On Refinements of Some Integral Inequalities for Differentiable Prequasiinvex Functions

Serap Özcan

Department of Mathematics, Faculty of Art and Science, Kırklareli University, 39100 Kırklareli, TURKEY.

Abstract. In this paper, using the new and improved form of Hölder’s integral inequality called Hölder–Işcan integral inequality, some new inequalities of the right-hand side of Hermite-Hadamard type inequality for prequasiinvex functions are established. The results obtained are compared with the known results. It is shown that the results obtained in this paper are better than those known ones.

1. Introduction

The concept of convexity has become a deep research area in pure and applied sciences. In recent years, several extensions and generalizations of classical convexity have been studied by many researchers using novel methods and ideas. Hanson [6] introduced an important generalization of convex functions called invex functions. Ben-Israel and Mond [4] introduced the notions of invex sets and preinvex functions. For recent applications and generalizations of the preinvex functions, we refer the interested reader to [2, 3, 9, 11, 14, 17].

Inequalities play a fundamental role in many branches of pure and applied mathematics. A number of studies have shown that convexity has a closely relationship with the theory of inequalities. One of the most famous inequality for convex functions is named Hermite-Hadamard integral inequality as follows:

Let \( f : I \subseteq \mathbb{R} \rightarrow \mathbb{R} \) be a convex mapping defined on the interval \( I \) of real numbers and \( a, b \in I \) with \( a < b \). Then

\[
\frac{f(a) + f(b)}{2} \leq \frac{1}{b-a} \int_a^b f(x) \, dx \leq \frac{f(a) + f(b)}{2}. \tag{1}
\]

Recently, Hermite-Hadamard inequality for convex functions and their variant forms has been a rich source of inspiration. For recent results, improvements, extensions and generalizations the inequality (1), please refer the monographs [1, 5, 7, 14, 15, 17, 19].

2. Preliminaries

Definition 2.1. [20] Let $K$ be a closed set in $\mathbb{R}^n$. Suppose that $f : K \to \mathbb{R}$ and $\eta : K \times K \to \mathbb{R}$ be continuous functions. Let $u \in K$, then the set $K$ is said to be invex at each $u$ with respect to $\eta (\cdot , \cdot)$, if $u + t\eta (v, u) \in K, \forall u, v \in K, t \in [0, 1]$.

$K$ is said to be an invex set with respect to $\eta$, if $K$ is invex at each $u \in K$. The invex set $K$ is also called $\eta$-connected set.

Note that if $\eta (v, u) = v - u$, invexity reduces to convexity. Thus, every convex set is also an invex set with respect to $\eta (v, u) = v - u$, but the converse is not true in general.

Definition 2.2. [13] The function $f$ on the invex set $K$ is said to be preinvex with respect to $\eta$, if the inequality $f (u + t\eta (v, u)) \leq (1 - t) f (u) + tf (v)$ holds for all $u, v \in K$ and $t \in [0, 1]$.

Definition 2.3. [16] The function $f$ on the invex set $K$ is said to be prequasiinvex with respect to $\eta$, if $f (u + t\eta (v, u)) \leq \max \{f (u), f (v)\}$ for all $u, v \in K$ and $t \in [0, 1]$.

Recently, Noor [14] has obtained the new form of Hermite-Hadamard inequality for the preinvex functions:

Theorem 2.4. [14] Let $f : [a, a + \eta (b, a)] \to (0, \infty)$ be a preinvex function on the interval of the real numbers $K^\circ$ (interior of $K$) and $a, b \in K^\circ$ with $a < a + \eta (b, a)$. Then the following inequality holds:

\[
\frac{f \left( \frac{2a + \eta (b, a)}{2} \right)}{2} \leq \frac{1}{\eta (b, a)} \int_a^{a + \eta (b, a)} f (x) \, dx \leq \frac{f (a) + f (b)}{2}.
\]

(2)

The famous Hölder integral inequality is given as follows:

Theorem 2.5. [13] Let $p > 1$ and $1/p + 1/q = 1$. If $f$ and $g$ are real functions defined on $[a, b]$ and if $|f|^p$ and $|g|^q$ are integrable functions on $[a, b]$, then

\[
\int_a^b |f (x) g (x)| \, dx \leq \left( \int_a^b |f (x)|^p \, dx \right)^{1/p} \left( \int_a^b |g (x)|^q \, dx \right)^{1/q},
\]

with equality holding if and only if $A |f (x)|^p = B |g (x)|^q$ almost everywhere, where $A$ and $B$ are constants.

