MULTI-PEAKON SOLUTIONS TO A FOUR-COMPONENT CAMASSA-HOLM TYPE SYSTEM∗

Zhaqilao

Abstract A four-component Camassa-Holm type system with cubic nonlinearity is investigated. It allows an arbitrary function Γ(x, t) to be involved in to include some existing integrable peakon equations as special reductions. We obtain N-peakon solutions of the four-component Camassa-Holm type system with two special cases of Γ(x, t). In particular, we give one- and two-peakon solutions in an explicit formula and are graphically plotted. Further, some interesting peaked solutions are found: some peakon waves possessing positive and negative amplitudes while others decaying and growing amplitudes.

Keywords Peakon wave, four-component Camassa-Holm type system, integrable system.

MSC(2010) 35D30, 35C08, 35C07, 37K10.

1. Introduction

In 1993, Camassa and Holm (CH) derived a completely integrable dispersive shallow water equation [2], which has been studied quite extensively in the past two decades. A significant property of this equation is that the CH equation admits peaked soliton (peakon) and multi-peakon wave solutions. As an integrable equation more diverse studies on the CH equation have been remarkably developed in the literatures [1, 10, 17]. Recently, more integrable equations with peakon properties attract much attention, including the Degasperis-Procesi (DP) equation [3, 11], the Fokas-Olver-Rosenau-Qiao (FORQ) equation [4, 5, 9, 12–14], the Novikov equation [7, 15], and other CH type equations [6, 8, 16, 18]. The CH and the DP equations are completely integrable peakon systems with quadratical nonlinearity, and the FORQ and the Novikov equations are typical integrable peakon systems with cubic nonlinearity.
Recently, Li, Liu and Popowicz studied the following $3 \times 3$ spectral problem \cite{8}

$$\Phi_x = U \Phi, \quad U = \begin{pmatrix} 0 & \lambda m_1 & 1 \\ \lambda n_1 & 0 & \lambda m_2 \\ 1 & \lambda n_2 & 0 \end{pmatrix},$$  \hspace{1cm} (1.1)

where $m_i = m_i(x,t)$, $n_i = n_i(x,t)$, $i = 1,2$. Actually, this spectral problem is a special case of the multi-component problem studied in \cite{17}. The spectral problem (1.1) is interesting because it could cover some $3 \times 3$ spectral problems for CH type equations as special cases, such as the three-component CH system proposed by Geng and Xue \cite{6}, one and two-component Novikov equations \cite{7,15}, and one and two-component Qiao equations \cite{12,16}.

Based on the spectral problem (1.1), the authors \cite{8} gave the following four-component CH type system

$$\begin{cases} m_{1t} + (\Gamma m_1)_x + n_2 (g_1 g_2 - \Gamma) + m_1 (f_2 g_2 + 2 f_1 g_1) = 0, \\ m_{2t} + (\Gamma m_2)_x - n_1 (g_1 g_2 - \Gamma) - m_2 (f_1 g_1 + 2 f_2 g_2) = 0, \\ n_{1t} + (\Gamma n_1)_x - m_2 (f_1 f_2 - \Gamma) - n_1 (f_2 g_2 + 2 f_1 g_1) = 0, \\ n_{2t} + (\Gamma n_2)_x + m_1 (f_1 f_2 - \Gamma) + n_2 (f_1 g_1 + 2 f_2 g_2) = 0, \end{cases} \hspace{1cm} (1.2)$$

where

$$f_1 = u_2 - v_{1x}, \quad f_2 = u_1 + v_{2x}, \quad g_1 = v_2 + u_{1x}, \quad g_2 = v_1 - u_{2x},$$

$$m_i = u_i - u_{ixx}, \quad n_i = v_i - u_{ixx}, \quad i = 1,2,$$  \hspace{1cm} (1.3)

and $\Gamma = \Gamma(x,t)$ is an arbitrary function. The system (1.2) is integrable in the sense of Lax pair associated with the spectral problem (1.1) and the following auxiliary spectral problem

$$\Phi_t = V \Phi, \quad V = \begin{pmatrix} -f_1 g_1 & \lambda^{-1} g_1 - \lambda \Gamma m_1 & -g_1 g_2 \\ -f_1 f_2 & -\lambda^{-2} + f_1 g_1 + f_2 g_2 & \lambda^{-1} g_2 - \lambda \Gamma m_2 \\ -f_2 f_2 & -\lambda^{-1} f_2 - \lambda \Gamma n_2 & -f_2 g_2 \end{pmatrix}. \hspace{1cm} (1.4)$$

