A trace formula and high energy spectral asymptotics for the perturbed Landau Hamiltonian

E. Korotyaev\(^*\) and A. Pushnitski\(^†\)

2 October 2003

Abstract

A two-dimensional Schrödinger operator with a constant magnetic field perturbed by a smooth compactly supported potential is considered. The spectrum of this operator consists of eigenvalues which accumulate to the Landau levels. We call the set of eigenvalues near the \(n\)'th Landau level an \(n\)'th eigenvalue cluster, and study the distribution of eigenvalues in the \(n\)'th cluster as \(n \to \infty\). A complete asymptotic expansion for the eigenvalue moments in the \(n\)'th cluster is obtained and some coefficients of this expansion are computed. A trace formula involving the first eigenvalue moments is obtained.

1 Introduction and Main Results

1. Introduction Let \(H\) in \(L^2(\mathbb{R}^2, dx_1 dx_2)\) be the following magnetic Schrödinger operator:

\[
H = \left( -i \frac{\partial}{\partial x_1} + \frac{B}{2} x_2 \right)^2 + \left( -i \frac{\partial}{\partial x_2} - \frac{B}{2} x_1 \right)^2, \quad B > 0.
\]

The operator \(H\) describes a quantum particle in \(\mathbb{R}^2\) in a constant homogeneous magnetic field of the magnitude \(B\); it is often called the Landau Hamiltonian. It is well known [8] that the spectrum of \(H\) consists of a sequence of eigenvalues (Landau levels) \(\Lambda_n = B(2n + 1), \ n \in \mathbb{Z}_+ \equiv \{0, 1, 2, \ldots\}\). Each of these eigenvalues has infinite multiplicity.

Let \(V \in C_0^\infty(\mathbb{R}^2)\) be a real valued function (potential in physical terminology). Consider the spectrum of the operator \(H + V\). It is well known (see [3]) that \(V\) is a relatively compact perturbation of \(H\) and therefore the essential spectrum of \(H + V\) is the same as that of \(H\), i.e. consists of the Landau levels. The operator \(H + V\) may have eigenvalues of finite multiplicities which can accumulate to the Landau levels.

Let us define disjoint intervals \(\Delta_0 = [\inf \sigma(H + V), 2B], \ \Delta_n = [\Lambda_n - B, \Lambda_n + B], \ n \in \mathbb{N},\) so that \(\sigma(H + V) \subset \bigcup_{n=0}^\infty \Delta_n\). We shall call the set \(\sigma(H + V) \cap \Delta_n\) the \(n\)'th eigenvalue cluster. For a fixed \(n\), the distribution of eigenvalues in the \(n\)'th cluster was studied in [10], [11] (these papers contain

\(^*\)Institut für Mathematik, Humboldt Universität zu Berlin, Rudower Chaussee 25, 12489, Berlin, Germany. e-mail: ek@mathematik.hu-berlin.de

\(^†\)Department of Mathematical Sciences, Loughborough University, Loughborough, LE11 3TU, U.K. e-mail: a.b.pushnitski@lboro.ac.uk
also references to earlier work on this problem). It was found that eigenvalues accumulate to 
Λn exponentially fast.

Our aim is to study the asymptotic distribution of eigenvalues in the n’th cluster as n → ∞. 
Our first preliminary result is that the width of the n’th cluster is O(n−1/2):

**Proposition 1.1.** There exist C > 0 and N ∈ N such that for all n ≥ N, one has

\[ \sigma(H + V) \cap \Delta_n \subset (\Lambda_n - Cn^{-1/2}, \Lambda_n + Cn^{-1/2}). \]

The constants C and N depend only on \( \sup_{x \in \mathbb{R}^2} |V(x)| \) and on the diameter of \( \text{supp } V \).

The power \( n^{-1/2} \) in the above Proposition is sharp; see Remark 3.2 below.

**2. Definition of eigenvalue moments \( \mu_n \).** We would like to define moments of eigenvalues in the n’th cluster. First, in order to explain the main idea of the definition, let us define the eigenvalue moments ‘naively’ for the case \( \|V\| < B \); here and in what follows \( \|V\| \equiv \|V\|_{L^\infty} \).

Fix \( n \in \mathbb{Z}_+ \) and enumerate \( \lambda_1, \lambda_2, \lambda_3, \ldots \) all eigenvalues in the n’th cluster so that \( |\lambda_1 - \Lambda_n| \geq |\lambda_2 - \Lambda_n| \geq |\lambda_3 - \Lambda_n| \geq \cdots \). Let us define the eigenvalue moments by

\[ \mu_n = \sum_j (\lambda_j - \Lambda_n), \quad n \in \mathbb{Z}_+ \quad (\|V\| < B). \]  

(1.1)

By the above quoted result of [10], [11], the rate of convergence \( \lambda_j \to \Lambda_n \) as \( j \to \infty \) is exponential, and therefore the series (1.1) converges absolutely.

In order to give the definition of eigenvalue moments which is suitable both for the case \( \|V\| < B \) and for the case \( \|V\| \geq B \), we need to recall the notion of the spectral shift function for the pair of operators \( H + V, H \). The spectral shift function was introduced in an abstract operator theoretic setting in [9, 7]; see also the book [14]. Recall that (see [3])

\[ (H + V - \lambda_0)^{-1} - (H - \lambda_0)^{-1} \in \text{Trace class}, \quad \lambda_0 < \inf \sigma(H + V). \]

(1.2)

This enables one to define the spectral shift function \( \xi \in L^1_{\text{loc}}(\mathbb{R}) \) for the pair \( H + V, H \). The spectral shift function \( \xi \) is determined by the following two conditions:

(i) For any ‘test function’ \( \phi \in C_0^\infty(\mathbb{R}) \), one has the trace formula:

\[ \text{Tr}(\phi(H + V) - \phi(H)) = \int_{-\infty}^{\infty} \xi(\lambda) \phi'(\lambda) d\lambda. \]  

(1.3)

(ii) \( \xi(\lambda) = 0 \) for \( \lambda < \inf \sigma(H + V) \).

Note that \( \phi(H + V) - \phi(H) \in \text{Trace class} \) by (1.2) (see [14]). In fact, the class of admissible test functions \( \phi \) is much wider than \( C_0^\infty(\mathbb{R}) \). In particular, this class includes exponentials \( \phi(\lambda) = e^{-t\lambda} \), \( t > 0 \); we will use the latter fact in the sequel.

Condition (i) determines the spectral shift function up to an additive constant; condition (ii) fixes this constant. As it follows from the trace formula (1.3), for \( \lambda \in \mathbb{R} \setminus \sigma(H + V) \) the spectral shift function can be determined by (see [14], section 8.7 and formula (8.2.20))

\[ \xi(\lambda) = \text{Tr}(E_H(\lambda) - E_{H+V}(\lambda)), \quad \lambda \in \mathbb{R} \setminus \sigma(H + V), \]  

(1.4)

where \( E_H(\lambda) \) and \( E_{H+V}(\lambda) \) are the spectral projections of \( H \) and \( H + V \) associated with the interval \( (-\infty, \lambda) \). In particular, it follows that \( \xi \) is constant and integer-valued on the intervals of the set \( \mathbb{R} \setminus \sigma(H + V) \).
Now we are ready to give a general definition of the eigenvalue moments:

\[ \mu_n = \int_{\Delta_n} \xi(\lambda) d\lambda, \quad n \in \mathbb{Z}_+. \]  \hspace{1cm} (1.5)

Let us explain why the definitions (1.5) and (1.1) coincide for \( \|V\| < B \). From (1.4) one can see that for \( \|V\| < B \)

\[ \xi(\lambda) = \begin{cases} 
\text{the number of eigenvalues of } H + V \text{ in } (\lambda, \Lambda_n + B) \text{ if } \lambda \in (\Lambda_n, \Lambda_n + B); \\
(-1) \times \text{the number of eigenvalues of } H + V \text{ in } (\Lambda_n - B, \lambda) \text{ if } \lambda \in (\Lambda_n - B, \Lambda_n). 
\end{cases} \]  \hspace{1cm} (1.6)

From here it follows that (1.5) and (1.1) coincide.

**Remark.** Proposition 1.1 shows that

\[ \sigma(H + \tau V) \cap \Delta_n \subset (\Lambda_n - Cn^{-1/2}, \Lambda_n + Cn^{-1/2}), \quad \forall \tau \in [0, 1] \]

for any \( V \) and all sufficiently large \( n \). From here, using (1.4) and a continuity in \( t \) argument, one can prove that for any \( V \) and all sufficiently large \( n \),

\[ \text{supp } \xi \cap \Delta_n \subset (\Lambda_n - Cn^{-1/2}, \Lambda_n + Cn^{-1/2}) \]  \hspace{1cm} (1.7)

and (1.6) holds true. Thus, definition (1.1) is applicable for any \( V \) and all sufficiently large \( n \).

3. Main result

**Theorem 1.2.** The asymptotic expansion

\[ \mu_n \sim \alpha_0 + \frac{\alpha_1}{n^{1/2}} + \frac{\alpha_2}{n} + \frac{\alpha_3}{n^{3/2}} + \cdots, \quad n \to \infty, \]  \hspace{1cm} (1.8)

holds true with some real coefficients \( \alpha_j \). Moreover, one has

\[ \alpha_0 = \frac{B}{2\pi} \int_{\mathbb{R}^2} V(x) dx, \quad \alpha_1 = \alpha_2 = 0, \quad \alpha_3 = -\frac{\sqrt{B}}{16\sqrt{2}\pi^3} \int_{\mathbb{R}^2} \int_{\mathbb{R}^2} \frac{V(x)V(y)}{|x-y|} dx dy. \]  \hspace{1cm} (1.9)

The identity (trace formula)

\[ \sum_{n=0}^{\infty} \left( \mu_n - \frac{B}{2\pi} \int_{\mathbb{R}^2} V(x) dx \right) = -\frac{1}{8\pi} \int_{\mathbb{R}^2} V^2(x) dx \]  \hspace{1cm} (1.10)

holds true.

