Abstract
Recently the theory of widths of Kolmogorov-Gelfand has received a great deal of interest due to its close relationship with the newly born area of Compressive Sensing in Signal Processing, cf. [5] and references therein. However fundamental problems of the theory of widths in multidimensional Theory of Functions remain untouched, as well as analogous problems in the theory of multidimensional Signal Analysis. In the present paper we provide a multidimensional generalization of the original result of Kolmogorov about the widths of an "ellipsoidal sets" consisting of functions defined on an interval.

1 Introduction
In his seminal paper [8] Kolmogorov has introduced the theory of widths and applied it very successfully to the following set of functions defined in the compact interval:

\[ K_p := \left\{ f \in AC^{p-1} ([a, b]) : \int_0^1 |f^{(p)}(t)|^2 dt \leq 1 \right\}. \]  

(1)

In the present paper we consider a natural multivariate generalization of the set \( K_p \) given by

\[ K^*_p := \left\{ u \in H^{2p} (B) : \int_B |\Delta^p u (x)|^2 dx \leq 1 \right\}. \]  

(2)
where $\Delta^p$ is the $p$-th iterate of the Laplace operator $\Delta = \sum_{j=1}^{n} \partial^2 / \partial x_j^2$ in $\mathbb{R}^n$.

We generalize the notion of width in the framework of the Polyharmonic Paradigm, and obtain analogs to the one-dimensional results of Kolmogorov.

The Polyharmonic Paradigm has been announced in [9] as a new approach in Multidimensional Mathematical Analysis (in particular, in the Moment Problem, Approximation and Spline Theory) which is based on solutions of higher order elliptic equations as opposed to the usual concept which is based on algebraic and trigonometric polynomials of several variables. The main result of the present research is a new aspect of the Polyharmonic Paradigm. It provides a new hierarchy of infinite-dimensional spaces of functions which are used for a generalization of the Kolmogorov’s theory of widths. This new hierarchy generalizes the hierarchy of finite-dimensional subspaces $S_N$ of the space $C^\infty (I)$ for an interval $I \subset \mathbb{R}$. Let us give a rough idea of this hierarchy in the case of a domain $D \subset \mathbb{R}^n$, where $D$ is a compact domain with sufficiently smooth boundary $\partial D$. In the new hierarchy in $\mathbb{R}^n$, the $N$-dimensional subspaces in $C^\infty (I)$ will be generalized by solution spaces

$$S_N = \{ u : P_{2N} u (x) = 0, \text{ for } x \in D \} \subset C^\infty (D),$$

where $P_{2N}$ is an elliptic operator of order $2N$ in the domain $D$; their precise definitions will be specified later on.

## 2 Kolmogorov’s result - a reminder

Let us recall the original result of Kolmogorov provided in his seminal paper [8] where he introduced for the first time the theory of widths. Kolmogorov has considered the set $K_p$ defined in (1). He proved that this is an ellipsoid by constructing explicitly its principal axes. Namely, he considered the eigenvalue problem

$$( -1)^p u^{(2p)} (t) = \lambda u (t) \quad \text{ for } t \in (0,1)$$  \hspace{1cm} (3)

$$u^{(p+j)} (0) = u^{(p+j)} (1) = 0 \quad \text{ for } j = 0, 1,\ldots, p - 1.$$  \hspace{1cm} (4)

By the results of M. Krein proved an year earlier [10], [13], Kolmogorov proved that problem (3)-(4) has the following properties, cf. also [12], Chapter 9.6, Theorem 9, p. 146, [15], section 4.4.4, Theorem 6, p. 244, [14]:

**Proposition 1** Problem (3)-(4) has a countable set of non-negative real eigenvalues with finite multiplicity. If we denote them by $\lambda_j$ in a monotone...
order, they satisfy $\lambda_j \to \infty$ for $j \to \infty$. They satisfy the following asymptotic $\lambda_j = \pi^2 p_j^2 \left( 1 + O \left( j^{-1} \right) \right)$. The corresponding orthonormalized eigenfunctions $\{\psi_j\}_{j=1}^{\infty}$ form a complete orthonormal system in $L_2([0,1])$. The eigenvalue $\lambda = 0$ has multiplicity $p$ and the corresponding eigenfunctions $\{\psi_j\}_{j=1}^{p}$ are the basis for the solutions to equation $u^{(p)}(t) = 0$ in the interval $(0,1)$.

Further, Kolmogorov provided a description of the axes of the ”cylindrical ellipsoid set” $K_p$, from which easily follows an approximation theorem of Jackson type.

