Supplemental Materials: Review of Filters for Air Sampling and Chemical Analysis in Mining Workplaces

Judith C. Chow *, John G. Watson, Xiaoliang Wang, Behrooz Abbasi, Wm. Randolph Reed and David Parks

S1. Supplemental Tables

Table S1. Summary of filter characteristics for sampling and analysis.

Table S2. Mass concentration under uncontrolled and controlled temperature and humidity environments.

Table S3. Major infrared bands of the principal polymorphs in crystalline silica.
Table S1. Summary of filter characteristics for sampling and analysis.

| Filter Type | Filter Characteristics and Analysis Methods | Trade Name, Supplier, Website, and Quantity Available | Filter Diameter | Pore Size (Thickness) | Cost US ($) | Comments |
|-------------|---------------------------------------------|------------------------------------------------------|-----------------|----------------------|------------|----------|
| **i) Porous Membrane Filters** | | | | | | |
| PTFE (Polytetrafluoroethylene) | **Physical Characteristics** | Thin film microporous membrane with synthetic fluoropolymer or polytetrafluoroethylene stretched between polymethylpentene (PMF) support ring. | Measurement Technology Laboratory (MTL), Minneapolis, MN, USA mtlcorp.com, accessed on 1 October, 2022 | 46.2 mm | 2 μm | H |
| | • Thin membrane with nearly transparent white surface. | PT47 polytetrafluoroethylene with fluorinated ethylene propylene (FEP) support ring | Package of 50 | | | |
| | • Minimal dispersion of transmitted radiation. | | | | | |
| | • High particle collection efficiencies. | Omnipore™ Millipore Sigma, Burlington, MA, USA sigmaaldrich.com | 47 mm | 0.2 and 1.5 μm | M |
| | • High mechanical strength. | Package of 100 | | | | |
| | • Low particle loading capacity. | Omnipore™ Millipore Sigma fishersci.com accessed on 1 October, 2022 | 47 mm | 0.1, 1, 5, and 10 μm | M |
| | • Limited temperature range. Melts at ~60 °C. | Teflo™ Pall Corporation, East Hills, NY, USA us.vwr.com accessed on 1 October, 2022 | 25 mm, 37 mm, and 47 mm | 1 μm (76 μm), 2 μm (46 μm), and 3 μm (30.4 μm) | H |
| | • High flow resistance and pressure drop. | Package of 25, 50, and 100 | | | | |
| | **Chemical Characteristics** | Usually low blank levels. | | | | |
| | • Composed of carbon-based material; inappropriate for carbon analysis. | | | | | |

- Complies with U.S. 40CFR1065 requirement for PTFE filters used in U.S. Federal Reference Method (FRM) network for PM$_2.5$ (particles with aerodynamic diameter less than 2.5 μm) sampling and mass determination.
- Most commonly applied for aerosol sampling in U.S. networks.

|---------------------|-------------------------------------------------------------------------------------------------------------|------------------------------------------------------|------------------|-----------------------|-------------|----------|
| nearly transparent white surface.  
  • High temperature resistance (82 °C).  
  **Chemical Characteristics**  
  • Inert to gas adsorption.  
  • Low hygroscopicity.  
  • Low extractables.  
  **Compatible Analysis Methods**  
  • Gravimetry, OA, XRF, PIXE, INAA, AAS, ICP/AES, ICP/MS, IC, AC, FTIR, and Raman | Zefon International, Ocala, Fl, USA  
zefon.com, accessed on 1 October, e0ww  
Package of 50 | 37 mm | NA | L |
| **PVC (Polyvinyl Chloride)**   | **Physical Characteristics**  
  • Thin membrane of PVC polymer.  
  • White opaque surface, diffuses transmitted light.  
  • Melts at ~100 °C.  
  • Low flow resistance.  
  • Potential electrostatic buildup.  
  **Chemical Characteristics** | Millipore  
emdmillipore.com, accessed on 1 October, 2022  
Package of 100 | 47 mm | 5 μm (50 μm) | H | • Specified by ASTM, NIOSH, and OSHA in monitoring and analyze for silica, quartz, and carbon black.  
  • Sampling of metals, silica, and dust. |
| GLA-5000  
Pall Corporation  
us.VWR.com, accessed on 1 October, 2022