**Remarks** (1) The coefficients \( \alpha_0, \alpha_1, \alpha_2 \) are obtained by comparing the asymptotic expansion (1.8) with the small \( t \) asymptotic expansion of \( \text{Tr} (e^{-t(H+V)} - e^{-tH}) \) — see section 2 below. It does not seem possible to obtain the coefficient \( \alpha_3 \) by using a similar argument; we obtain it by a more direct analysis (see end of section 4). (2) Some results concerning the eigenvalue distribution in clusters for large \( n \) can be found in [12]. (3) Similar trace formula for the two-dimensional perturbed harmonic oscillator was obtained in [6]. (4) It might be interesting to note in connection with the formula for \( \alpha_3 \) that the integral \( \int \int \frac{V(x)V(y)}{|x-y|} dx dy \) appears as the coefficient of the leading term in the high energy asymptotic expansion of the total scattering cross-section for the pair of operators \( -\Delta, -\Delta + V(x) \) in \( L^2(\mathbb{R}^2) \).
Along with the moments $\mu_n$, we will use the higher order moments

$$\mu_n^{(k)} = (k + 1) \int_{\Delta_n} (\lambda - \Lambda_n)^k \xi(\lambda) d\lambda, \quad k \in \mathbb{N}, \quad n \in \mathbb{Z}_+.$$  \hspace{1cm} (1.11)

In the case $\|V\| < B$, the last definition becomes $\mu^{(k)}_n = \sum_j (\lambda_j - \Lambda_n)^{k+1}$. We will also prove the asymptotic expansion

$$\mu_n^{(k)} \sim n^{-k/2} \left( \alpha_0^{(k)} + \frac{\alpha_1^{(k)}}{n^{1/2}} + \frac{\alpha_2^{(k)}}{n} + \frac{\alpha_3^{(k)}}{n^{3/2}} + \cdots \right), \quad k \in \mathbb{N}, \quad n \to \infty.$$  \hspace{1cm} (1.12)

Below for consistency we write $\mu_n \equiv \mu_n^{(0)}$, $\alpha_j \equiv \alpha_j^{(0)}$.

4. The structure of the paper

We will use three distinct arguments to prove Proposition 1.1, the asymptotic expansions (1.8), (1.12) and the trace formula (1.10). The proof of Proposition 1.1 is self-contained, the proof of the asymptotic expansions (1.8), (1.12) depends on the estimates (3.2), (3.3) obtained in the proof of Proposition 1.1, and the proof of the trace formula (1.10) depends on both Proposition 1.1 and the expansions (1.8), (1.12).

In section 2, assuming Proposition 1.1 and the existence of the asymptotic expansions (1.8), (1.12), we prove the trace formula (1.10) and derive formulae (1.9) for the coefficients $\alpha_0$, $\alpha_1$ and $\alpha_2$. The argument is quite elementary.

Proposition 1.1 is proven in section 3.

In Sections 4, 5, 6 we justify the asymptotic expansions (1.8), (1.12). The proof is based on a detailed analysis of the properties of the integral kernel of the resolvent of $H$ (see (5.1)) and on some facts from the theory of confluent hypergeometric functions. This part of the paper is fairly elementary in nature but technically is rather complicated.

In Section 4 we also prove the formula (1.9) for the coefficient $\alpha_3$.

5. Notation

We use notation $\|A\|$, $\|A\|_{S_2}$, $\|A\|_{S_1}$ for the operator norm, the Hilbert-Schmidt norm, and the trace class norm of an operator $A$. By $C$, $c$ we denote various constants in the estimates.

2 Proof of the trace formula

1. Heat kernel asymptotics.

Lemma 2.1. The asymptotic formula

$$\text{Tr}(e^{-tH} - e^{-t(H+V)}) = \frac{1}{4\pi} \int_{\mathbb{R}^2} V(x) dx - \frac{t}{8\pi} \int_{\mathbb{R}^2} V^2(x) dx + O(t^2), \quad t \to +0 \quad (2.1)$$

holds true.

Proof. The required asymptotics can be obtained by using general results on asymptotic expansions of heat kernels of second order elliptic operators. However, the two term asymptotic formula (2.1) is considerably simpler than the aforementioned general results, and so we prefer to give a direct ‘elementary’ proof. We use the formula

$$e^{-tH} - e^{-t(H+V)} = \int_0^t e^{-(t-t_1)H} V e^{-t_1(H+V)} dt_1.$$  \hspace{1cm} (2.2)
and the explicit formula for the integral kernel of $e^{-tH}$ (see [3]):

$$e^{-tH}(x,y) = \frac{B}{4\pi \sinh(Bt)} \exp(-\frac{B}{4}|x-y|^2 \coth(Bt) + i\frac{B}{4}[x,y]), \quad x,y \in \mathbb{R}^2, \quad t > 0, \quad (2.3)$$

where $[x,y] = x_1y_2 - x_2y_1$. Iterating $(2.2)$, we obtain

$$\text{Tr}(e^{-tH} - e^{-t(H+V)}) = I_1(t) + I_2(t) + I_3(t),$$

$$I_1(t) = \int_0^t \text{Tr}(e^{-(t-t_1)H}Ve^{-t_1H})dt_1 = t \text{Tr}(Ve^{-tH}) = \frac{1}{4\pi} \int_{\mathbb{R}^2} V(x)dx + O(t^2), \quad t \to +0,$$

$$I_2(t) = \int_0^t dt_1 \int_0^{t_1} dt_2 \text{Tr}(e^{-(t-t_1)H}Ve^{-(t_1-t_2)H}Ve^{-t_2H}),$$

$$I_3(t) = \int_0^t dt_1 \int_0^{t_1} dt_2 \int_0^{t_2} dt_3 \text{Tr}(e^{-(t-t_1)H}Ve^{-(t_1-t_2)H}Ve^{-(t_2-t_3)H}Ve^{-t_3(H+V)}).$$

Consider the term $I_2(t)$. Introducing the new variable $s = t - t_1 + t_2$, we have

$$I_2(t) = \int_0^t ds \, s \, \text{Tr}(e^{-sH}Ve^{-(s-t)H}V)$$

$$= \int_0^t ds \, \frac{s}{\sinh Bs \sinh B(t-s)} \int_{\mathbb{R}^2} dz \exp\left(-\frac{B}{4}(\coth Bs + \coth B(t-s))|z|^2\right) W(z),$$

where $W(z) = \frac{B^2}{(2\pi)^2} \int_{\mathbb{R}^2} V(y)V(y+z)dy$. Let us write $W(z) = W(0) + (W(z) - W(0))$ and split $I_2(t)$ accordingly: $I_2(t) = I_2^{(1)}(t) + I_2^{(2)}(t)$. For $I_2^{(1)}(t)$, explicitly computing the integrals, we obtain

$$I_2^{(1)}(t) = W(0) \frac{2\pi t^2}{B \sinh Bt} = \frac{t}{8\pi} \int_{\mathbb{R}^2} V^2(x)dx + O(t^3), \quad t \to +0.$$

For $I_2^{(2)}(t)$, using the estimate $|W(z) - W(0)| \leq C|z|$, we get

$$|I_2^{(2)}(t)| \leq C \int_0^t ds \, \frac{s}{\sinh Bs \sinh B(t-s)} \int_{\mathbb{R}^2} dz \, |z| \exp\left(-\frac{B}{4}(\coth Bs + \coth B(t-s))|z|^2\right)$$

$$= \frac{C_1}{\sinh Bt} \int_0^t ds \, s (\sinh Bs \sinh B(t-s))^{1/2} = O(t^2) \quad t \to +0.$$

Finally, let us estimate the term $I_3(t)$. Using the Hilbert-Schmidt norm estimate $\|e^{-tH}V\|_{S_2} \leq Ct^{-1/2}$, $t > 0$, we obtain

$$|\text{Tr}(e^{-(t-t_1)H}Ve^{-(t_1-t_2)H}Ve^{-(t_2-t_3)H}Ve^{-t_3(H+V)})|$$

$$\leq \|e^{-(t-t_1)H}V\|_{S_2} \|e^{-(t_1-t_2)H}V\|_{S_2} \|V\| \|e^{-t(H+V)}\| \leq \frac{C}{\sqrt{t-t_1} \sqrt{t_1-t_2}},$$

which yields $I_3(t) = O(t^2)$, $t \to +0.$

\textbf{2. Auxiliary estimate}

\textbf{Lemma 2.2.} One has

$$\int_{\Delta_n} |\xi(\lambda)| d\lambda = O(1), \quad n \to \infty.$$
Proof. Recall that the spectral shift function is monotone with respect to the perturbation \( V \). I.e., denoting temporarily by \( \xi(\lambda; V) \) the spectral shift function corresponding to the potential \( V \), we have

\[
\text{if } V_1 \leq V_2, \text{ then } \xi(\lambda; V_1) \leq \xi(\lambda; V_2) \text{ a.e. } \lambda \in \mathbb{R}.
\]

Also, we have \( \xi(\lambda; -V) = -\xi(\lambda; V) \). Let us choose \( V_1, V_2 \in C_0^\infty(\mathbb{R}^2) \) such that

\[
V_1 \geq 0, \quad V_2 \geq 0 \quad \text{and} \quad -V_2 \leq V \leq V_1.
\]

Then

\[
-\xi(\lambda; V_2) = \xi(\lambda; -V_2) \leq \xi(\lambda; V) \leq \xi(\lambda; V_1), \quad \xi(\lambda; V_1) \geq 0, \quad \xi(\lambda; V_2) \geq 0.
\]

Therefore, \( |\xi(\lambda; V)| \leq \xi(\lambda; V_1) + \xi(\lambda; V_2) \) and

\[
\int_{\Delta_n} |\xi(\lambda; V)| d\lambda \leq \int_{\Delta_n} \xi(\lambda; V_1) d\lambda + \int_{\Delta_n} \xi(\lambda; V_2) d\lambda.
\]

By the asymptotics (1.12) for \( \mu_n^{(0)} \), applied to the potentials \( V_1 \) and \( V_2 \), the r.h.s. of the last inequality is \( O(1) \) as \( n \to \infty \). ■

