Annulative $\pi$-extension of indoles and pyrroles with diiodobiaryls by Pd catalysis: rapid synthesis of nitrogen-containing polycyclic aromatic compounds†

Hiroyuki Kitano, a Wataru Matsuoka, b Hideto Ito * bc and Kenichiro Itami * abc

A palladium-catalyzed one-step annulative $\pi$-extension (APEX) reaction of indoles and pyrroles that allows rapid access to nitrogen-containing polycyclic aromatic compounds is described. In the presence of palladium pivalate and silver carbonate, diverse indoles or pyrroles coupled with diiodobiaryls in a double direct C–H arylation manner to be transformed into the corresponding $\pi$-extended compounds in a single step. The newly developed catalytic system enables the use of various pyrroles and indoles as templates with a series of diiodobiaryls to provide structurally complicated and largely $\pi$-extended nitrogen-containing polycyclic aromatic compounds that are otherwise difficult to synthesize.

Introduction

With desirable electronic properties and diverse biological activities, nitrogen-containing fused aromatics have long been recognized as privileged structures in the fields of organic materials and pharmaceutical science. As these properties can be readily tuned via skeletal modification of the core N-heteroarene structure, significant efforts have been devoted to develop new synthetic approaches for $\pi$-extended nitrogen-containing polycyclic aromatic compounds (N-PACs). Representative classical approaches include (i) intramolecular carbon–nitrogen bond formation of biaryl amines, (ii) intramolecular carbon–carbon bond formation of diaryl amines, and (iii) stepwise functionalization and $\pi$-extension of indoles and pyrroles. However, these methods require the use of prefunctionalized heteroaromatics such as halogenated pyrroles, anilines and indoles, and stepwise transformations from unfunctionalized (hetero)aromatics. To achieve maximum efficiency in N-PAC construction, a more direct and ‘intuitive’ method for $\pi$-extension of unfunctionalized pyrroles and indoles is called for.

Recently, we have introduced several new one-step methods for the annulative $\pi$-extension (APEX) of unfunctionalized (hetero)aromatics (Fig. 1a). Because such APEX reactions directly transform easily available unfunctionalized (hetero)arenes to polycyclic aromatic hydrocarbons, nanographenes...
and \( \pi \)-extended heteroaromatics in a double direct C–H arylation manner, these protocols offer large benefits in the context of cost, simplicity, and step/atom economy.\

Recently, we and others\(^{6-14} \) have reported transition-metal-catalyzed APEX reactions of indoles and pyrroles using various \( \pi \)-extension units such as alkyne,\(^{6,7,13} \) alkene,\(^{2,4,13} \) \( 1 \)-vinylpropargyl alcohols,\(^{13} \) \( \alpha \)-diazocarbonyl compounds,\(^{13} \) \( \alpha \)-bromomalchalcone,\(^{13} \) \( \alpha \)-bromocinnamate,\(^{13} \) cyclic diaryliodonium salts,\(^{14} \) dibenzogermoles\(^{15} \) and diidobiphenyls\(^{16} \) (Fig. 1b). However, these APEX reactions are limited in terms of lack of variety in \( \pi \)-extending agents, narrow substrate scope, and low functional group tolerance. Herein, we report a new catalytic APEX reaction that allows efficient pyrrole-to-indole, pyrrole-to-carbazole and indole-to-carbazole \( \pi \)-extensions. Our newly established catalytic system featuring palladium pivalate and silver carbonate in a mixed DMF/DMSO solvent system enabled the rapid synthesis of structurally complicated N-PACs from readily available unfunctionalized pyrroles/indoles and diidobiphenyls.

