Abstract

Recent data from the ATLAS and CMS detectors at the Large Hadron Collider at CERN give a hint of possible violation of flavor in the leptonic decays of the Higgs boson. In this work we analyze the flavor violating leptonic decays $H^0_1 \to l_i \bar{l}_j \ (i \neq j)$ within the framework of an MSSM extension with a vectorlike leptonic generation. Specifically we focus on the decay mode $H^0_1 \to \mu \tau$. The analysis is done including tree and loop contributions involving exchange of $W, Z$, charge and neutral higgs and leptons and mirror leptons, charginos and neutralinos and sleptons and mirror sleptons. It is found that a substantial branching ratio of $H^0_1 \to \mu \tau$, i.e., of as much a $O(1)\%$, can be achieved in this model, the size hinted by the ATLAS and CMS data. The flavor violating decays $H^0_1 \to e \mu, e \tau$ are also analyzed and found to be consistent with the current experimental limits. An analysis of the dependence of flavor violating decays on CP phases is given. The analysis is extended to include flavor decays of the heavier Higgs bosons. A confirmation of the flavor violation in Higgs boson decays with more data that is expected from LHC at $\sqrt{s} = 13$ TeV will be evidence of new physics beyond the standard model.

Keywords: Flavor violation, Higgs, vector multiplet, CP phases

1 Introduction

Recently the ATLAS\cite{1} and the CMS\cite{2} Collaborations at CERN have observed some possible hints of flavor violating decays of the Higgs boson $H^0_1$. Thus the ATLAS Collaboration finds \cite{1}

\[ BR(H^0_1 \rightarrow \mu\tau) = BR((H^0_1 \rightarrow \mu^+\tau^-) + BR((H^0_1 \rightarrow \mu^-\tau^+) = (0.77 \pm 0.62)\% \]  

while the CMS Collaboration finds \cite{2}

\[ BR(H^0_1 \rightarrow \mu\tau) = BR((H^0_1 \rightarrow \mu^+\tau^-) + BR((H^0_1 \rightarrow \mu^-\tau^+) = (0.84^{+0.39}_{-0.37})\% \]  

For the $e\mu$ and $e\tau$ modes the experiments find a 95\% CL bounds so that

\[ BR(H^0_1 \rightarrow e\mu) < 0.036\%, \]
\[ BR(H^0_1 \rightarrow e\tau) < 0.70\%. \]  

More data is expected in the near future which makes an investigation of the lepton flavor violation in Higgs decays a timely topic of investigation. Thus in the standard model there is no explanation of flavor violating leptonic decays of the Higgs boson and if they are confirmed that would be direct evidence for new physics beyond the standard model. In this work we explain the flavor violating leptonic decays of the Higgs boson in the framework of an extended MSSM with a vectorlike leptonic generation following the techniques discussed in \cite{3,4,5}. Flavor changing Higgs decays are of significant theoretical interest and for some previous works see, e.g., \cite{6}-\cite{28}.

In the analysis of this work the three leptonic generations mix with the vectorlike generation which leads to flavor violation for the Higgs interactions. The analysis is carried out at the tree (see Fig. 1) and loop level where loop diagrams involving $W, Z$, leptons and mirror leptons (see figs. (2) and (4)), charginos, neutralinos, sleptons and mirror sleptons (see figs. (3) and (5)), charged Higgs, neutral Higgs, sleptons and mirror sleptons (see figs. (6) and (7) are taken account of. It is shown that flavor violating decays of the Higgs of the size hinted by the ATLAS and CMS data can be achieved consistent with the Higgs boson mass constraint. The dependence of the branching ratio of the flavor violating decay $\mu\tau$ and well as the dependence of the Higgs boson mass on CP phases is analyzed.
Figure 1: Tree level contribution to the flavor violating $\mu^\pm\tau^\mp$ decay of the neutral Higgs bosons.

The outline of the rest of the paper is as follows. In section 2 we give a description of the extended MSSM model. In section 3 an analytic analysis of the triangle loops figs. 2 - (7) that contribute to the flavor changing processes is given. Numerical analysis is given in section 4. Here we also study the dependence of the flavor violation on CP phases. Conclusions are given in section 5. Further details of the analysis are given in the Appendix.

2 The Model

As mentioned in section 1 the model we use for the computation of the flavor violating leptonic decays of the Higgs boson is an extended MSSM which includes a vector like leptonic generation. As is well known vectorlike multiplets appear in a variety of unified models including string and D brane models [29, 30, 31, 32]. Many applications of these vector like multiplets exist in the literature [3, 4, 5, 33, 34, 35]. In our analysis we include one vector like matter multiplet along with the three generations of matter. We begin by defining the nota-
tion for the matter content of the model and their properties under $SU(3)_C \times SU(2)_L \times U(1)_Y$. For the four sequential leptonic families we use the notation

$$\psi_{iL} \equiv \left( \begin{array}{c} \nu_{iL} \\ \ell_{iL} \end{array} \right) \sim (1, 2, -\frac{1}{2}), \ell_{iL}^c \sim (1, 1, 1), \nu_{iL}^c \sim (1, 1, 0),$$

(4)

where the last entry on the right hand side of each $\sim$ is the value of the hypercharge $Y$ defined so that $Q = T_3 + Y$ and we have included in our analysis the singlet field $\nu_i^c$, with $i$ runs from 1 – 4. For the mirrors we use the notation

$$\chi^c \equiv \left( \begin{array}{c} E_{\mu L}^c \\ N_L^c \end{array} \right) \sim (1, 2, \frac{1}{2}), E_{\mu L} \sim (1, 1, -1), N_L \sim (1, 1, 0).$$

(5)

The main difference between the leptons and the mirrors is that while the leptons have $V-A$ interactions type interactions with $SU(2)_L \times U(1)_Y$ gauge bosons the mirrors have $V+A$
Figure 5: Left panel: Chargino loop diagram involving the exchange of sneutrinos and mirror sneutrinos. Right panel: Neutralino loop diagram involving the exchange of sleptons and mirror sleptons.