3. Proof of the trace formula (1.10) and formulae (1.9) for \( \alpha_0^{(0)}, \alpha_1^{(0)}, \alpha_2^{(0)} \).

1. By Krein’s trace formula (1.3) with \( \phi(\lambda) = e^{-t\lambda}, \ t > 0, \) and Lemma 2.1, we obtain

\[
\int_{-\infty}^{\infty} \xi(\lambda)e^{-t\lambda} d\lambda = \frac{1}{t} \text{Tr}(e^{-tH} - e^{-t(H+V)}) = \frac{1}{4\pi t} \int_{\mathbb{R}^2} V(x) dx - \frac{1}{8\pi} \int_{\mathbb{R}^2} V^2(x) dx + O(t), \quad (2.4)
\]

as \( t \to +0 \). On the other hand, one can rewrite the integral in the l.h.s. of (2.4) as a sum over the eigenvalue clusters:

\[
\int_{-\infty}^{\infty} \xi(\lambda)e^{-t\lambda} d\lambda = \sum_{n=0}^{\infty} \int_{\Delta_n} \xi(\lambda)e^{-t\lambda} d\lambda. \quad (2.5)
\]

Let us use Taylor’s formula for \( e^{-t\lambda}, \ \lambda \in \Delta_n \):

\[
|e^{-t\lambda} - e^{-t\Lambda_n}(1 - t(\lambda - \Lambda_n) + \frac{1}{2} t^2(\lambda - \Lambda_n)^2)| \leq Ct^3|\lambda - \Lambda_n|^3, \quad \lambda \in \Delta_n. \quad (2.6)
\]

By (1.7) and Lemma 2.2, we have

\[
\sum_{n=0}^{\infty} \int_{\Delta_n} |\xi(\lambda)||\lambda - \Lambda_n|^3 d\lambda = \sum_{n=0}^{\infty} O(n^{-3/2}) < \infty. \quad (2.7)
\]

Combining (2.5)–(2.7), we obtain

\[
\int_{-\infty}^{\infty} \xi(\lambda)e^{-t\lambda} d\lambda = \sum_{n=0}^{\infty} \mu_n^{(0)}(t) e^{-t\Lambda_n} - t \sum_{n=0}^{\infty} \mu_n^{(1)}(t) e^{-t\Lambda_n} + \frac{1}{2} \sum_{n=0}^{\infty} \mu_n^{(2)}(t) e^{-t\Lambda_n} + O(t^3), \quad t \to +0. \quad (2.8)
\]

Below we compare (2.4) and (2.8).
2. We will use the following elementary formulae for $t \to +0$:

\[
\sum_{n=0}^{\infty} e^{-t\Lambda_n} = \frac{e^{-Bt}}{1 - e^{-2Bt}} = \frac{1}{2Bt} + O(t); \quad (2.9)
\]

\[
\sum_{n=1}^{\infty} \frac{1}{n} e^{-t\Lambda_n} = \int_0^{\infty} x^{-1/2} e^{-tB(2x+1)} dx + O(1) = \frac{\sqrt{\pi}}{\sqrt{2Bt}} + O(1); \quad (2.10)
\]

\[
\sum_{n=1}^{\infty} \frac{1}{n} e^{-t\Lambda_n} = \int_1^{\infty} x^{-1} e^{-tB(2x+1)} dx + O(1) = -\log t + O(1); \quad (2.11)
\]

\[
\sum_{n=1}^{\infty} n^{-3/2} (1 - e^{-t\Lambda_n}) = \int_0^{t} \left( \sum_{n=1}^{\infty} n^{-3/2} \Lambda_n e^{-s\Lambda_n} \right) ds = 2\sqrt{2\pi Bt} + O(t). \quad (2.12)
\]

Using (2.9)–(2.11) and the asymptotic expansions (1.8), (1.12) for $\mu_n^{(k)}$, we obtain for $t \to +0$:

\[
\sum_{n=0}^{\infty} \mu_n^{(0)} e^{-t\Lambda_n} = \frac{\alpha_0^{(0)}}{2Bt} + \frac{\alpha_1^{(0)}}{\sqrt{2Bt}} - \alpha_2^{(0)} \log t + O(1); \quad (2.13)
\]

\[
\sum_{n=0}^{\infty} \mu_n^{(1)} e^{-t\Lambda_n} = \alpha_0^{(1)} \frac{\sqrt{\pi}}{\sqrt{2Bt}} + O(\log t); \quad (2.14)
\]

\[
\sum_{n=0}^{\infty} \mu_n^{(2)} e^{-t\Lambda_n} = O(\log t).
\]

Substituting this into (2.8) and comparing with (2.4), we find:

\[
\alpha_0^{(0)} = \frac{B}{2\pi} \int_{\mathbb{R}^2} V(x) dx, \quad \alpha_1^{(0)} = \alpha_2^{(0)} = 0.
\]

Thus, $\mu_n^{(0)} = \alpha_0^{(0)} + \alpha_3^{(0)} n^{-3/2} + O(n^{-2})$, and so we get:

\[
\sum_{n=0}^{\infty} \mu_n^{(0)} e^{-t\Lambda_n} = \alpha_0^{(0)} \sum_{n=0}^{\infty} e^{-t\Lambda_n} + \sum_{n=0}^{\infty} (\mu_n^{(0)} - \alpha_0^{(0)}) + \sum_{n=1}^{\infty} (\mu_n^{(0)} - \alpha_0^{(0)})(e^{-t\Lambda_n} - 1)
\]

\[
= \frac{\alpha_0^{(0)}}{2Bt} + \sum_{n=0}^{\infty} (\mu_n^{(0)} - \alpha_0^{(0)}) + \alpha_3^{(0)} \sum_{n=1}^{\infty} n^{-3/2} (e^{-t\Lambda_n} - 1) + \sum_{n=1}^{\infty} (\mu_n^{(0)} - \alpha_0^{(0)}) - \alpha_3^{(0)} n^{-3/2} (e^{-t\Lambda_n} - 1) + O(t)
\]

\[
= \frac{\alpha_0^{(0)}}{2Bt} + \sum_{n=0}^{\infty} (\mu_n^{(0)} - \alpha_0^{(0)}) - \alpha_3^{(0)} 2\sqrt{2\pi Bt} + o(\sqrt{t}), \quad (2.15)
\]

as $t \to +0$. Upon comparing with (2.4), we find the trace formula (1.10) and also the formula

\[
\alpha_0^{(1)} = -4B\alpha_3^{(0)}. \quad (2.16)
\]

We will use (2.16) later in section 4 in order to determine the coefficient $\alpha_3^{(0)}$. ■
3 Proof of Proposition 1.1

Let \( P_n, n \geq 0, \) be the orthogonal projection onto the eigenspace of the operator \( H \) corresponding to the Landau level \( \Lambda_n. \) An explicit formula for the integral kernel of \( P_n \) is available (see e.g. [11]):

\[
P_n(x, y) = \frac{B}{2\pi} L_n \left( \frac{B}{2} |x - y|^2 \right) \exp \left( -\frac{B}{4} |x - y|^2 + i \frac{B}{2} [x, y] \right), \quad x, y \in \mathbb{R}^2,
\]

where \( L_n \) is the Laguerre polynomial and \( [x, y] = x_1 y_2 - x_2 y_1. \)

**Lemma 3.1.** Let \( V \) be any bounded function on \( \mathbb{R}^2 \) with compact support. Then

\[
\| |V|^{1/2} P_n |V|^{1/2}\| = O(n^{-1/2}), \quad n \to \infty,
\]

\[
\| |V|^{1/2} P_n |V|^{1/2}\|_{S_2} = O(n^{-1/4}), \quad n \to \infty.
\]

In the proof of Proposition 1.1, we will only need the operator norm estimate (3.2). The Hilbert-Schmidt norm estimate (3.3) will be used in section 4.

**Proof.** We will use the following asymptotic formula for the Laguerre polynomials [5, 10.15(2)]:

\[
L_n(t) = e^{t/2} J_0(\sqrt{(4n + 2)t}) + R_n(t), \quad R_n(t) = O(n^{-3/4}), \quad n \to \infty,
\]

where the bound \( O(n^{-3/4}) \) is uniform on any bounded sub-interval of \([0, \infty)\). Let us write

\[
|V|^{1/2} P_n |V|^{1/2} = A_n + B_n,
\]

where \( A_n \) and \( B_n \) are the operators in \( L^2(\mathbb{R}^2) \) with the integral kernels

\[
A_n(x, y) = \frac{B}{2\pi} J_0(\sqrt{\Lambda_n} |x - y|) e^{i \frac{B}{2} [x, y]} |V(x)|^{1/2} |V(y)|^{1/2},
\]

\[
B_n(x, y) = \frac{B}{2\pi} R_n \left( \frac{B}{2} |x - y|^2 \right) e^{i \frac{B}{2} [x, y]} |V(x)|^{1/2} |V(y)|^{1/2}.
\]

As \( V \) is bounded and compactly supported, (3.4) gives

\[
\| B_n \| \leq \| B_n \|_{S_2} = O(n^{-3/4}), \quad n \to \infty.
\]

Let us prove the estimate (3.3). By (3.6), we only need to check that

\[
\| A_n \|_{S_2} = O(n^{-1/4}).
\]

The latter estimate immediately follows from the explicit form of the kernel of \( A_n \) and from the simple inequality \( |J_0(t)| \leq C/\sqrt{t} \) for \( t > 0. \)

Next, let us prove the estimate (3.2). Let \( \tilde{A}_n \) be the operator in \( L^2(\mathbb{R}^2) \) with the integral kernel\n
\[
\tilde{A}_n(x, y) = \frac{B}{2\pi} J_0(\sqrt{\Lambda_n} |x - y|) |V(x)|^{1/2} |V(y)|^{1/2}.
\]

Note that up to a constant, \( \tilde{A}_n \) coincides with the imaginary part of the sandwiched resolvent of the operator \(-\Delta \) in \( L^2(\mathbb{R}^2)\):

\[
\tilde{A}_n = \frac{2B}{\pi} \text{Im} |V|^{1/2} (-\Delta - \Lambda_n - i0)^{-1} |V|^{1/2}.
\]
It is well known (see [2]) that
\[ ||V||^{1/2}(-\Delta - \lambda - i0)^{-1}||V||^{1/2} = O(\lambda^{-1/2}), \quad \lambda \to \infty. \]

Thus, we obtain
\[ \|\tilde{A}_n\| = O(n^{-1/2}), \quad n \to \infty. \tag{3.7} \]

Next, observe that the kernel of \( \tilde{A}_n \) differs from that of \( A_n \) by a factor \( e^{i\frac{\rho}{2}[x,y]} \). We are going to use this observation and apply the theory of ‘multipliers of kernels of integral operators’ [4]. Let \( \Omega \) be a sufficiently large ball in \( \mathbb{R}^2 \) so that \( \text{supp} V \subset \Omega \) and let \( \rho \in L^\infty(\Omega \times \Omega) \). For a Hilbert-Schmidt class operator \( T \) on \( L^2(\Omega) \) with the integral kernel \( T(\cdot,\cdot) \in L^2(\Omega \times \Omega) \), let \( \tilde{T} \) be the operator with the integral kernel \( T(x,y)\rho(x,y) \). Evidently, \( \tilde{T} \) is also a Hilbert-Schmidt class operator and one has the estimate \( \|\tilde{T}\|_{s_2} \leq \|\rho\|_{L^\infty} \|T\|_{s_2} \).