## Results and discussion

We began our study by optimizing the reaction conditions for indole-to-carbazole extension of N-methylindole (1a) using 2,2′-diido-1,1′-biphenyl (2a) as a \( \pi \)-extending agent (Table 1). After extensive screening, we discovered that 1a (1.0 equiv.) coupled with 2a (1.5 equiv.) in the presence of Pd(OAc)\(_2\) (5 mol%) and Ag\(_2\)CO\(_3\) (3.0 equiv.) at 80 °C in 7 : 3 mixture of DMF/DMSO, formed biphenylylpalladium intermediate \( \text{A} \) (Scheme 1). Through the removal of iodide by silver salt may activate Pd complex \( \text{A} \) to form biphényl/palladium intermediate \( \text{A} \). Then, the removal of iodide by silver salt may activate Pd complex \( \text{A} \) to form electron-deficient aryl-Pd species, which then react with indole at the C2 position to afford intermediate \( \text{B} \). Through the control experiments on the C–H arylations of 1,2-dimethylindone and 1,3-dimethylindone with iodobenzene, the present APEX reaction seems to occur through the C2-arylation of indole rather than C3-arylation in the first step (see ESI† for details). Ultimately the conditions in entry 8 were deemed optimal for the present indole-to-carbazole APEX reaction.

A possible reaction mechanism of current indole-to-carbazole APEX reaction is shown in Scheme 1. Oxidative addition of 2a to palladium species (Pd(0) or Pd(ii)) occurs to form biphényl/palladium intermediate \( \text{A} \). Then, the removal of iodide by silver salt may activate Pd complex \( \text{A} \) to form electron-deficient aryl-Pd species, which then react with indole at the C2 position to afford intermediate \( \text{B} \). Through the control experiments on the C–H arylations of 1,2-dimethylindole and 1,3-dimethylindole with iodobenzene, the present APEX reaction seems to occur through the C2-arylation of indole rather than C3-arylation in the first step (see ESI† for details). Final step would be well-established Pd-catalyzed...

### Table 1 Screening of reaction conditions for the Pd-catalyzed indole-to-carbazole APEX reaction of N-methylindole (1a) and diidobiphenyl (2a)

| Entry | Pd cat. | Ag salt | Temp. (°C) | Yield (\%) |
|-------|---------|---------|------------|------------|
| 1     | Pd(OAc)\(_2\) | Ag\(_2\)CO\(_3\) (3.0 eq.) | 80 | 54 |
| 2     | Pd(OPiv)\(_2\) | Ag\(_2\)CO\(_3\) (3.0 eq.) | 80 | 61 |
| 3     | PdCl\(_2\) | Ag\(_2\)CO\(_3\) (3.0 eq.) | 80 | 3 |
| 4     | PdI\(_2\) | Ag\(_2\)CO\(_3\) (3.0 eq.) | 80 | 2 |
| 5     | Pd(PPh\(_3\))\(_4\) | Ag\(_2\)CO\(_3\) (3.0 eq.) | 80 | 4 |
| 6     | Pd(OOCOCF\(_3\))\(_2\) | Ag\(_2\)CO\(_3\) (3.0 eq.) | 80 | 0 |
| 7     | Pd(CH\(_3\))\(_2\)CN\(_4\)(BF\(_4\))\(_2\) | Ag\(_2\)CO\(_3\) (3.0 eq.) | 80 | 0 |
| 8     | Pd(OPiv)\(_2\) | AgOAc (1.5 eq.) | 80 | 78 (64) |
| 9     | Pd(OPiv)\(_2\) | AgOPiv (3.0 eq.) | 80 | 33 |
| 10    | Pd(OPiv)\(_2\) | AgOAc (3.0 eq.) | 80 | 0 |
| 11    | Pd(OPiv)\(_2\) | AgOOCOCF\(_3\) (3.0 eq.) | 80 | 0 |
| 12    | Pd(OPiv)\(_2\) | AgCO\(_3\) (1.5 eq.) | 100 | 57 |
| 13    | Pd(OPiv)\(_2\) | AgCO\(_3\) (1.5 eq.) | 100 | 58 |
| 14    | None | AgCO\(_3\) (1.5 eq.) | 80 | 0 |
| 15    | Pd(OPiv)\(_2\) | None | 80 | 0 |

* Yield was determined by \(^1\)H NMR analysis using dodecane as an internal standard. * Reaction time was 1 h. * Isolated yield in the parenthesis. Piv = pivaloyl.
in intramolecular C–H/C–I coupling to afford the cyclized compound 3aa.18