Figure 6: Loop diagrams with neutral Higgs, charged leptons and mirror charged leptons.

interactions. Further details of the model including the superpotential, Lagrangian, and mass matrices are given below.

As discussed above the analysis is based on the assumption that there is a vectorlike leptonic generation that lies at low scales. Including this vectorlike generation we discuss the superpotential, soft terms, the mass matrices and the particle and sparticle spectrum that enters in the analysis in this section. Thus the superpotential of the model for the lepton part is taken to be of the form
Fig. 7: Loops with charged Higgs, neutrinos and mirror neutrinos.

\[ W = -\mu_{ij} H_1 \tilde{H}_2 + \epsilon_{ij} \left[ f_1 \tilde{H}_1 \tilde{\psi}_L \tilde{\chi}_{ci} + f'_1 \tilde{H}_2 \tilde{\psi}_L \tilde{\chi}_{ci} + f_2 \tilde{H}_1 \tilde{\chi}_{cj} \tilde{N}_L + f'_2 \tilde{H}_2 \tilde{\chi}_{cj} \tilde{E}_L \right] + h_1 \tilde{H}_1 \tilde{\psi}_L \tilde{\mu}_L + h'_1 \tilde{H}_1 \tilde{\psi}_L \tilde{\mu}_L + h_2 \tilde{H}_2 \tilde{\psi}_L \tilde{\mu}_L + h'_2 \tilde{H}_2 \tilde{\psi}_L \tilde{\mu}_L + y_5 \tilde{H}_1 \tilde{\psi}_L \tilde{\psi}_L \tilde{N}_L + y'_5 \tilde{H}_2 \tilde{\psi}_L \tilde{\psi}_L \tilde{N}_L \]

\[ W = f_3 \epsilon_{ij} \tilde{\chi}_{ci} \tilde{\psi}_L + f'_3 \epsilon_{ij} \tilde{\chi}_{ci} \tilde{\psi}_L + f_4 \tilde{\psi}_L \tilde{\psi}_L \tilde{N}_L + f'_4 \tilde{\psi}_L \tilde{\psi}_L \tilde{N}_L + f''_4 \tilde{\psi}_L \tilde{\psi}_L \tilde{N}_L + f''_4 \tilde{\psi}_L \tilde{\psi}_L \tilde{N}_L, \tag{6} \]

where \( \tilde{\psi}_L \) stands for \( \tilde{\psi}_3L \), \( \tilde{\psi}_L \) stands for \( \tilde{\psi}_2L \) and \( \tilde{\psi}_eL \) stands for \( \tilde{\psi}_1L \). Mixings of the above type can arise via non-renormalizable interactions. Consider, for example, a term such as \( 1/M_P \tilde{\nu}_e L \Phi_1 \Phi_2 \). If \( \Phi_1 \) and \( \Phi_2 \) develop VEVs of size \( 10^{-9-10} \), a mixing term of the right size can be generated. We assume that the couplings in Eq. (6) are complex and we define their phases so that

\[ f_k = |f_k| e^{i\chi_k}, \quad f'_k = |f'_k| e^{i\chi'_k}, \quad f''_k = |f''_k| e^{i\chi''_k}, \]

\[ h_i = |h_i| e^{i\theta_{hi}}, \quad h'_i = |h'_i| e^{i\theta'_{hi}}, \quad h''_i = |h''_i| e^{i\theta''_{hi}}. \tag{7} \]

where \( k, i \) take on the appropriate values that appear in Eq. (6).

The mass terms for the neutrinos, mirror neutrinos, leptons and mirror leptons arise from the term

\[ \mathcal{L} = -\frac{1}{2} \frac{\partial^2 W}{\partial A_i \partial A_j} \psi_i \psi_j + \text{H.c.} \tag{8} \]

where \( \psi \) and \( A \) stand for generic two-component fermion and scalar fields. After spontaneous breaking of the electroweak symmetry, \( \langle H_1 \rangle = v_1/\sqrt{2} \) and \( \langle H_2 \rangle = v_2/\sqrt{2} \), we have the following set of mass terms written in the 4-component spinor notation so that

\[ -\mathcal{L}_m = \tilde{\xi}_R^T (M_f) \xi_L + \tilde{\eta}_R^T (M_e) \eta_L + \text{H.c.}, \tag{9} \]

\[ \xi_L = \begin{pmatrix} \hat{H}_1 \tilde{\nu}_L \tilde{\psi}_L \tilde{N}_L \end{pmatrix}, \quad \eta_L = \begin{pmatrix} \hat{H}_2 \tilde{\psi}_L \tilde{\nu}_e \tilde{N}_L \end{pmatrix}. \]
where the basis vectors in which the mass matrix is written is given by

\[
\begin{align*}
\bar{\xi}_R^T &= (\bar{\nu}_\tau R \bar{\nu}_\mu R \bar{\nu}_e R \bar{\nu}_{4R}),
\xi_L^T &= (\nu_\tau L \nu_\mu L \nu_e L \nu_{4L}),
\bar{\eta}_R^T &= (\bar{\tau}_R \bar{E}_R \bar{\mu}_R \bar{e}_R \bar{\ell}_{4R}),
\eta_L^T &= (\tau_L E_L \mu_L e_L \ell_{4L}),
\end{align*}
\]  

(10)

and the mass matrix \( M_f \) of neutrinos is given by

\[
M_f = \begin{pmatrix}
\frac{f'_1 v_2}{\sqrt{2}} & f_5 & 0 & 0 & 0 \\
-f_3 & \frac{f_2 v_1}{\sqrt{2}} & -f'_3 & -f''_3 & -h_6 \\
0 & f'_5 & h'_1 v_2/\sqrt{2} & 0 & 0 \\
0 & f''_5 & 0 & h'_2 v_2/\sqrt{2} & 0 \\
0 & h_8 & 0 & 0 & y_5 v_1/\sqrt{2}
\end{pmatrix}.
\]  

(11)

We define the matrix element (22) of the mass matrix as \( m_N \) so that

\[ m_N = f_2 v_1/\sqrt{2}. \]  

(12)