We notice that the system (1.2) contains an arbitrary function $\Gamma$, which amazingly leads (1.2) to some different CH type equations through certain choices of $\Gamma$. For instance, some cubic systems could be reduced (see \cite{8}).

In particular, if $\Gamma = 0$, we have

$$\begin{cases} m_{1t} + n_2 g_1 g_2 + m_1 (f_2 g_2 + 2 f_1 g_1) = 0, \\ m_{2t} - n_1 g_1 g_2 - m_2 (f_1 g_1 + 2 f_2 g_2) = 0, \\ n_{1t} - m_2 f_1 f_2 - n_1 (f_2 g_2 + 2 f_1 g_1) = 0, \\ n_{2t} + m_1 f_1 f_2 + n_2 (f_1 g_1 + 2 f_2 g_2) = 0, \end{cases} \hspace{1cm} (1.5)$$

where $f_i$, $g_i$, $m_i$ and $n_i$, $i = 1,2$ are given in (1.3). The system (1.5) can be rewritten
in the form of the following bi-Hamiltonian structure
\[
\begin{pmatrix}
  m_1 \\
  m_2 \\
  n_1 \\
  n_2
\end{pmatrix}_t = \mathcal{K} = \begin{pmatrix}
  0 & -1 & 0 & 0 \\
  1 & 0 & 0 & 0 \\
  0 & 0 & 0 & 1 \\
  0 & 0 & -1 & 0
\end{pmatrix}, \quad \mathcal{J} = \begin{pmatrix}
  2m_1\partial^{-1}m_1 - m_1\partial^{-1}m_2 & \mathcal{J}_{13} & \mathcal{J}_{14} \\
  -m_2\partial^{-1}m_1 & 2m_2\partial^{-1}m_2 & \mathcal{J}_{23} & \mathcal{J}_{24} \\
  -\mathcal{J}^*_{13} & -\mathcal{J}^*_{23} & 2n_1\partial^{-1}n_1 - n_1\partial^{-1}n_2 \\
  -\mathcal{J}^*_{14} & -\mathcal{J}^*_{24} & -2n_2\partial^{-1}n_1 & 2n_2\partial^{-1}n_2
\end{pmatrix}, \\
\mathcal{F} = (2\mathcal{P} + \mathcal{S}\partial)(\partial^3 - 4\partial)^{-1}\mathcal{P}^T - (2\mathcal{S} + \mathcal{P}\partial)(\partial^3 - 4\partial)^{-1}\mathcal{S}^T,
\]
\[
\mathcal{J}_{13} = -2m_4\partial^{-1}n_1 - n_2\partial^{-1}m_2, \quad \mathcal{J}_{14} = m_4\partial^{-1}n_2 + n_2\partial^{-1}m_1, \\
\mathcal{J}_{23} = m_2\partial^{-1}n_1 + n_1\partial^{-1}m_2, \quad \mathcal{J}_{24} = -2m_2\partial^{-1}n_2 - n_1\partial^{-1}m_1,
\]
\[
\mathcal{P} = (m_1, m_2, -n_1, -n_2)^T, \quad \mathcal{S} = (-n_2, n_1, -m_2, m_1)^T,
\]
\[
H_0 = \int (f_1 g_1 + f_2 g_2)(m_2 f_2 + n_1 g_1)dx, \quad H_1 = \int (m_2 f_2 + n_1 g_1)dx.
\]

The aim of this paper is to construct multi-peakon solutions for the four-component CH type system (1.2) with a special \( \Gamma \). In the case of \( \Gamma = 0 \), we solve the system (1.5) and obtain its multi-peakon solutions, which are not in the traveling wave type. In the case of \( \Gamma = \rho \) (\( \rho \) is a non-zero constant), we find the four-component CH type system (1.2) possesses the traveling wave type multi-peakon solutions.