**Proposition 2** Let $f \in L_2([a,b])$ have the $L_2$—expansion

$$f(t) = \sum_{j=1}^{\infty} f_j \psi_j(t).$$

Then $f \in K_p$ if and only if

$$\sum_{j=1}^{\infty} f_j^2 \lambda_j \leq 1.$$

For $N \geq p + 1$ and every $f \in K_p$ holds the following estimate (Jackson type approximation):

$$\left\| f - \sum_{j=1}^{N} f_j \psi_j(t) \right\|_{L_2} \leq \frac{1}{\sqrt{\lambda_{N+1}}} = O \left( \frac{1}{(N+1)^p} \right).$$

However, Komogorov didn’t stop at this point but asked further, whether the linear space $\hat{X}_N := \{\psi_j\}_{j=1}^{N}$ provides the ”best possible approximation among the linear spaces of dimension $N$” in the following sense: if we put

$$d_N(K_p) := \inf_{\hat{X}_N} \text{dist} \left( \hat{X}_N, K_p \right)$$

then Kolmogorov has proved in [8] the following equality

$$d_N(K_p) = \text{dist} \left( \hat{X}_N, K_p \right).$$

Hence, the above result reads as

$$d_N(K_p) = \frac{1}{\sqrt{\lambda_{N+1}}} \quad \text{for } N \geq p$$

$$d_N(K_p) = \infty \quad \text{for } N = 0, 1, \ldots, p - 1.$$
Here we have used the notations
\[
\text{dist} \left( X, K_p \right) := \sup_{y \in K_p} \text{dist} \left( X, y \right)
\]
\[
\text{dist} \left( X, y \right) = \inf_{x \in X} \| x - y \|.
\]

**Definition 3** The left quantity in (5) is called Kolmogorov \textit{N-width}, while the best approximation space \( \tilde{X}_N \) is called \textit{extremal (optimal) subspace}, cf. [12], [15], [14].

Thus the main concept of the theory of widths is closely related to a Jackson type theorem by which a special space \( \tilde{X}_N \) is identified. Then one has to find in which sense is the space \( \tilde{X}_N \) the extremal subspace. We may formulate it in other words: one has to find as wide class of spaces \( X_N \) as possible, among which \( \tilde{X}_N \) is the extremal subspace.

Now let us consider the following set which is a natural multivariate generalization of the above set \( K_p \) defined in (1): For simplicity sake we will restrict ourselves with the unit ball \( B \) in \( \mathbb{R}^n \). We put
\[
K^*_p := \left\{ u \in H^{2p} (B) : \int_B |\Delta^p u (x)|^2 \, dx \leq 1 \right\}.
\]
Let us remark that the Sobolev space \( H^{2p} (B) \) is the multivariate version of the space of absolutely continuous functions on the interval with a highest derivative in \( L_2 \) (as in (1)). An important feature of the set \( K^*_p \) is that it contains an infinite-dimensional subspace
\[
\left\{ u \in H^{2p} (B) : \Delta^p u (x) = 0, \quad \text{for } x \in B \right\}.
\]
Hence, all Kolmogorov widths are equal to infinity,
\[
d_N \left( K^*_p \right) = \infty \quad \text{for } N \geq 0
\]
and no way is seen to improve this if one remains within the finite-dimensional setting.

The main purpose of the present paper is to find a proper setting in the framework of the Polyharmonic Paradigm which generalizes the above results of Kolmogorov.

### 3 Elliptic differential operators and Elliptic BVP

As we said we restrict ourselves to a simple domain as the unit ball \( B \) in \( \mathbb{R}^n \). However the results below hold for a much bigger class of domains.
We will make extensive use of the following Green formula for the polyharmonic operator $\Delta^p$, cf. [3], p. 10:

$$
\int_B (\Delta^p u \cdot v - u \cdot \Delta^p v) \, dx = \sum_{j=0}^{p-1} \int_{\partial B} (\Delta^j u \cdot \partial_n \Delta^{p-1-j} v - \partial_n \Delta^j u \cdot \Delta^{p-1-j} v) \, ds.
$$

(6)

here $\partial_n$ denotes the normal derivative to $\partial B$, for functions $u$ and $v$ in the classes of Sobolev, $u, v \in H^{2p}(B)$.

For us the following eigenvalue problem will be important to consider for $U \in H^{2p}(B)$:

$$
\Delta^{2p} U(x) = \lambda U(x) \quad \text{for } x \in B
$$

(7)

$$
\Delta^{p+j} U(y) = \partial_n \Delta^{p+j} U(y) = 0, \quad \text{for all } y \in \partial B, \quad j = 0, 1, ..., p - 1
$$

(8)

where $\partial_n$ denotes the normal derivative at $y \in \partial B$. The operator $\Delta^{2p}$ is formally self-adjoint, cf. [11], however the BVP (7)-(8) is not a nice one from the point of view of Elliptic Boundary Value problems. Since a direct reference seems not to be available, we need a special consideration of this problem provided in the following theorem.