The mass matrix is not hermitian and thus one needs bi-unitary transformations to diagonalize it. We define the bi-unitary transformation so that

\[
D^\nu_R (M_f) D^\nu_L = \text{diag}(m_{\psi_1}, m_{\psi_2}, m_{\psi_3}, m_{\psi_4}, m_{\psi_5}).
\]  

(13)

In \( \psi_1, \psi_2, \psi_3, \psi_4, \psi_5 \) are the mass eigenstates for the neutrinos, where in the limit of no mixing we identify \( \psi_1 \) as the light tau neutrino, \( \psi_2 \) as the heavier mass mirror eigen state, \( \psi_3 \) as the muon neutrino, \( \psi_4 \) as the electron neutrino and \( \psi_5 \) as the other heavy 4-sequential generation neutrino. A similar analysis goes to the lepton mass matrix \( M_\ell \) where

\[
M_\ell = \begin{pmatrix}
\frac{f_1 v_1}{\sqrt{2}} & f_4 & 0 & 0 & 0 \\
f_3 & \frac{f'_2 v_2}{\sqrt{2}} & f'_3 & f''_3 & h_6 \\
0 & f'_4 & h_1 v_1/\sqrt{2} & 0 & 0 \\
0 & f''_4 & 0 & h_2 v_1/\sqrt{2} & 0 \\
0 & h_7 & 0 & 0 & y_5 v_1/\sqrt{2}
\end{pmatrix}.
\]  

(14)

We introduce now the mass parameter \( m_E \) defined by the (22) element of the mass matrix above so that

\[ m_E = f'_2 v_2/\sqrt{2}. \]  

(15)
The mass squared matrices of the slepton-mirror slepton and sneutrino-mirror sneutrino come from three sources: the F term, the D term of the potential and the soft SUSY breaking terms. After spontaneous breaking of the electroweak symmetry the Lagrangian is given by

\[ \mathcal{L} = \mathcal{L}_F + \mathcal{L}_D + \mathcal{L}_{\text{soft}}, \]  

where \( \mathcal{L}_F \) is deduced from \( -\mathcal{L}_F = F_i F_i^* \), while the \( \mathcal{L}_D \) is given by

\[
-\mathcal{L}_D = \frac{1}{2} m_Z^2 \cos^2 \theta_W \cos 2\beta \left\{ \tilde{\nu}_L \tilde{\nu}_L^* - \tilde{\tau}_L \tilde{\tau}_L^* + \tilde{\nu}_L \tilde{\nu}_L^* - \tilde{\mu}_L \tilde{\mu}_L^* + \tilde{\nu}_L \tilde{\nu}_L^* - \tilde{e}_L \tilde{e}_L^* \right\} + \frac{1}{2} m_Z^2 \sin^2 \theta_W \cos 2\beta \left\{ \tilde{\nu}_L \tilde{\nu}_L^* + \tilde{\tau}_L \tilde{\tau}_L^* + \tilde{\nu}_L \tilde{\nu}_L^* + \tilde{\mu}_L \tilde{\mu}_L^* + \tilde{\nu}_L \tilde{\nu}_L^* + \tilde{\nu}_L \tilde{\nu}_L^* + \tilde{\nu}_L \tilde{\nu}_L^* + \tilde{e}_L \tilde{e}_L^* \right\} + \tilde{\nu}_L \tilde{\nu}_L^* + \tilde{e}_L \tilde{e}_L^* + \tilde{\nu}_L \tilde{\nu}_L^* + \tilde{\nu}_L \tilde{\nu}_L^* + \tilde{\nu}_L \tilde{\nu}_L^* + \tilde{e}_L \tilde{e}_L^* - \tilde{E}_R \tilde{E}_R^* - \tilde{N}_R \tilde{N}_R^* + 2 \tilde{\nu}_L \tilde{\nu}_L^* - 2 \tilde{\tau}_R \tilde{\tau}_R^* - 2 \tilde{\nu}_R \tilde{\nu}_R^* - 2 \tilde{e}_R \tilde{e}_R^* - 2 \tilde{\ell}_4 \tilde{\ell}_4^* \}. 
\]

The trilinear couplings \( A_i \) are also complex and we define their phases so that

\[ A_i = |A_i| e^{i \alpha_i}. \]

We define the scalar mass squared matrix \( M_\tau^2 \) in the basis

\[ (\tilde{\tau}_L, \tilde{E}_L, \tilde{\tau}_R, \tilde{E}_R, \tilde{\mu}_L, \tilde{\mu}_R, \tilde{e}_L, \tilde{e}_R, \tilde{\ell}_4, \tilde{\ell}_4), \]

We label the matrix elements of these as \( (M_\tau^2)_{ij} = M_{ij}^\tau \) where the elements of the matrix are given in [36]. We assume that all the masses are of the electroweak size so all the terms enter in the mass squared matrix. We diagonalize this hermitian mass squared matrix by the unitary transformation

\[
\mathcal{D}^\dagger M_\tau^2 \mathcal{D}^\tau = \text{diag}(M_{\tau_1}^2, M_{\tau_2}^2, M_{\tau_3}^2, M_{\tau_4}^2, M_{\tau_5}^2, M_{\tau_6}^2, M_{\tau_7}^2, M_{\tau_8}^2, M_{\tau_9}^2, M_{\tau_{10}}^2). 
\]
The mass\(^2\) matrix in the sneutrino sector has a similar structure. In the basis
\[
(\tilde{\nu}_{\tau L}, \tilde{N}_L, \tilde{\nu}_{\tau R}, \tilde{N}_R, \tilde{\nu}_{\mu L}, \tilde{\nu}_{\mu R}, \tilde{\nu}_{e L}, \tilde{\nu}_{e R}, \tilde{\nu}_{4L}, \tilde{\nu}_{4R})
\] (22)
and write the sneutrino mass\(^2\) matrix in the form \((M_{\tilde{\nu}}^2)_{ij} = m_{\tilde{\nu}ij}\) where the elements are given in [36]. As in the charged lepton sector we assume that all the masses are of the electroweak size so all the terms enter in the mass\(^2\) matrix. This mass\(^2\) matrix can be diagonalized by the unitary transformation
\[
\tilde{D}^\dagger M_{\tilde{\nu}}^2 \tilde{D} = \text{diag}(M_{\tilde{\nu}1}^2, M_{\tilde{\nu}2}^2, M_{\tilde{\nu}3}^2, M_{\tilde{\nu}4}^2, M_{\tilde{\nu}5}^2, M_{\tilde{\nu}6}^2, M_{\tilde{\nu}7}^2, M_{\tilde{\nu}8}^2, M_{\tilde{\nu}9}^2, M_{\tilde{\nu}10}^2).
\] (23)