2. Multi-peakon solutions

In the following, we will derive multi-peakon solutions to the four-component CH type system (1.2) with \( \Gamma = \rho \), where \( \rho \) is a constant.

**Case 1.** Let us suppose that one-peakon solution of the four-component CH type system (1.2) with \( \Gamma = \rho \) is of the following form
\[
u_1 = p_1 e^{-|x - q_1|}, \quad u_2 = r_1 e^{-|x - q_1|}, \quad v_1 = s_1 e^{-|x - q_1|}, \quad v_2 = \tau_1 e^{-|x - q_1|}, \quad \tag{2.1}
\]
where \( p_1, r_1, s_1, \tau_1 \) and \( q_1 \) are functions of \( t \) to be determined. With the help of distribution theory, we are able to write out \( u_{1x}, u_{2x}, v_{1x}, v_{2x}, m_1, m_2, n_1 \) and \( n_2 \) as follows
\[
u_{1x} = -p_1 \text{sgn}(x - q_1)e^{-|x - q_1|}, \quad m_1 = 2p_1 \delta(x - q_1),
\]
\[
u_{2x} = -r_1 \text{sgn}(x - q_1)e^{-|x - q_1|}, \quad m_2 = 2r_1 \delta(x - q_1),
\]
\[
u_{1x} = -s_1 \text{sgn}(x - q_1)e^{-|x - q_1|}, \quad n_1 = 2s_1 \delta(x - q_1),
\]
\[
u_{2x} = -\tau_1 \text{sgn}(x - q_1)e^{-|x - q_1|}, \quad n_2 = 2\tau_1 \delta(x - q_1). \quad \tag{2.2}
\]
Substituting (2.1) and (2.2) into (1.2) with $\Gamma = \rho$, we arrive at the following one-peakon dynamical system

\[ q_{tt} = \rho, \]
\[ p_{tt} = -\frac{1}{3}\Delta_{11}p_t + (\rho - \theta_{11})\tau_t, \]
\[ \tau_{tt} = (\rho - \theta_{11})p_t - \frac{1}{3}\Delta_{11}\tau_t, \]
\[ r_{tt} = \frac{1}{3}\Delta_{11}r_t - (\rho - \theta_{11})s_t, \]
\[ s_{tt} = -\Delta_{11}s_t + \frac{1}{3}\Delta_{11}s_t, \]  

where $\Delta_{11} = p_t s_t + r_t \tau_t - \rho \tau_t$, $\theta_{11} = p_t r_t + s_t \tau_t$, $\Delta_{11}$ and $\theta_{11}$ taking derivative with respect to $t$, and using Eqs. (2.3), we have the following relations

\[ \Delta_{11}t = 0, \quad \theta_{11}t = 0. \]  

We get

\[ \Delta_{11} = A_1, \quad \theta_{11} = B_1, \]  

where $A_1$ and $B_1$ are arbitrary integration constants. Therefore, Eqs. (2.3) becomes

\[ q_{tt} = \rho, \]
\[ \left( \begin{array}{c} p_t \\ \tau_t \\ r_t \\ s_t \end{array} \right)_t = \left( \begin{array}{cccc} -\frac{1}{3} & A_1 - B_1 & 0 & 0 \\ 1 & -\frac{1}{3}A_1 & 0 & 0 \\ 0 & 0 & -\frac{1}{3} & 1 \\ 0 & 0 & 0 & -\frac{1}{3}A_1 \end{array} \right) \left( \begin{array}{c} p_t \\ \tau_t \\ r_t \\ s_t \end{array} \right), \]  