**Theorem 4** Problem (7)-(8) has only real non-negative eigenvalues.

1. The eigenvalue $\lambda = 0$ has infinite multiplicity with corresponding eigenfunctions $\{\psi'_j\}_{j=1}^{\infty}$ which represent an orthonormal basis of the space of all solutions to the equation $\Delta^p U(x) = 0$, for $x \in B$.

2. The positive eigenvalues are countably many and each has finite multiplicity, and if we denote them by $\lambda_j$ ordered increasingly, they satisfy $\lambda_j \to \infty$ for $j \to \infty$.

3. The orthonormalized eigenfunctions, corresponding to eigenvalues $\lambda_j > 0$, will be denoted by $\{\psi_j\}_{j=1}^{\infty}$. The set of functions $\{\psi_j\}_{j=1}^{\infty} \cup \{\psi'_j\}_{j=1}^{\infty}$ form a complete orthonormal system in $L_2(B)$.

**Remark 5** Problem (7)-(8) is widely known to be non-regular elliptic BVP, as well as non-coercive variational, c.f. [1], p. 150 at the end of section 10, Lions-Magenes Remark 9.8 (chapter 2, section 9.6, p. 240 in the Russian edition) and section 9.8 there, p. 242. This problem will give us the eigenfunctions $\psi_k$ in the notations in [12].

The proof is provided in the Appendix below, section 5.
4 The principal axes of the ellipsoid $K_p^*$ and Jackson type theorem

Here we will find the principal axes of the ellipsoid $K_p^*$ defined in (2).

We prove the following theorem which generalizes Kolmogorov’s one-dimensional [8], about the representation of the ellipsoid $K_p$ in principal axes.

**Theorem 6** Let $f \in K_p^*$. Then $f$ is represented in a $L_2$-series as

$$f(x) = \sum_{j=1}^{\infty} f'_j \psi'_j(x) + \sum_{j=1}^{\infty} f_j \psi_j(x)$$

(where by Theorem 4 the eigenfunctions $\psi'_j$ satisfy $\Delta^p \psi'_j(x) = 0$ while the eigenfunctions $\psi_j$ correspond to the eigenvalues $\lambda_j > 0$) where the coefficients satisfy the inequality

$$\sum_{j=1}^{\infty} \lambda_j f_j^2 \leq 1.$$

Vice versa, every sequence $\{f'_j\}_{j=1}^{\infty} \cup \{f_j\}_{j=1}^{\infty}$ with $\sum_{j=1}^{\infty} |f'_j|^2 + \sum_{j=1}^{\infty} |f_j|^2 < \infty$

and $\sum_{j=1}^{\infty} \lambda_j f_j^2 \leq 1$ define a function $f \in L_2(B)$ which is in $K_p^*$.

**Proof.**

1. According to Theorem 4, we know that arbitrary $f \in L_2(B)$ is represented as

$$f(x) = \sum_{j=1}^{\infty} f'_j \psi'_j(x) + \sum_{j=1}^{\infty} f_j \psi_j(x)$$

$$\|f\|^2_{L_2} = \sum_{j=1}^{\infty} |f'_j|^2 + \sum_{j=1}^{\infty} |f_j|^2 < \infty$$

with convergence in the space $L_2(B)$.

2. From the proof of Theorem 4, we know that if we put

$$\phi_j(x) = \Delta^p \psi_j(x)$$ for $j \geq 1$,

then the system of functions

$$\frac{\phi_j(x)}{\sqrt{\lambda_j}}$$ for $j \geq 1$
is orthonormal sequence which is complete in \( L_2 (B) \).

3. We will prove now that if \( f \in L_2 (B) \) then \( f \in K_p^* \) iff

\[
\sum_{j=1}^{\infty} f_j^2 \lambda_j \leq 1.
\]

Indeed, for every \( f \in H^{2p} (B) \) we have the expansion \( f (x) = \sum_{j=1}^{\infty} f_j \psi_j (x) + \sum_{j=1}^{\infty} f_j \phi_j (x) \). We want to see that it is possible to differentiate termwise this expansion, i.e.

\[
\Delta^p f (x) = \sum_{j=1}^{\infty} f_j \Delta^p \psi_j (x) = \sum_{j=1}^{\infty} f_j \phi_j (x)
\]

Since \( \left\{ \frac{\phi_j}{\sqrt{\lambda_j}} \right\}_{j\geq 1} \) is a complete orthogonal basis of \( L_2 (B) \) it is sufficient to see that

\[
\int_B \Delta^p f (x) \phi_j dx = \int_B \left( \sum_{j=1}^{\infty} f_j \Delta^p \psi_j (x) \right) \phi_j dx.
\]

