A NON-STANDARD BEZOUT THEOREM

TRISTRAM DE PIRO

Abstract. This paper provides a non-standard analogue of Bezout's theorem. This is achieved by showing that in all characteristics, the notion of Zariski multiplicity coincides with intersection multiplicity when we consider the full families of projective degree d and degree e curves in $P^2(L)$. The result is particularly interesting in that it holds even when we consider intersections at singular points of curves or when the curves contain non-reduced components. The proof also provides motivation for the fact that tangency is a definable relation for families of curves inside a non-linear 1-dimensional Zariski structure $X$. This is a crucial ingredient in unpublished work [13] that any such Zariski structure interprets a pure algebraically closed field $L$ with $X$ as a definable finite cover.

The techniques of non-standard analysis, originally developed for the real numbers, were recently introduced by Zilber in the context of Zariski structures. These methods have become extremely useful to model theorists in answering the question of Zilber's trichotomy for a large class of strongly minimal sets. This paper sets out to show that non-standard analysis can also be useful in algebraic geometry by providing a link with the extensive machinery developed by model theorists for analytic structures. We assume some familiarity with certain notions from algebraic and analytic geometry, as well as the material from Sections 1-5 of [5]. We summarise the relevant facts for the proof in the following three sections;

1. Etale Morphisms and Algebraic Multiplicity

Definition 1.1. A morphism $f$ of finite type between varieties $X$ and $Y$ is said to be etale if for all $x \in X$ there are open affine neighborhoods $U$ of $x$ and $V$ of $f(x)$ with $f(U) \subset V$ such that restricted to these neighborhoods the pull back on functions is given by the inclusion;

\[ \text{The author was supported by the William Gordon Seggie Brown research fellowship.} \]
The coordinate free definition of etale is that $f$ should be flat and unramified, where a morphism $f$ is unramified if the sheaf of relative differentials $\Omega_{X/Y} = 0$, clearly this last condition is satisfied using the condition $(\ast)$. If we tensor the exact sequence,

$$f^* \Omega_Y \to \Omega_X \to \Omega_{X/Y} \to 0$$

with $L(x)$ the residue field of $x$, we obtain an isomorphism

$$f^* \Omega_Y \otimes L(x) \to \Omega_X \otimes L(x).$$

Identifying $\Omega_X \otimes L(x)$ with $T^*_x X$ gives that

$$df : \left( m_x/m_x^2 \right)^* \to \left( m_{f(x)}/m_{f(x)}^2 \right)^*$$

is an isomorphism of tangent spaces or dually $f^*(m_{f(x)}) = m_x$. Call this property of etale morphisms $(\ast\ast)$.

We will also require some facts about the etale topology on an algebraic variety $Y$. We consider a category $Y_{et}$ whose objects are etale morphisms $U \to Y$ and whose arrows are $Y$-morphisms from $U \to V$. This category has the following 2 desirable properties. First given $y \in Y$, the set of objects of the form $(U, x) \to (Y, y)$ form a directed system, namely $(U, x) \subset (U', x')$ if there exists a morphism $U \to U'$ taking $x$ to $x'$. Secondly, we can take “intersections” of open sets $U_i$ and $U_j$ by considering $U_{ij} = U_i \times_Y U_j$; the projection maps are easily shown to be etale and the composition of etale maps is etale, so $U_{ij} \to Y$ still lies in $Y_{et}$. If $Y$ is an irreducible variety over $L$, then all etale morphisms into $Y$ must come from reduced schemes of finite type over $L$, though they may well fail to be irreducible considered as algebraic varieties. Now we can define the local ring of $Y$ in the etale topology to be;

$$\mathcal{O}_{y,Y} = \lim_{\to, y \in U} \mathcal{O}_U(U)$$

As any open set $U$ of $Y$ clearly induces an etale morphism $U \to Y$ of inclusion, we have that $\mathcal{O}_{y,Y} \subset \mathcal{O}_{y,Y}$. We want to prove that $\mathcal{O}_{y,Y}$ is a Henselian ring and in fact the smallest Henselian ring containing...
Lemma 1.2. Let $R$ be a local ring with residue field $k$. Suppose that $R$ satisfies the following condition;

If $f_1, \ldots, f_n \in R[x_1, \ldots, x_n]$ and $\tilde{f}_1, \ldots, \tilde{f}_n$ have a common root $\tilde{a}$ in $k^n$, for which $\text{Jac}(\tilde{f})(\tilde{a}) = (\frac{\partial \tilde{f}_i}{\partial x_j})(\tilde{a}) \neq 0$, then $\tilde{a}$ lifts to a common root in $R^n$. (*)

Then $R$ is Henselian.

It remains to show that $O_{y,Y}^\wedge$ satisfies (*).

Proof. Given $f_1, \ldots, f_n$ satisfying the condition of (*), we can assume the coefficients of the $f_i$ belong to $O_{U_i}(U_i)$ for covers $U_i \to Y$; taking the intersection $U_1, \ldots, U_n$ we may even assume the coefficients define functions on a single etale cover $U$ of $Y$. By the remarks above we can consider $U$ as an algebraic variety over $K$, and even an affine algebraic variety after taking the corresponding inclusion. We then consider the variety $V \subset U \times A^n$ defined by $\text{Spec}(\frac{R(U)[x_1, \ldots, x_n]}{f_1, \ldots, f_n})$. Letting $u \in U$ denote the point in $U$ lying over $y \in Y$, the residue of the coefficients of the $f_i$ at $u$ corresponds to the residue in the local ring $R$, which tells us exactly that the point $(u, \tilde{a})$ lies in $V$. By the Jacobian condition, we have that the projection $\pi: V \to U$ is etale at the point $(u, \tilde{a})$, and hence on some open neighborhood of $(u, \tilde{a})$, using Nakayama’s Lemma applied to $\Omega_{V/U}$. Therefore, replacing $V$ by the open subset $U' \subset V$ gives an etale cover of $U$ and therefore of $Y$, lying over $y$. Now clearly the coordinate functions $x_1, \ldots, x_n$ restricted to $U'$ lie in $O_{y,Y}^\wedge$ and lift the root $\tilde{a}$ to a root in $O_{y,Y}^\wedge$.

We define the Henselization of a local ring $R$ to be the smallest Henselian ring $R' \supset R$, with $R' \subset \text{Frac}(R)_{\text{alg}}$. We have in fact that;

Theorem 1.3. Given an algebraic variety $Y$, $O_{y,Y}^\wedge$ is the Henselization of $O_{y,Y}$.

The following theorem requires some knowledge of Zariski structures, see [3] sections 1-4, or section 2 of this paper.

Theorem 1.4. Zariski multiplicity is preserved by etale morphisms

Let $\pi: X \to Y$ be an etale morphism with $Y$ smooth, then any $(ab) \in \text{graph}(\pi) \subset X \times Y$ is unramified in the sense of Zariski structures.
For this we need the following fact whose algebraic proof relies on the fact that etale morphisms are flat, see [11];

**Fact 1.5.** Any etale morphism can be locally presented in the form

\[
\begin{array}{ccc}
V & \xrightarrow{g} & \text{Spec}((A[T]/f(T))_d) \\
\downarrow \pi & & \downarrow \pi' \\
U & \xrightarrow{h} & \text{Spec}(A)
\end{array}
\]

where \(f(T)\) is a monic polynomial in \(A[T]\), \(f'(T)\) is invertible in \((A[T]/f(T))_d\) and \(g, h\) are isomorphisms.

Using Lemma 4.6 of [5] and the fact that the open set \(V\) is smooth, we may safely replace \(\text{graph}(\pi)\) by \(\text{graph}(\pi')\subset F'' \times F\) where \(F''\) is the projective closure of \(\text{Spec}((A[T]/f(T))\), \(F\) is the projective closure of \(\text{Spec}(A)\) and \(\text{graph}(\pi')\) is the projective closure of \(\text{graph}(\pi')\) and show that \((g(b)a)\) is Zariski unramified. Note that over the open subset \(U = \text{Spec}(A) \subset F\), \(\text{graph}(\pi') = \text{Spec}(A[T]/f(T))\) as this is closed in \(U \times F''\). For ease of notation, we replace \((g(b)a)\) by \((ba)\).

Suppose that \(f\) has degree \(n\). Let \(\sigma_1 \ldots \sigma_n\) be the elementary symmetric functions in \(n\) variables \(T_1, \ldots T_n\). Consider the equations

\[
\begin{align*}
\sigma_1(T_1, \ldots, T_n) &= a_1 \\
& \ldots \\
\sigma_n(T_1, \ldots, T_n) &= a_n (*)
\end{align*}
\]

where \(a_1, \ldots a_n\) are the coefficients of \(f\) with appropriate sign. These cut out a closed subscheme \(C \subset \text{Spec}(A[T_1 \ldots T_N])\). Suppose \((ba) \in \text{graph}(\pi') = \text{Spec}(A[T]/f(T))\) is ramified in the sense of Zariski structures, then I can find \((a'b_1b_2) \in \mathcal{V}_{ab}\) with \((a'b_1), (a'b_2) \in \text{Spec}(A(T)/f(T))\) and \(b_1, b_2\) distinct. Then complete \((b_1b_2)\) to an \(n\)-tuple \((b_1b_2c'_1 \ldots c'_{n-2})\) corresponding to the roots of \(f\) over \(a'\). The tuple \((a'b_1b_2c'_1 \ldots c'_{n-2})\) satisfies \(C\), hence so does the specialisation \((abbc_1 \ldots c_{n-2})\). Then the tuple \((b_1b_2c'_1 \ldots c'_{n-2})\) satisfies (*) with the coefficients evaluated at \(a\). However such a solution is unique up to permutation and corresponds to the roots of \(f\) over \(a\). This shows that \(f\) has a double root at \((ab)\).
and therefore \( f'(T)|_{ab} = 0 \). As \((ab)\) lies inside \( \text{Spec}(A[T]/f(T))_d \), this contradicts the fact that \( f' \) is invertible in \( A[T]/f(T))_d \).

We also review some facts about algebraic multiplicity and show that algebraic multiplicity is preserved by etale morphisms.

**Definition 1.6.** Given projective varieties \( X_1, X_2 \) and a finite morphism \( f : X_1 \to X_2 \), the algebraic multiplicity \( \text{mult}_{f(a)}(X_1/X_2) \) of \( f \) at \( a \in X_1 \) is \( \text{length}(O_{a,X_1}/f^*m_{f(a)}) \) where \( m_{f(a)} \) is the maximal ideal of the local ring \( O_{f(a)} \).

**Remarks 1.7.** Note that this is finite, by the fact that finite morphisms have finite fibres and the ring \( O_{a,X_1}/f^*m_{f(a)} \) is a localisation of the fibre \( f^{-1}(f(a)) \cong R(f^{-1}(U)) \otimes_{R(U)} L \cong R(f^{-1}(U))/m_{f(a)} \) where \( U \) is an affine subset of \( X_2 \) containing \( f(a) \).