Power-mean integral inequality as a different version of Hölder integral inequality can be given as follows:

Theorem 2.6. [13] Let $q \geq 1$. If $f$ and $g$ are real functions defined on $[a, b]$ and if $|f|$, $|f|^q$ are integrable functions on $[a, b]$, then

\[
\int_a^b |f (x) g (x)| \, dx \leq \left( \int_a^b |f (x)| \, dx \right)^{1/q - 1} \left( \int_a^b |f (x)|^q |g (x)| \, dx \right)^{1/q}.
\]

In [12], Latif obtained some inequalities of Hermite-Hadamard type for differentiable prequasiinvex mappings connected with the right part of the inequality [2] were proved using the following lemma:
Lemma 2.7. Let $K \subseteq \mathbb{R}$ be an open invex subset with respect to $\eta : K \times K \to \mathbb{R}$. Suppose that $f : K \to \mathbb{R}$ is a differentiable mapping on $K$ such that $f' \in L([a, a + \eta(b, a)])$. Then for all $a, b \in K$ with $a < a + \eta(b, a)$ the following equality holds:

$$
\frac{f(a) + f(a + \eta(b, a))}{2} - \frac{1}{\eta(b, a)} \int_a^{a+\eta(b, a)} f(x) \, dx = \frac{\eta(b, a)}{4} \left[ \int_0^1 (-t) f'(a + \frac{(1-t)}{2} \eta(b, a)) \, dt + \int_0^1 tf'(a + \frac{(1+t)}{2} \eta(b, a)) \, dt \right].
$$

In [12], Latif obtained the following result for prequasiinvex functions using the above lemma:

Theorem 2.8. Let $K \subseteq [0, \infty)$ be an open invex subset with respect to $\eta : K \times K \to \mathbb{R}$ and $a, b \in K$ with $a < a + \eta(b, a)$. Assume that $f : K \to \mathbb{R}$ is a differentiable mapping on $K$ such that $f' \in L([a, a + \eta(b, a)])$. If $|f'|$ is prequasiinvex on $K$, then for every $a, b \in K$ with $\eta(b, a) > 0$ we have the following inequality:

$$
\left\| f(a) + f(a + \eta(b, a)) - \frac{1}{\eta(b, a)} \int_a^{a+\eta(b, a)} f(x) \, dx \right\| \leq \frac{\eta(b, a)}{4} \left[ \sup \left\{ |f'(a)|, \sqrt{f'(a + \frac{1}{2} \eta(b, a))} \right\} + \sup \left\{ |f'(a + \frac{1}{2} \eta(b, a))|, |f'(a + \eta(b, a))| \right\} \right].
$$

In [12], Latif obtained the following result for prequasiinvex functions using Lemma 2.7 and Hölder integral inequality:

Theorem 2.9. Let $K \subseteq [0, \infty)$ be an open invex subset with respect to $\eta : K \times K \to \mathbb{R}$ and $a, b \in K$ with $a < a + \eta(b, a)$. Assume that $f : K \to \mathbb{R}$ is a differentiable mapping on $K$ such that $f' \in L([a, a + \eta(b, a)])$. If $|f'|^q$ is prequasiinvex on $K$ for $q > 1$, then, for every $a, b \in K$ with $\eta(b, a) > 0$ we have the following inequality:

$$
\left\| f(a) + f(a + \eta(b, a)) - \frac{1}{\eta(b, a)} \int_a^{a+\eta(b, a)} f(x) \, dx \right\| \leq \frac{\eta(b, a)}{4 (p + 1)^{1/p}} \left[ \sup \left\{ |f'(a)|^p, |f'(a + \frac{1}{2} \eta(b, a))|^p \right\} \right]^{1/q} + \left[ \sup \left\{ |f'(a + \frac{1}{2} \eta(b, a))|^p, |f'(a + \eta(b, a))|^p \right\} \right]^{1/q},
$$

where $1/p + 1/q = 1$.