Due to the boundary properties of \( \phi_j \) and since \( \phi_j = \Delta^p \psi_j \), we obtain

\[
\int_B \Delta^p f (x) \phi_j dx = \int_B f (x) \Delta^p \phi_j dx = \lambda_j \int_B f \psi_j dx = \lambda_j f_j.
\]

On the other hand

\[
\int_B \left( \sum_{k=1}^{\infty} f_k \phi_k (x) \right) \phi_j dx = \lambda_j f_j.
\]

Hence

\[
\Delta^p f (x) = \sum_{j=1}^{\infty} f_j \Delta^p \psi_j (x) = \sum_{j=1}^{\infty} f_j \phi_j (x) = \sum_{j=1}^{\infty} \sqrt{\lambda_j} f_j \frac{\phi_j (x)}{\sqrt{\lambda_j}}
\]

and since \( \left\{ \frac{\phi_j}{\sqrt{\lambda_j}} \right\}_{j\geq 1} \) is an orthonormal system, it follows

\[
\| \Delta^p f \|_{L_2}^2 = \sum_{j=1}^{\infty} \lambda_j f_j^2.
\]
Thus if $f \in K_p$ it follows that $\sum_{j=1}^{\infty} \lambda_j f_j^2 \leq 1$.

Now, assume vice versa, that $\sum_{j=1}^{\infty} f_j^2 \lambda_j \leq 1$ holds together with $\sum_{j=1}^{\infty} |f_j|^2 + \sum_{j=1}^{\infty} |f_j|^2 < \infty$. We have to see that the function

$$f(x) = \sum_{j=1}^{\infty} f_j' \psi_j(x) + \sum_{j=1}^{\infty} f_j \psi_j(x)$$

belongs to the space $H^{2p}(B)$. Based on the completeness and orthonormality of the system $\left\{ \frac{\phi_j(x)}{\sqrt{\lambda_j}} \right\}_{j=1}^{\infty}$ we may define the function $g \in L_2$ by putting

$$g(x) = \sum_{j=1}^{\infty} \sqrt{\lambda_j} f_j \frac{\phi_j(x)}{\sqrt{\lambda_j}} = \sum_{j=1}^{\infty} f_j \phi_j(x);$$

it obviously satisfies $\|g\|_{L_2} \leq 1$.

As is well known from the theory of Elliptic Boundary Value Problems we may find a function $F \in H^{2p}(B)$ which is a solution to equation $\Delta^p F = g$ (see Theorem 5.3 in chapter 2, section 5.3, [11]). Let its representation be

$$F(x) = \sum_{j=1}^{\infty} f_j' \psi_j(x) + \sum_{j=1}^{\infty} F_j \psi_j(x)$$

with some $F_j$ satisfying $\sum_j |F_j|^2 < \infty$. As above we obtain

$$\lambda_j \int_B F \psi_j dx = \int_B F \Delta^{2p} \psi_j dx = \int_B \Delta^p F \cdot \Delta^p \psi_j dx = \int_B g \cdot \phi_j dx$$

which implies $F_j = f_j$. Hence, $F = f$ and $f \in H^{2p}(B)$. This ends the proof.

We are able to prove finally a **Jackson type** result as in Proposition 2.

**Theorem 7** Let $N \geq 1$. Then for every $N \geq 1$ and every $f \in K_p^*$ holds the following estimate:

$$\left\| f - \sum_{j=1}^{\infty} f_j' \psi_j(x) - \sum_{j=1}^{N} f_j \psi_j(x) \right\|_{L_2} \leq \frac{1}{\sqrt{\lambda_{N+1}}}. $$
**Proof.** The proof follows directly. Indeed, due to the monotonicity of $\lambda_j$, and inequality (9), we obtain

$$
\left\| f - \sum_{j=1}^{\infty} f_j' \psi_j'(x) - \sum_{j=1}^{N} f_j \psi_j(x) \right\|_{L_2}^2 = \sum_{j=N+1}^{\infty} f_j^2 \leq \frac{1}{\lambda_{N+1}} \sum_{j=N+1}^{\infty} f_j^2 \lambda_j \leq \frac{1}{\lambda_{N+1}}.
$$

This ends the proof.