We arrive at the following general solution of Eq. (2.6)

\[ q_1 = \rho t + \omega_1, \]
\[ p_1 = C_1 e^{\lambda_1^{(1)}t} + C_2 e^{\lambda_2^{(1)}t}, \]
\[ \tau_1 = C_1 e^{\lambda_1^{(1)}t} - C_2 e^{\lambda_2^{(1)}t}, \]
\[ r_1 = C_3 e^{\lambda_3^{(1)}t} + C_4 e^{\lambda_4^{(1)}t}, \]
\[ s_1 = -C_3 e^{\lambda_3^{(1)}t} + C_4 e^{\lambda_4^{(1)}t}, \]  

where

\[ \lambda_1^{(1)} = \frac{1}{3}(3\rho - A_1 - 3B_1), \quad \lambda_2^{(1)} = \frac{1}{3}(-3\rho - A_1 + 3B_1), \]
\[ \lambda_3^{(1)} = \frac{1}{3}(3\rho + A_1 - 3B_1), \quad \lambda_4^{(1)} = \frac{1}{3}(-3\rho + A_1 + 3B_1), \]  

$A_1 = -2(C_2C_3 + C_1C_4)$, $B_1 = 2(C_2C_3 + C_1C_4)$ and $C_1$, $C_2$, $C_3$, $C_4$, $\omega_1$ are arbitrary integration constants. From (2.1) and (2.7), we obtain one-peakon solution of (1.2) with $\Gamma = \rho$:

\[ u_1 = (C_1 e^{\lambda_1^{(1)}t} + C_2 e^{\lambda_2^{(1)}t}) e^{-|\xi_1|}, \quad u_2 = (C_3 e^{\lambda_3^{(1)}t} + C_4 e^{\lambda_4^{(1)}t}) e^{-|\xi_1|}, \]
\[ v_1 = (C_3 e^{\lambda_3^{(1)}t} + C_4 e^{\lambda_4^{(1)}t}) e^{-|\xi_1|}, \quad v_2 = (C_1 e^{\lambda_1^{(1)}t} - C_2 e^{\lambda_2^{(1)}t}) e^{-|\xi_1|}, \]  

(2.9)
where \( \xi_1 = x - \rho t - \omega_1 \) and \( \lambda^{(i)}_1 \) \((i = 1, 2, 3, 4)\) are given in (2.8). See Figs. 1-2 for the profile of the one-peakon dynamics for the potentials \( u_i \) and \( v_i \) \((i = 1, 2)\) in (2.9). In Fig. 1, (a),(d) and (b),(c) show that the one-peakon with amplitudes exponentially decaying and growing with time \( t \) respectively. And an interesting phenomenon is shown in Fig. 2: the amplitude of \( u_1 \) (or \( u_2 \)) is changed from positive to negative (or negative to positive ) while \( v_1 \) (or \( v_2 \)) has positive amplitude which is changed from decaying to growing along the \( t \) axis.

![Figure 1](image_url)

**Figure 1.** The one-peakon wave (2.9) with \( \rho = 1, C_1 = 1, C_2 = C_3 = 0, C_4 = \frac{2}{3} \) and \( \omega_1 = -2 \).

**Case 2.** A two-peakon solution is given in the form of

\[
\begin{align*}
    u_1 &= p_1 e^{-|x-q_1|} + p_2 e^{-|x-q_2|}, \\
    u_2 &= r_1 e^{-|x-q_1|} + r_2 e^{-|x-q_2|}, \\
    v_1 &= s_1 e^{-|x-q_1|} + s_2 e^{-|x-q_2|}, \\
    v_2 &= \tau_1 e^{-|x-q_1|} + \tau_2 e^{-|x-q_2|},
\end{align*}
\]

where \( p_i, r_i, s_i, \tau_i \) and \( q_i \) \((i = 1, 2)\) are functions of \( t \) to be determined. In a similar process as case 1, we can find the two-peakon dynamical system, which consists of ten equations. Let us start from the first two equations: \( q_{1t} = \rho \) and \( q_{2t} = \rho \), which yield