We now have the following:

**Theorem 1.8.** Algebraic multiplicity is preserved by etale morphisms;

Given finite morphisms \( f : X_3 \to X_2 \) and \( g : X_2 \to X_1 \) with \( f \) etale. If \( a \in X_3 \), then \( \text{mult}_{a}^{\text{alg}}(X_3/X_1) = \text{mult}_{f(a)}^{\text{alg}}(X_2/X_1) \).

**Proof.** This result is essentially given in [12]. Let \( O_{f(a),X_2}^\wedge \) be the Henselisation of the local ring at \( f(a) \). By base change, we have an etale morphism \( f' : X' = X_3 \times_{X_2} \text{Spec}(O_{f(a),X_2}^\wedge) \to \text{Spec}(O_{f(a),X_2}) \). By the definition of an etale morphism given above, we may write this cover locally in the form \( \text{Spec}(O_{f(a),X_2}^\wedge[[x_1,\ldots,x_n]])/f_1,\ldots,f_n) \), with \( \text{det}(\partial f_i/\partial x_j) \neq 0 \) at each closed point in the fibre over \( f(a) \). At the closed point \( a \), let \( a_i \) be the residues of the \( x_i \) in \( L \), then we have that \( (a_1,\ldots,a_n) \) is a common root for \( \{\bar{f}_1,\ldots,\bar{f}_n\} \) where \( \bar{f}_i \) is obtained by reducing \( f_i \) with respect to the maximal ideal \( m_{f(a),X_2} \) of \( O_{f(a),X_2}^\wedge \). As \( O_{f(a),X_2}^\wedge \) is Henselian, by the above, and the determinant condition, we can lift the roots \( a_i \) to roots \( a_i \) of the \( \bar{f}_i \) in \( O_{f(a),X_2}^\wedge \). We therefore obtain a subscheme \( Z = \text{Spec}(O_{f(a),X_2}^\wedge[[x_1,\ldots,x_n]]/\langle x_1-\alpha_1,\ldots,x_n-\alpha_n \rangle) \) of \( X' \) which is isomorphic to \( \text{Spec}(O_{f(a),X_2}^\wedge) \) under the restriction of \( f \). Let \( Q \) be the \( O_X \) ideal defining \( Z \), we then have that \( m_{a,X'} = f^*m_{f(a),X_2} \oplus Q_a \). As \( f \) is etale, by (***) after definition 1.1 above, \( m_{a,X'} = f^*m_{f(a),X_2} \), therefore \( Q_a = 0 \) and by Nakayama’s lemma \( Q = 0 \) in an open neighborhood of \( a \) in \( X' \). This gives that \( Z = X' \) in an open neighborhood of \( a \). Hence we obtain the sequence \( O_{f(a),X_2} \to i^*O_{a,X_2} \to i^*O_{a,X'} \) (***) where the map \( i^*f^* \) is the inclusion of \( O_{f(a),X_2} \) inside
Now if \( n \subset m_{f(a),X_2} \) is the pullback \( g^*m_{gf(a),X_1} \), we have that \( \text{length}(O_{f(a),X_2}/n) = \text{length}(O_{f(a),X_2}/m) \), hence the result follows by \((***\)) as required.

2. Zariski Multiplicity

We work in the context of Theorem 3.3 in [5]. Namely, \( W \) (we used the notation \( V \) in [5]) will denote a smooth projective variety defined over an algebraically closed field \( L \), considered as a Zariski structure with closed sets given by algebraic subvarieties defined over \( L \). All notions connected to the definition of Zariski multiplicity will come from a fixed specialisation map \( \pi : W(K) \to W(L) \) where \( K \) denotes a ”universal” algebraically closed field containing \( L = K_0 \). We consider \( D \) a smooth subvariety of some cartesian power \( W^m \) and a finite cover, with respect to projection onto the first coordinate, \( F \subset D \times W^k \), all defined over \( L \). This allows us to make sense of Zariski multiplicity. In general, we can move freely between Zariski structure notation and algebraic geometry notation. Clearly \((*)\) makes sense algebraically. Conversely, if \( X \) and \( Y \) denote fixed projective varieties defined over \( L \) with \( Y \) smooth and a finite morphism \( f : X \to Y \) over \( L \) is given, then we can reduce to the situation of \((*)\) by taking \( F \) to be \( \text{graph}(f) \subset X \times Y \) with the projection map onto the second factor and \( W \) to be the corresponding projective space \( P^n(L) \) where \( X, Y \subset P^n(L) \). We can even take \( W \) to be the 1-dimensional Zariski structure \( P^1(L) \) by using the embedding of \( P^n(L) \) into the \( N \)’th Cartesian power of \( P^1(L) \) for sufficiently large \( N \).

We use the definition of Zariski multiplicity for irreducible finite covers given in 4.1 of [3]. We will also require the following generalisation;

**Definition 2.1.** Let \( F \subset D \times W^k \) be an equidimensional, finite cover of smooth \( D \), with irreducible components \( C_1, \ldots, C_n \). Then for \((ab) \in F\), we define \( \text{Mult}_{ab}(F/D) = \sum_{(ab) \in C_i} \text{Mult}_{ab}(C_i/D) \).

Clearly this is well defined using the definition of Zariski multiplicity for irreducible covers. However, until Lemma 2.9, the assumption that \( F \) is irreducible will be in force.

**Lemma 2.2.** Zariski multiplicity is multiplicative over composition

Suppose that \( F_1, F_2 \) and \( F_3 \) are smooth, irreducible, with \( F_2 \subset F_1 \times W^k \) and \( F_3 \subset F_2 \times W^l \) finite covers. Let \((abc) \in F_3 \subset F_1 \times W^k \times W^l \). Then \( \text{mult}_{abc}(F_3/F_1) = \text{mult}_{ab}(F_2/F_1) \text{mult}_{abc}(F_3/F_2) \).
Proof. To see this, let \( m = \text{mult}_{ab}(F_2/F_1) \) and \( n = \text{mult}_{abc}(F_3/F_2) \). Choose \( a' \in \mathcal{V}_a \cap F_1(K_\omega) \) generic over \( L \). By definition, we can find distinct \( b_1 \ldots b_m \) in \( W^k(K_\omega) \cap \mathcal{V}_b \) such that \( F_2(a',b_i) \) holds. As \( F_2 \) is a finite cover of \( F_1 \), we have that \( \dim(a'\mathbf{b}_i/L) = \dim(a'/L) = \dim(F_1) = \dim(F_2) \), so each \( (a'\mathbf{b}_i) \in \mathcal{V}_{ab} \cap F_2 \) is generic over \( L \). Again by definition, we can find distinct \( c_{i1} \ldots c_{in} \) in \( W^l(K_\omega) \cap \mathcal{V}_c \) such that \( F_3(a'\mathbf{b}_i,c_{ij}) \) holds. Then the \( mn \) distinct elements \( (a'\mathbf{b}_i,c_{ij}) \) are in \( \mathcal{V}_{abc} \), so by definition of multiplicity \( \text{mult}_{abc}(F_3/F_1) = mn \) as required.

Lemma 2.3. Let hypotheses be as in the above lemma with the extra condition that the cover \( F_3/F_2 \) is etale. Then for \( (abc) \in F_3 \), \( \text{mult}_{abc}(F_3/F_1) = \text{mult}_{ab}(F_2/F_1) \)

Proof. This is an immediate consequence of Lemma 2.2 and Theorem 1.4.

Lemma 2.4. Zariski multiplicity is summable over specialisation

Suppose that \( F \subset D \times W^k \) is a finite irreducible cover with \( D \) smooth. Suppose \( (ab) \in F \), \( a' \in \mathcal{V}_a \cap D \) and \( a'' \in \mathcal{V}_{a'} \cap D \) with \( a'' \) generic over \( L \). Then

\[
\text{Mult}_{ab}(F/D) = \sum_{y' \in \mathcal{V}_b \cap F(a'y)} \text{Mult}_{a'y}(F/D)
\]

Proof. Suppose \( F(a''b_1), \ldots F(a''b_n) \) hold with \( b_i \in \mathcal{V}_b \), so \( \{b_1, \ldots, b_n\} \) witness the fact that \( \text{Mult}_{ab}(F/D) = n \). Write \( \{b_1, \ldots, b_n\} \) as \( \{b_{11}, \ldots, b_{1m_1}, b_{21}, \ldots, b_{2m_2}, \ldots, b_{11}, \ldots, b_{1j}, \ldots, b_{im_i}, \ldots, b_{mm_n}\} \) (*), where \( b_{ij} \) maps to \( a_i \) in the specialisation taking \( a'' \) to \( a' \). To prove the lemma, it is sufficient to show that \( F(a'y) \cap \mathcal{V}_b = \{a_1, \ldots, a_n\} \) and \( \text{Mult}_{a'a_i}(F/D) = m_i \). The second statement just follows from the fact that \( a'' \) is generic in \( D \) over \( L \) in \( \mathcal{V}_{a'} \). To prove the first statement, suppose we can find \( a_{n+1} \) with \( F(a'a_{n+1}) \) and \( a_{n+1} \in \mathcal{V}_b \) but \( a_{n+1} \notin \{a_1, \ldots, a_n\} \). By Theorem 3.3 in [5], we can find \( c \) with \( F(a''c) \) and \( (a''c) \) specialising to \( (a'a_{n+1}) \). As \( a_{n+1} \in \mathcal{V}_b \), \( (a'a_{n+1}) \) specialises to \( (ab) \), hence so does \( (a''c) \). Therefore, \( c \) must witness the fact that \( \text{Mult}_{ab}(F/D) = n \) and appear in the set \( \{b_1, \ldots, b_n\} \). This clearly contradicts the arrangement of \( \{b_1, \ldots, b_n\} \) given in (*).

Definition 2.5. Let \( F \subset U \times V \times W^k \) be an irreducible finite cover of \( U \times V \) with \( U \) and \( V \) smooth.
3.2 of [5], we can choose algebraically closed fields from notation identical. By the construction in section 2 and Lemma

\[ \pi \]

Over

\[ \mathbb{P} \]

Over

\[ \mathbb{L} \]

Over

\[ \mathbb{L} \]

Over, the fibres \( F \) and \( F(U, v) \) are finite covers of \( V \) and \( U \) respectively. In order to see this, observe that the fibres \( F(u, V) \) and \( F(U, v) \) are equidimensional covers of \( V \) and \( U \) respectively. In order to see this, as \( U \) is smooth, it satisfies the presmoothness axiom with the smooth projective variety \( W^k \) given in Definition 1.1 of [5]. The fibre \( F(u, V) = F \cap (W^k \times \{u\} \times V) \). By presmoothness, each irreducible component of the intersection has dimension at least \( \text{dim}(F) + \text{dim}(W^k \times V) - \text{dim}(U \times V \times W^k) = \text{dim}(F) - \text{dim}(U) = \text{dim}(V) \). As \( F(u, V) \) is a finite cover of \( V \), it has exactly this dimension. Now we can use the definition of Zariski multiplicity given in 1.4.