In [12], Latif also obtained the following result for prequasiinvex functions using Lemma 2.7 and power-mean integral inequality:

Theorem 2.10. Let $K \subseteq \mathbb{R}$ be an open invex subset with respect to $\eta : K \times K \to \mathbb{R}$ and $a, b \in K$ with $a < a + \eta(b, a)$. Suppose $f : K \to \mathbb{R}$ is a differentiable mapping on $K$ such that $f' \in L([a, a + \eta(b, a)])$. If $|f'|^q$ is prequasiinvex on $K$ for $q \geq 1$, then, for every $a, b \in K$ with $\eta(b, a) > 0$ the following inequality holds:

$$
\left\| f(a) + f(a + \eta(b, a)) - \frac{1}{\eta(b, a)} \int_a^{a+\eta(b, a)} f(x) \, dx \right\| \leq \frac{\eta(b, a)}{8} \left[ \left( \sup \left\{ |f'(a)|^q, |f'(a + \frac{1}{2} \eta(b, a))|^q \right\} \right) \right]^{1/q} + \left( \sup \left\{ |f'(a + \frac{1}{2} \eta(b, a))|^q, |f'(a + \eta(b, a))|^q \right\} \right) \right]^{1/q}.
$$

In [8], İşcan obtained the following integral inequality which gives better results than classical Hölder inequality:

$$
\left\| f(a) + f(a + \eta(b, a)) - \frac{1}{\eta(b, a)} \int_a^{a+\eta(b, a)} f(x) \, dx \right\| \leq \frac{\eta(b, a)}{8} \left[ \left( \sup \left\{ |f'(a)|^q, |f'(a + \frac{1}{2} \eta(b, a))|^q \right\} \right) \right]^{1/q} + \left( \sup \left\{ |f'(a + \frac{1}{2} \eta(b, a))|^q, |f'(a + \eta(b, a))|^q \right\} \right) \right]^{1/q}.
$$
Theorem 2.11. (Hölder-İscan Integral Inequality) Let \( p > 1 \) and \( 1/p + 1/q = 1 \). If \( f \) and \( g \) are real functions defined on \([a, b] \) and if \( |f|^p \) and \( |g|^q \) are integrable functions on \([a, b] \), then

\[
i \quad \int_a^b |f(x)g(x)| \, dx \leq \frac{1}{b-a} \left\{ \left( \int_a^b (b-x) |f(x)|^p \, dx \right)^{\frac{1}{p}} \left( \int_a^b (b-x) |g(x)|^q \, dx \right)^{\frac{1}{q}} + \left( \int_a^b (x-a) |f(x)|^p \, dx \right)^{\frac{1}{p}} \left( \int_a^b (x-a) |g(x)|^q \, dx \right)^{\frac{1}{q}} \right\} \tag{6}
\]

In [10], a different represent of Hölder-İscan inequality was given as follows:

Theorem 2.12. (Improved Power-mean Integral Inequality) Let \( q \geq 1 \). If \( f \) and \( g \) are real functions defined on \([a, b] \) and if \( |f|, |f||g|^q \) are integrable functions on \([a, b] \), then

\[
i \quad \int_a^b |f(x)g(x)| \, dx \leq \frac{1}{b-a} \left\{ \left( \int_a^b (b-x) |f(x)|^p \, dx \right)^{\frac{1}{q}} \left( \int_a^b (b-x) |g(x)|^q \, dx \right)^{\frac{1}{q}} + \left( \int_a^b (x-a) |f(x)|^p \, dx \right)^{\frac{1}{q}} \left( \int_a^b (x-a) |g(x)|^q \, dx \right)^{\frac{1}{q}} \right\} \tag{7}
\]

\[
ii \quad \int_a^b |f(x)| \, dx \leq \frac{1}{b-a} \left\{ \left( \int_a^b (b-x) |f(x)|^p \, dx \right)^{\frac{1}{q}} \left( \int_a^b (b-x) |g(x)|^q \, dx \right)^{\frac{1}{q}} + \left( \int_a^b (x-a) |f(x)|^p \, dx \right)^{\frac{1}{q}} \left( \int_a^b (x-a) |g(x)|^q \, dx \right)^{\frac{1}{q}} \right\} \tag{8}
\]

3. Main Results

In this section, we will obtain some new upper bounds for the right-hand side of Hermite-Hadamard inequality for differentiable prequasiinvex functions and we will show that the new upper bounds we obtained are better than the ones given in [12].

