1. General information

Unless otherwise noted, all reactions or reagents were obtained from commercial suppliers and used as received. Unless otherwise noted, all catalytic reactions were set up in an argon atmosphere glovebox (Vigor, SGI800-750TS-F). The substrates and reagents for catalytic reactions were degassed and stored in the glovebox, unless otherwise noted. All work-up and purification procedures were carried out with reagent-grade solvents in air.

Thin Layer Chromatography analyses were performed on silica gel coated glass plates (0.25 mm) with fluorescence indicator UV254. For detection of spots, irradiation of UV light at 254 nm or staining reagent using Potassium permanganate solution was used. Flash column chromatography was conducted with silica gel 60 (particle size 230-400 mesh, Huanghai) at room temperature and under elevated pressure.

Gas chromatography (GC) analysis was conducted on a Shimadzu GC-2030 instrument equipped with a Rtx-5 column (30 m × 0.25 mm) with dodecane as an internal standard. GC-MS analysis was conducted on a Agilent 5977B GC/MSD instrument equipped with a HP-5MS UI column (30 m × 0.25 mm). 1H NMR, 19F NMR and 13C NMR spectra were recorded at 400 MHz, 376 MHz and at 101 or 151 MHz, respectively in CDCl3 at room temperature. 1H NMR was reported as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quadruplet, m = multiplet), coupling constant (J values) in Hz and integration. Chemical shifts (δ) were reported with respect to the corresponding solvent residual peak at 7.26 ppm for CDCl3 for 1H NMR. 13C NMR spectra (1H-broadband decoupled) were reported in ppm using the central peak of CDCl3 (77.16 ppm). High-resolution mass spectrometric measurements were provided by the Department of The State Key Laboratory of Biotherapy, Sichuan University. The molecular ion [M]+, [M+H]+ and [M+Na]+ are given in m/z units.

2. General procedure for the synthesis of α, α-bis(trifluoromethyl) tosylate

**General procedure A:**

![Chemical reaction diagram]

In a glovebox filled with argon, dried CsF (1 mol%), Me3SiCF3 (3.0 equiv), phenyl carboxylate (1 equiv) and 1,4-dioxane were added to a two necked flask. After stirring the mixture at room temperature for 6 h, the resulting solution was filtered through a pad of silica gel and further eluted with EtOAc. The crude mixture was concentrated under reduced pressure, and the resulting mixture
was purified by flash column chromatography over silica gel. The product obtained above, 1,4-dioxane and 1 M NaOH were added to a round bottom flask and stirred for 30 min at room temperature. The resulting crude mixture was filtered through silica gel, further eluted with EtOAc and concentrated under reduced pressure. The resulting mixture was purified by flash column chromatography over silica gel and the alcohol was obtained.

**General procedure B**[2]

![Diagram](image)

To a stirred solution of pentafluorophenyl ester (1.0 equiv) in toluene (0.2 M) was added trimethyl(trifluoromethyl)silane (6.0 equiv). The reaction mixture was cooled to 0 °C in an ice bath and a solution of tetrabutylammonium fluoride (1 M in THF) (0.35 equiv) was added dropwise. The reaction mixture was allowed to reach room temperature and stirred for 18 h. The reaction was monitored by TLC (petroleum ether), and if necessary, additional trimethyl-(trifluoromethyl)silane could be added. Diethyl ether was added and the organic phase was washed with aqueous HCl (1 M). The aqueous phase was extracted with EtOAc (2 times). The combined ethereal phases were washed with H₂O, dried over Na₂SO₄, and concentrated under reduced pressure. The crude product was purified by flash column chromatography on silica gel to afford the desired product. The product obtained above, THF (0.2 M) and 6 M HCl (half volume of THF) were added and stirred overnight at room temperature. The mixture was diluted with H₂O and the product was extracted with EtOAc (2 times). The organic phases were combined, dried over Na₂SO₄, and concentrated under reduced pressure. The crude product was purified by flash column chromatography on silica gel to afford the desired product.

![Diagram](image)

Et₃N (4.0 equiv) was added dropwise to a stirred solution of α-trifluoromethylcarbinol (1.0 equiv) and DMAP (1.0 equiv) in CH₂Cl₂ (0.2 M) at 0 °C, and the p-toluenesulfonyl chloride (1.1 eq) was added. The solution was stirred at room temperature until completion and quenched with saturated aq. NaHCO₃, the layers were separated and the aqueous layer was extracted with CH₂Cl₂. The organic layer was washed with brine, dried over Na₂SO₄ and concentrated in vacuo. The α, α-bis(trifluoromethyl)-tosylates were purified by silica gel column chromatography.[3]
3. Standard conditions for preparing the gem-Difluoro-2-trifluromethyl Styrene Derivatives

In the glovebox, α, α-bis(trifluoromethyl) tosylates (0.2 mmol), PdI₂ (3.6 mg, 0.01 mmol), DPPP (4.1 mg, 0.01 mmol), and Zn (26.2 mg, 0.4 mmol) were added into an oven-dried 4 mL vial with a magnetic stirring bar, followed by addition of DMA (1.0 mL). The vial was sealed and removed out of the glovebox and heated to 80 °C. After 12 h, the vial was cooled to room temperature. The mixture was passed through a short silica gel pad with EtOAc. The filtrate was concentrated and the residue was purified by flash column chromatography to give the desired product.