3 Analysis of flavor violating leptonic decays of the Higgs boson

Flavor changing decays of this extended MSSM model arise at both the tree level due to lepton and mirror lepton mass mixing and at the loop level. There are several diagrams that contribute to the decays. These include the exchange of the charged \(W\) bosons and neutrinos and mirror neutrinos (see left panel of Fig. 2), exchange of \(Z\) bosons and leptons and mirror leptons (see right panel of Fig. 2), exchange of charginos, sneutrinos and mirror sneutrinos (see left panel of Fig. 3) and the exchange of neutralinos, charged sleptons and mirror charged sleptons (see right panel of Fig. 3). Additional diagrams which involve Higgs-neutrino-neutrino, Higgs-lepton-lepton, Higgs-sneutrino-sneutrino and Higgs-slepton-slepton vertices are given in Fig. 4 and Fig. 5. Other diagrams involve neutral and charged Higgs running in the loops are given in Figs. 6 and 7. So at the tree level, there is a coupling between the fields \(H_1^1, H_2^2, \mu\) and \(\tau\) due to mixing given by (see section 6)

\[
- \mathcal{L}_{\text{eff}} = \bar{\mu}_3 \chi_3 P_L \tau H_1^1 + \bar{\mu}_3 \eta_3 P_L \tau H_2^2 + \bar{\tau}_3 \chi_3 P_L \mu H_1^1 + \bar{\tau}_3 \eta_3 P_L \mu H_2^2 + H.c.
\] (24)

The loop corrections produces the effective Lagrangian

\[
\mathcal{L}_{\text{eff}} = \bar{\mu} \delta \xi_{\mu \tau} P_R \tau H_1^1 + \bar{\mu} \Delta \xi_{\mu \tau} P_L \tau H_1^1 + \bar{\mu} \delta \xi'_{\mu \tau} P_R \tau H_2^2 + \bar{\mu} \Delta \xi'_{\mu \tau} P_L \tau H_2^2 + H.c.
\] (25)
This effective Lagrangian written in terms of the mass eigen states of the neutral Higgs $H_i^0$ with $i = 1, 2, 3$ reads

$$
\mathcal{L}_{\text{eff}} = \mu \{ -\alpha_{3ii}^s + \alpha_i^s \} + \gamma_5 \{ -\alpha_{3ii}^p + \alpha_i^p \} \tau H_i^0 \\
+ \bar{\tau} \{ -\alpha_{13i}^s + \alpha_i^s \} + \gamma_5 \{ -\alpha_{13i}^p + \alpha_i^p \} \bar{\mu} H_i^0
$$

(26)

where the couplings are given by

$$
\alpha_{kji}^s = \frac{1}{2\sqrt{2}} \left( \chi_{kj} \{ Y_{1i} + iY_{33} \sin \beta \} + \eta_{kj} \{ Y_{2i} + iY_{33} \cos \beta \} \right)
+ \chi_{jk}^* \{ Y_{1i} - iY_{33} \sin \beta \} + \eta_{jk}^* \{ Y_{2i} - iY_{33} \cos \beta \} )
$$

$$
\alpha_{kji}^p = \frac{1}{2\sqrt{2}} \left( -\chi_{kj} \{ Y_{1i} + iY_{33} \sin \beta \} - \eta_{kj} \{ Y_{2i} + iY_{33} \cos \beta \} \right)
+ \chi_{jk}^* \{ Y_{1i} - iY_{33} \sin \beta \} + \eta_{jk}^* \{ Y_{2i} - iY_{33} \cos \beta \} )
$$

$$
\alpha_i^s = \frac{1}{2\sqrt{2}} \left( \{ \delta_{\mu\tau} + \Delta_{\mu\tau} \} \{ Y_{1i} + iY_{33} \sin \beta \} + \{ \delta_{\mu\tau}^* + \Delta_{\mu\tau}^* \} \{ Y_{2i} + iY_{33} \cos \beta \} \right)
+ \{ \delta_{\mu\tau} - \Delta_{\mu\tau} \} \{ Y_{1i} - iY_{33} \sin \beta \} + \{ \delta_{\mu\tau}^* - \Delta_{\mu\tau}^* \} \{ Y_{2i} - iY_{33} \cos \beta \} \right)
$$

$$
\alpha_i^p = \frac{1}{2\sqrt{2}} \left( \{ \delta_{\mu\tau} - \Delta_{\mu\tau} \} \{ Y_{1i} + iY_{33} \sin \beta \} + \{ \delta_{\mu\tau}^* - \Delta_{\mu\tau}^* \} \{ Y_{2i} + iY_{33} \cos \beta \} \right)
+ \{ \delta_{\mu\tau}^* + \Delta_{\mu\tau}^* \} \{ Y_{1i} - iY_{33} \sin \beta \} + \{ \delta_{\mu\tau} + \Delta_{\mu\tau} \} \{ Y_{2i} - iY_{33} \cos \beta \} \right)
$$