We first show that both left and right multiplicity are well defined. In order to see this, observe that the fibres \( F(u, V) \) and \( F(U, v) \) are finite covers of \( V \) and \( U \) respectively with \( U \) and \( V \) smooth. Moreover, the fibres \( F(u, V) \) and \( F(U, v) \) are equidimensional covers of \( V \) and \( U \) respectively. In order to see this, as \( U \) is smooth, it satisfies the presmoothness axiom with the smooth projective variety \( W^k \) given in Definition 1.1 of [5]. The fibre \( F(u, V) = F \cap (W^k \times \{u\} \times V) \). By presmoothness, each irreducible component of the intersection has dimension at least \( \text{dim}(F) + \text{dim}(W^k \times V) - \text{dim}(U \times V \times W^k) = \text{dim}(F) - \text{dim}(U) = \text{dim}(V) \). As \( F(u, V) \) is a finite cover of \( V \), it has exactly this dimension. Now we can use the definition of Zariski multiplicity given in 1.4.

We then claim the following;

**Lemma 2.6. Factoring Multiplicity**

In the situation of the above definition, we have that;

\[ \text{Mult}_{u,v,x}(F/U \times V) = \sum_{x' \in (\mathcal{V}_x \cap F(y,v') \cap \mathcal{V}_y \cap F(u,u'))} \text{RightMult}_{x',u,v}(F/U \times V) \] for \( u' \) generic in \( U \) over \( L \).

\[ \text{Mult}_{u,v,x}(F/U \times V) = \sum_{x' \in (\mathcal{V}_x \cap F(y,v') \cap \mathcal{V}_y \cap F(u,u'))} \text{LeftMult}_{x',u,v}(F/U \times V) \] for \( v' \) generic in \( V \) over \( L \).

**Proof.** We just prove the first statement, the proof of the second is apart from notation identical. By the construction in section 2 and Lemma 3.2 of [5], we can choose algebraically closed fields \( L = K_0 \subset K \subset K_n \subset \mathbb{K} \), and tuples \( u' \in K_{n_1}, v' \in K_{n_2} \) such that \( u' \) is generic in \( U \) over \( L \), \( v' \) is generic in \( V \) over \( K_n \) with specialisations \( \pi_1 : P^n(K_{n_1}) \to P^n(L) \) and \( \pi_2 : P^n(K_{n_2}) \to P^n(K_1) \) such that \( \pi_2(u'v') = (u'v) \) and \( \pi_1(u'v) = (uv) \). Now \( \text{dim}(u'v'/L) = \text{dim}(v'/L(u')) + \text{dim}(u'/L) = \text{dim}(V) + \text{dim}(U) \), hence \( u'v' \) is generic in \( U \times V \) over \( L \). Therefore \( \text{Mult}_{u,v,x} = \text{Card}(\mathcal{V}_x \cap F(u'v')) \). Let \( S = \{y_{11}, \ldots, y_{1m_1}, \ldots, y_{ij}, \ldots, y_{n1}, \ldots, y_{n1} \} \).
... $y_{mn}$ be distinct elements in $V_x \cap W^k$ witnessing this multiplicity such that for $1 \leq j_i \leq m_i$, $\pi_2(y_{ji}) = z_i \in V_x \cap W^k$. It is sufficient to show that $RightMult_{u,v,z}(F_U \times V) = m_i$ and $\{z_1, \ldots, z_n\}$ enumerates $V_x \cap F(y, u', v)$. The first statement follows as $v' \in V_a \cap V$ is generic in $V$ over $L(u')$. For the second statement, suppose that we can find $z_{n+1} \in V_x \cap F(y, u', v)$ with $z_{n+1} \notin \{z_1, \ldots, z_n\}$. Consider $F(u', V)$ as a finite cover of $V$, defined over $L(u')$, so by the above $F(u', V)$ is an equidimensional finite cover of $V$. Then, as $v'$ was chosen to be generic in $V$ over $L(u')$, choosing an irreducible component of $F(u', V)$ passing through $(z_{n+1}, u', v)$, by the lifting result of Theorem 3.3 in [5], we can find $y_{n+1} \in V_{z_{n+1}} \cap W^k$ such that $F(y_{n+1}, u', v')$. Clearly, $y_{n+1} \in S$ which contradicts the definition of $S$. 

Theorem 3.3 of [5] does not hold in the case when $D$ fails to be smooth. However, in the case of etale covers, we still have the following result:

**Lemma 2.7. Lifting Lemma for Etale Covers**

Let $F \subset D \times W^k$ be an etale cover of $D$ defined over $L$, with the projection map denoted by $f$. Then given $a \in D$, $(ab) \in F$ and $a' \in V_a \cap D$ generic over $L$, we can find $b' \in V_b$ such that $F(a', b')$ holds. Moreover $b'$ is unique, hence $\text{Mult}_{ab}(F/D) = 1$. Moreover, in the situation of Lemma 2.3, without requiring that $F_2$ is smooth, we have that for $(abc) \in F_3$, $\text{mult}_{abc}(F_3/F_1) = \text{mult}_{ab}(F_2/F_1)$.

**Proof.** Using the definition of etale given in section 1 above, we can assume that the cover is given algebraically in the form $f^* : L[D] \to L[D_1, \ldots, x_n]$ with $\text{det}(\partial f_i/\partial x_j)_{ij}(x) \neq 0$ for all $x \in F$. So we can present the cover in the form $f_1(x, y) = 0, f_2(x, y) = 0, \ldots, f_n(x, y) = 0$, with $y \in D$ and $x$ in $A^n(L)$. Let $L_m$ be the algebraic closure of the field generated by $L$ and $\bar{g}(a)$ where $\bar{g}$ is a tuple of functions defining $D$ locally. Consider the system of equations $f_1(x, a) = f_2(x, a) = \ldots = f_n(x, a) = 0$ defined over $L_m$. Then this system is solved by $b$ in $L_m$ with the property that $\text{det}(\partial f_i/\partial x_j)_{ij}(b) \neq 0$. Now suppose that $a' \in V_a \cap D$ is chosen to be generic over $L$. By the construction given in 2 of [5] and the following Lemma 2.2, we may assume that $a'$ lies in $L_s[[t^{1/r}]]$, the formal power series in the variable $t^{1/r}$ for some algebraically closed field $L_s$ extending $L_m$. This is a henselian ring, hence if we consider the system of equations $f_1(x, a') = f_2(x, a') = \ldots = f_n(x, a') = 0$ with coefficients in $L_s[[t^{1/r}]]$, by the fact that the system specialises to a solution in $L_s$ with the condition (*) we can find a solution $b'$ in $L_s[[t^{1/r}]]$. Then $(a'b')$ lies in $F$ and by construction $b' \in V_b$. The
uniqueness result follows from the proof of Theorem 1.4. For the last part, suppose that \( \text{mult}_{ab}(F_2/F_1) = n \), then we can find \( a' \in \mathcal{V}_a \cap F_1 \) generic over \( L \) and \( \{b_1, \ldots, b_n\} \in \mathcal{V}_b \cap W^k \) distinct such that \( F(a', b_i) \) holds. Each \( (a'b_i) \) is generic in \( F_2 \) over \( L \), hence by the previous part of the lemma, we can find a unique \( c_i \in \mathcal{V}_c \cap W^l \) such that \( F_3(a'b_ic_i) \) holds. This show that \( \text{mult}_{abc}(F_3/F_1) = n \) as required.

\[
\square
\]

**Lemma 2.8.** Lifting Lemma for Etale Covers with Right(Left) Multiplicity

Let hypotheses be as in Lemma 1.5, with the additional assumption that \( F_1 = U \times V \), \( F_2 \) is a smooth irreducible cover of \( F_1 \) and \( F_3 \) is an irreducible etale cover of \( F_2 \). Then with, notion as in the lemma, given \( (uvbc) \in F_3 \), \( \text{RightMult}_{uvbc}(F_3/F_1) = \text{RightMult}_{uvb}(F_2/F_1) \). Similarly for left multiplicity.

**Proof.** Suppose that \( \text{RightMult}_{uvb}(F_2/F_1) = n \), then for \( v' \in \mathcal{V}_b \) generic in \( V \) over \( L \), we can find \( \{b_1, \ldots, b_i, \ldots, b_n\} \in \mathcal{V}_b \) with \( F_2(uvb_i) \) holding. For each \( b_i \) we claim that there exists a unique \( c_i \in \mathcal{V}_c \) such that \( F_3(uvb'_bc_i) \) holds. For the existence, we can use Lemma 2.7, with the simple modification that, with the notation there, if \( L_m \) is the algebraic closure of the field generated by \( g(uv) \), then provided \( \dim(V) \geq 1 \), we can find \( v' \in \mathcal{V}_v \cap V \) generic over \( L \) with \( uv' \in L_s[[t^{1/r}]] \) for some algebraically closed field \( L_s \) containing \( L_m \). For the uniqueness, we can use the fact that Zariski multiplicity is summable over specialisation (Lemma 2.4) and the fact that for generic \( (u'vb'_c) \in \mathcal{V}_{uvb} \cap F_2 \), we can find a unique \( c'_i \in \mathcal{V}_c \) such that \( F_3(u'vb'_ic'_i) \) holds. Finally, we claim that \( \{b_1c_1, \ldots, b_nc_n\} \) enumerate \( F_3(uvx) \cap \mathcal{V}_{bc} \). This is clear by the above proof and the fact that \( \{b_1, \ldots, b_n\} \) enumerates \( F_2(uvx) \cap \mathcal{V}_b \).

\[
\square
\]

**Lemma 2.9.** The following versions of the above properties hold when we consider finite equidimensional covers, possibly with components, with the definition of Zariski multiplicity given in 2.1.

**Proof.** For Lemma 2.3, we replace the hypotheses with \( F_1 \) is smooth irreducible, \( F_2 \) is an equidimensional finite cover of \( F_1 \) and \( F_3 \) is an etale cover of \( F_2 \). We then claim, using notation as in Lemma 2.2, that \( \text{mult}_{abc}(F_3/F_1) = \text{mult}_{ab}(F_2/F_1) \). By definition \( \text{mult}_{abc}(F_3/F_1) = \sum_{(abc) \in C_i} (\text{mult}_{abc}(C_i/F_1)) \), where \( C_i \) are the irreducible components of \( F_3 \) passing through \( (abc) \). As \( F_3 \) is an etale cover of \( F_2 \), the images of the \( C_i \) are precisely the irreducible components \( D_i \) of \( F_2 \) passing through \( (ab) \), each \( C_i \) is an etale cover of \( D_i \) and \( \text{mult}_{ab}(F_2/F_1) = \sum_{(ab) \in D_i} (\text{mult}_{ab}(D_i/F_1)) \). Hence, it is sufficient to prove the result in
the case when \( F_2 \) and \( F_3 \) are irreducible. This is just Lemma 2.3

For Lemma 2.4, we replace the hypothesis with \( F \) is an equidimensional finite cover of \( D \). The proof then goes through exactly as in the lemma with the observation that if we find \( a_{n+1} \in V \) and \( F(a'a_{n+1}) \) then we can find an irreducible component \( C \) passing through \((a'a_{n+1})\) which allows us to apply Theorem 3.3 in [5] to obtain \( c \) with \( C(a''c) \) and \((a''c)\) specialising to \((a'a_{n+1})\).