Next, suppose that the mapping \( T \mapsto \tilde{T} \) sends the trace class \( S_1 \) into itself and there is a trace class norm bound \( \|\tilde{T}\|_{S_1} \leq C\|T\|_{S_1} \). Then, by duality between the trace class \( S_1 \) and the class \( \mathbb{B}(L^2(\Omega)) \) of all bounded operators on \( L^2(\Omega) \), the mapping \( T \mapsto \tilde{T} \) can be extended onto \( \mathbb{B}(L^2(\Omega)) \) and the norm bound \( \|\tilde{T}\| \leq C\|T\| \) holds true. In this case \( \rho \) is called a bounded multiplier on the class \( \mathbb{B}(L^2(\Omega)) \).

A sufficient condition (see [4]) for \( \rho \) to be a bounded multiplier on \( \mathbb{B}(L^2(\Omega)) \) is
\[ \sup_{x \in \Omega} \|\rho(x,\cdot)\|_{H^s(\Omega)} < \infty, \quad s > 1, \]
where \( H^s(\Omega) \) is the standard Sobolev class. Clearly, \( \rho(x,y) = e^{i\frac{\rho}{2}[x,y]} \) satisfies the above condition, and therefore
\[ \|A_n\| \leq C\|\tilde{A}_n\| = O(n^{-1/2}), \quad n \to \infty, \]
which yields (3.2). ■

**Proof of Proposition 1.1.** The proof is valid for any bounded compactly supported potential. By the Birman-Schwinger principle, it suffices to show that for some \( C > 0 \) and all sufficiently large \( n \),
\[ ||V||^{1/2}R(\lambda)||V||^{1/2} < 1, \quad \text{for all} \ \lambda \in \Delta_n, \quad |\lambda - \Lambda_n| > \frac{C}{\sqrt{n}}, \tag{3.8} \]
where \( R(\lambda) = (H - \lambda)^{-1} \). Choose \( l \in \mathbb{N} \) sufficiently large so that \( ||V||/\Lambda_l < 1/2 \), and write \( R(\lambda) \) as
\[ R(\lambda) = \sum_{k=n-l}^{n+l} \frac{P_k}{\Lambda_k - \lambda} + \tilde{R}(\lambda). \]

Then, for \( \lambda \in \Delta_n \),
\[ ||V||^{1/2}R(\lambda)||V||^{1/2} \leq \sum_{k=n-l}^{n+l} \frac{|||V||^{1/2}P_k|||V||^{1/2}||}{|\Lambda_k - \lambda|} + ||V||^{1/2}\tilde{R}(\lambda)||V||^{1/2}. \]

By the choice of \( l \), one has \( ||V||^{1/2}\tilde{R}(\lambda)||V||^{1/2} < 1/2 \). On the other hand, by Lemma 3.1,
\[ \sum_{k=n-l}^{n+l} \frac{|||V||^{1/2}P_k|||V||^{1/2}||}{|\Lambda_k - \lambda|} \leq (2l + 1)O(n^{-1/2}) \max_{n-l \leq k \leq n+l} |\Lambda_k - \lambda|^{-1} = O(n^{-1/2})|\Lambda_n - \lambda|^{-1}. \]

Thus, we get (3.8) for sufficiently large \( C > 0 \). ■
Proof of the asymptotic expansions \((1.8), (1.12)\)

We will prove the asymptotic expansion \((1.12)\) by expressing the eigenvalue moments \(\mu^{(k)}_n\) as contour integrals of an analytic function. Let \(\Gamma_n\) be a positively oriented circle around \(\Lambda_n\) with the radius \(B\). First, we need estimates on the norm of the 'sandwiched resolvent' of \(H\) on the contours \(\Gamma_n\).

**Lemma 4.1.** For \(n \to \infty\), one has

\[
\sup_{z \in \Gamma_n} \| |V|^{1/2} R(z) |V|^{1/2} \| = O(n^{-1/2} \log n), \tag{4.1}
\]

\[
\sup_{z \in \Gamma_n} \| |V|^{1/2} R(z) |V|^{1/2} \|_{S_2} = O(n^{-1/4} \log n). \tag{4.2}
\]

**Proof.** Let us prove (4.1). Using the estimate (3.2), we get for \(z \in \Gamma_n\):

\[
\| |V|^{1/2} R(z) |V|^{1/2} \| \leq \sum_{k=1}^{\infty} \frac{\| |V|^{1/2} P_k |V|^{1/2} \|}{|\Lambda_k - \lambda|} \leq \sum_{k=1}^{\infty} \frac{C}{\sqrt{k} |\Lambda_k - z|} + O(n^{-1})
\]

\[
\leq C \int_0^{n-1} \frac{dx}{\sqrt{x} B(2x + 1) - z} + C \int_{n+1}^{\infty} \frac{dx}{\sqrt{x} B(2x + 1) - z} + O(n^{-1/2}) = O(n^{-1/2} \log n),
\]

as \(n \to \infty\). The estimate (4.2) can be proven in a similar fashion by using (3.3).

The core of the proof of the expansions \((1.8), (1.12)\) is the following Lemma.

**Lemma 4.2.** For all \(k \in \mathbb{Z}_+\) and all \(j \geq 2\), the integrals

\[
\int_{\Gamma_n} \text{Tr}(VR(z))^j (z - \Lambda_n)^k dz \tag{4.3}
\]

have an asymptotic expansion in integer powers of \(n^{-1/2}\) as \(n \to \infty\).
The proof of Lemma 4.2 is given in sections 5, 6.

**Proof of the asymptotic expansions** (1.8), (1.12). First of all, note that it suffices to prove (1.8), (1.12) with some complex coefficients \( \alpha_j^{(k)} \); indeed, as \( \mu_n^{(k)} \) are real, *a posteriori* the coefficients \( \alpha_j^{(k)} \) are easily seen to be real. Thus, in what follows we will work with expansions with complex coefficients.

By [3, Theorem 2.11], the difference of the resolvents of \( H + V \) and \( H \) belongs to the trace class. This enables us to define the analytic function

\[
W(z) = \text{Tr}((H + V - z)^{-1} - (H - z)^{-1}) = - \int_{-\infty}^{\infty} \frac{\xi(\lambda)}{(\lambda - z)^2} d\lambda, \quad z \in \mathbb{C} \setminus (\sigma(H) \cup \sigma(H + V)).
\]

The second equality in the above formula is due to Krein’s trace formula (1.3). Let \( n \) be sufficiently large so that

\[
\text{supp} \xi \cap \Delta_n \subset [\Lambda_n - \frac{B}{2}, \Lambda_n + \frac{B}{2}]
\]

(see (1.7)). Let, as above, \( \Gamma_n \) be a positively oriented circle around \( \Lambda_n \) with the radius \( B \).

Integrating \( W(z)(z - \Lambda_n)^{k+1} \) over \( z \) around \( \Gamma_n \), we obtain

\[
- \frac{1}{2\pi i} \int_{\Gamma_n} W(z)(z - \Lambda_n)^{k+1} dz = \int_{-\infty}^{\infty} d\lambda \xi(\lambda) \frac{1}{2\pi i} \int_{\Gamma_n} \frac{(z - \Lambda_n)^{k+1}}{(z - \lambda)^2} dz = (k + 1) \int_{\Delta_n} \xi(\lambda)(\lambda - \Lambda_n)^k d\lambda = \mu_n^{(k)}. \tag{4.4}
\]

Firstly we prove the expansion (1.12) (i.e. assume \( k \geq 1 \)). Expanding the resolvent \( (H + V - z)^{-1} \) yields

\[
W(z) = \sum_{j=1}^{\infty} (-1)^j \text{Tr}[R(z)(VR(z))^j]. \tag{4.5}
\]

Lemma 4.1 ensures that the series in (4.5) converges absolutely for \( z \in \Gamma_n \) and large \( n \). Substituting the expansion (4.5) into (4.4) and subsequently integrating by parts in each term of the series, we obtain

\[
\mu_n^{(k)} = (k + 1) \sum_{j=k+1}^{\infty} \frac{(-1)^j}{j} \frac{1}{2\pi i} \int_{\Gamma_n} \text{Tr}(VR(z))^j(z - \Lambda_n)^k dz, \quad k \in \mathbb{N}. \tag{4.6}
\]

Here the summation starts from \( j = k + 1 \), as for \( j \leq k \) the integrand is analytic at \( z = \Lambda_n \) and therefore the integral vanishes. Using Lemma 4.1, we obtain the following estimates for the integrals in the r.h.s. of (4.6):

\[
\left| \int_{\Gamma_n} \text{Tr}(VR(z))^j(z - \Lambda_n)^k dz \right| \leq B^k \int_{\Gamma_n} ||V||^{1/2} R(z)||V||^{1/2} ||R(z)||_{2,2}^2 ||V||^{1/2} ||V||^{1/2} |z|^{j-2} dz 
\leq C \left( \frac{C \log n}{n^{1/4}} \right)^2 \left( \frac{C \log n}{n^{1/2}} \right)^{j-2}.
\]

This ensures that the series (4.6) converges absolutely (for sufficiently large \( n \)) and gives a bound for the remainder:

\[
\left| \sum_{j=N}^{\infty} \frac{(-1)^j}{j} \frac{1}{2\pi i} \int_{\Gamma_n} \text{Tr}(VR(z))^j(z - \Lambda_n)^k dz \right| = O \left( \frac{(\log n)^N n^{-(-N-1)/2}}{n^{1/2}} \right), \quad n \to \infty. \tag{4.7}
\]
Combining Lemma 4.2 with the estimate (4.7), we obtain that the moments \( \mu_n^{(k)} \), \( k \geq 1 \) have an asymptotic expansion in integer powers of \( n^{-1/2} \) as \( n \to \infty \). We also need to prove that first several terms of the expansion vanish, so that the expansion starts from the term \( Cn^{-k/2} \). This can be seen as follows. Note that for \( j = k + 1 \) we can compute the integral in the series (4.6), which gives

\[
\mu_n^{(k)} = \text{Tr}(VP_n)^{k+1} + (k+1) \sum_{j=k+2}^{\infty} \frac{(-1)^j}{j} \frac{1}{2\pi i} \int_{\Gamma_n} \text{Tr}(VR(z))^j(z - \Lambda_n)^k dz, \quad k \in \mathbb{Z}_+.
\] (4.8)

Lemma 3.1 gives

\[
\text{Tr}(VP_n)^{k+1} \leq \|VP_n\|^{1/2} \|V\|^{1/2} \|VP_n\|^{1/2} \|V\|^{1/2}\|k-1 = O(n^{-k/2}), \quad n \to \infty.
\]

Combining this with the estimate (4.7) with \( N = k + 2 \), we obtain \( \mu_n^{(k)} = O(n^{-k/2}) \) as \( n \to \infty \).