\[
q_1 = \rho t + \omega_1, \quad q_2 = \rho t + \omega_2,
\]

where \( \omega_1 \) and \( \omega_2 \) are constants. Without loss of generality, we suppose \( \omega_2 > \omega_1 \). With the help of (2.11), the two-peakon dynamical system can be rewritten as

\[
\begin{align*}
    p_{tt} &= \rho \tau_i + \frac{2}{3} \Delta_{tt} p_i - E_{1}^{(i)} E_{2}^{(i)} \tau_i - (E_{1}^{(i)} E_{2}^{(i)} + 2E_{1}^{(i)} E_{4}^{(i)}) p_i, \\
    \tau_{tt} &= \rho p_i + \frac{2}{3} \Delta_{tt} \tau_i - E_{1}^{(i)} E_{4}^{(i)} p_i - (E_{1}^{(i)} E_{4}^{(i)} + 2E_{3}^{(i)} E_{2}^{(i)}) \tau_i, \\
    r_{tt} &= -\rho s_i - \frac{2}{3} \Delta_{tt} r_i + E_{1}^{(i)} E_{2}^{(i)} s_i + (E_{1}^{(i)} E_{4}^{(i)} + 2E_{3}^{(i)} E_{2}^{(i)}) r_i, \\
    s_{tt} &= -\rho r_i - \frac{2}{3} \Delta_{tt} s_i + E_{3}^{(i)} E_{4}^{(i)} r_i + (E_{3}^{(i)} E_{2}^{(i)} + 2E_{1}^{(i)} E_{4}^{(i)}) s_i, \quad (i = 1, 2).
\end{align*}
\]
Figure 2. The one-peakon wave (2.9) with $\rho = -4$, $C_1 = -C_2 = 1$, $C_3 = -2$, $C_4 = \frac{2}{3}$ and $\omega_1 = -2$.

where

$$E^{(1)}_1 = \tau_1 + (r_2 + p_2)\Omega_{12}, \quad E^{(1)}_2 = s_1 - (r_2 - s_2)\Omega_{12},$$

$$E^{(1)}_3 = p_2 - (\tau_1 - p_1)\Omega_{12}, \quad E^{(1)}_4 = r_2 + (r_1 + s_1)\Omega_{12},$$

and $\Omega_{12} = e^{\omega_1 - \omega_2}$. Apparently, (2.12) implies the following relations

$$\Delta_{ii} = (p_i s_i + r_i \tau_i) = 0, \quad (i = 1, 2). \quad (2.13)$$

Therefore, we obtain

$$\Delta_{ii} = A_i, \quad (i = 1, 2), \quad (2.14)$$

where $A_i \ (i = 1, 2)$ are the integration constants.