For Definition 2.5, we alter the hypothesis to \( F \) is an equidimensional finite cover of \( U \times V \). Again, we can use an identical proof to show that left multiplicity and right multiplicity are well defined. The proof of Lemma 2.6 with the new hypothesis on \( F \) is identical.

We don’t require a modified version of Lemma 2.7, the result we need is contained in the modified proof of Lemma 2.3.

For Lemma 2.8, we alter the hypotheses to \( F_2 \) is an equidimensional cover of \( F_1 \) and \( F_3 \) is an etale cover of \( F_2 \). We then claim that for \((uvb)\) a non-singular point of \( F_2 \) and \((uvbc) \in F_3\), necessarily non-singular as well, that \( \text{RightMult}_{uvbc}(F_3/F_1) = \text{RightMult}_{uvb}(F_2/F_1) \) and similarly for left multiplicity. To prove this, note that as \((uvb)\) and \((uvbc)\) are non-singular points, there exist unique components \( C \) and \( D \) passing through \((uvb)\) and \((uvbc)\) respectively. Now replacing \( C \) and \( D \) by the open subsets \( C' \) and \( D' \) of smooth points, we can apply the definition of Right Multiplicity and the proof of Lemma 2.8.

\[ \square \]

3. Analytic Methods

In order to use the method of etale morphisms, which preserve Zariski multiplicity, we need to work inside the Henselisation of local rings \( L[x_1, \ldots, x_n][x_1, \ldots, x_n] \). In the next section, we will only need the result for the local ring in 2 variables \( L[x, y][x,y] \).

We let \( L[[x_1, \ldots, x_n]] \) denote the ring of formal power series in \( n \) variables, which is the formal completion of \( L[x_1, \ldots, x_n][x_1, \ldots, x_n] \) with respect to the canonical order valuation, see for example Section 2 of [5]. The following is a classical result, requiring the fact that etale morphisms are flat, used in the proof of the Artin approximation theorem. This relates the Henselisation of the ring \( L\{x_1, \ldots, x_n\} \) of strictly convergent power series in several variables with its formal completion.
Lemma 3.1. Weierstrass Preparation

Let $F(x_1, \ldots, x_n)$ be a polynomial in $L[x_1, \ldots, x_n]$ which is regular in the variable $x_n$. Then we have $F(x_1, \ldots, x_n) = U(x_1, \ldots, x_n)G(x_1, \ldots, x_n)$ where $U(x_1, \ldots, x_n)$ is a unit in the local ring $L[[x_1, \ldots, x_n]]$ and $G(x_1, \ldots, \ldots, x_n)$ is a Weierstrass polynomial in $x_n$ with coefficients in $L[[x_1, \ldots, x_{n-1}]]$.

We will require the Weierstrass decomposition to hold inside Henselisation($L[x_1, \ldots, x_n]$), therefore we need to show that the Weierstrass data can be found inside $L(x_1, \ldots, x_n)^{alg}$. This is achieved by the following lemma;

Lemma 3.2. Definability of Weierstrass data

Let $F(x_1, \ldots, x_n)$ be a polynomial with coefficients in $L$ such that $F$ is regular in $x_n$, then if $F(x_1, \ldots, x_n) = U(x_1, \ldots, x_n)G(x_1, \ldots, x_n)$ is the Weierstrass decomposition of $F$ with $G(x_1, \ldots, x_n) = x_n^m + a_1(x_1, \ldots, x_{n-1})x_n^{m-1} + \ldots + a_m(x_1, \ldots, x_{n-1})$, and $a_i \in L[[x_1, \ldots, x_{n-1}]]$, $U(x_1, \ldots, x_n) \in L[[x_1, \ldots, x_n]]$, then $a_i(x_1, \ldots, x_{n-1}) \in L(x_1, \ldots, x_{n-1})^{alg}$ and $U(x_1, \ldots, x_n) \in L(x_1, \ldots, x_n)^{alg}$.

Proof. This can be proved by rigid analytic methods. Equip $L$ with a complete non-trivial non-archimedean valuation $v$ and corresponding norm $||.||_v$, this can be done for example by assuming that $L$ is the completion of an algebraically closed field with any non-archimedean valuation, see [3]. Let $T_{n-1}(L)$ be the free Tate algebra in the indeterminate variables $x_1, \ldots, x_{n-1}$ over $L$, that is the subalgebra of strictly convergent power series in $L[[x_1, \ldots, x_{n-1}]]$. By the proof of Weierstrass preparation in [4], as $F \in T_{n-1}(L)[x_n]$, the coefficients $a_i$ lie in $T_{n-1}(L)$ and $U(x_1, \ldots, x_n) \in T_{n-1}(L)[x_n]$. Now choose $(u_1, \ldots, u_{n-1}) \subset L$ transcendental over the coefficients of $F$ with $\max(||u_i||) \leq 1$. Then if $s_1(\bar{u}), \ldots, s_m(\bar{u})$ denote the roots of $F(\bar{u}, x_n)$ with $||s_i(\bar{u})|| \leq 1$, then
both \( U(\bar{u}, s_i(\bar{u})) \) and \( G(\bar{u}, s_i(\bar{u})) \) define elements of \( L \) and moreover, by a theorem in [14], we have that the coefficients \( a_i(\bar{u}) \) are symmetric functions of the \( s_i(\bar{u}) \). Hence the \( a_i(\bar{u}) \) belong to \( L(\bar{u})^{\text{alg}} \). As \( \bar{u} \) was transcendental, we have that each \( a_i(\bar{u}) \in L[x_1, \ldots, x_{n-1}]^{\text{alg}} \). As \( U(x_1, \ldots, x_n) = F/G(x_1, \ldots, x_n) \), we clearly have that \( U(x_1, \ldots, x_n) \in L[x_1, \ldots, x_n]^{\text{alg}} \) as well.

\[ \square \]

4. Families of Curves in \( P^2(L) \)

We consider the family \( Q_d \) of projective curves in \( P^2(L) \) with degree \( d \). An element of \( Q_d \) may be written;

\[ \sum_{0 \leq i+j \leq d} a_{ij}(X/Z)^i(Y/Z)^j = 0 \]

which, rewriting in homogenous form, becomes;

\[ \sum_{0 \leq i+j \leq d} a_{ij}X^iY^jZ^{d-(i+j)} = 0 \]

For ease of notation, we will use affine coordinates \( x = X/Z \) and \( y = Y/Z \). More generally, if we give an affine cover, we implicitly assume that it can be projectivized by taking \( \bar{y} = (y_1, \ldots, y_n) = (Y_1/Z, \ldots, Y_n/Z) \). As the notion of Zariski multiplicity is local, this will not effect our calculations.

Now consider two such families \( Q_d \) and \( Q_e \). Then we have the cover obtained by intersecting degree \( d \) and degree \( e \) curves

\[ \text{Spec}(L[x, y, u_{ij}, v_{ij}]/ < s(u_{ij}, x, y), t(v_{ij}, x, y) >) \rightarrow \text{Spec}(L[u_{ij}, v_{ij}]). \]

(*)

where

\[ s(u_{ij}, x, y) = \sum_{0 \leq i+j \leq d} u_{ij}x^iy^j \]
\[ t(v_{ij}, x, y) = \sum_{0 \leq i+j \leq e} v_{ij}x^iy^j \]

We denote the parameter space for degree \( d \) curves by \( U \) and the parameter space for degree \( e \) curves by \( V \). These are affine spaces of dimension \((d+1)(d+2)/2\) and \((e+1)(e+2)/2\) respectively. The cover (*) is generically finite, that is there exists an open subset \( U' \subset \text{Sp}(L[u_{ij}, v_{ij}]) \) for which the restricted cover has finite fibres. Throughout this section,
we will denote the base space of the cover by $U \times V$, bearing in mind that we implicitly mean by this $(U \times V) \cap U'$. Now, given 2 fixed parameters sets $\bar{u}$ and $\bar{v}$, with $(\bar{u}, \bar{v}) \in U'$, corresponding to curves $C_{\bar{u}}$ and $C_{\bar{v}}$, the algebraic multiplicity of the cover $(*)$ at $(00, \bar{u}, \bar{v})$ is exactly the intersection multiplicity $I(C_{\bar{u}}, C_{\bar{v}}, 00)$ of the curves at $(00)$. The cover $(*)$ is equidimensional as $U \times V$ satisfies the presmoothness axiom with the smooth projective variety $P^2(L)$. Restricting to a finite cover over $U'$, by definition 2.1 we can also define the Zariski multiplicity of the cover at the point $(00, \bar{u}, \bar{v})$. The main result that we shall prove in this paper is the following, which generalises an observation given in [10]:

**Theorem 4.1.** In all characteristics, the algebraic multiplicity and Zariski multiplicity of the cover $(*)$ coincide at $(00, \bar{u}, \bar{v})$.

**Definition 4.2.** We say that a monic polynomial $p(x, \bar{y})$ is Weierstrass in $x$ if $p(x, \bar{y}) = x^n + ... + q_j(\bar{y})x^{n-j} + ... + q_n(\bar{y})$ with $q_j(\bar{0}) = 0$.

**Definition 4.3.** Let $F(x, \bar{y})$ be a polynomial in $x$ with coefficients in $L[\bar{y}]$. We say the cover 

$$\text{Spec}(L[x\bar{y}] / \langle F(x, \bar{y}) \rangle) \to \text{Spec}(L[\bar{y}])$$

is generically reduced if for generic $\bar{u} \in \text{Spec}(L[\bar{y}])$, $F(x, \bar{u})$ has no repeated roots.

**Definition 4.4.** Let $F \to U \times V$ be a finite cover with $U$ and $V$ smooth, such that for $(\bar{u}, \bar{v}) \in U \times V$ the fibre $F(\bar{u}, \bar{v})$ consists of the intersection of algebraic curves $F_{\bar{u}}, F_{\bar{v}}$. We call the family sufficiently deformable at $(\bar{u}_0, \bar{v}_0)$ if there exists $\bar{w} \in U$ generic over $L$ such that $F_{\bar{w}}$ intersects $F_{\bar{v}_0}$ transversely at simple points.

We now require a series of lemmas;

**Lemma 4.5.** Let $F(x, \bar{y})$ be a Weierstrass polynomial in $x$ with $F(0, \bar{0}) = 0$ then algebraic multiplicity and Zariski multiplicity coincide at $(0, \bar{0})$ if the cover 

$$\text{Spec}(L[x\bar{y}] / \langle F(x, \bar{y}) \rangle) \to \text{Spec}(L[\bar{y}])$$

is generically reduced.