Secondly we prove the expansion (1.8), i.e., the case \( k = 0 \). Here the only difference is that the first term in the series (4.6) is not well defined, as \( VR(z) \) is not of the trace class. However, this term can be written as (cf. (4.8)) \( \text{Tr}(VP_n)^{1/2} |V|^1/2 \text{sign} V \), and by the explicit form (3.1) of the integral kernel of \( P_n \), the last expression equals \( \frac{\pi}{2\pi} \int V(x)dx \). The rest of the argument is the same as for \( k \geq 1 \).

**Proof of the formula** (1.9) for \( \alpha_3^{(0)} \). We will prove

\[
\alpha_0^{(1)} = \frac{B^{3/2}}{4\sqrt{2\pi}3} \int_{\mathbb{R}^2} \int_{\mathbb{R}^2} \frac{V(x)V(y)}{|x-y|} dx dy.
\] (4.9)

By (2.16), this will also imply the formula (1.9) for \( \alpha_3^{(0)} \).

Due to (4.8) and (4.7), we have

\[
\mu_n^{(1)} = \text{Tr}(VP_n)^2 + O((\log n)^3 n^{-1}), \quad n \to \infty,
\]

so it suffices to prove that

\[
\text{Tr}(VP_n)^2 = \frac{\alpha_0^{(1)}}{n^{1/2}} + o(n^{-1/2}), \quad n \to \infty,
\]

with \( \alpha_0^{(1)} \) given by (4.9). By formula (3.1) for the integral kernel of \( P_n \), we have

\[
\text{Tr}(VP_n)^2 = \left( \frac{B}{2\pi} \right)^2 \int_{\mathbb{R}^2 \times \mathbb{R}^2} V(x)V(y) L_n(B|x - y|^2) \exp(-\frac{B}{2}|x - y|^2) dx dy
\]
\[
= \frac{B}{2\pi^2} \int_0^\infty L_n(t^2) e^{-t^2} h(t) dt,
\]

where \( h \in C_0^\infty(\mathbb{R}) \) is given by

\[
h(t) = \int_{\mathbb{S}^1} d\omega \int_{\mathbb{R}^2} dy V(y) V(y + \sqrt{\frac{2}{B}} t\omega), \quad t \in \mathbb{R}.
\]

By (3.4),

\[
\int_0^\infty L_n(t^2) e^{-t^2} h(t) dt = \int_0^\infty J_0(t\sqrt{4n + 2})^2 h(t) dt + O(n^{-3/4}), \quad n \to \infty.
\]
Next, using the asymptotics of the Bessel function, we obtain
\[ |J_0(x) - \sqrt{\frac{2}{\pi x}} \cos(x - \frac{\pi}{4})| \leq Cx^{-1/2}(1 + x)^{-1}, \quad x > 0, \]
and therefore
\[ |J_0(x)^2 - \frac{2}{\pi x} (\cos(x - \frac{\pi}{4}))^2| \leq Cx^{-1}(1 + x)^{-1}, \quad x > 0. \quad (4.10) \]

One has
\[
\int_0^\infty \frac{2}{\pi \sqrt{4n+2}} (\cos(t\sqrt{4n+2} - \frac{\pi}{4}))^2 h(t) dt = \frac{1}{\pi \sqrt{4n+2}} \int_0^\infty h(t) dt \\
+ \frac{1}{\pi \sqrt{4n+2}} \int_0^\infty \cos(2t\sqrt{4n+2} - \frac{\pi}{4}) h(t) dt = \frac{1}{2\pi \sqrt{n}} \int_0^\infty h(t) dt + o(n^{-1/2}), \quad n \to \infty; \quad (4.11)
\]
\[
\int_0^\infty \frac{1}{t\sqrt{4n+2}(1+t\sqrt{4n+2})} h(t) dt = o(n^{-1/2}), \quad n \to \infty. \quad (4.12)
\]

Combining (4.10), (4.11), (4.12), and computing the integral \( \int_0^\infty h(t) dt \) yields formula (4.9).

## 5 Analytic properties of the resolvent \( R(z) \)

In this section, we discuss analytic properties of the integral kernel of the resolvent \( R(z) = (H - z)^{-1} \) and reduce the proof of Lemma 4.2 to Lemma 6.1. Our analysis is based on the following explicit formula for this kernel:

**Lemma 5.1.** For any \( z \in \mathbb{C} \setminus \sigma(H) \), the integral kernel of the resolvent \( R(z) \) of the magnetic Hamiltonian \( H \) can be expressed in terms of \( \Gamma \)-function and confluent hypergeometric function \( U(a, b; \zeta) \) as follows:

\[
R(z)(x, y) = \frac{1}{4\pi} \Gamma \left( \frac{1}{2} - \frac{a}{2B} \right) U \left( \frac{1}{2} - \frac{a}{2B}, 1; \frac{B}{i} |x - y|^2 \right) \exp \left( -\frac{B}{4} |x - y|^2 + i\frac{B}{2} [x, y] \right), \quad (5.1)
\]

where \( x, y \in \mathbb{R}^2, \ x \neq y \).

**Proof.** Let us employ the integral representation [1, (13.2.5)] for the confluent hypergeometric function
\[
\Gamma(a)U(a, 1; \zeta) = \int_0^\infty e^{-\zeta \tau} \tau^{a-1}(1 + \tau)^{-a} d\tau, \quad 0 < \text{Re} \ a < 1, \quad \zeta > 0 \quad (5.2)
\]
and the explicit formula (2.3) for the heat kernel [3] of the magnetic Hamiltonian \( H \). Substituting (2.3) into the formula
\[
R(z) = \int_0^\infty e^{-tH} e^{t\zeta} dt,
\]
denoting \( \zeta = \frac{B}{2} |x - y|^2 \), making the change of variable \( \tau = (\coth(Bt) - 1)/2 \) in the integral, and taking into account (5.2), one obtains (5.1) for \( -B < \text{Re} \ z < B \). Analytic continuation in \( z \) completes the argument.
For the reader’s convenience and ease of further reference we start by recalling the necessary facts about the confluent hypergeometric functions \( U(a, b; \zeta) \), \( M(a, b; \zeta) \). Our main sources are [1] and [13]. The functions \( U(a, b; \zeta) \) and \( M(a, b; \zeta) \) are two linearly independent solutions to the Kummer’s equation
\[
\zeta \frac{d^2 U}{d\zeta^2} + (b - \zeta) \frac{dU}{d\zeta} - aU = 0.
\]
We are only interested in the case \( b = 1 \) (see (5.1)) or \( b \) lying in a small neighbourhood of 1, so we assume that \(|b - 1| < 1/2\); this will simplify our discussion. We also assume \( 0 < \zeta \leq R \) for some fixed \( R > 0 \), as we are interested in the case \( \zeta = \frac{R}{2} |x - y|^2 \) when both \( x \) and \( y \) are in \( \text{supp} V \) (see (4.3)).

The function \( M(a, b; \zeta) \) is given by a convergent Taylor series
\[
M(a, b; \zeta) = 1 + \frac{a \zeta}{b} + \frac{a(a + 1) \zeta^2}{b(b + 1) 2!} + \frac{a(a + 1)(a + 2) \zeta^3}{b(b + 1)(b + 2) 3!} + \cdots
\]
As it is readily seen from the above series, \( M(a, b; \zeta) \) is analytic in \((a, b, \zeta) \in \mathbb{C} \times \{ b : |b - 1| < 1/2 \} \times \mathbb{C} \). For \(-a \notin \mathbb{Z}_+ \), \( \zeta > 0 \), \( b \neq 1 \), the function \( U(a, b; \zeta) \) is defined by
\[
\Gamma(a)U(a, b; \zeta) = \frac{\pi}{\sin(\pi b)} \left( \frac{\Gamma(a)}{\Gamma(1 + a - b)\Gamma(b)} M(a, b; \zeta) - \zeta^{1-b} \frac{M(1 + a - b, 2 - b; \zeta)}{\Gamma(2 - b)} \right).
\] (5.3)
We assume that \( \arg \zeta = 0 \); this fixes the branch of \( \zeta^{1-b} \). The function \( \Gamma(a)U(a, b; \zeta) \) is meromorphic in \( a \in \mathbb{C} \) with poles at \( a = 0, -1, -2, \ldots \) which correspond to the Landau levels — see (5.1).

The r.h.s. of (5.3) is analytic in \( b \) with a removable singularity at \( b = 1 \); the limit as \( b \to 1 \) is easy to compute:
\[
\Gamma(a)U(a, 1; \zeta) = -2M'_b(a, 1; \zeta) - M'_a(a, 1; \zeta) - (2\gamma + \psi(a) - \log \zeta)M(a, 1; \zeta),
\] (5.4)
where \( M'_a = \partial M/\partial a \), \( M'_b = \partial M/\partial b \), \( \psi(a) = \Gamma'(a)/\Gamma(a) \) is the digamma function, \( \gamma \) is Euler’s constant \( \gamma = -\psi(1) \approx 0.577 \), and \( \log \zeta \in \mathbb{R}, \zeta > 0 \).