|---------------------------------|---------------------------------------------|-----------------------------------------------------|-----------------|-----------------------|-------------|--------------------------------------------------------------------------|
| **Silver Membrane**             | **Physical Characteristics**                | Millipore sigmaaldrich.com, accessed on 1 October, 2022 Package of 50 | 25 mm           | 0.45 μm               | H           | • Used for air sampling of carbon black, coal, tar products, coke oven emissions, asbestos, and silica |
|                                 | • Thin membrane of sintering, uniform metallic silver particle. • Grayish-white surface with low light transmittance. • Melts at 350 °C. • Conductive with high flow resistance. | SKC skcinc.com, accessed on 1 October, 2022 Package of 50 | 13, 25, 37, and 47 mm | 0.2, 0.45, 0.8, 1, 2, 3, and 5 μm (50 μm) | H           | • Used for industrial hygiene sampling. • 99.97% pure metallic silver. |
|                                 | **Chemical Characteristics**                | Sterlitech Corporation, Auburn, WA, USA sterlitech.com, accessed on 1 October, 2022 Package of 25–100 | 13, 37, and 47 mm | 0.2, 0.45, 0.8, 1.2, 3, and 5 μm | H           |                                                                           |
|                                 | • Resistant to chemical attack by all fluids. • Passively adsorbs organic vapors. • Low hygroscopicity. • High blank weight. • Low extractables. | Advantec Corp, Irvine, CA, USA us.VWR.com, accessed on 1 October, 2022 Package of 100 | 47 or 50 mm      | 0.2, 0.45, 0.65, 0.8, 1, and 3 μm | L           | • For microbiological examination and water sampling, including white, black, and gem membranes with or without hydrophobic edge. |
|                                 | **Compatible Analysis Methods**             |                                                      |                 |                       |             |                                                                           |
|                                 | • Gravimetry, XRD, FTIR, and Raman          |                                                      |                 |                       |             |                                                                           |

**MCE (Mixed Cellulose Esters)**

- Thin membrane of mixed cellulose esters, cellulose nitrate, and cellulose acetate. Some filters include PVC membrane.
- White opaque surface diffuses transmitted light.
| Filter Type | Filter Characteristics and Analysis Methods | Trade Name, Supplier, Website, and Quantity Available | Filter Diameter | Pore Size (Thickness) | Cost US ($) | Comments |
|-------------|--------------------------------------------|-----------------------------------------------------|----------------|----------------------|-------------|----------|
| • Melts at ~75–130 °C.  
• High loading capacity.  
• Potential electrostatic build up. | Millipore MCE  
emdmillipore.com, accessed on 1 October, 2022  
Package of 100 | 47 mm | 1 μm (30–80 μm) | L | |
| Chemical Characteristics  
• High hygroscopicity.  
• Negligible ash content.  
• Dissolves in many organic solvents.  
• Low chemical resistance.  
• Low hygroscopicity.  
• Low blank weight.  
• Biologically inert. | SKC MCE  
skcinc.com  
Package of 100 | 25 mm | 0.8 μm | | |
| Compatible Analysis Methods  
• Gravimetry, OM, TEM, SEM, XRD, FTIR, Raman, and biomedical applications. | Nalgene MCE  
Thermo Scientific  
us.VWR.com, accessed on 1 October, 2022  
Package of 100 | 47 mm | 0.2 and 0.45 μm | M | • Pharmaceutical industries often use cellulose nitrate filters. Also known as nitrocellulose for molecular biology filtration, prepared by reaction of cellulose and nitric acids.  
• Cellulose acetate membrane filter is a mixture of cellulose diacetate and triacetate. |