**Proof.** We have that $F(x, \bar{y}) = x^n + q_1(\bar{y})x^{n-1} + ... + q_n(\bar{y})$ where $q_i(\bar{0}) = 0$. The algebraic multiplicity is given by $\text{length}(L[x]/F(x, \bar{0})) =$
ord(F(x, 0)) = n in the ring \( L[x] \) with the canonical valuation. We first claim that the Zariski multiplicity is the number of solutions to
\[
x^n + q_1(\tilde{e})x^{n-1} + \ldots + q_n(\tilde{e}) = 0
\]
where \( \tilde{e} \) is generic in \( V_0 \). For suppose that \( (a, \tilde{e}) \) is such a solution, then \( F(a, \tilde{e}) = 0 \) and by specialisation \( F(\pi(a), 0) = 0 \). As \( F \) is a Weierstrass polynomial in \( x \), \( \pi(a) = 0 \), hence \( a \in V_0 \), giving the claim. We have that \( Disc(F(x, \tilde{y})) = Res_{\tilde{y}}(F, \frac{\partial F}{\partial x}) \) is a regular polynomial in \( \tilde{y} \) defined over \( L \). By the fact that the cover is generically reduced, this defines a proper closed subset of \( Spec(L[\tilde{y}]) \). Therefore, \( Disc(F(x, \tilde{y}))|_{\tilde{e}} \neq 0 \), hence \( \tilde{e} \) has no repeated roots. This gives the lemma.

\[\text{Lemma 4.6.} \text{ Let } F(x, \tilde{y}) \text{ be any polynomial with } F(x, 0) \neq 0 \text{ and } F(0, 0) = 0. \text{ Then if the cover } Spec(L[x, \tilde{y}]/ < F(x, \tilde{y}) >) \rightarrow Spec(L[\tilde{y}]) \text{ is generically reduced, the Zariski multiplicity at } (0, 0) \text{ equals } ord(F(x, 0)) \text{ in } L[x].\]

\[\text{Proof.} \text{ By the Weierstrass Preparation Theorem, Lemma 3.1, we can write } F(x, \tilde{y}) = U(x, \tilde{y})G(x, \tilde{y}) \text{ with } U(x, \tilde{y}), G(x, \tilde{y}) \in L[[x, \tilde{y}]], G(x, \tilde{y}) \text{ a Weierstrass polynomial in } x \text{ and } deg(G) = ord(F(x, 0)), \text{ see also the more closely related statement given in [2]. By Lemma 3.2, we may take the new coefficients to lie inside the Henselized ring } L[x, \tilde{y}]_0^\wedge, \text{ hence inside some finite etale extension } L[x, \tilde{y}]_{ext} \text{ of } L[x, \tilde{y}] \text{ (possibly after localising } L[x, \tilde{y}] \text{ corresponding to an open subset of } Spec(L[x, \tilde{y}]) \text{ containing } (0, 0)). \text{ Now we have the sequence of morphisms:}
\]
\[
Sp(L[x, \tilde{y}]_{ext}/UG) \rightarrow Spec(L[x, \tilde{y}]/F) \rightarrow Spec(L[\tilde{y}])
\]

The left hand morphism is etale at 0, hence by Lemma 2.3 or Lemma 2.7, to compute the Zariski multiplicity of the right hand morphism, we need to compute the Zariski multiplicity of the cover

\[
Spec(L[x, \tilde{y}]_{ext}/UG) \rightarrow Spec(L[\tilde{y}])
\]

at \( (0, 0)^{lift} \), the marked point in the cover above \( (0, 0) \). Choose \( \epsilon \in V_0 \), the fibre of the cover is given formally analytically by \( L[[x, \tilde{y}]]/ < UG > \otimes L[\tilde{y}] \), hence by solutions to \( U(x, \epsilon)G(x, \epsilon) \). By definition of Zariski multiplicity, we consider only solutions \( (x\epsilon) \) in \( V_{(0, 0)^{lift}} \). As \( U(x, \tilde{y}) \) is a unit in the local ring \( L[x, \tilde{y}]_{(0, 0)^{lift}} \), we must have \( U(x, \tilde{e}) \neq 0 \) for such solutions, otherwise by specialisation \( U((0, 0)^{lift}) = 0 \). Hence, the solutions are given by \( G(x, \tilde{e}) = 0 \). Now, we use the previous lemma to give that the Zariski multiplicity is exactly \( deg(G) \) as required.
Now return to the cover

\[ Sp(L[x, y, u_{ij}, v_{ij}]/ < s(u_{ij}, x, y), t(v_{ij}, x, y) >) \rightarrow Sp(L[u_{ij}, v_{ij}]) \] (*)

We will show below, Lemma 4.12, that this is a sufficiently deformable family at \((\bar{u}_0, \bar{v}_0)\) when \(C_{\bar{u}_0}\) and \(C_{\bar{v}_0}\) define reduced curves. We claim the following;

**Lemma 4.7.** Suppose parameters \(\bar{u}^0\) and \(\bar{v}^0\) are chosen such that \(C_{\bar{u}^0}\) and \(C_{\bar{v}^0}\) are reduced Weierstrass polynomials in \(x\). Then the Zariski multiplicity of the cover (*) at \((0, 0, \bar{u}^0, \bar{v}^0)\) equals the intersection multiplicity \(I(C_{\bar{u}^0}, C_{\bar{v}^0}, (0, 0))\) of \(C_{\bar{u}^0}\) and \(C_{\bar{v}^0}\) at \((0, 0)\).

**Proof.** Introduce new parameters \(\bar{u}'\) and \(\bar{v}'\). Let \(C_{\bar{u}'}^\prime\) and \(C_{\bar{v}'}^\prime\) denote the curves \(C_{\bar{u}^0}\) and \(C_{\bar{v}^0}\) deformed by the parameters \(\bar{u}'\) and \(\bar{v}'\) respectively. That is \(C_{\bar{u}'}^\prime\) is given by the new equation \(\Sigma_{1 \leq i + j \leq d}(u_{ij}^0 + u_{ij}')x^iy^j\). Let \(F(y, \bar{u}', \bar{v}') = \text{Res}(C_{\bar{u}'}^\prime, C_{\bar{v}'}^\prime)\). Then,

\[ F(0, \bar{0}, \bar{0}) = \text{Res}(s(u_{ij}^0, x, 0), t(v_{ij}^0, x, 0)) = 0 \]

as \(C_{\bar{u}^0}\) and \(C_{\bar{v}^0}\) are Weierstrass in \(x\) and share a common solution at \((0, 0, \bar{u}^0, \bar{v}^0)\). By a result due to Abhyankar, see for example [1], \(\text{ord}_y(F(y, \bar{0}, \bar{0})) = \Sigma_x I(C_{\bar{u}^0}, C_{\bar{v}^0}, (0, x))\) at common solutions \((x, 0)\) to \(C_{\bar{u}^0}\) and \(C_{\bar{v}^0}\) over \(y = 0\). As \(C_{\bar{u}^0}\) and \(C_{\bar{v}^0}\) are Weierstrass polynomials in \(x\), this is just \(I(C_{\bar{u}^0}, C_{\bar{v}^0}, (0, 0))\). By the previous lemma and the fact that \(F(y, \bar{u}, \bar{v})\) is generically reduced (see argument (†) below), it is therefore sufficient to prove that the Zariski multiplicity of the cover (*) at \((0, 0, \bar{u}^0, \bar{v}^0)\) equals the Zariski multiplicity of the cover \(\text{Spec}(L[y, \bar{u}', \bar{v}'])/ < F(y, \bar{u}', \bar{v}') > \rightarrow \text{Spec}(L[\bar{u}', \bar{v}'])\) (**) at \((0, \bar{0}, \bar{0})\). Suppose the Zariski multiplicity of (**) equals \(n\). Then there exist distinct \(y_1, \ldots, y_n \in V_0\) and \((\delta, \epsilon)\) generic in \(V_0 \cap U \times V\) such that \(F(y_i, \delta, \epsilon)\) holds. Consider \(Q(\bar{u}', \bar{v}') = \text{Res}(F(y, \bar{u}', \bar{v}'), \partial F/\partial y(y, \bar{u}', \bar{v}'))\). This defines a closed subset of \(U \times V\) defined over \(L\), we claim that this in fact proper closed (†). By the fact that the family is sufficiently deformable at \((\bar{u}_0, \bar{v}_0)\), we can find \((\bar{u}, \bar{v}_0)\) such that \(C_{\bar{u}}\) intersects \(C_{\bar{v}_0}\) transversally at point \(e\) points. Without loss of generality, making a linear change of coordinates, we may suppose that for there do not exist points of intersection of the form \((x_1y)\) and \((x_2y)\) for \(x_1 \neq x_2\). By Abhyankar’s result, this implies that \(F(y, \bar{u}', \bar{v}_0)\) has no repeated roots. Then, by genericity of \((\delta, \epsilon)\), we have that \(Q(\delta, \epsilon) \neq 0\). Hence \(F(y_i, \delta, \epsilon)\) is a non-repeated root. By Abhyankar’s result, we can find a unique \(x_i\) with \((x_iy)\) a common solution to the deformed curves \(C_{\bar{u}^0}^\delta\) and \(C_{\bar{v}^0}^\epsilon\). We
claim that each \((x_i, y_i) \in V_{00}\). As \(C_{\vartheta^0}(x_i, y_i) = 0\), by the fact \((\bar{u}^0, \bar{\delta}, y_i)\) specialises to \((\bar{u}^0, 0, 0)\) and \(C_{\varphi^0}\) is a Weierstrass polynomial in \(x\), we have that \(\pi(x_i) = 0\) as well. This shows that the Zariski multiplicity of the cover (*) is at least \(n\). A virtually identical argument shows that the Zariski multiplicity of the cover (**) is at most \(n\) as well.

We now have the following result;

**Lemma 4.8.** Let \(C_{\vartheta^0}\) and \(C_{\varphi^0}\) be reduced curves, having finite intersection, then the Zariski multiplicity of the cover (*) at \(((0, 0), \bar{u}^0, \bar{v}^0)\) equals the intersection multiplicity \(I(C_{\vartheta^0}, C_{\varphi^0}, (0, 0))\) of \(C_{\vartheta^0}\) and \(C_{\varphi^0}\) at \((0, 0)\).

**Proof.** We have \(C_{\vartheta^0} = s(u_{ij}^0, x, y)\) and \(C_{\varphi^0} = t(v_{ij}^0, x, y)\). By making the substitutions \(\bar{U} = \bar{u}^0 + \bar{u}\) and \(\bar{V} = \bar{v}^0 + \bar{v}\), we may assume that \(\bar{u}^0 = \bar{v}^0 = 0\). Moreover, we can suppose that;

\[ s(\bar{0}_{ij}, x, 0) \neq 0 \quad \text{and} \quad t(\bar{0}_{ij}, x, 0) \neq 0. (**)

This can be achieved by making the invertible linear change of variables \((x' = x, y' = \lambda x + \mu y)\) with \((\lambda, \mu) \in L^2\) and \(\mu \neq 0\), noting that as \(C_{\vartheta_0}\) and \(C_{\varphi_0}\) are curves, for some choice of \((\lambda, \mu)\), the corresponding polynomials \(s(u_{ij}^0, x, y)\) and \(t(v_{ij}^0, x, y)\) do not vanish identically on the line \(\lambda x + \mu y = 0\). It is trivial to check that the transformation preserves both Zariski multiplicity and intersection multiplicity, so our calculations are not effected.