Using the reflection formula for the \( \psi \) function,
\[
\psi(a) = \psi(1 - a) - \pi \cot(\pi a),
\]
let us rearrange formula (5.4) as
\[
\Gamma(a)U(a, 1; \zeta) = \tilde{M}(a, \zeta) + \pi \cot(\pi a) M(a, 1; \zeta),
\] (5.5)
\[
\tilde{M}(a, \zeta) = -2M'_b(a, 1; \zeta) - M'_a(a, 1; \zeta) - (2\gamma + \psi(1 - a) + \log \zeta)M(a, 1; \zeta).
\] (5.6)
The function \( \tilde{M}(a, \zeta) \) is analytic in \( a \) at the points \(-a \in \mathbb{Z}_+ \). The singularities of \( \Gamma(a)U(a, 1; \zeta) \) written in the form (5.5) are easy to analyze, as they are due to the elementary function \( \cot \pi a \).

Incidentally, (5.5) gives a formula for the residues of the resolvent \( R(z) \); due to the identity \( M(-n, 1; \zeta) = L_n(\zeta) \), this formula agrees with (3.1).

**Proof of Lemma 4.2.** Substituting formula (5.1) into the integrals (4.3) and using (5.5), we see that in order to obtain the required asymptotic expansions, we need to analyse the asymptotics of the integrals
\[
\int_{\gamma_n} (a + n)^k (\cot \pi a)^u G(a) da, \quad n \to \infty, \quad k \in \mathbb{Z}_+, \quad u \in \mathbb{N},
\] (5.7)
where $\gamma_n$ is a positively oriented circle around $a = -n$ with the radius $1/2$, and $G(a)$ is the analytic function

$$G(a) = \int_{\mathbb{R}^j} F(x_1, \ldots, x_j) \Pi_{p=1}^j M_p(a, b | x_{p+1} - x_p |^2) dx_1 \cdots dx_j, \quad x_{j+1} = x_1. \quad (5.8)$$

Here

$$F(x_1 \ldots x_j) = V(x_1) \cdots V(x_j) \exp \left( -\frac{R}{2} \sum_{p=1}^j |x_{p+1} - x_p|^2 + i \frac{R}{2} \sum_{p=1}^j [x_p, x_{p+1}] \right), \quad x_{j+1} = x_1,$$

each of the functions $M_p(a, \zeta)$ is either $M(a, 1; \zeta)$ or $\tilde{M}(a, \zeta)$ and at least one of the functions $M_p(a, \zeta)$ is $M(a, 1; \zeta)$.

Applying the residue formula to the integral (5.7), we see that the required statement follows from Lemma 5.2 below.

**Lemma 5.2.** For any $F \in C^\infty_0(\mathbb{R}^j)$, let $G(a)$ be given by (5.8), where each of the functions $M_p(a, \zeta)$ is either $M(a, 1; \zeta)$ or $\tilde{M}(a, \zeta)$ and at least one of the functions $M_p(a, \zeta)$ is $M(a, 1; \zeta)$. Then the function $G(a)$ and all of its derivatives $G^{(s)}(a)$, $s \geq 1$, admit asymptotic expansions in integer powers of $|a|^{-1/2}$ as $a \to -\infty$, $a \in \mathbb{R}$.

**Proof.** The proof is based on using suitable asymptotic expansions of the functions $M(a, 1; \zeta)$ and $\tilde{M}(a, \zeta)$ in terms of Bessel functions and on application of Lemma 6.1.

(i) First consider the special case when $M_p(a, \zeta) = M(a, 1; \zeta)$ for all $p$ in (5.8). Our main tool will be a convergent expansion of $M(a, b; \zeta)$ in terms of Bessel functions due to Tricomi [13]. For our purposes it suffices to consider the following range of parameters:

$$\text{Re } a \leq -1, \quad |\text{Im } a| \leq 1, \quad |b - 1| \leq 1/2, \quad 0 < \zeta \leq R \quad (5.9)$$

for some fixed $R > 0$. The expansion of [13] (see also [1, (13.3.7)]) reads:

$$M(a, b; \zeta) = \Gamma(b) e^{\zeta/2} \left( \frac{b - 2a}{2} \right)^{(1-b)/2} \sum_{m=0}^\infty \left( \frac{\zeta}{2b - 4a} \right)^{m/2} A_m J_{b-1+m}(\sqrt{2b - 4a}\zeta), \quad (5.10)$$

where $J_{b-1+m}$ are Bessel functions and $A_m = A_m(a, b)$ are the coefficients in the Taylor expansion

$$f(z) = \left( \frac{e^z}{1+z} \right)^{b} \left( e^{2z} \frac{1-z}{1+z} \right)^{-a} = \sum_{m=0}^\infty A_m z^m, \quad |z| < 1. \quad (5.11)$$

Note that $\text{Re } (b - 2a) \geq 1$ and the principal values of $\left( \frac{b-2a}{2} \right)^{(1-b)/2}$ and $\sqrt{2b - 4a}$ are taken in (5.10). Due to a fast decay of the Bessel function $J_\nu(z)$ for $\nu \to \infty$, the series (5.10) converges absolutely for the range of parameters (5.9). Take $b = 1$ and for a given $N \in \mathbb{N}$, write Tricomi’s expansion (5.10) as

$$M(a, 1; \zeta) = M_N^{(0)}(a, \zeta) + M_N^{(1)}(a, \zeta), \quad (5.12)$$

where

$$M_N^{(0)}(a, \zeta) = e^{\zeta/2} \sum_{m=0}^{N-1} A_m(a, 1) \left( \frac{\zeta}{2 - 4a} \right)^{m/2} J_m(\sqrt{2-4a}\zeta).$$
Let us recall the argument of [13] which gives the estimate for \( M^{(1)}_N(a, \zeta) \). By inspecting the integral representation for the Bessel function, one obtains a uniform estimate

\[
\left| J_m(\sqrt{2-4a}\,\zeta) \right| \leq C \quad \text{for} \quad m \in \mathbb{Z}_+, \quad \text{Re} \, a \leq -1, \quad |\text{Im} \, a| \leq 1, \quad 0 < \zeta \leq R. \tag{5.13}
\]

Next, one needs to estimate for the coefficients \( A_m \) of the expansion (5.10). Applying Cauchy’s theorem to the Taylor expansion (5.11) yields

\[
|A_m| \leq r^{-m}\max_{|z|=r}|f(z)|
\]

for any \( r \in (0, 1) \). Note that

\[
f(z) = \left( \frac{e^z}{1+z} \right)^b (1 + O(z^3))^{-a}, \quad z \to 0.
\]

Choosing \( r = |a|^{-\frac{1}{12}} \) (one can take \( r = |a|^{-\delta} \) for any \( 1/3 < \delta < 1/2 \)), one obtains for all sufficiently large \( |a| \):

\[
|A_m| \leq C|a|^{\frac{m}{12}}(1 + C|a|^{-\frac{1}{12}})^{-\text{Re} \, a} \leq 2C|a|^{\frac{m}{12}}. \tag{5.14}
\]

Combining (5.13) and (5.14) gives for all sufficiently large \( |a| \):

\[
|M^{(1)}_N(a, \zeta)| \leq C \sum_{m=N}^{\infty} |a|^{\frac{m}{12}} \left| \frac{R}{2-4a} \right|^{m/2} = O(|a|^{-\frac{1}{12}N}), \quad \text{Re} \, a \to -\infty, \quad |\text{Im} \, a| \leq 1. \tag{5.15}
\]

In the same way, the estimates (5.13) and (5.14) show that

\[
|M^{(0)}_N(a, \zeta)| = O(1), \quad \text{Re} \, a \to -\infty, \quad |\text{Im} \, a| \leq 1. \tag{5.16}
\]

Substituting (5.12) into (5.8), we obtain

\[
G(a) = G^{(0)}_N(a) + G^{(1)}_N(a),
\]

where

\[
G^{(0)}_N(a) = \int_{\mathbb{R}^{2j}} F(x_1, \ldots, x_j) \prod_{p=1}^j M^{(0)}_N(a, \frac{R}{2} |x_{p+1} - x_p|^2) \, dx_1 \cdots dx_j, \quad x_{j+1} \equiv x_1.
\]

By (5.16), (5.15), we get

\[
G^{(1)}_N(a) = O(|a|^{-\frac{1}{12}N}), \quad \text{Re} \, a \to -\infty, \quad |\text{Im} \, a| \leq 1.
\]

By Cauchy’s formula for the derivatives, this entails

\[
\left( \frac{d}{da} \right)^s G^{(1)}_N(a) = O(|a|^{-\frac{1}{12}N}), \quad a \to -\infty, \quad a \in \mathbb{R}.
\]

As \( N \) can be taken arbitrary large, we see that it suffices to prove that for any \( N > 0 \), all derivatives \( \left( \frac{d}{da} \right)^s G^{(1)}_N(a) \), \( s \in \mathbb{Z}_+ \), have an asymptotic expansion for \( a \to -\infty, a \in \mathbb{R} \).

From (5.11) it follows that the coefficients \( A_m(a, b) \) are polynomials in \( a \) and \( b \). This observation reduces the problem to justifying the asymptotic expansion of the integral (5.8), where each of
the functions $\mathcal{M}_p(a, \zeta)$ is $\zeta^{m/2}J_m(\sqrt{(2-4a)\zeta})$ with some $m \in \mathbb{Z}_+$. Such an expansion is provided by Lemma 6.1.

(ii) Consider the general case. First let us obtain an expansion for $\tilde{M}(a, \zeta)$ similar to (5.10). Substituting (5.10) into the r.h.s. of (5.6), after a rearrangement we obtain

$$
\tilde{M}(a, \zeta) = -(\psi(1-a) - \log(\frac{1}{2} - a)) e^{\zeta^2/2} \sum_{m=0}^\infty A_m \left( \frac{\zeta}{2-4a} \right)^{m/2} J_m(\sqrt{(2-4a)\zeta}) - 2e^{\zeta^2/2} \sum_{m=0}^\infty A_m \left( \frac{\zeta}{2-4a} \right)^{m/2} \hat{J}_m(\sqrt{(2-4a)\zeta}) - e^{\zeta^2/2} \sum_{m=0}^\infty B_m \left( \frac{\zeta}{2-4a} \right)^{m/2} J_m(\sqrt{(2-4a)\zeta}),
$$

(5.17)

where

$$
B_m = \left( 2 \frac{\partial A_m}{\partial b} + \frac{\partial A_m}{\partial a} \right) \bigg|_{b=1}, \quad \hat{J}_m(z) = \frac{\partial J_\nu(z)}{\partial \nu} \bigg|_{\nu=m}.
$$

A fast decay of $J_m$ and $\hat{J}_m$ as $m \to \infty$ ensures convergence of the series and validates differentiation with respect to $a$ and $b$.