(27)

where the matrix elements $Y$ are defined by

$$
YM_{Higgs}^2 Y^T = \text{diag}(m_{H_1}^2, m_{H_2}^2, m_{H_3}^2)
$$

(28)

and $\chi_{ij}$ and $\eta_{ij}$ are given in Eq. (59). The decay of the neutral Higgs $H_i^0$ into an anti tau and a muon is given by

$$
\Gamma_i(H_i^0 \rightarrow \bar{\tau}\mu) = \frac{1}{4\pi m_{H_i}^2} \sqrt{[(m_\tau^2 + m_{\mu}^2 - m_{H_i}^2)^2 - 4m_\tau^2m_{\mu}^2]}
\times \left\{ \frac{1}{2} \left[ | - \alpha_{3ii}^s + \alpha_i^s |^2 + | - \alpha_{3ii}^p + \alpha_i^p |^2 \right] (m_{H_i}^2 - m_\tau^2 - m_{\mu}^2) \right\}
\times \left\{ \frac{1}{2} \left[ | - \alpha_{3ii}^s + \alpha_i^s |^2 - | - \alpha_{3ii}^p + \alpha_i^p |^2 \right] (2m_\tau m_{\mu}) \right\}
$$

$$
\Gamma_i(H_i^0 \rightarrow \mu\bar{\tau}) = \frac{1}{4\pi m_{H_i}^2} \sqrt{[(m_\tau^2 + m_{\mu}^2 - m_{H_i}^2)^2 - 4m_\tau^2m_{\mu}^2]}
\times \left\{ \frac{1}{2} \left[ | - \alpha_{13i}^s + \alpha_i^s |^2 + | - \alpha_{13i}^p + \alpha_i^p |^2 \right] (m_{H_i}^2 - m_\tau^2 - m_{\mu}^2) \right\}
\times \left\{ \frac{1}{2} \left[ | - \alpha_{13i}^s + \alpha_i^s |^2 - | - \alpha_{13i}^p + \alpha_i^p |^2 \right] (2m_\tau m_{\mu}) \right\}
$$

(29)
We give a computation of each of the different loop contributions to $\delta \xi_{\mu \tau}$, $\Delta \xi_{\mu \tau}$, $\delta \xi'_{\mu \tau}$ and $\Delta \xi'_{\mu \tau}$ in the Appendix.

4 Numerical analysis

As discussed in the introduction, the promising Higgs boson decays for the observation of flavor violation are $\mu \tau$, i.e., $\bar{\tau} \mu, \tau \bar{\mu}$. In MSSM one has three neutral Higgs bosons $H_1^0, H_2^0, H_3^0$ with $H_1^0$ being the lightest which is the observed Higgs boson. As is well known in the presence of CP phases the CP even and CP odd Higgs bosons mix [37] (for a recent analysis see [38]). Thus the mass eigenstates in general will have dependence on CP phases. We will investigate the dependence of the flavor violating decays as well as of the Higgs boson mass on the CP phases in the analysis. We also note that one may allow large CP phases consistent with the current limits on EDM constraints due the cancellation mechanism discussed in many works [39, 40, 41]. Thus the flavor violating branching ratios of $H_1$ into $\bar{\tau} \mu, \tau \bar{\mu}$ are given by

$$BR(H_1^0 \to \bar{\tau} \mu) = \frac{\Gamma(H_1^0 \to \bar{\tau} \mu)}{\Gamma(H_1^0 \to \bar{\mu} \tau) + \Gamma(H_1^0 \to \bar{\tau} \mu) + \sum_i \Gamma(H_1^0 \to \bar{f}_i f_i) + \Gamma_{H_1, DB}}$$

$$BR(H_1^0 \to \tau \bar{\mu}) = \frac{\Gamma(H_1^0 \to \tau \bar{\mu})}{\Gamma(H_1^0 \to \bar{\mu} \tau) + \Gamma(H_1^0 \to \bar{\tau} \mu) + \sum_i \Gamma(H_1^0 \to \bar{f}_i f_i) + \Gamma_{H_1, DB}}$$

(30)

where $f_i$ stand for fermionic particles that have coupling with the Higgs boson and have a mass less than half the higgs boson mass and $\Gamma_{H_1, DB}$ is the decay width into diboson states which include $gg, \gamma \gamma, \gamma Z, ZZ, WW$. Thus the computation of the branching ratios of Eq. (30) involve the decay widths

$$\Gamma_i(H_i^0 \to \bar{f} f)_{f=b,d,s} = \frac{3g^2 m_f^2}{32\pi m_W^2 \cos^2 \beta} M_i \{ |Y_{i1}|^2 (1 - \frac{4m_f^2}{M_i^2})^{3/2} + |Y_{i3}|^2 \sin^2 \beta (1 - \frac{4m_f^2}{M_i^2})^{1/2} \}$$

$$\Gamma_i(H_i^0 \to \bar{f} f)_{f=\tau,\mu,e} = \frac{g^2 m_f^2}{32\pi m_W^2 \cos^2 \beta} M_i \{ |Y_{i1}|^2 (1 - \frac{4m_f^2}{M_i^2})^{3/2} + |Y_{i3}|^2 \sin^2 \beta (1 - \frac{4m_f^2}{M_i^2})^{1/2} \}$$

$$\Gamma_i(H_i^0 \to \bar{f} f)_{f=u,c} = \frac{3g^2 m_f^2}{32\pi m_W^2 \sin^2 \beta} M_i \{ |Y_{i2}|^2 (1 - \frac{4m_f^2}{M_i^2})^{3/2} + |Y_{i3}|^2 \cos^2 \beta (1 - \frac{4m_f^2}{M_i^2})^{1/2} \}.$$ 

(31)

The decays into $ZZ$ and $WW$ final states are off shell with the final states being dominantly four fermions. We note that $\tau \mu$ final states do not originate from any of the diboson decay modes of the Higgs boson. Further, at a mass of 125 GeV the Higgs boson is effectively
in the decoupling limit. Thus we approximate the diboson decay widths as given by the standard model.