In particular, as $\tau_1 = p_1$ and $\tau_2 = -p_2$, (2.12) is reduced to

$$\left( \begin{array}{c} p_1 \\ p_2 \\ r_1 \\ r_2 \\ s_1 \\ s_2 \end{array} \right)_t = \left( \begin{array}{cccccc} \frac{1}{3}(-4A_1 + 3\rho) & 0 & 0 & -\frac{1}{3}(4A_2 + 3\rho) \\ 0 & -\frac{1}{3}(4A_2 + 3\rho) & \frac{1}{3}(4A_2 + 3\rho) \\ \frac{1}{3}A_1 & -A_1\Omega_{12} & A_1 - \rho & A_1\Omega_{12} \\ -A_2\Omega_{12} & \frac{1}{3}A_2 & -A_2\Omega_{12} & -A_2 - \rho \\ A_1 - \rho & A_1\Omega_{12} & \frac{1}{3}A_1 & -A_1\Omega_{12} \\ -A_2\Omega_{12} & -A_2 - \rho & -A_2\Omega_{12} & \frac{1}{3}A_2 \end{array} \right) \left( \begin{array}{c} p_1 \\ p_2 \\ r_1 \\ r_2 \\ s_1 \\ s_2 \end{array} \right), \quad (2.15)$$
where $\Omega_{12} = e^{\omega_1 - \omega_2}$. Solving (2.15), we obtain
\begin{align*}
p_1 &= \tau_1 = C_1e^{\lambda_1^{(2)}t}, \quad p_2 = -\tau_2 = C_2e^{\lambda_2^{(2)}t}, \\
r_1 &= -\frac{(2A_1 + A_2)C_3}{3A_2\Omega_{12}} e^{\lambda_3^{(2)}t} - C_5e^{\lambda_5^{(2)}t} + \frac{3A_1\Omega_{12}C_6}{A_1 + 2A_2} e^{\lambda_6^{(2)}t}, \\
r_2 &= C_3e^{\lambda_3^{(2)}t} + C_4e^{\lambda_4^{(2)}t} - C_6e^{\lambda_6^{(2)}t}, \\
s_1 &= -\frac{(2A_1 + A_2)C_3}{3A_2\Omega_{12}} e^{\lambda_3^{(2)}t} + C_5e^{\lambda_5^{(2)}t} - \frac{3A_1\Omega_{12}C_6}{A_1 + 2A_2} e^{\lambda_6^{(2)}t}, \\
s_2 &= C_3e^{\lambda_3^{(2)}t} + C_4e^{\lambda_4^{(2)}t} + C_6e^{\lambda_6^{(2)}t},
\end{align*}
(2.16)

where
\begin{align*}
\lambda_1^{(2)} &= \frac{1}{3}(-4A_1 + 3\rho), \quad \lambda_2^{(2)} = -\frac{1}{3}(4A_2 + 3\rho), \quad \lambda_3^{(2)} = \frac{1}{3}(4A_1 - 3\rho), \\
\lambda_4^{(2)} &= -\frac{1}{3}(2A_2 + 3\rho), \quad \lambda_5^{(2)} = \frac{1}{3}(-2A_1 + 3\rho), \quad \lambda_6^{(2)} = \frac{1}{3}(4A_2 + 3\rho),
\end{align*}
(2.17)

with $\Omega_{12} = e^{\omega_1 - \omega_2}, A_1 = -\frac{2C_2C_3C_6}{2C_1C_3C_6 + 3C_2C_6\Omega_{12}}, A_2 = 2C_2C_6$, and $\omega_k$ ($k = 1, 2$), $C_i$ ($i = 1, 2, 3, 4, 5, 6$) are the integration constants.

Substituting (2.16) into (2.10), we obtain the two-peakon solution of (1.2)
\begin{align*}
u_1 &= C_1e^{\lambda_1^{(2)}t}e^{-|\xi_1|} + C_2e^{\lambda_2^{(2)}t}e^{-|\xi_2|}, \\
u_2 &= \left(-\frac{(2A_1 + A_2)C_3}{3A_2\Omega_{12}} e^{\lambda_3^{(2)}t} - C_5e^{\lambda_5^{(2)}t} + \frac{3A_1\Omega_{12}C_6}{A_1 + 2A_2} e^{\lambda_6^{(2)}t}\right) e^{-|\xi_1|} \\
&\quad + \left(C_3e^{\lambda_3^{(2)}t} + C_4e^{\lambda_4^{(2)}t} - C_6e^{\lambda_6^{(2)}t}\right) e^{-|\xi_2|}, \\
v_1 &= \left(-\frac{(2A_1 + A_2)C_3}{3A_2\Omega_{12}} e^{\lambda_3^{(2)}t} + C_5e^{\lambda_5^{(2)}t} - \frac{3A_1\Omega_{12}C_6}{A_1 + 2A_2} e^{\lambda_6^{(2)}t}\right) e^{-|\xi_1|} \\
&\quad + \left(C_3e^{\lambda_3^{(2)}t} + C_4e^{\lambda_4^{(2)}t} + C_6e^{\lambda_6^{(2)}t}\right) e^{-|\xi_2|}, \\
v_2 &= C_1e^{\lambda_1^{(2)}t}e^{-|\xi_1|} - C_2e^{\lambda_2^{(2)}t}e^{-|\xi_2|},
\end{align*}
(2.18)