|--------------------------|--------------------------------------------------------|-----------------|-----------------------|-------------|----------|
| • Thick mat of cellulose fibers or fiber cloth, often called a “paper” fiber filter. | SKC skcinc.com Package of 500 | 37 mm | NA | L | |
| • White opaque surface, diffuses transmitted light. | Whatman 41 Cytiva us.VWR.com, accessed on 1 October, 2022 Package of 100 | 25, 32, 42.5, 47, 50, 55, 60, 70, 90, 110, 125, 150, 180, 240, and 320 mm diameter, and 20.3 x 25.4 cm² and 46 x 57 cm² | NA | L | • Commonly impregnated with acid or base solution to capture precursor gases such as NO₂, SO₂, NH₃, HNO₃, and organic acid. Typically placed behind the Teflon-membrane or quartz-fiber filters |
| Filter Type          | Filter Characteristics and Analysis Methods                                                                 |
|---------------------|---------------------------------------------------------------------------------------------------------------|
| Pure Quartz-fiber   | Nature of particle deposit.                                                                                   |
|                     | - Variable flow resistance.                                                                                  |
|                     | **Chemical Characteristics**                                                                                  |
|                     | - High purity, low blank levels. Made of carbon-based material, so inappropriate for carbon analysis.         |
|                     | - Adsorbs gases, especially water vapor.                                                                      |
|                     | - Most appropriate for adsorbing gases such as HNO$_3$, SO$_2$, NH$_3$, and NO$_2$ when impregnated with reactive chemicals. |
|                     | - High hygroscopicity and moisture sensitive.                                                                 |
|                     | - Low ash content.                                                                                           |
|                     | - High blank weight.                                                                                        |
|                     | **Compatible Analysis Methods**                                                                               |
|                     | - Gravimetry, ICP/AES, ICP/MS, IC, and AC                                                                    |

|---------------------|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|-----------------|-----------------------|-------------|--------------------------------------------------------------------------|
| Mixed quartz-fiber  | **Physical Characteristics**<br>• Quartz (SiO₂) fibers with ~5% borosilicate content.<br>• White opaque surface, diffuse transmitted light.<br>• High particle collection efficiencies.<br>• Some batches can melt at ~500 °C. Effects on thermal carbon analysis are unknown.<br>• Becomes brittle when heated.<br>• Low flow resistance.<br>**Chemical characteristics**<br>• Contains large and variable quantities of Na, Al, and Si in all batches. Variable levels of other metals are found in many batches.<br>• Passively adsorbs organic vapors. Adsorbs little HNO₃, NO₂, and SO₂.<br>• Low hygroscopicity.<br>• High blank weight.<br>**Compatible Analysis Methods**<br>• Gravimetry, XRF, PIXE, AA, ICP/AES, ICP/MS for some metals. IC, AC, T, TOR, TMO, and TOT. | Whatman QM/A Cytiva cytivalifesciences.com, accessed on 1 October, 2022 Package of 100 | 25, 32, 37, 47, 50, 55, 82, 85, 90, 101.6, 110, 118, 150 mm diameter, and 20.3 x 25.4 cm² | (475 μm) | L | • Commonly used in the high volume sampling for TSP (total suspended particles) and PM₁₀ (particles with aerodynamic diameter <10 μm). |
| Filter Type       | Filter Characteristics and Analysis Methods |
|------------------|---------------------------------------------|
| **Teflon-coated Glass-Fiber** | Physical Characteristics  |
|                  | • Thick mat of borosilicate reinforced with woven glass cloth and bonded with PTFE.  |
|                  | • Glass fiber supporting Teflon is shiny.  |
|                  | • High particle collection efficiencies.  |
|                  | • Glass melts at ~260°C. Teflon melts at ~60 °C.  |
|                  | • Low flow resistance.  |
|                  | Chemical Characteristics  |
|                  | • Low blank levels for ions (glass backing and carbon content make it less suitable for elemental and carbon analyses).  |
|                  | • Inert to adsorption of HNO₃, NO₂, and SO₂.  |
|                  | • Low hygroscopicity.  |
|                  | • High blank weight.  |
|                  | Compatible Analysis Methods  |
|                  | • Gravimetry, IC, and AC.  |
| **Glass-Fiber**  | Physical Characteristics  |
|                  | • Borosilicate glass fiber or binder free.  |
|                  | • White opaque surface  |

| diffuses transmitted light. • High particle collection efficiencies. • Melts at ~500 °C. • Low flow resistance | Tisch Environmental, Cleavs, OH, USA TE-G653 and TE-EPM2000 tisch-env.com, accessed on 2 October, 2022 Package of 100 | 20.3 × 25.4 cm² | NA | L |