Although flavor violating $\tau \mu$ mode of the Higgs boson in the model we consider arises already at the tree level as shown in Fig. 1 here we give an analysis of this decay by inclusion of both the tree as well as the loop contributions arising from the exchange diagrams of Figs 2-7 which are computed in section 3. In this extended MSSM model one has one vector like generation of leptons which consists of a sequential fourth generation and a mirror generation. It is the mixing of the normal three generations with the vector generation that leads to the flavor violating decays. The flavor mixing arises via the mass matrices the details of which can be found in section 2. To show that such mixings can indeed produce flavor violating Higgs decays of significant size, i.e., $\mathcal{O}(1)\%$, we give in table 1 a numerical analysis for flavor flavor violating decays for a specific point in the parameter space. In table 1 $m_A$ is mass of the CP odd Higgs before loop corrections are taken into account. We use $m_A$ as a free parameter in the analysis. In the analysis of table (1) we find that a branching ratio of $\sim 0.33\%$ is achieved which is consistent with the size hinted by the ATLAS and the CMS experiments (see Eqs. (1) and (2)). In table (1) we also give the relative contribution of the loop vs the tree as well as the branching ratios for the flavor violating decays $H_1 \rightarrow \mu e$ and $H_1 \rightarrow e \tau$. In table (2) we give the relative loop contribution from $W$ and $Z$, and from lepton and mirror lepton exchange, and in table (3) we give the loop contribution arising from the MSSM sector, i.e., from the chargino and neutralino exchange, and from the charged Higgs and neutral Higgs, and from slepton and mirror slepton exchange. In table (4) we give the tree level couplings of the Higgs decay to $\tau$ and $\mu$ in comparison to the loop corrections to couplings given in tables (2) and (3) as defined in equations 24 and 25.

We discuss now further details of the analysis which includes both tree and loop contributions. In the left panel of fig. 8 we exhibit the dependence of $\text{BR}(H^0_1 \rightarrow \tau \mu)$ on $\tan \beta$ and the branching ratio is seen to be sensitive to it. The sensitivity of the light Higgs boson mass on $\tan\beta$ is exhibited in the right panel of fig. 8 and one finds that a shift in the Higgs boson mass in the range 1-2 GeV can arise from variations in $\tan\beta$. The rest of the analysis relates to the dependence of the flavor violating decays and of the Higgs boson mass on CP phases. Thus Fig. 9 exhibits the dependence of $\text{BR}(H^0_1 \rightarrow \mu \tau)$ on $\theta_{A_d}$ (top left panel) and on $\theta_{A_u}$ (top right panel) and the dependence of the Higgs boson mass $m_{H_1}$ on on $\theta_{A_d}$ (bottom left panel) and on $\theta_{A_u}$ (bottom right panel). In Fig. 10 we exhibit the
dependence of $\text{BR}(H_1^0 \rightarrow \tau \mu)$ on $\chi_3$ (left panel) and on $\chi_4$ (right panel). Fig. (11) exhibits the dependence of $\text{BR}(H_1^0 \rightarrow \tau \mu)$ on $\theta_{h_8}$ which enters through the neutrino mass matrix and thus enters the loop contributions arising from the W and Z exchange diagrams of Fig. 2 and Fig. 4. Fig. (12) exhibits the dependence of $\text{BR}(H_1^0 \rightarrow \tau \mu)$ on $A_0 = A_0^\nu$ which enter through the slepton and sneutrino mass squared matrices which affect the loop corrections arising from the SUSY exchange diagrams of fig. (3) and (5). Finally in Fig. 13 we exhibit the dependence of $\text{BR}(H_1^0 \rightarrow \tau \mu)$ (left panel) and of $m_{H_1}$ (right panel) on $\theta_{\mu}$. The dependence on $\theta_{\mu}$ arises since it enters the chargino, the neutralino, and the slepton mass matrices and thus affects the loop corrections given by the exchange diagrams of fig. (3) and fig. (5) and the exchange diagrams of fig. (6) and fig. (7).

In summary one finds that a sizable branching ratio for the flavor violating Higgs decay $H_1^0 \rightarrow \mu \tau$ can arise in the extended MSSM model with a vectorlike generation. The branching ratios for the $e\mu$ and $e\tau$ decays are found to be much smaller. While the assumed model is a low energy model, it appears possible to embed it in a UV complete model. However, an analysis of it is outside the framework of this work.
Table 1: The light Higgs boson $H_1$ decay branching ratios into flavor violating decay modes $\tau\mu$, $e\mu$, $e\tau$. Column 2 gives the contribution at the tree level while column 3 gives the result with tree plus loop contributions. The results of the table are consistent with the experimental data of Eqs. (1), (2), and (3). The mass for the Higgs boson is: $m_{H_1^0} = 125$ GeV. The parameters used are $\tan(\beta) = 15, m_0 = 12 \times 10^3, m^\mu_0 = 12 \times 10^3, |\mu| = 600, \theta_\mu = 2.5, |A_0| = 8000, |A^\mu_0| = 8000, \theta_{A_0} = 2, \theta_{A^\mu_0} = 3, |m_1| = 320, |m_2| = 400, \theta_{m_1} = 1 \times 10^{-1}, \theta_{m_2} = 0.2, m_A = 300, m^\nu_0 = 1500, m^\mu_0 = 1500, |A_0|^ = 5400, |A^\mu_0|^ = 6000, \theta_{A^\mu_0} = 0.3, \theta_{A_0} = 0.6, |h_6| = 2600, |h_7| = 30, |h_8| = 7500, |h^\nu_6| = 6500, |h^\mu_6| = 6500, |h^\mu_8| = 6500, \theta_{h_6} = 0.2, \theta_{h_7} = 0.1, \theta_{h_8} = 1, \theta_{h^\nu_6} = -3, \theta_{h^\mu_6} = -3, |f_3| = 20, |f^\prime_3| = 0.2, |f^\prime_3| = 0.003, |f_4| = 0.8, |f^\prime_4| = 0.3, |f^\prime_4| = 0.1, |f^\mu_5| = 0.004, |f^\mu_5| = 0.002, |f^\mu_5| = 0.002, |h_3| = 15, |h^\mu_3| = 0.2, |h^\nu_3| = 0.003, |h_4| = 60, |h^\nu_4| = 1.5, |h^\mu_4| = 0.1, |h_5| = 60, |h^\nu_5| = 1.5, |h^\nu_5| = 0.1, \theta_{h_3} = 1.05, \theta_{h^\nu_3} = 1.05, \theta_{h^\nu_3} = 1.1, \theta_{h^\nu_3} = -1, \theta_{h^\nu_3} = -0.9, \theta_{h^\nu_3} = -2.4, \theta_{h^\nu_3} = -1, \theta_{h^\nu_3} = -9 \times 10^{-1}, \theta_{h^\nu_3} = -2.4, \chi_3 = 1.05, \chi^\prime_3 = -0.4, \chi^\prime_3 = 1.1, \chi_4 = -1, \chi^\prime_4 = 0.3, \chi^\prime_4 = -1.4, \chi_5 = 1.5, \chi^\prime_5 = 1.5, \chi^\prime_5 = 1.5. The mirror and the fourth sequential generation masses are $m_E = 210, m_N = 300, m_G = 440$, and $m_{G^\nu} = 100$ and the Yukawa couplings are $y_2 = 6.39, y^\prime_2 = 0.432, y^\prime_5 = 0.426$, and $y_5 = 5.7$. The parameters $m_A, h_3, h^\nu_3, h^\mu_3, h^\mu_4, h^\nu_4, h_5, h^\nu_5, y_2, y^\prime_2$ are as defined in [38]. All masses are in GeV and angles in rad.