Using the expansion (5.17), we can complete the argument by following the same steps as in part (i) of the proof. First we need to obtain estimates for the remainders of the series in the r.h.s. of (5.17) in the strip $\text{Re} a \leq -1$, $|\text{Im} a| \leq 1$ (cf. (5.15)). The estimate for the remainder term of the first series in the r.h.s. of (5.17) is provided by (5.15). The estimate for the second series in the r.h.s. of (5.17) is obtained in exactly the same way by using the estimates $|\hat{J}_0(\sqrt{(2-4a)\zeta})| \leq C + C|\log|2-4a)\zeta||$ and (see [1, (9.1.22)])

$$
|\hat{J}_m(\sqrt{(2-4a)\zeta})| \leq C, \quad m \in \mathbb{N}, \quad \text{Re} a \leq -1, \quad |\text{Im} a| \leq 1, \quad 0 < \zeta \leq R
$$

instead of (5.13). In order to estimate the remainder term of the third series, we need an estimate on the coefficients $B_m$. The coefficients $B_m$ are readily seen to be Taylor coefficients of the function (cf. (5.11))

$$
g(z) = \left( 2 \frac{\partial f}{\partial b}(z) + \frac{\partial f}{\partial a}(z) \right) = f(z) \log(1 - z^2)^{-1/2}
$$

which similarly to (5.14) gives

$$
|B_m| \leq C|a|_m n^m.
$$

This gives the analogue of the estimate (5.15) for the third series in the r.h.s. of (5.17).

Next, the function $\psi(1-a) - \log(\frac{1}{2} - a)$ in (5.17) admits asymptotic expansion in integer powers of $a^{-1}$ as $\text{Re} a \to -\infty$ (see [1, 6.3.18]). Thus, we have reduced the problem to justifying an asymptotic expansion of the integral (5.8), where each of the functions $\mathcal{M}_p(a, \zeta)$ is either $\zeta^{m/2}J_m(\sqrt{(2-4a)\zeta})$ or $\zeta^{m/2}\hat{J}_m(\sqrt{(2-4a)\zeta})$ and at least one of the functions $\mathcal{M}_p(a, \zeta)$ is $\zeta^{m/2}J_m(\sqrt{(2-4a)\zeta})$. Finally, the formula [1, (9.1.66)]

$$
(\zeta/2)^m \hat{J}_m(\zeta) = \frac{\pi}{2} \left( \frac{\zeta}{2} \right)^m Y_m(\zeta) + \frac{m!}{2} \sum_{k=0}^{m-1} \frac{(\zeta/2)^k}{(m-k)!k!} J_k(\zeta)
$$

reduces the problem to Lemma 6.1. ■
6 Asymptotics of integrals containing Bessel functions

Lemma 6.1. Let $F \in C_0^\infty(\mathbb{R}^2)$. Define a function $G_1(\kappa)$, $\kappa > 0$, by

$$G_1(\kappa) := \int_{\mathbb{R}^2} F(x_1, \ldots, x_j) \prod_{p=1}^j J_{mp}(\kappa |x_p - x_{p+1}| |x_p - x_{p+1}|_{mp} dx_1 \cdots dx_j, \quad x_{j+1} = x_j$$  \quad (6.1)

where each of the functions $J_{mp}(\zeta)$ is either $J_{mp}(\zeta)$ or $Y_{mp}(\zeta)$ with some $m_p \in \mathbb{Z}_+$, and at least one of the functions $J_{mp}(\zeta)$ is $J_{mp}(\zeta)$. Then the function $G_1(\kappa)$ and all of its derivatives $G_1^{(s)}(\kappa)$, $s \geq 1$, have a complete asymptotic expansion in integer powers of $\kappa^{-1}$ for $\kappa \to +\infty$.

Proof. Recall the identity [1, (9.1.27)]

$$\zeta^{\nu+1} J_{\nu+1}(\zeta) = 2 \nu \zeta^\nu J_{\nu}(\zeta) - \zeta^{2(\nu-1)} J_{\nu-1}(\zeta), \quad J_{\nu} = J_{\nu} \text{ or } J_{\nu} = Y_{\nu}. \quad (6.3)$$

This identity allows us to reduce the problem to the case when all the indices $m_p$ in the integral (6.1) are 0 or 1. Next, assume for the convenience of notation that the first $l$ functions $J$ in the integral (6.1) are the Neumann functions $Y$, and the remaining $j - l$ functions are the Bessel functions $J$. For $\kappa_1 > 0$, $\kappa_2 > 0, \ldots, \kappa_j > 0$ define

$$G_2(\kappa_1, \ldots, \kappa_j)$$

$$= \int_{\mathbb{R}^2} F(x_1, \ldots, x_j) \prod_{p=1}^l Y_0(\kappa_p |x_p - x_{p+1}|) \prod_{p=l+1}^j J_0(\kappa_p |x_p - x_{p+1}|) dx_1 \cdots dx_j, \quad x_{j+1} = x_1.$$  \quad (6.2)

Formulae

$$\frac{dJ_0(\kappa |x|)}{d\kappa} = -|x|J_1(\kappa |x|), \quad \frac{dY_0(\kappa |x|)}{d\kappa} = -|x|Y_1(\kappa |x|)$$

show that it suffices to obtain an asymptotic expansion of the functions

$$\left( \frac{\partial}{\partial \kappa_1} \right)^{\beta_1} \cdots \left( \frac{\partial}{\partial \kappa_j} \right)^{\beta_j} G_2(\kappa_1, \ldots, \kappa_j) |_{\kappa_1=\ldots=\kappa_j=\kappa}, \quad \beta_p \in \mathbb{Z}_+ \quad (6.3)$$

for $\kappa \to \infty$. We shall obtain an asymptotic expansion for the function $G_3(\kappa) := G_2(\kappa, \ldots, \kappa)$ as $\kappa \to \infty$. From the construction it will be clear that the derivatives (6.3) can be dealt with in the same way. Let us make a change of variables in the integral (6.2). Denote

$$y_p = x_p - x_{p+1}, \quad p = 1, \ldots, j - 1, \quad z = x_1 + \cdots + x_j,$$

$$F_1(y) = \int_{\mathbb{R}^2} F(x_1 \ldots x_j) dy, \quad F_1 \in C_0^\infty(\mathbb{R}^{2j-2}).$$

Then we obtain

$$G_3(\kappa) = \int_{\mathbb{R}^{2j-2}} F_1(y) J_0(\kappa |y_1 + \cdots + y_{j-1}|) \prod_{p=1}^l Y_0(\kappa |y_p|) \prod_{p=l+1}^{j-1} J_0(\kappa |y_p|) dy.$$  \quad (6.4)

Next, we use the formulae

$$J_0(\kappa |y|) = \frac{1}{\pi} \int_{\mathbb{R}^2} e^{i\kappa uy} \delta(u^2 - 1) du, \quad Y_0(\kappa |y|) = -\frac{1}{\pi} \text{v.p.} \int_{\mathbb{R}^2} \frac{e^{i\kappa uy}}{u^2 - 1} du.$$
Substituting these formulae into (6.4), we obtain
\[
G_3(\kappa) = \text{v.p.} \int_{\mathbb{R}^j} \frac{\delta(u_{i+1}^2 - 1) \cdots \delta(u_j^2 - 1)}{(u_1^2 - 1) \cdots (u_j^2 - 1)} F_2(\kappa(u_1 - u_j, u_2 - u_j, \ldots, u_{j-1} - u_j)) du_1 \ldots du_j,
\]
where \(F_2\) is (up to a multiplicative constant) the Fourier transform of \(F_1\). Note that \(F_2\) belongs to the Schwartz class \(S(\mathbb{R}^{2j-2})\).

In order to simplify the last integral, we introduce some notation. Let us use the polar coordinates \(u_i = r_i^{1/2} \vec{\omega}_i\), where \(\vec{\omega}_i = (\cos \omega_i, \sin \omega_i) \in \mathbb{R}^2, \omega_i \in \mathbb{T} = \mathbb{R}/2\pi \mathbb{Z}\). Denote also \(\omega = (\omega_1, \ldots, \omega_{j-1}) \in \mathbb{T}^{j-1}, r = (r_1, \ldots, r_l) \in \mathbb{R}_+^l\). Define the function
\[
f(r, \omega, \omega_j) = (r_1^{1/2} \vec{\omega}_1 - \vec{\omega}_j, \ldots, r_l^{1/2} \vec{\omega}_l - \vec{\omega}_j, \vec{\omega}_{l+1} - \vec{\omega}_j, \ldots, \vec{\omega}_{j-1} - \vec{\omega}_j) \in \mathbb{R}^{2j-2}.
\]
With this notation, we have
\[
G_3(\kappa) = 2^{-j} \int_T d\omega_j \int_{\mathbb{T}^{j-1}} d\omega \text{v.p.} \int_{\mathbb{R}_+^l} dr \frac{F_2(\kappa f(r, \omega, \omega_j))}{(r_1 - 1) \cdots (r_l - 1)}.
\] (6.5)