Now we are able to prove a generalization of Kolmogorov’s result about widths [8]. It is important which classes of spaces we are going to choose for generalizing the widths. We introduce the following subspaces in $L_2(B)$: For integers $M \geq 1$ we define

$$
S_M := \{ u \in H^{2M}(B) : Q_{2M} u(x) = 0, \text{ for } x \in B \} \quad (10)
$$

where $Q_{2M}$ is a uniformly strongly elliptic operator of order $2M$, cf. [2], [11], or [9], p. 473. We denote by $F_N$ a finite-dimensional subspace of $L_2(B)$ of dimension $N$. We denote the special subspaces for $P_{2M} = \Delta^M$ by

$$
\tilde{S}_M := \{ u \in H^{2M}(B) : \Delta^M u(x) = 0, \text{ for } x \in B \},
$$

and the special finite-dimensional subspaces

$$
\tilde{F}_N := \{ \psi_j : j \leq N \} \text{ lin} \quad (12)
$$

where $\psi_j$ are the eigenfunctions from Theorem 4.

The following results are analogs to the original Kolmogorov’s results about widths, cf. [8], or the more detailed exposition in [12] (in Theorem 9, p. 146), [15] and [14].

**Theorem 8** Let $Q_{2M}$ be a strongly elliptic differential operator of order $2M$ in $B$, and let $N \geq 0$ be arbitrary.

1. If $M < p$ then

$$
\inf_{Q_{2M}} \text{ dist } (S_M \oplus F_N, K_p^*) = \infty.
$$

Hence,

$$
\inf_{Q_{2M}} \text{ dist } (S_M \oplus F_N, K_p^*) = \infty.
$$

2. If $M = p$ then

$$
\inf_{S_p \oplus F_N} \text{ dist } (S_p \oplus F_N, K_p^*) = \text{ dist } (\tilde{S}_p \oplus \tilde{F}_N, K_p^*).
$$
Proof. 1. If we assume that $S_M$ and $\tilde{S}_p$ are transversal the proof is clear since $\tilde{S}_p \subset K_p^*$ and there will be an infinite-dimensional space in $\tilde{S}_p \subset K_p^*$ containing infinite axes with direction $y \in \tilde{S}_p$, such that

$$\text{dist} (S_M \oplus F_N, y) > 0$$

which implies

$$\text{dist} (S_M \oplus F_N, K_p^*) = \infty.$$ 

If they are not transversal we apply Lemma 9; it is clear that the finite-dimensional subspaces do not disturb the result, and the proof is finished.

2. For proving the second item, let us first note that $\tilde{S}_p \subset S_p \oplus F_N$. Indeed, since $\tilde{S}_p \subset K_p^*$ the violation of $\tilde{S}_p \subset S_p \oplus F_N$ would imply that there exists an infinite axis $y$ in $K_p^*$ not contained in $S_p \oplus F_N$ which would immediately give

$$\text{dist} (S_p \oplus F_N, K_p^*) = \infty.$$ 

But by the Lemma 11 it follows that $P_{2p} = C(x) \Delta^p$ for some function $C(x)$. Hence $S_p = \tilde{S}_p$.

Further we follow the usual way as in [12] to see that $\tilde{F}_N$ is extremal among all spaces $F_N$, i.e.

$$\inf_{\tilde{F}_N} \text{dist} (\tilde{S}_p \oplus F_N, K_p^*) = \text{dist} (\tilde{S}_p \oplus \tilde{F}_N, K_p^*).$$

This ends the proof.

We prove the following result which shows the mutual position of two subspaces:

Lemma 9 Let the integers $M$ and $N$ satisfy $M < N$, and the integer $M_1 \geq 0$. Then for the corresponding $S_M$ and $S_N$ defined in (10) by the operators $P_{2M}$ and $Q_{2N} = \Delta^N$ respectively, holds

$$\text{dist} (S_M \oplus F_{M_1}, S_N) = \infty.$$ 

There is a linear subspace $Y_{N\cdot M} \subset S_N$ with $Y_{N\cdot M} \perp S_M$ and it is an infinite-dimensional space of solutions to an Elliptic Boundary Value Problem.

Proof. Let us consider the case $M_1 = 0$. For the uniformly strongly elliptic operator $P_{2M}$ we choose the Dirichlet system of boundary operators $B_j = \frac{\partial^{m_j-1}}{\partial n^{m_j-1}}$. It is a classical fact (cf. Remark 1.3 in chapter 2, section 1.4 in [11]) that this system satisfies conditions (iii) in section 5.1, chapter 2 in [11],
or in other words, the system of operators \( \left\{ P_{2M}; \frac{\partial}{\partial n} : j = 0, 1, \ldots, M - 1 \right\} \) forms a regular Elliptic Boundary Value Problem (this is the so-called called Dirichlet BVP associated with the operator \( P_{2M} \)). Hence, we may apply the existence Theorem 5.2 and Theorem 5.3 in [11]. As in Theorem 2.1 (section 2.2, chapter 2 in [11]) we complete the system \( \{ B_j \}_{j=1}^M \) by the system of boundary operators \( S_j = \frac{\partial^{M-1+j}}{\partial n^{M-1+j}} \). Hence, the system composed \( \{ B_j \}_{j=1}^M \cup \{ S_j \}_{j=1}^M \) is a Dirichlet system of order \( 2M \) (cf. e.g. Definition 23.12, p. 474 in [9]). Further, by Theorem 2.1 in [11] quoted above, there exists a unique Dirichlet system of order \( 2M \) of boundary operators \( \{ C_j, T_j \}_{j=1}^M \) which is uniquely determined as the adjoint to the system \( \{ B_j, S_j \}_{j=1}^M \), and the following Green formula holds:

\[
\int_B (P_{2M}u \cdot v - u \cdot P_{2M}^*v) \, dx = \sum_{j=1}^M \int_{\partial B} (S_j u \cdot C_j v - B_j u \cdot T_j v) \, d\sigma_y, \tag{13}
\]

for all \( u, v \in H^{2M}(B) \); here \( d\sigma_y \) denotes the surface element on the sphere \( \partial B \).

We consider the elliptic operator \( \Delta^N P_{2M} \). As a product of two uniformly strongly elliptic operators it is such again. By a standard construction of Theorem 2.1 in [11] cited above (section 2.2, chapter 2 in [11]), we complete the Dirichlet system of operators \( \{ B_j, S_j \}_{j=1}^M \) with \( N-M \) boundary operators \( R_j = \frac{\partial^{M-1+j}}{\partial n^{M-1+j}} \), \( j = 1, 2, \ldots, N-M \). Again by the above cited theorem, the Dirichlet system of boundary operators

\[
\{ B_j, S_j \}_{j=1}^M \cup \{ R_j \}_{j=1}^{N-M}
\]

covers the operator \( \Delta^N P_{2M} \). Finally, we consider the solutions \( g \in H^{2N+2M}(B) \) to the following Elliptic Boundary Value Problem:

\[
\Delta^N P_{2M}^* g (x) = 0 \quad \text{for } x \in B \tag{14}
\]
\[
B_j g (y) = S_j g (y) = 0 \quad \text{for } j = 0, 1, \ldots, N - 1, \text{ for } y \in \partial B \tag{15}
\]
\[
R_j g (y) = h_j (y) \quad \text{for } j = 1, 2, \ldots, N - M, \text{ for } y \in \partial B. \tag{16}
\]

We may apply the existence Theorem 5.2 and Theorem 5.3 in chapter 2 in [11], to the solvability of problem (14)-(16) in the space \( H^{2M+2N}(B) \).

First of all, it is clear from (14) that \( P_{2M}^* g \in S_N \).

Let us check the properties of the function \( P_{2M}^* g \). By the Green formula (13), the function \( P_{2M}^* g \) satisfies \( P_{2M}^* g \perp S_M \), or equivalently,

\[
\int_B P_{2M}^* g \cdot v \, dx = 0 \quad \text{for all } v \text{ with } P_{2M} v = 0.
\]
By the general existence Theorem 5.3 (the Fredholmness property) in [11] mentioned above, we know that a solution $g$ to problem (14)-(16) exists for those boundary data \( \{ h_j \}_{j=1}^{N-M} \) which satisfy only a finite number of linear restrictions, provided by conditions (5.18) there; these are determined by the solutions to the homogeneous adjoint Elliptic BVP. Hence, it follows that the set $Y_{N-M}$ of the functions $P_{2M}^* g$ where $g$ is a solution to (14)-(16) is infinite-dimensional. It follows that the space $S_N \setminus S_M$ is infinite-dimensional as well, hence
\[
\text{dist} (S_M \bigoplus F_M, S_N) = \infty.
\]

Since obviously a finite-dimensional subspace $F_M$ would not disturb the above argumentation, this ends the proof.

\[\blacksquare\]

**Remark 10**Lemma 9 may be considered as a generalization in our setting of a theorem of Gohberg-Krein of 1957 (cf. [12], Theorem 2 on p. 137) in a Hilbert space.

We need the following intuitive result which is however not trivial.

**Lemma 11** Let for some elliptic differential operator $P_{2N}$ of order $2N$ the following inclusion hold $S_N \subset S_N \setminus F$, i.e.
\[
\{ u \in H^{2N} (B) : P_{2N} u (x) = 0, \ x \in B \} \subset \{ u \in H^{2N} (B) : \Delta^N u (x) = 0, \ x \in B \} \setminus F,
\]
where $F \subset L_2 (B)$ is a finite-dimensional space. Then
\[
P_{2N} (x, D_x) = c (x) \Delta^N
\]
for some function $C (x)$.