| BR($H_1^0 \rightarrow \tau\mu$) | Tree level | Tree plus loop |
|-------------------------------|-------------|----------------|
| $BR(H_1^0 \rightarrow \tau\mu)$ | 0.325 | 0.321 |
| $BR(H_1^0 \rightarrow e\mu)$ | $3.386 \times 10^{-6}$ | $3.350 \times 10^{-6}$ |
| $BR(H_1^0 \rightarrow e\tau)$ | $3.613 \times 10^{-2}$ | $3.572 \times 10^{-2}$ |

Figure 8: Left panel: $BR(H_1^0 \rightarrow \mu\tau)$ versus $\tan(\beta)$ when $m_A = 200$ (red), 300 (green), 400 (blue) where the solid lines are tree and the dashed lines are tree plus loop contributions. Right panel: $m_{H_1^0}$ vs $\tan(\beta)$ when $m_A = 200$ (red), 300 (green), 400 (blue) where $m_{H_1^0}$ includes tree and loop contribution.
Figure 9: Top panels: $\text{BR}(H_1^0 \rightarrow \mu \tau)$ as a function of $\theta_{A_0^d}$ (left panel) and as function of $\theta_{A_0^u}$ (right panel) when $|A_0^d| = 4000$ (red), 6000 (green), 8000 (blue) (left panel) and $|A_0^u| = 5200, 5400, 5600$ (right panel). The rest of the parameters are as in Table (1). The solid curves are the tree while the dashed curves are the tree and the loop. Bottom Panels: $m_{H_1^0}$ as a function of $\theta_{A_0^d}$ (left panel) and $\theta_{A_0^u}$ (right panel) corresponding to each of the curves of the top panels.
Figure 10: Left panel: $\text{BR}(H^0_1 \rightarrow \mu \tau)$ as a function of the CP phase $\chi_3$ when $|f_3| = 15$ (red), 20 (green), and 25 (blue). Right panel: $\text{BR}(H^0_1 \rightarrow \mu \tau)$ as a function of the CP phase $\chi_4$ when $|f_4| = 0.2$ (red), 0.8 (green), and 1.4 (blue). The solid curves are tree level while the dashed curves include the loop contributions of fig. (3)-(7).

Figure 11: $\text{BR}(H^0_1 \rightarrow \mu \tau)$ vs $\theta_{h_8}$ (the phase of $h_8$) when $|h_8| = 750$ (red), 7500 (green), 75000 (blue) where the horizontal solid line gives the tree value and the dashed curves show tree and loop contributions. The rest of the parameters are common with table 1.
Figure 12: BR($H_1^0 \to \mu \tau$) vs $\theta_{A_0} = \theta_{A_0^}\nu$ when $|A_0| = |A_0^\nu| = 800$ (red), 8000 (green), 80000 (red) where the horizontal solid line at the top gives the tree and the dashed curves give the tree plus loop contributions. The rest of the parameters are common with table 1.

Figure 13: Left panel: BR($H_1^0 \to \mu \tau$) versus $\theta_\mu$ when $|\mu| = 500$ (red), 600 (green), 700 (blue) where the horizontal solid line at the top is the tree and the dashed lines at the are the tree plus loop. Right panel: $m_{H_1}$ vs $\theta_\mu$ for the same $|\mu|$ values as the left panel where the horizontal solid line gives the tree and the dashed curves give the tree plus loop. The rest of the parameters are common with table 1.
Table 2: W and Z loop contributions to $\delta \xi_{\mu\tau}$, $\Delta \xi_{\mu\tau}$, $\delta \xi'_{\mu\tau}$, $\Delta \xi'_{\mu\tau}$ arising from the exchange diagrams of Fig. 2 and Fig. 4 for two points (i) and (ii) on two curves of Fig. 8. (i) is on the dashed green curve for $m_A = 300$ at $\tan(\beta) = 15$ which is the parameter point of table 1 and (ii) is on dashed blue curve for $m_A = 400$ at $\tan(\beta) = 20$. Changes in these loop contributions are solely due to the change in $\tan(\beta)$. The light Higgs mass eigenstate for (i) is $m_{H_0} = 124.98$ and for (ii) is $m_{H_0} = 124.96 \text{ GeV}$.

| Quantity | Loop contribution |
|----------|-------------------|
| (i) $\delta \xi_{\mu\tau}$ | $6.82 \times 10^{-9} - 3.02 \times 10^{-9}i$ |
| (i) $\Delta \xi_{\mu\tau}$ | $-7.41 \times 10^{-10} - 2.63 \times 10^{-9}i$ |
| (i) $\delta \xi'_{\mu\tau}$ | $-3.39 \times 10^{-10} - 1.30 \times 10^{-9}i$ |
| (i) $\Delta \xi'_{\mu\tau}$ | $-1.11 \times 10^{-8} - 3.94 \times 10^{-8}i$ |
| (ii) $\delta \xi_{\mu\tau}$ | $9.09 \times 10^{-9} - 3.99 \times 10^{-9}i$ |
| (ii) $\Delta \xi_{\mu\tau}$ | $-5.56 \times 10^{-10} - 1.97 \times 10^{-9}i$ |
| (ii) $\delta \xi'_{\mu\tau}$ | $-3.39 \times 10^{-10} - 1.30 \times 10^{-9}i$ |
| (ii) $\Delta \xi'_{\mu\tau}$ | $-1.11 \times 10^{-8} - 3.95 \times 10^{-8}i$ |