Theorem 3.1. Let \( K \subseteq [0, \infty) \) be an open invex subset with respect to \( \eta : K \times K \to \mathbb{R} \) and \( a, b \in K \) with \( a < a + \eta(b,a) \). Assume that \( f : K \to \mathbb{R} \) is a differentiable mapping on \( K \) such that \( f' \in L([a, a + \eta(b,a)]) \). If \( |f'|^q \) is prequasiinvex on \( K \) for \( q > 1 \), then, for every \( a, b \in K \) with \( \eta(b,a) > 0 \) we have the following inequality:

\[
\left| \frac{f(a) + f(a + \eta(b,a))}{2} - \frac{1}{\eta(b,a)} \int_a^{a + \eta(b,a)} f(x) \, dx \right| \leq \underbrace{\frac{\eta(b,a)}{4} \left( \frac{1}{2} \right)^{\frac{1}{q}} \left( \frac{1}{p+2} \right)^{\frac{1}{p}}}_{\text{term 1}} + \underbrace{\left[ \sup \left\{ \left| f'(a) \right|^q, \left| f'(a + \frac{1}{2} \eta(b,a)) \right|^q \right\} \right]^{\frac{1}{q}}}_{\text{term 2}} + \underbrace{\left[ \sup \left\{ \left| f'(a) \right|^q, \left| f'(a + \eta(b,a)) \right|^q \right\} \right]^{\frac{1}{q}}}_{\text{term 3}}. \tag{8}
\]
where $1/p + 1/q = 1$.

**Proof.** From Lemma 2.7 and using Hölder-İşcan integral inequality (6), we have

$$\left| \frac{f(a) + f(a + \eta(b,a))}{2} - \frac{1}{\eta(b,a)} \int_a^{a + \eta(b,a)} f(x) \, dx \right|$$

$$\leq \frac{\eta(b,a)}{4} \left[ \int_0^1 |t| f'(a + \frac{t}{2} \eta(b,a)) \, dt + \int_0^1 |t| f'(a + \frac{1-t}{2} \eta(b,a)) \, dt \right]$$

$$\leq \frac{\eta(b,a)}{4} \left[ \left( \int_0^1 (1-t)'^p \, dt \right)^{1/p} \left( \int_0^1 (1-t) \left| f'(a + \frac{1-t}{2} \eta(b,a)) \right|^q \, dt \right)^{1/q} \right]$$

$$+ \frac{\eta(b,a)}{4} \left[ \left( \int_0^1 (1-t)'^p \, dt \right)^{1/p} \left( \int_0^1 (1-t) \left| f'(a + \frac{1-t}{2} \eta(b,a)) \right|^q \, dt \right)^{1/q} \right]$$

By the prequasiinvexity of $|f'|^q$ on $K$ for $q > 1$, then, for every $a, b \in K$ with $\eta(b,a) > 0$ and $t \in [0,1]$, we have

$$\left| f'(a + \frac{1-t}{2} \eta(b,a)) \right|^q \leq \sup \left\{ \left| f'(a) \right|^q, \left| f'(a + \frac{1}{2} \eta(b,a)) \right|^q \right\}, \hspace{1cm} (9)$$

and

$$\left| f'(a + \frac{1-t}{2} \eta(b,a)) \right|^q \leq \sup \left\{ \left| f'(a) \right|^q, \left| f'(a + \frac{1}{2} \eta(b,a)) \right|^q \right\}, \hspace{1cm} (10)$$

where $1/p + 1/q = 1$.