4. The procedure for the gram scale reaction

In the glovebox, α, α-bis(trifluoromethyl) tosylates (3.0 mmol), PdI₂ (54.0 mg, 0.15 mmol), DPPP (61.5 mg, 0.15 mmol), and Zn (393.0 mg, 6 mmol) were added into a 50 mL sealed tube with a magnetic stirring bar, followed by addition of DMA (15.0 mL). The tube was sealed and removed out of the glovebox and heated to 80 °C. After 12 h, the vial was cooled to room temperature. The mixture was passed through a silica gel pad with EtOAc. The filtrate was concentrated and the residue was purified by flash column chromatography to give the desired product.

a). Effect of CF₃ group

In the glovebox, 1,1,1-trifluoro-2-phenylpropan-2-yl 4-methylbenzenesulfonate (3), PdI₂ (5 mol%, 3.6 mg), DPPP (5 mol%, 4.1 mg), and Zn (2.0 equiv, 26.2 mg) were added into an oven-dried 4 mL vial with a magnetic stirring bar, followed by addition of DMA (1.0 mL). The vial was sealed and removed out of the glovebox and heated to 80 °C. After 12 h, the vial was cooled to room temperature. The mixture was passed through a short silica gel pad with EtOAc. The filtrate was analyzed by GC-MS, and the yields were determined by GC-MS analysis using dodecane as the internal standard.

b). D₂O queching reaction

In the glovebox, 1a, PdI₂ (3.6 mg, 0.01 mmol), DPPP (4.1 mg, 0.01 mmol), and Zn (26.2 mg, 0.4 mmol) were added into an oven-dried 4 mL vial with a magnetic stirring bar, followed by addition of D₂O (38.0 mg, 0.4 mmol) and DMA (1.0 mL). The vial was sealed and removed out of the glovebox and heated to 80 °C. After 12 h, the vial was cooled to room temperature. The mixture
was passed through a short silica gel pad with EtOAc. The organic layer was washed with H₂O, dried over Na₂SO₄ and concentrated in vacuo. The 4 were purified by silica gel column chromatography.

Compound 4 are all white solid. ¹H NMR (400 MHz, Chloroform-d) δ 7.95-7.84 (m, 4H), 7.62-7.51 (m, 2H), 7.51 (d, J = 8.6 Hz, 1H), 4.23-4.19 (m, 0.1H). ¹⁹F NMR (376MHz, Chloroform-d) δ -65.19.

7. Synthetic utility experiments

a)

A solution of azole (34.0 mg, 0.5 mmol) in DMF (0.5 mL) was added dropwise to a mixture of 2a (154.8 mg, 0.6 mmol) and K₃PO₄ (212.0 mg, 1 mmol) in DMF (0.5 mL) via syringe and then stirred at room temperature for 12 h (monitored by TLC). After completion of the reaction, the mixture was quenched with H₂O (10 mL). The aqueous phase was extracted with CH₂Cl₂ (3 × 10 mL). The organic layer was dried over Na₂SO₄ and filtered, and the filtrate was concentrated in vacuo. The crude product was purified by column chromatography on silica gel to afford the pure target compound 9.¹¹
1-(1,3,3,3-tetrafluoro-2-(naphthalen-2-yl)prop-1-en-1-yl)-1H-imidazole (5) was obtained as a colorless oil (104.0 mg, 68%, Z/E = 1/4); \(^1\)H NMR (400 MHz, Chloroform-\(d\)): \(\delta\) 7.81 - 7.62 (m, 5H), 7.42 - 7.33 (m, 2H), 7.13 - 7.09 (m, 1H), 6.73 (s, 1H), 6.59 (s, 1H). \(^{19}\)F NMR (376 MHz, Chloroform-\(d\)): \(\delta\) -58.32 (d, \(J_{\text{FF}} = 22.6\) Hz, 3F), 45.39 (d, \(J_{\text{FF}} = 22.6\) Hz, 1F). \(^{13}\)C NMR (151 MHz, Chloroform-\(d\)): \(\delta\) 149.4 - 147.5 (m, CF=CAr-CF\(_3\)), 136.5, 133.4, 133.1, 130.0 (d, \(J_{\text{CF}} = 1.0\) Hz), 129.5, 128.6, 128.2, 127.8, 127.6, 127.0, 126.5 (d, \(J_{\text{CF}} = 1.0\) Hz), 124.9, 117.7, 124.6 - 119.2 (m, CF=CAr-CF\(_3\)), 103.5 - 103.2 (m, CF=CAr-CF\(_3\)).