We may then apply the Weierstrass preparation theorem, Lemma 3.1, in the ring \(L[[u_{ij}, v_{ij}, x, y]]\), obtaining factorisations \(s(u_{ij}, x, y) = U_1(u_{ij}, x, y)S(u_{ij}, x, y)\) and \(t(v_{ij}, x, y) = U_2(v_{ij}, x, y)T(v_{ij}, x, y)\) where \(U_1\) and \(U_2\) are units in the local rings \(L[[u_{ij}, x, y]]\) and \(L[[v_{ij}, x, y]]\), \(S, T\) are Weierstrass polynomials in \(x\) with coefficients in \(L[[u_{ij}, y]]\) and \(L[[v_{ij}, y]]\) respectively. A close inspection of the Weierstrass preparation theorem, see [2], shows that we can obtain the following uniformity in the parameters \(\bar{u}\) and \(\bar{v}\);

Namely, if \(U = \{u_{ij} : s(u_{ij}, x, 0) \neq 0\}\) and \(V = \{v_{ij} : t(v_{ij}, x, 0) \neq 0\}\), are the constructible sets for which (*) holds, then if we let \(R_U\) and \(R_V\) denote the coordinate rings of \(U\) and \(V\), we may assume \(U_1, U_2\) lie in \(R_U[[x, y]]\) and the coefficients of \(S, T\) lie in \(R_U[[y]]\) and \(R_V[[y]]\) respectively. By Lemma 3.2, we may assume that \(U_1, U_2, S\) and \(T\) lie
in a finite etale extension $R_{U \times V}[x, y]^{\text{ext}}$ of the algebra $A = R_{U \times V}[x, y]$ (again, possibly after localisation corresponding to an open subvariety of $\text{Spec}(A)$. Now we have the sequence of morphisms;

$$\text{Spec}(R_{U \times V}[x, y]^{\text{ext}}_{<U_1S,U_2T>}) \to \text{Spec}(R_{U \times V}[x, y]^{\text{ext}}_{<s,t>}) \to \text{Spec}(R_{U \times V})$$

We claim that the left hand morphism is etale at the point $(\bar{0}, \bar{0}, (00)\text{lift})$. This follows from the fact that $R_{U \times V}[x, y]^{\text{ext}}$ is an etale extension of $R_{U \times V}[x, y]$ and the maximal ideal given by $(\bar{0}, \bar{0}, (00)\text{lift})$ contains $<U_1S,U_2T>$. Now consider the cover;

$$\text{Spec}(R_{U \times V}[x, y]^{\text{ext}}_{<U_1S,U_2T>}) \to \text{Spec}(R_{U \times V}) (*** )$$

For $\bar{u}, \bar{v}$ in $U \times V$, the fibre of this cover over $\bar{u}, \bar{v}$ corresponds exactly to the intersection of the reducible curves $C'_{\bar{u}}$ and $C'_{\bar{v}}$ which lift the original curves $C_{\bar{u}}$ and $C_{\bar{v}}$ to an etale cover of $\text{Spec}(L[[x,y]])$. By Theorem 1.8 and Lemma 2.3 (in the case when $C_{\bar{u}_0}, C_{\bar{v}_0}$ intersect at simple points) or Lemma 2.7 (for singular points of intersection) and the corresponding Lemma 2.9 for reducible covers, it is sufficient to show that the Zariski multiplicity of the cover (*** ) at $(\bar{0}, \bar{0}, (00)\text{lift})$ corresponds to the intersection multiplicity of the curves $C'_{\bar{u}_0}, C'_{\bar{v}_0}$ at $(00)^{\text{lift}}$. The idea now is to apply Lemma 4.7 to the Weierstrass factors of $C'_{\bar{u}}$ and $C'_{\bar{v}}$. This will be achieved by the "unit removal" lemma below (Lemma 4.15).

We first require some more definitions and a moving lemma for curves;

**Definition 4.9.** Let $X \to \text{Spec}(L[[x,y]])$ be an etale cover in a neighborhood of $(0,0)$, with distinguished point $(0,0)^{\text{lift}}$. We call a curve $C$ on $X$ passing through $(0,0)^{\text{lift}}$ Weierstrass if, in the power series ring $L[[x,y]]$, the defining equation of $C$ may be written as a Weierstrass polynomial in $x$ with coefficients in $L[[y]]$.

**Definition 4.10.** Let $F \to U \times V$ be a finite equidimensional cover of a smooth base of parameters $U \times V$ with a section $s : U \times V \to F$. We call the cover Weierstrass with units if the fibres $F(\bar{u}, \bar{v})$ can be written as the intersection of reducible curves $C'_{\bar{u}}$ and $C'_{\bar{v}}$ in an etale cover $A_{\bar{u}, \bar{v}}$ of $U_{\bar{u}, \bar{v}} \subset \text{Spec}(L[[x,y]])$ with the distinguished point $s(\bar{u}, \bar{v})$ lying above $(0,0)$ and $C'_{\bar{u}}, C'_{\bar{v}}$ factoring as $U_{\bar{u}}F_{\bar{u}}$ and $U_{\bar{v}}F_{\bar{v}}$ with $U_{\bar{u}}, U_{\bar{v}}$
units in the local ring $O_{s(\bar{u}, \bar{v}), A_{\bar{u}, \bar{v}}}$ and $F_{\bar{u}}, F_{\bar{v}}$ Weierstrass curves in $A_{\bar{u}, \bar{v}}$.

Let hypotheses on $F, U$ and $V$ be as above. We call the cover Weierstrass if the fibres $F(\bar{u}, \bar{v})$ can be written as above but with $C_{\bar{u}}, C_{\bar{v}}$ Weierstrass curves in $A_{\bar{u}, \bar{v}}$.

We say that a Weierstrass cover (with units) factors through the family of projective degree $d$ and degree $e$ curves if the cover $F \to U \times V$ factors as $F \to F' \to U \times V$ where $F' \to U \times V$ is the finite equidimensional cover obtained by intersecting the families $Q_d$ and $Q_e$ restricted to $U$ and $V$.

**Lemma 4.11.** The cover (*** in Lemma 4.8 is a Weierstrass cover with units factoring through the family of projective degree $d$ and degree $e$ curves.

**Proof.** Clear by the above definitions. □

**Lemma 4.12. Moving Lemma for Reduced Curves**

Let $Q_d$ and $Q_e$ be the families of all projective degree $d$ and degree $e$ curves. That is, with the usual coordinate convention $x = X/Z, y = Y/Z$, $Q_d$ consists of all curves of the form $s(\bar{u}, x, y) = \sum_{0 \leq i+j \leq d} u_{ij} x^i y^j$. Then, if $\bar{u}, \bar{v}$ are chosen in $L$, so that the reduced curves $C_{\bar{u}}$ and $C_{\bar{v}}$ are defined over $L$, if the tuple $\bar{u}'$ is chosen to be generic in $U$ over $L$, the deformed curve $C_{\bar{u}}'$ intersects $C_{\bar{v}}$ transversally at simple points.

**Proof.** We can give an explicit calculation;

Let $C_{\bar{u}}'$ be defined by the equation $s(\bar{u}', x, y) = \sum_{0 \leq i+j \leq d} u_{ij}' x^i y^j$ and $C_{\bar{v}}$ by $t(\bar{v}, x, y) = \sum_{0 \leq i+j \leq e} v_{ij} x^i y^j$ with $\{v_{ij} : 0 \leq i + j \leq e\} \subset L$ and $\{u_{ij}' : 0 \leq i + j \leq d\}$ algebraically independent over $L$. Let $(x_0 y_0)$ be a point of intersection, then $\dim(x_0 y_0/L) = 1$, otherwise $\dim(x_0 y_0/L) = 0$ and, as $L$ is algebraically closed, we must have that $x_0, y_0 \in L$. Substituting $(x_0 y_0)$ into the equation $s(\bar{u}', x, y) = 0$, we get a non trivial linear dependence over $L$ between $u_{00}$ and $u_{ij}'$ for $1 \leq i + j \leq d$ which is impossible. Now, the locus of singular points for $C_{\bar{v}}$ is defined over $L$ and hence $(x_0 y_0)$ is a simple point of $C_{\bar{v}}$. Now we further claim that $s(\bar{u}', x, y) = 0$ defines a non-singular curve in $P^2(K_\omega)$ with transverse intersection to $C_{\bar{v}}$. Consider the conditions $\text{Sing}(\bar{u})$ given by $\exists x_0 \exists y_0 (\frac{\partial s}{\partial x}(x_0 y_0), \frac{\partial s}{\partial y}(x_0 y_0)) = (0, 0)$ and $\text{Non-Transverse}(\bar{u})$ by $\exists x_0 \exists y_0 (\frac{\partial s}{\partial x}(x_0 y_0) \frac{\partial s}{\partial y}(x_0 y_0) - \frac{\partial s}{\partial y}(x_0 y_0) \frac{\partial s}{\partial x}(x_0 y_0)) = 0$. By the properness of $P^2(K_\omega)$, these conditions define closed subsets of the...
parameter space $U$ defined over $L$. We claim that this in fact a proper closed subset. This can be proved in a number of ways. In the case where we restrict ourselves to affine curves, the result follows from a classical result of Kleiman, see [8], as affine space $A^2(K_\omega)$ is homogeneous for the action of the additive group $(A^2(K_\omega), +)$. More generally, we can use the moving lemma, given in [7], by observing that the class of all degree $d$ projective curves is closed under rational equivalence. We can also use the following enumerative method, we will abbreviate $K_\omega$ to $K$;

Consider the vector bundle $S$ of dimension 3 on $P^2(K)$ given by $H^0(O_{P^2}(K)(d))/I^2_p(d)$ where $I^2_p(d)$ is the vector space of degree $d$ projective curves vanishing to second order at $p$. Let $F_1$ be the projective equation of $C_{\bar{u}}$ and $F_2$ a generically independent projective curve of degree $d$. Then we have a map from the trivial vector bundle $V_2$ of dimension 2 on $P^2(K)$ given by $\Phi_p : \lambda F_1 \oplus \mu F_2 \rightarrow S$. The number of singular curves in the pencil is given by the \{ $p \in P^2(K) : \Phi_p$ has non-trivial kernel \}. This is exactly the second Chern class $Ch_2(S)$ which has codimension 2 as a cycle on $P^2(K)$. This method gives infinitely many non-singular curves projective curves of degree $d$ in the pencil.