Using the inequalities (9) and (10), we have,

$$\left| \frac{f(a) + f(a + \eta(b,a))}{2} - \frac{1}{\eta(b,a)} \int_a^{a + \eta(b,a)} f(x) \, dx \right|$$

$$\leq \frac{\eta(b,a)}{4} \left[ \left( \frac{1}{(p+1)(p+2)} \right)^{1/p} + \frac{1}{p+2} \right] \left\{ \sup \left\{ \left| f'(a) \right|^q, \left| f'(a + \frac{1}{2} \eta(b,a)) \right|^q \right\} \right\}^{1/q}$$

$$+ \frac{\eta(b,a)}{4} \left[ \left( \frac{1}{(p+1)(p+2)} \right)^{1/p} + \frac{1}{p+2} \right] \left\{ \sup \left\{ \left| f'(a + \frac{1}{2} \eta(b,a)) \right|^q, \left| f'(a + \eta(b,a)) \right|^q \right\} \right\}^{1/q}$$

$$= \frac{\eta(b,a)}{4} \left[ \left( \frac{1}{(p+1)(p+2)} \right)^{1/p} + 1 \right]$$

$$\times \left\{ \sup \left\{ \left| f'(a) \right|^q, \left| f'(a + \frac{1}{2} \eta(b,a)) \right|^q \right\} \right\}^{1/q} + \left\{ \sup \left\{ \left| f'(a + \frac{1}{2} \eta(b,a)) \right|^q, \left| f'(a + \eta(b,a)) \right|^q \right\} \right\}^{1/q}$$

where

$$\int_0^1 t \, dt = \int_0^1 (1-t) \, dt = \frac{1}{2},$$
\[
\int_0^1 t |t|^p \, dt = \frac{1}{p+2}
\]
and
\[
\int_0^1 (1-t) |t|^p \, dt = \frac{1}{(p+1)(p+2)}.
\]
\[\square\]

**Remark 3.2.** The inequality \([\text{[3.3]}]\) gives better results than the inequality \([\text{[4]}]\). Let us show that
\[
\left(\frac{1}{2}\right)^{1/q} \left(\frac{1}{p+2}\right)^{1/p} \left[\left(\frac{1}{p+1}\right)^{1/p} + 1\right] \leq \left(\frac{1}{p+1}\right)^{1/p}.
\]

An easy calculation gives
\[
\left(\frac{1}{2}\right)^{1/q} \left(\frac{1}{p+2}\right)^{1/p} \left[\left(\frac{1}{p+1}\right)^{1/p} + 1\right] = \left(\frac{1}{2}\right)^{1/q} \left[\left(\frac{1}{p+2}\right)^{1/p} + \left(\frac{p+1}{p+2}\right)^{1/p}\right].
\]
Thus, using concavity of the function \(h : [0, \infty) \to \mathbb{R}, h(x) = x^s, 0 < s \leq 1\), we have
\[
\left(\frac{1}{2}\right)^{1/q} \left[\left(\frac{1}{p+2}\right)^{1/p} + \left(\frac{p+1}{p+2}\right)^{1/p}\right] = 2^{1/p} \left[\frac{1}{2} \left(\frac{1}{p+2}\right)^{1/p} + \frac{1}{2} \left(\frac{p+1}{p+2}\right)^{1/p}\right] \leq 2^{1/p} \left(\frac{\frac{1}{p+2} + \frac{p+1}{p+2}}{2}\right)^{1/p} = 1
\]
which is the required.

**Theorem 3.3.** Let \(K \subseteq \mathbb{R}\) be an open invex subset with respect to \(\eta : K \times K \to \mathbb{R}\) and \(a, b \in K\) with \(a < a + \eta(b, a)\). Suppose \(f : K \to \mathbb{R}\) is a differentiable mapping on \(K\) such that \(f' \in L([a, a + \eta(b, a)])\). If \(|f''|^q\) is prequasiinvex on \(K\) for \(q \geq 1\), then for every \(a, b \in K\) with \(\eta(b, a) > 0\) the following inequality holds:
\[
\left|\frac{f(a) + f(a + \eta(b, a))}{2} - \frac{1}{\eta(b, a)} \int_a^{a+\eta(b, a)} f(x) \, dx\right|
\leq \frac{\eta(b, a)}{4} \left(\frac{1}{q+1}\right)^{1/q} \left[\left(\sup \left\{f'(a)^q, f'(a + \frac{1}{2} \eta(b, a))^q\right\}\right)^{1/q} + \left(\sup \left\{f'(a)^q, f'(a + \eta(b, a))^q\right\}\right)^{1/q}\right].
\]  