Table 3: SU3, neutral Higgs and charged Higgs loop corrections to $\delta \xi_{\mu\tau}$, $\Delta \xi_{\mu\tau}$, $\delta \xi'_{\mu\tau}$, $\Delta \xi'_{\mu\tau}$ arising from the exchange diagrams of figs. (3), (5), (6) and (7) for the same two parameter points as discussed in table [2]. Changes in the SUSY loop contributions are solely due to the change in $\tan(\beta)$ while changes in the neutral and charged Higgs loop corrections are due to both of the changes in $\tan(\beta)$ and $m_A$ where $m_A$ enters the theory through the Higgs mass matrix only.
Aside from $h \to \tau \mu$ there are other flavor violating decays such as $\tau \to \mu \gamma$ on which Babar Collaboration [44] and Bell Collaboration [45] have put significant limits on the branching ratio. The current experimental limit on the branching ratio of this process from the BaBar Collaboration [44] and from the Belle Collaboration [45] is

$$B(\tau \to \mu + \gamma) < 4.4 \times 10^{-8} \text{ at 90\% CL (BaBar)}$$

$$B(\tau \to \mu + \gamma) < 4.5 \times 10^{-8} \text{ at 90\% CL (Belle)}$$ (32)

Because of gauge invariance the decay of $\tau \to \mu \gamma$ can occur only at the loop level. In MSSM flavor violation can be generated from the off diagonal elements of the slepton mass squared matrix. The off-diagonal slepton mass squared matrix leads to flavor violating decays $h \to \tau \mu$ and $\tau \to \mu \gamma$. Since both $h \to \tau \mu$ and $\tau \to \mu \gamma$ occur only at the loop level and because $\tau \to \mu \gamma$ is severely constrained by Eq. (32), it is difficult to generate a sizable branching ratio for $h \to \tau \mu$ indicated by Eq. (3). The situation in the extended MSSM with a vector generation we consider here is very different. Here the flavor violating decay of the Higgs $H_1 \to \tau \mu$ already occurs at the tree level and the loop correction is a negligible correction while $\tau \to \mu \gamma$ occurs only at the loop level. Indeed two of the authors (TI, PN) analyzed the $\tau \to \mu \gamma$ decay in the extended MSSM with a vector generation in [42]. There this decay was found to have a significant model dependence because of the much larger parameter space of the extended MSSM relative to the MSSM case. However, as discussed above because of the fact that $H_1 \to \tau \mu$ already occurs at the tree level while $\tau \to \mu \gamma$ occurs only at the loop level and further because of the large parameter space of our model relative to MSSM the $\tau \to \mu \gamma$ can be suppressed (see, for example, Fig. 3 of [42] where the $\tau \to \mu \gamma$
branching ratio varies over a wide range.) Further, the formalism given here allows one to compute the flavor violating decay $Z \to \mu^\pm \tau^\mp$. Interestingly unlike the process $\tau \to \mu \gamma$ which can occur only at the loop level because at the tree level this decay is forbidden, the decay $Z \to \mu^\pm \tau^\mp$ can occur at the tree level. Currently the experiment gives an upper limit on the branching ratio for this process of $1.2 \times 10^{-5}$\cite{13}. We have checked that for the parameter space considered in this model the branching ratio for $Z \to \mu^\pm \tau^\mp$ lies lower than the experimental upper limit stated above. The analysis of the branching ration $\tau \to 3\mu$ (which experimentally has an upper limit of $2.1 \times 10^{-8}$\cite{13}) is more involved and requires a separate treatment. However, based on our previous analysis of $\tau \to \mu \gamma$ we expect that the branching ratio of this process to be consistent with experiment. In summary our analysis of $h \to \tau \mu$ presented here is robust.

5 Conclusion

Recent data from the ATLAS and CMS detectors at CERN hint at the possible violation of flavor in the leptonic decays of the Higgs boson. Such a violation can occur only in models beyond the standard model of electroweak interactions. In this work we investigate such violations in an extension of MSSM with a vector like leptonic generation consisting of a fourth generation and a mirror generation. Within this framework we first give a general analysis of leptonic decays of $H_i^0 \to \ell_j \ell_k$ $(i,j,k=1-3)$. The analysis is carried out including tree and loop contributions where the loop contributions include diagrams with exchanges of $W$, $Z$, charged and neutral Higgs, and of charginos and neutralinos. It is shown that for the light Higgs boson $H_1^0$ the flavor violating decay branching ratio for $H_1^0 \to \mu \tau$ can be as much as $\mathcal{O}(1)\%$ which is the size hinted at by the ATLAS and CMS data. We analyze the $H_1^0 \to e\mu, e\tau$ modes and show that the branching ratios for these are consistent with the current data. Analysis of the dependence of the $\mu \tau$ branching ratio on CP phases is given and it is shown that the flavor violating decays are sensitively dependent on the phases. A small variations of the Higgs boson mass on CP phases is found and exhibited. The analysis is then extended to the flavor violating decays of the heavier Higgs bosons. The analysis is carried out including tree and loop contributions where the loop contributions include diagrams with exchanges of $W$, $Z$, charged and neutral Higgs, and of charginos and neutralinos. A confirmation of flavor violating decays will provide direct evidence for new physics beyond the standard model. Such a possibility exists with more data that is expected from the LHC.
at $\sqrt{s} = 13$ TeV.

Appendix

In this Appendix we give a computation of each of the different loop contributions to \( \delta \xi_{\mu \tau} \), \( \Delta \xi_{\mu \tau} \), \( \delta \xi'_{\mu \tau} \) and \( \Delta \xi'_{\mu \tau} \) discussed in Sec. 3. We put the results in the same order as the Feynman diagrams of Figs. 2-7.