where $\xi_j = x - \rho t - \omega_j$ ($j = 1, 2$) and $\lambda_i^{(2)}$ ($i = 1, 2, 3, 4, 5, 6$) are given in (2.17). See Figs. 3-4 for the graph of the two-peakon solution (2.18), which are of traveling wave type. Fig. 3 and Fig. 4 show the right-traveling and left-traveling waves, respectively. The amplitudes of the peakons to equation (2.18) grow/decay exponentially with time $t$. All two-peakon waves have the same velocity $\rho$. Namely, the collision between the two-peakon waves will never happen.

**Case N.** Following the procedure in cases 1 and 2, the $N$-peakon solutions of the four-component Camassa-Holm type system (1.2) are just linear superpositions
\begin{align*}
u_1 &= \sum_{j=1}^{N} p_j e^{-|x-q_j|}, \quad u_2 = \sum_{j=1}^{N} r_j e^{-|x-q_j|}, \quad v_1 = \sum_{j=1}^{N} s_j e^{-|x-q_j|}, \quad v_2 = \sum_{j=1}^{N} \tau_j e^{-|x-q_j|},
\end{align*}
(2.19)
where $p_j$, $r_j$, $s_j$ and $\tau_j$ ($j = 1, 2, \ldots, N$) are $N$ amplitudes of the potentials $\nu_1$, $u_2$, $v_1$ and $v_2$, respectively, and $q_j$ ($j = 1, 2, \ldots, N$) are $N$-peak positions. Functions
Figure 3. The two-peakon wave (2.18) with $\rho = 1$, $C_1 = 1$, $C_2 = \frac{1}{2}$, $C_3 = \frac{3}{4}$, $C_4 = \frac{1}{2}$, $C_5 = \frac{3}{2}$, $C_6 = -\frac{1}{3}$, $\omega_1 = -2$ and $\omega_2 = 2$.

Figure 4. The two-peakon wave (2.18) with $\rho = -2$, $C_1 = 1$, $C_2 = \frac{1}{2}$, $C_3 = \frac{3}{4}$, $C_4 = \frac{1}{2}$, $C_5 = \frac{3}{2}$, $C_6 = \frac{1}{3}$, $\omega_1 = -2$ and $\omega_2 = 2$. 
$p_j$, $r_j$, $s_j$, $\tau_j$ and $q_j$ ($j = 1, 2, \ldots, N$) evolve according to the following system:

\[
q_{jt} = \rho,
\]

\[
p_{jt} = \rho p_j + \frac{2}{3} \Delta_j p_j - \sum_{l,k=1}^{N} [t_j (r_l - p_l \varrho_{jl}) (s_k + r_k \varrho_{jk}) + p_j (p_l - \tau_l \varrho_{jl}) (s_k + r_k \varrho_{jk})]
\]

\[
+ 2p_j (r_l + s_l \varrho_{jl}) (\tau_k - p_k \varrho_{jk})] \Lambda,
\]

\[
r_{jt} = -\rho s_j - \frac{2}{3} \Delta_j r_j - \sum_{l,k=1}^{N} [-s_j (r_l - p_l \varrho_{jl}) (s_k + r_k \varrho_{jk}) - r_j (r_l + s_l \varrho_{jl})]
\]

\[
\times (\tau_k - p_k \varrho_{jk}) - 2r_j (p_l - \tau_l \varrho_{jl})(s_k + r_k \varrho_{jk})] \Lambda,
\]

\[
s_{jt} = -\rho r_j - \frac{2}{3} \Delta_j s_j - \sum_{l,k=1}^{N} [-s_j (r_l - p_l \varrho_{jl}) (s_k + r_k \varrho_{jk}) - s_j (r_l + s_l \varrho_{jl})(\tau_k - p_k \varrho_{jk})]
\]