Under the optimized conditions, various types of π-extended carbazoles/indoles 3, 5 were prepared from the corresponding indole/pyrrole derivatives 1, 4 and diiodobiaryls 2. Scheme 2 illustrates the scope of applicable indole and pyrrole derivatives (1a–1m). N-Alkyl (2a, 2h), N-benzyl (2c), N-phenyl (2d) indoles and cross-linked lilolidine (2e) were converted smoothly to dibenzocarbazoles 3ba–3da in good to moderate yield, however the reaction of N-acetyl indole 2f did not provide the expected π-extension product 3fa. The presence of substituents at the 5-, 6-, or 7-positions of the indole ring was well-tolerated, giving various nitro- (3ga), cyano- (3ha, 3ka), bromo- (3ia), methoxy- (3ja, 3ka), and benzyloxy-substituted (3ma) dibenzocarbazoles in moderate yields (40–62%). These results suggest that substituents on the benzene ring of indole do not critically affect the reaction progress. Interestingly, we found that the current APEX reaction between N-substituted pyroles and 2a was mono-selective for the formation of dibenzoindoles 5aa and 5ba in 39% and 43% yields; only trace amounts of the di-APEX tetrabenzocarbazole products, the main products of our previous report,19 were observed. As synthetic methods to prepare the dibenzocarbazoles skeleton remain limited and inefficient,20 the current APEX protocol provides a valuable, streamlined entry to this compound class.

The scope of diiodobiaryls in the current APEX reaction is shown in Scheme 3. The reaction of N-methylindole (2a) with unsymmetrical 4-chloro-2,2′-diiodo-1,1′-biphenyl (2b) gave a 1 : 1.4 regioisomeric mixture of 3ab and 3ab′ in 94% combined yield. APEX reactions of 1a and 4a with 4,4′-dibromo-2,2′-diiodo-1,1′-biphenyl (2c) smoothly occurred to give dibromodibenzocarbazole 3ac and dibromodibenzoindole 5cc in 81% and 44% yield, respectively. To our delight, the reaction of 1a with 2,2′-diiodo-1,1′-binaphthalene (2d) gave dinaphthocarbazole 3ad containing a [5]helicene moiety in 25% yield, whose helical structure was confirmed by X-ray crystallographic

**Scheme 3** Substrate scope of diiodobiaryls. a0.20 mmol scale.

in moderate yields (40–62%). These results suggest that substituents on the benzene ring of indole do not critically affect the reaction progress. Interestingly, we found that the current APEX reaction between N-substituted pyroles and 2a was mono-selective for the formation of dibenzoindoles 5aa and 5ba in 39% and 43% yields; only trace amounts of the di-APEX tetrabenzocarbazole products, the main products of our previous report,19 were observed. As synthetic methods to prepare the dibenzocarbazoles skeleton remain limited and inefficient,20 the current APEX protocol provides a valuable, streamlined entry to this compound class.

The scope of diiodobiaryls in the current APEX reaction is shown in Scheme 3. The reaction of N-methylindole (2a) with unsymmetrical 4-chloro-2,2′-diiodo-1,1′-biphenyl (2b) gave a 1 : 1.4 regioisomeric mixture of 3ab and 3ab′ in 94% combined yield. APEX reactions of 1a and 4a with 4,4′-dibromo-2,2′-diiodo-1,1′-biphenyl (2c) smoothly occurred to give dibromodibenzocarbazole 3ac and dibromodibenzoindole 5cc in 81% and 44% yield, respectively. To our delight, the reaction of 1a with 2,2′-diiodo-1,1′-binaphthalene (2d) gave dinaphthocarbazole 3ad containing a [5]helicene moiety in 25% yield, whose helical structure was confirmed by X-ray crystallographic
analysis. As this example clearly demonstrates, the late-stage attachment of complex, extended polyaromatic units is one of the most remarkable characteristics in the present APEX reaction.