**Proof.** Since the general case is rather technical we will consider only $N = 1$ in $B \subset \mathbb{R}^2$. It is clear that the arguments are purely local so we will prove that equality (17) holds at $(x_1, x_2) = x = 0 \in B$. Assume that
\[
P_{2N} (x, D_x) u (x) = a (x) u_{x_1, x_1} + 2b (x) u_{x_1, x_2} + c (x) u_{x_2, x_2} + d (x) u_{x_1} + e (x) u_{x_2} + f (x) u
\]
here $w_{x_j}$ denotes the partial derivative $\frac{\partial u}{\partial x_j}$. By assumption, for the function $u \in \tilde{S}_1 \setminus F$ holds also
\[
(a (x) - c (x)) u_{x_1, x_1} + 2b (x) u_{x_1, x_2} + d (x) u_{x_1} + e (x) u_{x_2} + f (x) u = 0.
\]
Let us denote the following harmonic functions by \( u^j \) for \( j = 1, 2, ..., 6 \), as follows: \( 1, x_1, x_2, x_1^2 - x_2^2, x_1x_2 \). Let us assume that they do not belong to \( F \). We see that the Jacobi matrix of these functions at \( x_1 = x_2 = 0 \), is

\[
\begin{pmatrix}
0 & 0 & 0 & 0 & 1 \\
0 & 1 & 0 & 0 & 0 \\
0 & 0 & 1 & 0 & 0 \\
2 & 0 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 & 0
\end{pmatrix}
\]

which is obviously non-degenerate. Hence, \( a(0) - c(0) = b(0) = d(0) = e(0) = f(0) = 0 \).

In the case if some of the above functions \( u^j \) belongs to the space \( F \), it is possible to approximate it by other harmonic functions also including up to their second derivatives at 0 (one may apply approximation arguments as in [6]). The respective Jacobian will be non-zero and the conclusion of the theorem will follow. This ends the proof.

The proof of Theorem 8 above permits a much bigger generalization which will be provided in a forthcoming paper.

## 5 Appendix on Elliptic Boundary Value Problems

### 5.1 Proof of Theorem 4

**Proof.** (1) We consider the following auxiliary elliptic eigenvalue problem

\[
\Delta^{2p} \phi (x) = \lambda \phi (x) \quad \text{on } B, \tag{18}
\]

\[
\partial \Delta^j \phi (y) = \Delta^j \phi (y) = 0 \quad \text{for } j = 0, 1, ..., p - 1, \text{ for } y \in \partial B. \tag{19}
\]

It is straightforward to check that this is a regular Elliptic BVP considered in the Sobolev space \( H^{2p} (B) \) since it satisfies all conditions (i)-(iii) in chapter 2, section 5.1, [11], cf. also [7]. Hence, we are able to apply the existence theorems in section 5.3 there. Further, it is straightforward to check that it is a self-adjoint problem (cf. section 2.5, chapter 2, [11]): in the polyharmonic Green formula (6) we put \( \{B_j\}_{j=1}^{2p} = \{\partial \Delta^j, \Delta^j\}_{j=0}^{p-1} \) and we see that in the context of the general Green formula (13) the adjoint system of operators \( \{C_j\}_{j=1}^{2p} = \{\partial \Delta^j, \Delta^j\}_{j=0}^{p-1} \) which proves the self-adjointness of problem (18)-(19). Hence, we may apply the main results about the Spectral theory of regular self-adjoint Elliptic BVP. We refer to [7], section 3 in chapter 2, p.
Theorem 2.52, and to references therein (cf. in particular the monograph of Yu. Berezanskii devoted to expansions in eigenfunctions [4], chapter 6, section 2).

By the uniqueness Lemma 12 the eigenvalue problem (18)-(19) has only zero solution for $\lambda = 0$. It has eigenfunctions $\phi_k \in H^{2p} (B)$ with eigenvalues $\lambda_k > 0$ for $k = 1, 2, 3, \ldots$ for which $\lambda_k \to \infty$ as $k \to \infty$.

(2) Next we consider the problem

$$\Delta^{2p} \varphi = \phi_k$$

$$\partial \Delta^j \varphi (y) = \Delta^j \varphi (y) = 0 \quad \text{for } j = 0, 1, \ldots, p - 1, \text{ for } y \in \partial B,$$

in the Sobolev space $H^{2p} (B)$. Obviously, the Elliptic BVP defined by problem (20)-(21) coincides with the Elliptic BVP defined by (18)-(19) and all remarks there hold. Hence, problem (20)-(21) has unique solution $\varphi_k \in H^{2p} (B)$. We put

$$\psi_k = \Delta^p \varphi_k.$$

Hence, $\Delta^p \psi_k = \phi_k$. We infer that on the boundary $\partial B$ hold the equalities $\Delta^{p+j} \psi_k = \Delta^j \phi_k$ and $\partial \Delta^{p+j} \psi_k = \partial \Delta^j \phi_k$; since $\phi_k$ are solutions to (18)-(19) it follows

$$\Delta^{p+j} \psi_k (y) = \partial \Delta^{p+j} \psi_k (y) = 0 \quad \text{for } j = 0, 1, \ldots, p - 1, \text{ for } y \in \partial B.$$ (22)

We will prove that $\psi_k$ are solutions to problem (7)-(8), they are mutually orthogonal, and they are also orthogonal to the space $\{ v \in H^{2p} : \Delta^p v = 0 \}$.

