that
\[
\sigma_k(t) \geq e^{\int_{0}^{t} B_k(\theta)d\theta} \left[ \sigma_k(0) - C_s \int_{0}^{t} e^{-\int_{0}^{\tau} B_k(\theta)d\theta} d\tau \right] \quad t \in \left[ 0, \frac{\vartheta_k}{n^{p-1}} \right], \quad k \gg 1.
\]

For \( t = \vartheta_k/n^{p-1} \) we have
\[
(3.37)\quad \sigma_k \left( \frac{\vartheta_k}{n^{p-1}} \right) \geq e^{\int_{0}^{\vartheta_k/n^{p-1}} B_k(\theta)d\theta} \left[ \sigma_k(0) - C_s \int_{0}^{n^{p-1}} e^{-\int_{0}^{\tau} B_k(\theta)d\theta} d\tau \right].
\]

Let us focus on the term \( \int_{0}^{\vartheta_k/n^{p-1}} B_k(\theta)d\theta \); the choice of \( x_k, \vartheta_k \) of Lemma 2.1 gives for it, by the change of variables \( \theta' = n^{p-1}\theta \) and for \( k \) large enough, the following estimate from below:
\begin{align*}
\int_0^{\frac{\varrho_k}{n^{p-1}}} B_k(\theta)d\theta &= \int_0^{\frac{\varrho_k}{n^{p-1}}} \operatorname{Im} a_{p-1}(\theta, x_k + pA_p(\theta)n^{p-1}) n^{p-1}d\theta - A_s \int_0^{\frac{\varrho_k}{n^{p-1}}} \left(1 + \frac{n^{p-1}}{\varrho_k}\right) d\theta \\
&\geq \int_0^{\varrho_k} \operatorname{Im} a_{p-1} \left(\frac{\theta'}{n^{p-1}}, x_k + pA_p \left(\frac{\theta'}{n^{p-1}}\right) n^{p-1}\right) d\theta' - 2A_s \\
&= \int_0^{\varrho_k} \operatorname{Im} a_{p-1} \left(\frac{\theta'}{n^{p-1}}, x_k + pa_p(\tau_k)\theta'\right) d\theta' - 2A_s \\
&\geq M \log(1 + \varrho_k) + k - 2A_s,
\end{align*}

(3.38)

for some \( \tau_k \in [0, \theta'/n^{p-1}] \), since \( A_p(\theta'/n^{p-1})n^{p-1} = \theta'a_p(\tau_k) \) by the mean value theorem for integration.

Similarly it follows that for every \( \tau \in [0, \frac{\varrho_k}{n^{p-1}}] \):

\begin{align*}
\int_0^{\tau} B_k(\theta)d\theta \geq \int_0^{n^{p-1}\tau} \operatorname{Im} a_{p-1} \left(\frac{\theta'}{n^{p-1}}, x_k + pa_p(\tau'_k)\theta'\right) d\theta' - 2A_s \geq -2A_s
\end{align*}

(3.39)

for some \( \tau'_k \in [0, \theta'/n^{p-1}] \), because of Lemma 2.1, since \( n^{p-1}\tau \leq n^{p-1}\frac{\varrho_k}{n^{p-1}} = \varrho_k \).

Finally, from (3.36) and (3.2) we have \( \|\sigma_k(0)\| \geq \|v_k(0)\| \geq \|h\| > 0 \); therefore, substituting the estimates (3.38) and (3.39) into (3.37), we have proved the following desired estimate from below for the function \( \sigma_k(t) \):

**Proposition 3.4.** For every \( M > 0 \) and \( k \in \mathbb{N} \) let \( x_k, \varrho_k \) be as in Lemma 2.1. Taking \( \mu \geq 2 \) in (2.13) and \( n \) as in (2.9) with \( a, \mu \) satisfying (3.31), it is possible to construct the functions \( v_k^{\alpha,\beta} \) in (2.17) and then to choose \( s \) great enough (see (3.35)) such that the function \( \sigma_k(t) \) defined in (3.30) satisfies the following estimate from below:

\begin{align*}
\sigma_k \left(\frac{\varrho_k}{n^{p-1}}\right) \geq c(1 + \varrho_k)^M, \quad k \gg 1,
\end{align*}

(3.40)

for some \( c > 0 \).

4. Estimate from above and proof of the main Theorem.

The estimate from above is now quite simple to be obtained and it is shown in the following:

**Proposition 4.1.** For every \( M > 0 \) and \( k \in \mathbb{N} \) let \( x_k, \varrho_k \) be as in Lemma 2.1. Taking \( \mu \geq 2 \) in (2.13) and \( n \) as in (2.9) with \( a, \mu \) satisfying (3.31), it is possible to construct the functions \( v_k^{\alpha,\beta} \) in (2.17) and then to choose \( s \) great enough (see (3.35)) such that the function \( \sigma_k(t) \) defined in (3.30) satisfies the following estimate from above for all \( t \in [0, \frac{\varrho_k}{n^{p-1}}] \):

\begin{align*}
\sigma_k(t) \leq C \varrho_k^{\frac{1}{\alpha} + 2 + a_\theta}, \quad k \gg 1,
\end{align*}

(4.1)

for some \( C > 0 \).