\begin{align}
\text{(11)}
\end{align}

**Proof.** Using Lemma \(2.7\), power-mean integral inequality and prequasiinvexity of \(|f''|^q\), we get
\[
\left|\frac{f(a) + f(a + \eta(b, a))}{2} - \frac{1}{\eta(b, a)} \int_a^{a+\eta(b, a)} f(x) \, dx\right|
\leq \frac{\eta(b, a)}{4} \left[\int_0^1 |t| f'(a + \frac{1}{2} \eta(b, a)) \, dt + \int_0^1 |t| f'(a + \frac{1}{2} \eta(b, a)) \, dt\right]
\]
Suppose \( f: K \rightarrow \mathbb{R} \) is a differentiable mapping on \( K \) such that \( f' \in L ([a, a + \eta (b, a))] \). If \( |f'|^p \) is prequasiinvex on \( K \), then for every \( a, b \in K \) with \( a < a + \eta (b, a) \) we have the following inequality:

\[
\left| \frac{f(a) + f(a + \eta (b, a))}{2} - \frac{1}{\eta (b, a)} \int_a^{a+\eta(b,a)} f(x) \, dx \right| \leq \frac{\eta (b, a)}{8} \left[ \sup \left\{ \left| f' (a) \right|^p, \left| f' (a + \frac{1}{2} \eta (b, a)) \right|^p \right\} \right] + \left( \sup \left\{ \left| f' (a + \frac{1}{2} \eta (b, a)) \right|^p, \left| f' (a + \eta (b, a)) \right|^p \right\} \right)^{1/q}.
\] (12)

Note that, the inequality (12) coincides with the inequality (3) in Theorem 2.8.

**Theorem 3.5.** Let \( K \subseteq \mathbb{R} \) be an open invex subset with respect to \( \eta : K \times K \rightarrow \mathbb{R} \) and \( a, b \in K \) with \( a < a + \eta (b, a) \). Suppose \( f: K \rightarrow \mathbb{R} \) is a differentiable mapping on \( K \) such that \( f' \in L ([a, a + \eta (b, a))] \). If \( |f'|^p \) is prequasiinvex on \( K \) for \( q \geq 1 \), then for every \( a, b \in K \) with \( \eta (b, a) > 0 \) the following inequality holds:

\[
\left| \frac{f(a) + f(a + \eta (b, a))}{2} - \frac{1}{\eta (b, a)} \int_a^{a+\eta(b,a)} f(x) \, dx \right| \leq \frac{\eta (b, a)}{4} \left( \frac{1}{2} \right)^{1-1/q} \left( \frac{1}{q} \right)^{1/q} \left\lfloor \left( \frac{1}{q+1} \right)^{1/q} + 1 \right\rfloor \times \left[ \left( \sup \left\{ \left| f' (a) \right|^p, \left| f' (a + \frac{1}{2} \eta (b, a)) \right|^p \right\} \right)^{1/q} + \left( \sup \left\{ \left| f' (a + \frac{1}{2} \eta (b, a)) \right|^p, \left| f' (a + \eta (b, a)) \right|^p \right\} \right)^{1/q} \right].
\] (13)