Let us see that

$$\Delta^{2p} \psi_k = \lambda_k \psi_k.$$

By the definition of $\psi_k$ this is equivalent to

$$\Delta^{3p} \varphi_k = \lambda_k \Delta^p \varphi_k;$$

from $\Delta^{2p} \varphi_k = \phi_k$ this is equivalent to

$$\Delta^p \phi_k = \lambda_k \Delta^p \varphi_k$$

On the other hand, we have obviously $\Delta^{2p} \phi_k = \lambda_k \Delta^{2p} \varphi_k$ by the basic properties of $\phi_k$ and $\varphi_k$, hence

$$\Delta^{2p} (\phi_k - \lambda_k \varphi_k) = 0.$$

Note that both $\phi_k$ and $\varphi_k$ satisfy the same zero boundary conditions, namely (19) and (21). Hence, by the uniqueness Lemma 12 it follows that $\phi_k - \lambda_k \varphi_k = 0$.
0 which implies $\Delta^{2p}\psi_k = \lambda_k \psi_k$. Thus we see that $\psi_k$ is a solution to problem (7)-(8) and does not satisfy $\Delta^p \psi = 0$.

The orthogonality to the subspace $\{v \in H^{2p} : \Delta^p v = 0\}$ follows easily from the Green formula (6) and the zero boundary conditions (22) of $\psi_k$, by the following:

$$
\int_D \left( \Delta^{2p} \psi_k \cdot v - \psi_k \cdot \Delta^{2p} v \right) dx \\
= \sum_{j=0}^{2p-1} \int_{\partial D} \left( \Delta^j \psi_k \cdot \partial_n \Delta^{2p-1-j} v - \partial_n \Delta^j \psi_k \cdot \Delta^{2p-1-j} v \right)
$$

and since $\int_D \Delta^{2p} \psi_k \cdot v dx = \lambda_k \int_D \psi_k \cdot v dx$.

The orthonormality of the system $\{\psi_k\}_{k=1}^{\infty}$ follows now easily by the equality

$$
\lambda_k \int_D \psi_k \psi_j dx = \int_D \Delta^{2p} \psi_k \psi_j dx = \int_D \Delta^p \psi_k \Delta^p \psi_j dx = \int_D \phi_k \phi_j dx
$$

and the orthogonality of the system $\{\phi_k\}_{k=1}^{\infty}$. For the completeness of the system $\{\psi_k\}_{k=1}^{\infty}$, let us assume that for some $f \in L_2(B)$ holds

$$
\int_B f \cdot \psi_k dx = \int_B f \cdot \psi'_k dx = 0 \quad \text{for all } k \geq 1. \quad (23)
$$

Then the Green formula (6) implies

$$
0 = \lambda_k \int_B f \cdot \psi_k dx = \int_B f \cdot \Delta^{2p} \psi_k dx = \int_B \Delta^p f \cdot \Delta^p \psi_k dx \\
= \int_B \Delta^p f \cdot \phi_k dx \quad \text{for all } k \geq 1.
$$

By the completeness of the system $\{\phi_k\}_{k \geq 1}$ this implies that $\Delta^p f = 0$. From the second orthogonality in (23) follows that $f \equiv 0$, and this ends the proof of the completeness of the system $\{\psi'_j\}_{j=1}^{\infty} \cup \{\psi_j\}_{j=1}^{\infty}$.

We have used above the following simple result.

**Lemma 12** The solution to problem (18)-(19) for $\lambda = 0$ is unique.

**Proof.** From Green formula (6) we obtain

$$
\int_B [\Delta^p \phi]^2 dx = \int_B \phi \cdot \Delta^{2p} \phi dx = 0,
$$
hence $\Delta \phi = 0$. Now we apply the second Green formula (2.11) in [3] which infers immediately $\phi \equiv 0$.

Acknowledgement: The author acknowledges the support of the Alexander von Humboldt Foundation, and of Project Astroinformatics, DO-02-275 with Bulgarian NSF. The author thanks Prof. Matthias Lesch for the interesting discussion about hierarchies of infinite-dimensional linear spaces. I have got a good advice on the elliptic BVP (7)-(8) from a conversation with Prof. P. Popivanov, N. Kutev and D. Boyadzhiev.