**Proof.** The estimate (2.21) obtained in Section 2 and definition (3.36) immediately give:

\[ \sigma_k(t) \leq \sum_{0 \leq \alpha + \beta \leq s} C_{\alpha,\beta} \left(\frac{\varrho_k^{\mu+1}}{n}\right)^{\alpha + \beta} \varrho_k^{\frac{1}{\alpha} + 2 + a_\theta} \leq C \varrho_k^{\frac{1}{\alpha} + 2 + a_\theta} \]

for some \( C > 0 \), since \( s \) has been fixed in (3.35). \( \Box \)

We are now ready to give the proof of Theorem 1.1.
Proof of Theorem 1.1. Let us assume, by contradiction, that the Cauchy problem (1.2) is well-
posed in $H^\infty$ but (1.6) does not hold true. Then at least one of the two conditions (2.3) or (2.4)
does not hold true. As we remarked in Section 2, we can assume, without loss of generality,
that (2.3) does not hold and apply Lemma 2.1. By Propositions 3.4 and 4.1 we come to the
estimate:
\[ c(1 + \eta^k)^M \leq \sigma_k \left( \frac{\eta_k}{n^p-1} \right) \leq C\eta_k^{\frac{1}{2}+2+aq}, \]
for positive constants $c, C$ not depending on $k$, giving rise to a contradiction for $k$ large enough,
if we choose
\[ M > \frac{1}{2} + 2 + aq. \]
Therefore condition (1.6) must be satisfied and the proof is complete.

\[ \square \]

Appendix A.

The localized pseudo-differential operators $W_{\alpha,k}^\alpha(t, x, D_x)$ of the present paper have symbols
\[ w_{\alpha,k}^\alpha(t, x, \xi) \] depending on the parameter $t$ and belonging to the class $S_{0,0}^0$ of all functions $p(x, \xi) \in C^\infty(\mathbb{R}^2)$ such that for every $\alpha, \beta \geq 0$
\[ |D_x^\beta \partial_\xi^\alpha p(x, \xi)| \leq C_{\alpha,\beta}; \] (A.1)
$S_{0,0}^0$ is a Fréchet space with semi-norms
\[ |p|_0 := \max_{\alpha \leq \ell, \beta \leq \ell} \sup_{x, \xi \in \mathbb{R}} |\partial_\xi^\alpha D_x^\beta p(x, \xi)|. \] (A.2)
The class $S_{0,0}^0$ corresponds to the classical class $S_{m,\delta}^m$ (defined by $|D_x^\beta \partial_\xi^\alpha p(x, \xi)| \leq C_{\alpha,\beta}(\xi)^{m-\alpha+\delta}$ instead of (A.1); see [KG]) with $m = \rho = \delta = 0$. In the $S_{0,0}^m$ classes the usual asymptotic expansion formula
\[ p(x, \xi) \sim \sum_{\alpha \geq 0} \frac{1}{\alpha!} \partial_\xi^\alpha p_1(x, \xi) D_x^\beta p_2(x, \xi) \]
fails to be true, and we need to use the expansion formula with a remainder, as in [KG, Thm. 3.1, Chap. 2] (see also [I1, Thm. A]):

**Theorem A.1.** Let $P_j(x, D_x)$ be pseudo-differential operators with symbols $p_j(x, \xi) \in S_{0,0}^m_j$, $j = 1, 2$. Then the operator $P(x, D_x) = P_1(x, D_x) \circ P_2(x, D_x)$ has symbol given by the oscillatory integral
\[ p(x, \xi) = \int \int e^{-i\eta p_1(x, \xi + \eta)p_2(x + y, \xi)} dy d\eta \in S_{0,0}^{m_1 + m_2}, \]
where $d\eta = (2\pi)^{-1}d\eta$.

Moreover, the following expansion formula holds for every $\nu \in \mathbb{N}$:
\[ p(x, \xi) = \sum_{\alpha \leq \nu-1} \frac{1}{\alpha!} \partial_\xi^\alpha p_1(x, \xi) D_x^\beta p_2(x, \xi) + \int_0^1 (1 - \theta)^{\nu-1} (\nu - 1)! r_{\theta,\nu}(x, \xi) d\theta, \]
where
\[ r_{\theta,\nu}(x, \xi) := \int \int e^{-i\eta p_1(x, \xi + \theta \eta) D_x^\beta p_2(x + y, \xi)} dy d\eta \in S_{0,0}^{m_1 + m_2}. \]
We recall from [KG, Lemm 2.2, Chap. 7], (see also [I1, Thm. B]):
Theorem A.2. Let \( p_j(x, \xi) \in S_{0,0}^0 \) for \( j = 1, 2 \) and define
\[
p_\theta(x, \xi) := \int \int e^{-i\eta \cdot \theta} p_1(x, \xi + \theta \eta) p_2(x + y, \xi) \, dy \, d\eta.
\]
Then for every \( \ell \in \mathbb{N}_0 \) there exists a constant \( C_\ell > 0 \) such that
\[
|p_\theta|_{\ell,\ell}^0 \leq C_\ell |p_1|_{\ell+2,\ell+2}^0 |p_2|_{\ell+2,\ell+2}^0
\]
for all \( \theta \in [0,1] \).

We conclude the appendix with the statement of the Calderón-Vaillancourt’s Theorem about continuity of pseudo-differential operators with symbols in the class \( S_{0,0}^0 \) acting on \( L^2 \) (see [CV] or [I2, Thm. C]):

Theorem A.3. Let \( p(x, D_x) \) be a pseudo-differential operator with symbol \( p(x, \xi) \in S_{0,0}^0 \). Then:
\[
\|p(x, D_x)u\| \leq C |p|_{2,2}^0 \|u\|
\]
for all \( u \in L^2 \), with a positive constant \( C \) independent of \( p \) and \( u \).