**Proof.** From Lemma 2.7 improved power-mean integral inequality \( \mathcal{F} \) and prequasiinvexity of \( |f'|^p \), we
Assume that $f' : \mathbb{R} \to \mathbb{R}$ is differentiable on $K$ such that $f' \in L([a, a + \eta(b, a)])$. If $f'$ is prequasiinvex on $K$, then for every $a, b \in K$ with $\eta(b, a) > 0$ we have the following inequality:

$$
\left| \frac{f(a) + f(a + \eta(b, a))}{2} - \frac{1}{\eta(b, a)} \int_a^{a+\eta(b, a)} f(x) \, dx \right|
\leq \frac{\eta(b, a)}{4} \left[ \int_0^1 (1 - t) \left| f'(a + \left(1 - \frac{1}{2}\right) \eta(b, a) \right| \, dt + \int_0^1 |t| \left| f'(a + \left(1 + \frac{1}{2}\right) \eta(b, a) \right| \, dt \right]
\leq \frac{\eta(b, a)}{4} \left[ \left( \int_0^1 (1 - t) dt \right)^{1-1/q} \left( \int_0^1 (1 - t)|t|^q \left| f'(a + \left(1 - \frac{1}{2}\right) \eta(b, a) \right| \, dt \right) \right]^{1/q}
+ \frac{\eta(b, a)}{4} \left[ \left( \int_0^1 (1 - t) dt \right)^{1-1/q} \left( \int_0^1 (1 - t)|t|^q \left| f'(a + \left(1 + \frac{1}{2}\right) \eta(b, a) \right| \, dt \right) \right]^{1/q}
\leq \frac{\eta(b, a)}{4} \left( \frac{1}{q+2} \right)^{1/q} \left( \frac{1}{q+1} \right)^{1/q} + \left( \sup \left\{ \left| f'(a) \right|^q, \left| f'(a + \frac{1}{2} \eta(b, a)) \right|^q \right\} \right)^{1/q}
+ \frac{\eta(b, a)}{4} \left( \frac{1}{q+2} \right)^{1/q} \left( \frac{1}{q+1} \right)^{1/q} + \left( \sup \left\{ \left| f'(a + \frac{1}{2} \eta(b, a)) \right|^q, \left| f'(a + \eta(b, a)) \right|^q \right\} \right)^{1/q}
\leq \frac{\eta(b, a)}{4} \left( \frac{1}{q+2} \right)^{1/q} \left[ \left( \frac{1}{q+1} \right)^{1/q} + 1 \right] \left[ \left( \frac{1}{q+2} \right)^{1/q} \right]^{1/q} + \left( \sup \left\{ \left| f'(a) \right|^q, \left| f'(a + \frac{1}{2} \eta(b, a)) \right|^q \right\} \right)^{1/q}
\times \left[ \left( \sup \left\{ \left| f'(a + \frac{1}{2} \eta(b, a)) \right|^q, \left| f'(a + \eta(b, a)) \right|^q \right\} \right)^{1/q} \right],
$$

where

$$
\int_0^1 (1 - t)|t|^q \, dt = \frac{1}{(q+1)(q+2)}
$$

and

$$
\int_0^1 t|t|^q \, dt = \frac{1}{q+2}.
$$

If $q = 1$ in the inequality (13), then we get the following result:

**Corollary 3.6.** Let $K \subseteq [0, \infty)$ be an open invex subset with respect to $\eta : K \times K \to \mathbb{R}$ and $a, b \in K$ with $a < a + \eta(b, a)$. Assume that $f : K \to \mathbb{R}$ is a differentiable mapping on $K$ such that $f' \in L([a, a + \eta(b, a)])$. If $f'$ is prequasiinvex on $K$, then for every $a, b \in K$ with $\eta(b, a) > 0$ we have the following inequality:

$$
\left| \frac{f(a) + f(a + \eta(b, a))}{2} - \frac{1}{\eta(b, a)} \int_a^{a+\eta(b, a)} f(x) \, dx \right|
\leq \frac{\eta(b, a)}{8} \left[ \sup \left\{ \left| f'(a) \right|^q, \left| f'(a + \frac{1}{2} \eta(b, a)) \right|^q \right\} + \sup \left\{ \left| f'(a + \frac{1}{2} \eta(b, a)) \right|^q, \left| f'(a + \eta(b, a)) \right|^q \right\} \right].
$$

Note that, the inequality (14) coincides with the inequality (3) in Theorem 2.8.

**Remark 3.7.** The inequality (13) is better than the inequality (3). Proof can be made similar to Remark 3.2.
Acknowledgement

The author is thankful to the Editor and anonymous referees for their constructive comments and valuable suggestions.