**Chemical Characteristics**
- High blank levels.
- Adsorbs HNO₃, NO₂, SO₂, and organic vapors with sulfate and nitrate artifact.
- Variable hygroscopicities.
- High blank weight.

**Compatible Analysis Methods**
- Gravimetry and OA

AAS: Atomic Absorption Spectrophotometry; AC: Automated Colorimetry; IC: Ion Chromatography; ICP/AES: Inductively-Coupled Plasma with Atomic Emission Spectrophotometry; ICP/MS: Inductively-Coupled Plasma with Mass Spectrophotometry; INAA: Instrumental Neutron Activation Analysis; NA: not available; OA: Optical Absorption or Light Transmission (bₐbs); OM: Optical Microscopy; PIXE: Proton-Induced X-Ray Emissions; SEM: Scanning Electron Microscopy; T: Thermal Carbon Analysis; TEM: Transmission Electron Microscopy; TMO: Thermal Manganese Oxidation Carbon Analysis; TOR: Thermal/Optical Reflectance Carbon Analysis; TOT: Thermal/Optical Transmission Carbon Analysis; XRD: X-Ray Diffraction; XRF: X-Ray Fluorescence; FTIR: Fourier Transform Infrared Spectrometry; Raman: Raman Spectrometry; * Cost; Low: less than $300 per 100 filters; Medium: between $301–500 per 100 filters; High: more than $501 per 100 filters
Table S2. Mass concentration under uncontrolled and controlled temperature and humidity environments [126].

| Filter Type (Manufacturer) | Uncontrolled Temperature and Humidity (Average ± Std. Dev.) | Controlled Temperature and Humidity (Average ± Std. Dev.) | CV<sup>a</sup> | CV<sup>a</sup> |
|----------------------------|-----------------------------------------------------------|-----------------------------------------------------------|--------------|--------------|
| Teflon membrane filter (Omega) | 244.371 ± 0.0047 mg | 244.370 ± 0.0049 mg | 0.0019% | 0.0020% |
| PVC membrane filter (Omega) | 13.259 ± 0.0021 mg | 13.257 ± 0.0023 mg | 0.0160% | 0.0174% |
| MCE membrane filter (Gelman) | 41.582 ±0.1132 mg | 41.435 ± 0.0431 mg | 0.2722% | 0.104% |
| Glass-fiber filter (Whatman) | 87.933 ± 0.0628 mg | 87.844 ± 0.0118 mg | 0.0714% | 0.0134% |

<sup>a</sup>CV: Coefficient of variation is the ratio of standard deviation to the mean expressed as percentage. Tsai et al (2002) define the CV as relative deviation. <sup>b</sup>Controlled Experimental Chamber condition: temperature of 22–26 °C and relative humidity 39.5–41%. Uncontrolled Experimental Chamber condition: 24–28.5 °C and relative humidity 40–65%. Manufacturers are Omega Specialty Instrument Co., Chelmsford, MA, USA, Gelman Sciences, Inc. Ann Arbor, MI, USA, Whatman, Inc., Florham Park, NJ, USA.

Table S3. Major infrared bands of the principal polymorphs in crystalline silica [140].

| Polymorph | Primary Absorbance | Secondary Absorbance |
|-----------|--------------------|----------------------|
| α-quartz  | 780 and 799 cm<sup>-1</sup> | 695 cm<sup>-1</sup> |
| Cristobalite | 621 cm<sup>-1</sup> | 796 cm<sup>-1</sup> |
| Tridymite | 567 cm<sup>-1</sup> | 789 cm<sup>-1</sup> |