Note that
\[
f(r, \omega, \omega_j) = 0 \Leftrightarrow \left( r = (1, \ldots, 1) \in \mathbb{R}_+^l \text{ and } \omega = (\omega_j, \ldots, \omega_j) \right)
\]
and \(\text{rank } f'(r, \omega, \omega_j) = l + j - 1\) at the point \(r = (1, \ldots, 1), \omega = (\omega_j, \ldots, \omega_j)\). Let us show that only an arbitrary small neighbourhood of the point \(r = (1, \ldots, 1), \omega = (\omega_j, \ldots, \omega_j)\) gives contribution to the asymptotics of the integral (6.5). First recall some estimates for the principal value integrals. Let \(\delta > 0\) and \(\phi \in C^\infty(-\delta, \delta)\). Then
\[
\text{v.p.} \int_{-\delta}^\delta \frac{\phi(x)}{x} dx = \int_{-\delta}^\delta \phi'(x) \log|x| dx,
\]
and using the Cauchy-Schwarz inequality, one obtains
\[
\left| \text{v.p.} \int_{-\delta}^\delta \frac{\phi(x)}{x} dx \right| \leq C(\delta) \|\phi'\|_{L^2(-\delta, \delta)}. \tag{6.6}
\]
Similarly, for \(\phi \in C^\infty([-\delta, \delta]^l)\),
\[
\left| \text{v.p.} \int_{-\delta}^\delta \frac{\phi(x)}{x_1 \cdots x_l} dx \right| \leq C(\delta) \left\| \frac{\partial^l \phi}{\partial x_1 \cdots \partial x_l} \right\|_{L^2((-\delta, \delta)^l)}. \tag{6.7}
\]
Denote \(U = (1 - \varepsilon, 1 + \varepsilon)^l \times (\omega_j - \varepsilon, \omega_j + \varepsilon)^j \subset \mathbb{R}_+^l \times \mathbb{T}^{j-1}\) where \(\varepsilon > 0\) is sufficiently small. Let us show that
\[
G_3(\kappa) = 2^{-j} \int_T d\omega_j \text{v.p.} \int_U dr d\omega \frac{F_2(\kappa f(r, \omega, \omega_j))}{(r_1 - 1) \cdots (r_l - 1)} + O(\kappa^{-\infty}). \tag{6.8}
\]
For simplicity consider the case \(j = 2, l = 1\). Then for \(\kappa \to \infty\) one has
\[
\left| \int_T d\omega_2 \int_T d\omega_1 \int_{\mathbb{R}_+ \setminus (1 - \varepsilon, 1 + \varepsilon)} \frac{dr_1}{r_1 - 1} F_2(\kappa f(r_1, \omega_1, \omega_2)) \right| \leq C \sup_{|r_1 - 1| > \varepsilon} |F_2(\kappa f(r_1, \omega_1, \omega_2))| = O(\kappa^{-\infty}),
\]
19
and also by (6.6)

\[
\left| \int_{\T} d\omega_j \text{v.p.} \int_{1-\varepsilon}^{1+\varepsilon} \frac{dr_1}{r_1-1} \int_{\T} d\omega_1 F_2(\kappa f(r_1, \omega_1, \omega_2)) \right|^2 \leq C \int_{\T} d\omega_j \int_{1-\varepsilon}^{1+\varepsilon} \frac{dr_1}{r_1-1} \left| \frac{\partial F_2(\kappa f(r_1, \omega_1, \omega_2))}{\partial r_1} \right|^2 = O(\kappa^{-\infty}),
\]

as \( F_2 \) is the Schwartz class function.

Thus, it suffices to prove an asymptotic expansion of the integral in the r.h.s. of (6.8). The asymptotic expansion of the integral over \((r, \omega)\) is provided by Lemma 6.2 below. It remains to prove that the asymptotic expansion given by Lemma 6.2 is uniform in \(\omega_j\). In order to show this, let us introduce the matrix

\[
\psi_\tau = \begin{pmatrix} \cos \tau & -\sin \tau \\ \sin \tau & \cos \tau \end{pmatrix}, \quad \tau \in \T,
\]

and the vector \(e = (1, 0) \in \R^2\). We rewrite the function \(f(r, \omega, \omega_j)\) in the form

\[
f(r, \omega, \omega_j) = \Psi_{\omega_j} \left( (r_1^{1/2} \psi_{\nu_1} - 1)e, \ldots, (r_1^{1/2} \psi_{\nu_l} - 1)e, (\psi_{\nu_{l+1}} - 1)e, \ldots, (\psi_{\nu_{j-1}} - 1)e \right)
= \Psi_{\omega_j} f(r, \nu, 0), \quad \nu_p = \omega_p - \omega_j, \quad \nu = (\nu_1, \ldots, \nu_{j-1}) \in \T^{j-1},
\]

where \(\Psi_\tau = \text{diag}(\psi_\tau, \ldots, \psi_\tau)\) is a matrix in \(\R^{2j-2}\). Substituting (6.9) into (6.8), we obtain

\[
G_3(\kappa) = 2^{-j} \int_{\T} d\omega_j \text{v.p.} \int_{U_1} dr_1 dv \frac{F_2(\kappa \Psi_{\omega_j} f(r, \nu, 0))}{(r_1 - 1) \cdots (r_l - 1)}, \quad U_1 = (1-\varepsilon, 1+\varepsilon)^l \times (\varepsilon, \varepsilon)^{j-1} \subset \R^l \times \T^{j-1}.
\]

From the last formula and the proof of Lemma 6.2 it is clear that the expansion given by Lemma 6.2 is uniform in \(\omega_j\); integrating this expansion over \(\omega_j\), we get the required expansion for \(G_3(\kappa)\).

**Lemma 6.2.** Let \(f \in C^\infty(\R^m, \R^n), m \leq n, \text{ and suppose that } f(0) = 0, \text{ rank } f'(0) = m\). Then for any sufficiently small open neighbourhood of zero \(U \subset \R^m\), any \(F \in \mathcal{S}(\R^n)\), and \(l \in \{0, 1, \ldots, m\}\), the integral

\[
I(\kappa) = \text{v.p.} \int_U \frac{F(\kappa f(x))}{x_1 \cdots x_l} dx
\]

has a complete asymptotic expansion

\[
I(\kappa) = \kappa^{l-m} (c_0 + c_1 \kappa^{-1} + c_2 \kappa^{-2} + \cdots), \quad \kappa \to \infty.
\]

**Proof.** Choose \(U\) sufficiently small so that

\[
|f(x) - f'(0)x| \leq \frac{1}{2} |f'(0)x|, \quad \forall x \in U.
\]

For a given \(N \in \N, N > l\), let us prove that

\[
I(\kappa) = \kappa^{l-m} \sum_{i=0}^{N-m-1} c_i \kappa^{-i} + O(\kappa^{l-N}), \quad \kappa \to \infty.
\]
By Taylor’s formula for $f(x)$ and $F(\kappa f(x))$,

$$f(x) = f'(0)x + f_2(x), \quad f_2(x) = \sum_{s=1}^{N} \frac{1}{s!}\frac{d^s}{dx^s}(0)x^s + f_N(x),$$  \hspace{1cm} (6.13)$$

$$F(\kappa f(x)) = F(\kappa f'(0)x + \kappa f_2(x)) = \sum_{q=0}^{N} F^{(q)}(\kappa f'(0)x)(\kappa f_2(x))^q + F_N(x, \kappa),$$  \hspace{1cm} (6.14)$$

$$F_N(x, \kappa) = \frac{1}{N!} \int_{0}^{1} (1 - \tau)^N \frac{d}{d\tau} F(\kappa f'(0)x + \kappa \tau f_2(x)) d\tau. \hspace{1cm} (6.15)$$

Here we use simplified notation; $f^{(s)}(0)x^s$ stands for the polynlinear form of the $s$’th differential of $f$ at zero, etc.

Substituting (6.13) into (6.14) and collecting the terms that contain and that do not contain $f_N(x)$ into two different sums, we can write

$$F(\kappa f(x)) = \sum_{0 \leq q \leq N} \tilde{F}_q(\kappa x)P_q(x) + \sum_{q \geq N+1} \tilde{F}_q(\kappa x)g_q(x) + F_N(x, \kappa). \hspace{1cm} (6.16)$$

Here both sums over $q$ are finite, $\tilde{F}_q \in \mathcal{S}(\mathbb{R}^m)$ are obtained from various components of derivatives of $F$, $P_q(x)$ are polynomials in $x$ of degree $q$, and $g_q \in C^\infty(U)$ are functions, satisfying the polynomial type estimates

$$\left| \left( \frac{\partial}{\partial x_1} \right)^{\beta_1} \cdots \left( \frac{\partial}{\partial x_l} \right)^{\beta_l} g_q(x) \right| \leq C|\beta|^{q-|\beta|}, \quad |\beta| = \beta_1 + \cdots + \beta_l \leq q, \quad x \in U. \hspace{1cm} (6.17)$$

Consider the terms obtained by substitution of the r.h.s. of (6.16) into the integral (6.10). First, using the estimate (6.7) and the fact that $\tilde{F}_q$ is a Schwartz class function, we obtain

$$\text{v.p.} \int_{U} \frac{\tilde{F}_q(\kappa x)}{x_1 \cdots x_l} P_q(x) dx = \text{v.p.} \int_{\mathbb{R}^m} \frac{\tilde{F}_q(\kappa x)}{x_1 \cdots x_l} P_q(x) dx + O(\kappa^{-\infty}) = \kappa^{l-q-m} \text{v.p.} \int_{\mathbb{R}^m} \frac{\tilde{F}_q(x)}{x_1 \cdots x_l} P_q(x) dx + O(\kappa^{-\infty}), \quad \kappa \rightarrow \infty.$$  

So, these terms will give contribution to the asymptotics (6.12).

Next, consider the terms obtained by substitution of the second sum in (6.16) into the integral (6.10). Using (6.17), we obtain the estimate

$$\left| \frac{\partial^l (\tilde{F}_q(\kappa x)g_q(x))}{\partial x_1 \cdots \partial x_l} \right|_{L^2(U)} \leq C\kappa^{l-\frac{m}{2}-q}.$$  

By (6.7), it follows that all the corresponding integrals are $O(\kappa^{l-N})$ as $\kappa \rightarrow \infty$.

Finally, consider the term $F_N(x, \kappa)$. By (6.11), we obtain for some $c > 0$:

$$|f'(0)x + \tau f_2(x)| \geq \frac{1}{2}|f'(0)x| \geq c|x|, \quad x \in U, \quad \tau \in (0, 1).$$

Using this fact, we obtain

$$|F_N(x, \kappa)| \leq C\kappa^{N+1} \sup_{||y|| \geq \kappa|x|} |F^{(N+1)}(y)f_2(x)|^{N+1}$$
and therefore
\[ \|F_N(\cdot, \kappa)\|_{L^2(U)} \leq O(\kappa^{-\frac{m}{2} - N - 1}), \quad \kappa \to +\infty. \]

Similarly, one can prove the estimate
\[ \left\| \frac{\partial^l F_N(x, \kappa)}{\partial x_1 \cdots \partial x_l} \right\|_{L^2(U)} \leq \kappa^{j - \frac{m}{2} - N - 1}. \]

By (6.7), it follows that the integral of \( F_N \) is \( O(\kappa^{j-N-1}) \) and will only give contribution to the remainder term in (6.12). □