For the transversality calculation, we first assume that $C_{\bar{v}}$ is non-singular. Consider the vector bundle $S$ of dimension 2 on $C_{\bar{v}}$ given by $H^0(O_{P^2}(K)(d))/Tan_p(d)$ where $Tan_p(d)$ is the vector space of degree $d$ projective curves tangent to $C_{\bar{v}}$ at $p$. Again we have a map from the trivial vector bundle $V_2$ of dimension 2 on $C_{\bar{v}}$ given as above by $\Phi_p$. The number of curves in the pencil which are tangent to $C_{\bar{v}}$ is the first Chern class $Ch_1(S)$ which has codimension 1 as a cycle on $C_{\bar{v}}$. Again this gives an infinite number of curves with transverse intersection in the pencil. In case $C_{\bar{v}}$ is singular, we obtain a jump in rank of $S$ at the finitely many singular points, so cannot apply the above method. We resolve this as follows, let $\{ p_1, \ldots, p_r \}$ be the finitely many singular points on $C_{\bar{v}}$. Choosing $2(d+1)$ generically independent non-singular points on $C_{\bar{v}}$, we can find 2 independent degree $d$ projective curves $F_1$ and $F_2$ not passing through the singular set of $C_{\bar{v}}$. Now we blow up $P^2(K)$ along the curve $C_{\bar{v}}$. In the case when $p_1, \ldots, p_r$ are all not cusp points, the exceptional divisor $E$ of the blow up $\pi : Bl \rightarrow P^2(K)$ consists of a smooth curve $C_0$ and $r$ copies of $P_1$. We label the crossings $\{ q_1, q_2, \ldots, q_{2r} \}$ on $C_0$, mapping to the singular points of $C_{\bar{v}}$. We obtain a pencil of curves on $Bl$ by taking $(\lambda F_1 + \mu F_2)'$ the proper transform of the curves $\lambda F_1 + \mu F_2$ in $Bl$ (by construction,
these curves avoid \{q_1, \ldots, q_{2r}\}. Now we consider the following vector bundle \( S \) on \( C_0 \). At \( C_0 \setminus \{q_1, \ldots, q_{2r}\} \), this is just the pull back \( \pi^* S \) of the bundle considered above. At the crossings \((q_{2j-1}, q_{2j})\), it consists of the spaces \( H^0(\mathcal{O}_{P^2(K)}(d))/V_{p_j}^+ \) and \( H^0(\mathcal{O}_{P^2(K)}(d))/V_{p_j}^- \), where \( V_{p_j}^+ \) and \( V_{p_j}^- \) consist of the spaces of projective curves of degree \( d \) passing through \( p_j \) and tangent to the principal axes of the normal cone at \( p_j \).

An easy calculation shows that \( S \) is a vector bundle of rank 2 on the smooth projective curve \( C_0 \). Now consider the trivial bundle \( V^2 \) on \( C_0 \) given by \( \lambda F_1 + \mu F_2 \) and the corresponding map \( \Phi_{\bar{u}} \). Again, the points on \( C_0 \) for which this has non-zero kernel is given by \( Ch_1(S) \). This gives infinitely many curves in the family \( \lambda F_1 + \mu F_2 \) transverse to \( C_0 \). Now consider the exceptional divisor of smooth curves with normal crossings. A similar calculation (omitted), using the same method, works.

\[ \square \]

**Remarks 4.13.** If we restrict the family of curves, the result in general fails. A simple example is given by the family of all projective degree 3 curves \( Q_{3,0} \) passing through \((0,0)\) with \( x = X/Z \) and \( y = Y/Z \). If we take \( C_0 \) to be the cusp \( x^2 - y^3 \), then any curve in \( Q_{3,0} \) will have a non-transverse intersection with \( C_0 \) at the origin. In general we have to use deformation theory arguments or enumerative methods to decide this question.

**Lemma 4.14.** Moving Lemma for Curves with Finitely Many Marked Points

Let hypotheses be as in the previous lemma with \( C_{\bar{u}} \) and \( C_{\bar{v}} \) defining reduced curves. Suppose also that there exists finitely many marked points \( \{p_1, \ldots, p_n\} \) on \( C_\bar{v} \) defined over \( L \). Then for \( \bar{u}' \in U \) generic over \( L \) the deformed curve \( C_{\bar{u}}' \) intersects \( C_\bar{v} \) transversely at finitely many simple points excluding the set \( \{p_1, \ldots, p_n\} \).

**Proof.** As before, the condition that \( \bar{u}' \) defines a curve \( C_{\bar{u}}' \) either with non-transverse intersection to \( C_\bar{v} \) or passing through at least one of the points \( \{p_1, \ldots, p_n\} \) is a closed subset of \( U \) defined over \( L \). Using the above proof and the obvious fact that we can find a curve \( C_{\bar{u}}' \) not passing through any of the points \( \{p_1, \ldots, p_n\} \), we see that it is proper closed.

\[ \square \]

**Lemma 4.15.** Unit Removal for Reduced Curves
Let \((\pi, s) : F \to U \times V\) be a Weierstrass cover with units factoring through projective degree \(d\) and degree \(e\) curves. Let \((\bar{u}, \bar{v}) \in U \times V\), then there exists a Weierstrass cover \((\pi', s') : F^- \to U' \times V'\) with \(U' \subset U\) and \(V' \subset V\) open subsets, \((\bar{u}, \bar{v}) \in U' \times V'\), such that \(\text{Mult}_{(\bar{u}, \bar{v}, s(\bar{u}, \bar{v}))}((F/\bar{u} - \bar{v}) \times V) = \text{Mult}_{(\bar{u}, \bar{v}, s'(\bar{u}, \bar{v}))}((F^-/U' \times V')\).

**Proof.** Let \(C_{\bar{u}}'\) and \(C_{\bar{v}}'\) be the Weierstrass curves with units in \(A_{\bar{u}, \bar{v}}\) lifting the curves \(C_{\bar{u}}\) and \(C_{\bar{v}}\). Now suppose that \(\text{Mult}_{(\bar{u}, \bar{v}, s(\bar{u}, \bar{v}))}((F/\bar{u} - \bar{v}) \times V) = n\). Then we can find \((\bar{u}', \bar{v}') \in V_{\bar{u}0} \cap U \times V\) generic over \(L\) such that the deformed curve \(\bar{C}_{\bar{u}}'\) intersects \(\bar{C}_{\bar{v}}'\) at the \(n\) distinct points \(x_1, \ldots, x_n\) in \(V_{s(\bar{u}, \bar{v})}\). Now using the Weierstrass factorisations of \(C_{\bar{u}}'\) and \(C_{\bar{v}}'\), we claim that \(U_{\bar{u}}'(x_i) \neq 0\) and \(U_{\bar{v}}'(x_i) \neq 0\). Suppose not, then \(U_{\bar{u}}'(x_i) = U_{\bar{v}}'(x_i) = 0\) and as \((\bar{u}', \bar{v}', x_i)\) specialises to \((\bar{u}, \bar{v}, s(\bar{u}, \bar{v}))\), then \(U_{\bar{u}}(s(\bar{u}, \bar{v})) = U_{\bar{v}}(s(\bar{u}, \bar{v})) = 0\). This contradicts the fact that \(U_{\bar{u}}\) and \(U_{\bar{v}}\) are units in the local ring \(O_{s(\bar{u}, \bar{v}), A_{\bar{u}, \bar{v}}}\). Therefore, we must have that \(F_{\bar{u}}'(x_i) = F_{\bar{v}}'(x_i) = 0\). This shows that \(\text{Mult}_{(\bar{u}, \bar{v}, s(\bar{u}, \bar{v}))}((F^-/U \times V) \geq n\) where \(F^- \to U \times V\) is the cover of \(U \times V\) obtained by taking as fibres \(F^-/(\bar{u}, \bar{v})\) the intersection of the Weierstrass factors \(F_{\bar{u}}\) and \(F_{\bar{v}}\). Formally, if \(F\) is defined by \(\text{Spec}(\frac{R_{U \times V}[x,y]}{<S,T>})\) then \(F^-\) is defined by \(\text{Spec}(\frac{R_{U \times V}[x,y]}{<S,T>})\). Clearly as \(F^- \subset F\) is a union of components of \(F\), we have that \(\text{Mult}_{(\bar{u}, \bar{v}, s(\bar{u}, \bar{v}))}((F^-/U \times V) \leq n\) as well. This proves the lemma.

\(\square\)

We now complete the proof of Lemma 4.8. By unit removal, it is sufficient to compute the Zariski multiplicity of the cover

\[\text{Spec}(\frac{R_{U \times V}[x,y]}{<S,T>}) \to \text{Spec}(R_{U \times V})\]

The fibre over \((\bar{u}, \bar{v})\) of this cover corresponds exactly to the intersection of the Weierstrass curves \(F_{\bar{u}}\) and \(F_{\bar{v}}\) lifting \(C_{\bar{u}}\) and \(C_{\bar{v}}\). We then use Lemma 2.7, noting that the Weierstrass factors are still reduced, see \([2]\), to finish the result, with the straightforward modification that we work in a uniform family of etale covers.

We now turn to the problem of non-reduced curves. We will show the following stronger version of Lemma 4.8

**Lemma 4.16.** Let \(C_{\bar{u}}'\) and \(C_{\bar{v}}'\) be non-reduced curves having finite intersection, then the Zariski multiplicity of the cover (*) at \(((0,0), \bar{u}^0, \bar{v}^0)\)
equals the intersection multiplicity $I(C_{\bar{u}_0}, C_{\bar{v}_0}, (0,0))$ of $C_{\bar{u}_0}$ and $C_{\bar{v}_0}$ at $(0,0)$.

First, we will require some more lemmas.

**Lemma 4.17.** Let $C_{\bar{u}_0}$ and $C_{\bar{v}_0}$ be reduced curves intersecting transversally at $(0,0)$. Then the Zariski multiplicity, left multiplicity and right multiplicity of the cover (*) at $((0,0), \bar{u}_0, \bar{v}_0)$ equals 1.

**Proof.** First note that by Lemma 2.6 (and corresponding Lemma 2.9), and the fact that a generic deformation $C_{\bar{v}_0}'$ will still intersect $C_{\bar{u}_0}$ transversally by Lemma 4.12, it is sufficient to prove the result for right multiplicity.

In order to show this we require the following result, given for analytic curves in [2], we will only need the result for polynomials;

**Implicit Function Theorem:**

If $G(X,Y)$ is a power series with $G(0,0) = 0$ implies there exists a power series $\eta(X)$ with $\eta(0) = 0$ such that $G(X, \eta(X)) = 0$.

In order to show that $RightMult_{(0,0), \bar{u}_0, \bar{v}_0}(F'/U \times V) = 1$, where $F'$ is the family obtained by intersecting degree $d$ and degree $e$ curves, we apply the implicit function theorem to the curve $C_{\bar{u}_0}$ at the point $(0,0)$. Moreover, as the first curve is non-singular at $(0,0)$, we may also assume that $G_Y(0,0) \neq 0$. Now let $\eta(X)$ be given by the theorem. As the intersection of the curves $C_{\bar{u}_0}$ and $C_{\bar{v}_0}$ is transverse, $ord_X H(X, \eta(X)) = 1$. Now we have the sequence of maps;

$$L[\bar{v}] \rightarrow \frac{L[X,Y][\bar{v}]}{<G(\bar{u},X,Y),H(\bar{v},X,Y)>} \rightarrow \frac{L[X][\eta(X)]}{<Y-\eta(X),H(\bar{v},X,Y)>}.$$

where $L[X]^{ext}$ is an etale extension of $L[X]$ containing $\eta(X)$. (Note that $\eta(X)$ is trivially algebraic over $L(X)$). This corresponds to a sequence of finite covers $F_1 \rightarrow F'(u_0, V) \rightarrow \text{Spec}(L[\bar{v}])$. The left hand morphism is trivially etale at $(\bar{v}^0, (00)^{left})$, hence it is sufficient to compute the Zariski multiplicity of $F' \rightarrow \text{Spec}(L[\bar{v}])$ at $(\bar{v}^0, (00)^{left})$ by Lemma 2.3 (or corresponding Lemma 2.9). This is a straightforward calculation, the fibre over $\bar{v}^0$ consists of the scheme $\text{Spec}(L[X,\eta(X)]) = \text{Spec}(L)$ as $ord_X (H(X, \eta(X))) = 1$, hence is etale at the point $(\bar{v}^0, (00)^{left})$. 