\[
+ 2s_j (p_l - \tau_l \varrho_{jl})(s_k + r_k \varrho_{jk})] \Lambda,
\]

\[
\tau_{jt} = \rho p_j + \frac{2}{3} \Delta_j \tau_j - \sum_{l,k=1}^{N} [p_j (r_l + s_l \varrho_{jl}) (p_k - \tau_k \varrho_{jk}) + \kappa_j (r_l + s_l \varrho_{jl})(\tau_k - p_k \varrho_{jk})]
\]

\[
+ 2\tau_j (p_l - \tau_l \varrho_{jl})(s_k + r_k \varrho_{jk})] \Lambda,
\]

(2.20)

where $\varrho_{jl} = \text{sgn}(q_j - q_l)$, $\varrho_{jk} = \text{sgn}(q_j - q_k)$, $\Lambda = e^{-|q_j - q_l| - |q_j - q_k|}$, $\Delta_{jj} = p_j s_j + r_j \tau_j$, $(1 \leq j; k; l \leq N)$. In the above formula, $q_{jt} = \rho$ ($\rho \neq 0$) implies that $N$-peakon waves move at the same velocity $\rho$ in the traveling wave type whereas $\rho = 0$ implies that all peak positions do not change along with the time $t$.

### 3. Conclusions

In this paper, we study a generalized four-component CH system (1.2) with an arbitrary function $\Gamma(x,t)$. This model provides a large class of peakon dynamical systems and covers several well-known integrable peakon equations associated with $3 \times 3$ spectral problems. We obtain two kinds of multi-peakon solutions to the system (1.2) with $\Gamma = \rho$: 1) for $\rho = 0$, the multi-peakon solutions are not in the traveling wave type and 2) if $\rho \neq 0$, the multi-peakon solutions are in the traveling wave type. Furthermore, the peakon solutions (2.9) and (2.18) can be reduced to the solutions of the model (1.5) if $\rho = 0$.

We believe that some generalizations and reduction of the model (1.2) deserve a further investigation. For example, we can get the one-peakon solution to (1.2) with $\Gamma(x,t) = \rho + \alpha(u_1v_1 + u_2v_2) + \beta(u_1u_2 + v_1v_2)$:

\[
u_1 = (C_1 e^{\lambda_1 t} + C_2 e^{\lambda_2 t}) e^{-|\zeta_1|}, \quad u_2 = (C_3 e^{\lambda_3 t} + C_4 e^{\lambda_4 t}) e^{-|\zeta_1|},
\]

\[
v_2 = (C_5 e^{\lambda_5 t} - C_6 e^{\lambda_6 t}) e^{-|\zeta_1|}, \quad u_1 = (-C_1 e^{\lambda_1 t} + C_2 e^{\lambda_2 t}) e^{-|\zeta_1|},
\]

where $\zeta_1 = x - (\rho + \alpha A_1 + \beta B_1) t - \omega_1$, $\lambda_1 = \frac{1}{3}(-3\rho - A_1 - 3\alpha A_1 + 3B_1 - 3\beta B_1)$, $\lambda_2 = \frac{1}{3}(3\rho - A_1 + 3\alpha A_1 - 3B_1 + 3\beta B_1)$, $\lambda_3 = \frac{1}{3}(-3\rho + A_1 - 3\alpha A_1 + 3B_1 - 3\beta B_1)$, $\lambda_4 = \frac{1}{3}(3\rho + A_1 + 3\alpha A_1 - 3B_1 + 3\beta B_1)$, $A_1 = 2(C_2 C_3 - C_1 C_4)$, $B_1 = 2(C_2 C_3 + C_1 C_4)$ and $\alpha$, $\beta$, $\rho$, $\omega_1$, and $C_i$ ($i = 1, 2, 3, 4$) are constants. The question arises: how to construct multi-peakon (for $N \geq 2$) solutions to (1.2) with $\Gamma(x,t) = \rho + \alpha(u_1v_1 + u_2v_2) + \beta(u_1u_2 + v_1v_2)$? This question is still under investigation.