To demonstrate the power of the current APEX reaction to build complex, unsymmetrical N-PACs from simple starting materials, we employed a two-step sequence to synthesize tetrabenzocarbazole 6, a compound difficult to prepare via known methods (Scheme 4). First, APEX reaction of N-methylpyrrole (4c) with 2a was carried out to give the corresponding N-methylbenzoindole (5ca) in 37% yield. Notably, this reaction did not give double-APEX product which is the major product in the previously developed APEX reaction of N-phenylpyrrole. Then, 5ca was further reacted with 4,4'-dibromo-2,2'-diodo-1,1'-biphenyl (2c) by using Pd(CH2CN)4(BF4)2/AgOPiv/TfOH catalytic system to give the desired product 6 in 33% yield.

Rapid access to a new class of unsymmetrically substituted tetrabenzocarbazole is notable, and should contribute to the exploration of new compounds for organic electronics application.

The current APEX reaction also provided a facile route to polycyclic aromatic compounds containing both nitrogen and sulfur (N–S-PACs) (Scheme 5). N-Methylindole (1a) coupled with 3,3'-diodo-2,2'-bibenzothiophene (7) to give di(benzothieno)carbazole 8 in 32%. To our delight, the reaction of N-methylpyrrole (4c) with diiodo-2,2'-bibenzothiophene 7 afforded a double APEX product, tetra(benzothieno)carbazole 9, in 15% yield. While the yields were low, the generation of these novel N–S-PAC structures, which are highly interesting from the viewpoint of optoelectronic properties yet otherwise difficult to synthesize by conventional organic reactions, is notable.

The structural and electronic properties of 8 and 9 were elucidated via X-ray crystallography, UV-vis/photoluminescence spectroscopy, and DFT/TD-DFT calculations at the B3LYP/6-31G(d) level of theory (Fig. 2). Single crystal X-ray structures (Fig. 2a, b, S2 and S3†) reveal that compound 8 adopts a relatively flattened structure in the solid state (Fig. 2a), while compound 9 possesses a twisted structure owing to the embedded heterohelicene moiety. DFT calculations for 8 (Fig. 2c) reveal delocalization of the HOMO (−5.23 eV) over the entire molecule, while the LUMO (−1.49 eV) localizes on a benzothienocarbazole wing. On the other hand, the HOMO and LUMO of 9 are delocalized over entire molecule, and thus the energy level of LUMO (−1.72 eV) is slightly lower than that of 8. The UV-vis absorption spectra of 8 and 9 in CH2Cl2 show that both compounds have broad absorption bands between 300 and 450 nm (Fig. 2e). Absorption maxima were found at 294, 317, 339, 357, 381 and 399 nm (Fig. 2e). Absorption maxima were found at 294, 317, 339, 357, 381 and 399 nm in 8, and the corresponding peaks were also found in 9 at 305, 332, 348, 393 and 412 nm. The TD-DFT calculations revealed that the longest-wavenumber absorptions in 8 and 9 (399 and 412 nm) are attributed to the allowed HOMO–LUMO transitions (see ESI† for details). The fluorescence spectra of 8 and 9 in CH2Cl2 display broad emissions with emission maxima of 427 and 437 nm, respectively (Fig. 2e).
Conclusions

In summary, we have developed a novel palladium-catalyzed APEX reaction to enable the annulative π-extension of indoles/pyrroles with diiodobenzenes. Use of the Pd(OPiv)₂/Ag₂CO₃ catalytic system in a mixed DMF/DMSO solvent allows the preparation of a diverse range of N-PACs in a single step, including several previously unsynthesized structures. Rapid access to exotic scaffolds such as complex, unsymmetrically substituted tetrabenzocarbazoles and extended N-heteroarenes featuring multiple helicene moieties is a particular highlight of the present APEX protocol. Developed APEX methodology also has great potential for the efficient and rapid synthesis of planar and non-planar π-extended N-PACs such as π-extended azacoronulenes, aza-buckybowl and pyrrolopyrrole which are regarded as one of promising materials for optoelectronics. Further investigations into the reaction mechanism and applications of this APEX method towards the synthesis of larger π-extended heteroaromatics are currently underway.