A NON-STANDARD BEZOUT THEOREM 23
By Theorem 1.4, the Zariski multiplicity is 1.

\[ \square \]

**Lemma 4.18.** Let hypotheses be as in Lemma 4.17, then for any \((\bar{u}', \bar{v}') \in \mathcal{V}_{(u^0, v^0)}\), we have that \(\text{Card}(F'(\bar{u}', \bar{v}') \cap \mathcal{V}_{0,0}) = 1\)

**Proof.** This follows immediately from Lemma 4.17 and Lemma 2.4.

\[ \square \]

**Definition 4.19.** For ease of notation, given curves \(C_{\bar{u}}\) and \(C_{\bar{v}}\) of degree \(d\) and degree \(e\) intersecting at \(x \in \mathbb{P}^2(K_{\omega})\), we define \(\text{Mult}_x(C_{\bar{u}}, C_{\bar{v}})\) to be the corresponding Zariski multiplicity of the cover \(F' \to U \times V\) at the point \((x, \bar{u}, \bar{v})\). Similarly for left/right multiplicity.

We can now give the proof of Lemma 4.16;

**Proof.** Case 1. \(C_{\bar{v}_0}\) is a reduced curve (possibly having components). Write \(C_{\bar{u}_0} = G_1(X, Y) \cdots G_m(X, Y) = 0\) with \(G_i\) the reduced irreducible components of \(C_{\bar{u}_0}\) with degree \(d_i\) passing through \((0, 0)\).

Choose \(\zeta_1, \ldots, \zeta_m, \ldots, \zeta_1, \ldots, \zeta_m\) independent generic in \(U_i\), the parameter space for degree \(d_i\) projective curves with \(\zeta_i \in \mathcal{V}_{\bar{u}_0}\), where \(\bar{u}_i^0\) defines \(G_i\). By repeated application of Lemma 4.14, the deformed curves \(\prod_{ij} G_i^{\zeta_i} = 0\) intersect \(C_{\bar{v}_0}\) transversely at disjoint sets of points. We denote by \(Z_{\zeta_i}^{\zeta_i}\) those points lying in \(\mathcal{V}_{\bar{v}_0}\). Now the curve defined by \(\prod_{ij} G_i^{\zeta_i} = 0\) is a deformation \(C_{\bar{v}_0}^{\zeta_i}\) of \(C_{\bar{v}_0}\). We let \(Z_{\bar{v}_0}\) denote the points of intersection of \(C_{\bar{v}_0}^{\zeta_i}\) with \(C_{\bar{v}_0}\) in \(\mathcal{V}_{00}\). Then we have;

\[ Z_{\zeta} = \bigcup_{ij} Z_{\zeta_i}^{\zeta_j} \]
\[ \text{Card}(Z_{\zeta}) = \sum_{ij} \text{Card}(Z_{\zeta_i}^{\zeta_j}) \]

By Lemma 2.4, we have that

\[ \text{LeftMult}_{(00)}(C_{\bar{u}_0}, C_{\bar{v}_0}) = \sum_{x \in Z_{\zeta}} \text{LeftMult}_x(C_{\bar{u}_0}^{\zeta_i}, C_{\bar{v}_0}^{\zeta_i}) \]
\[ = \sum_{i,j} \sum_{x \in Z_{\zeta_i}^{\zeta_j}} \text{LeftMult}_x(C_{\bar{u}_0}^{\zeta_i}, C_{\bar{v}_0}^{\zeta_j})(*) \]

We now claim that for a point \(x \in Z_{\zeta_i}^{\zeta_j}\),

\[ \text{LeftMult}_x(C_{\bar{u}_0}^{\zeta_i}, C_{\bar{v}_0}^{\zeta_j}) = \text{LeftMult}_x(C_{\bar{u}_0}^{\zeta_i}, C_{\bar{v}_0}^{\zeta_j})(**) \]
This follows as both the reduced curves $\bar{C}_u$ and $\bar{G}_v$ intersect $\bar{C}_{\bar{v}_0}$ transversely at $x$. Hence, in both cases the left multiplicity is $1$, by Lemma 4.17.

Combining $(\ast)$ and $(\ast\ast)$, we obtain;

$$\text{LeftMult}_{(00)}(\bar{C}_u, \bar{C}_v) = \sum_{i,j} \sum_{x \in Z_{\bar{v}_i}} \text{LeftMult}_x(G_i, \bar{C}_v)$$

Now using Lemma 2.4 again gives that;

$$\text{LeftMult}_{(00)}(\bar{C}_u, \bar{C}_v) = \sum_{i=1}^{m} n_i \text{LeftMult}_{(00)}(G_i, C_v, (00)) \quad (\ast\ast\ast)$$

If we go through exactly the same calculation with $\text{Mult}$ replacing $\text{Left Mult}$, we see as well that

$$\text{Mult}_{(00)}(\bar{C}_u, \bar{C}_v) = \sum_{i=1}^{m} n_i \text{Mult}_{(00)}(G_i, C_v, (00))$$

By Lemma 4.8, this gives

$$\text{Mult}_{(00)}(\bar{C}_u, \bar{C}_v) = \sum_{i=1}^{m} n_i I(G_i, C_v, (00))$$

By a straightforward algebraic calculation, see references below for the definitive result, this gives

$$\text{Mult}_{(00)}(\bar{C}_u, \bar{C}_v) = I(C_u, C_v, (00))$$

as required.

Case 2. Both $\bar{C}_{\bar{u}_0}$ and $\bar{C}_{\bar{v}_0}$ define non-reduced curves. Write $\bar{C}_{\bar{u}_0}$ as above and $\bar{C}_{\bar{v}_0}$ as $H_1^{e_1} \ldots H_n^{e_n}$ with $H_i$ the reduced components with degree $c_i$ of $\bar{C}_{\bar{v}_0}$ passing through (00). Then $H_1 \ldots H_n = 0$ defines a reduced curve passing through (00). Now repeat the argument in Case 1 for the curves $\bar{C}_{\bar{u}_0}$ and $H_1 \ldots H_n = 0$. Again let $Z_{\bar{v}}$ be the intersection points of the deformed curve $\bar{C}_{\bar{u}_0}$ with $H_1 \ldots H_n = 0$ in $V_{(00)}$. By $(\ast\ast\ast)$ of Case 1, Lemma 2.4 and Lemma 4.18 with the fact that the intersection of $\bar{C}_{\bar{u}_0}$ with $H_1 \ldots H_n$ is transverse, we have;

$$\text{Card}(Z_{\bar{v}}) = \sum_{i=1}^{m} n_i \text{Mult}_{(00)}(G_i, H_1 \ldots H_n)$$
Now using the argument in Case 1 applied to the reduced curves $G_i$ and $H_1 \ldots H_n$, we have;

$$\text{Card}(Z_i) = \sum_{i=1}^{m} n_i \sum_{j=1}^{n_i} I(G_i, H_j, (00)) \quad (*)$$

We claim that for any component $H_j$

$$\text{Card}(H_j \cap Z_i) = \sum_{i=1}^{m} n_i I(G_i, H_j, (00))$$

This follows as the deformed curve $C_{\bar{u}_0}^{e}$ a fortiori intersects $H_j$ transversely at simple points. Therefore, again by Case 1, gives the expected multiplicity. Now, using this together with $(*)$, we write $Z_{\bar{u}}$ as $\bigcup_j Z_j \bar{u}$ where $Z_j \bar{u}$ are the disjoint sets consisting of the intersection of $C_{\bar{u}_0}^{e}$ with $H_j$. Then by Lemma 2.6, we have that

$$\text{Mult}_{(00)}(C_{\bar{u}_0}, C_{\bar{v}_0}) = \sum_j \sum_{x \in Z_j} \text{Right Mult}_x(C_{\bar{u}_0}, C_{\bar{v}_0})$$

We can now calculate the Right Mult term by applying Case 1 to the intersection of $C_{\bar{v}_0}$ with the reduced curve $C_{\bar{u}_0}^{e}$ at the points of intersection $x \in Z_j$. At a point $x \in Z_j$, we have that

$$\text{Right Mult}_x(C_{\bar{u}_0}, C_{\bar{v}_0}) = e_j I(C_{\bar{u}_0}^{e}, H_j, x) = e_j$$

as the intersection is transverse. Finally this gives;

$$
\text{Mult}_{(00)}(C_{\bar{u}_0}, C_{\bar{v}_0}) = \sum_{i=1}^{m} \sum_{j=1}^{n_i} n_i e_j I(G_i, H_j, (00))
$$

By an algebraic result, see [9] for the case of complex algebraic curves, or [6] for its generalisation to algebraic curves in arbitrary characteristics, we have

$$\text{Mult}_{(00)}(C_{\bar{u}_0}, C_{\bar{v}_0}) = I(C_{\bar{u}_0}, C_{\bar{v}_0}, (00))$$

as required.

The following version of Bezout’s theorem in all characteristics is now an easy generalisation from the above lemma. For curves $C_1$ and $C_2$ in $P^2(L)$, we let $M(C_1, C_2, x)$ denote the intersection multiplicity or the Zariski multiplicity, we know from the above that the two are equivalent.
Theorem 4.20. Non-Standard Bezout

Let $C_1$ and $C_2$ be projective curves of degree $d$ and degree $e$ in $P^2(L)$, possibly with non-reduced components, intersecting at finitely many points $\{x_1, \ldots, x_i, \ldots x_n\}$, then we have;

$$\sum_{i=1}^{n} M(C_1, C_2, x_i) = de.$$  

Of course, we could just quote the algebraic result given in [8] (though this in fact only holds for reduced curves). Instead we can give a non-standard proof, which in many ways is conceptually simpler and doesn’t involve any algebra;

Proof. Let $Q_d$ and $Q_e$ be the families of all projective degree $d$ and degree $e$ curves. Then we have the cover $F \to U \times V$ with $F \subset U \times V \times P^2(L)$ obtained by intersecting the families $Q_d$ and $Q_e$. We have that

$$\sum_{i=1}^{n} M(C_1, C_2, x_i) = \sum_{i=1}^{n} Mult_{x_i \in F(\bar{u_0}, \bar{v_0})}(F/U \times V)$$

where $(\bar{u_0}, \bar{v_0})$ define $C_1$ and $C_2$. By Lemma 4.3 in [5], this equals

$$\sum_{x \in F(\bar{u}, \bar{v})} Mult_{x, \bar{u}, \bar{v}}(F/U \times V)$$

where $(\bar{u}, \bar{v})$ is generic in $U \times V$. Using, for example, the proof of Lemma 4.12, generically independent curves $C_{\bar{u}}$ and $C_{\bar{v}}$ intersect transversely at a finite number of simple points. Hence, by Lemma 4.17, the Zariski multiplicity calculated at these points is 1. As the cover $F$ has degree $de$, there is a total number $de$ of these points as required.
