CORRECTION

Correction: Do Longer Intervals between Challenges Reduce the Risk of Adverse Reactions in Oral Wheat Challenges?

Noriyuki Yanagida, Takanori Imai, Sakura Sato, Motohiro Ebisawa

There are errors in Table 1. Please see the corrected Table 1 here.
Table 1. Grading of symptoms.

|                | 1 (mild)                                      | 2 (moderate)                              | 3 (severe)                                      |
|----------------|----------------------------------------------|------------------------------------------|------------------------------------------------|
| Skin           | Localized urticarial or exanthema or wheal or pruritis | Generalized urticarial or exanthema or wheal or pruritis | -                                              |
|                | Swollen eyelid or lip                        | Swollen face                              | -                                              |
| Gastrointestinal tract | Pruritus of the throat or oral cavity | Throat pain                               | -                                              |
|                | Mild abdominal pain                          | Moderate abdominal pain                    | Cramps                                         |
|                | Nausea, emesis, diarrhea                     | Recurrent emesis or diarrhea              | Continuous emesis, loss of bowel control       |
| Respiratory tract | Intermittent cough, nasal congestion, sneezing, rhinorrhea | Repetitive cough                          | Persistent cough, hoarseness, “barky” cough    |
|                |                                            | Chest tightness, mild wheezing            | Apparent wheezing, dyspnea, cyanosis, saturation <92%, swallowing or speaking difficulties, throat tightness, respiratory arrest |
| Cardiovascular | -                                           | Pale face, mild hypotension, tachycardia (increase >15 beats/min) | Hypotension, dysrhythmia, severe bradycardia, cardiac arrest |
| Neurological   | Change in activity level, tiredness          | “Light-headedness,” feeling of “pending doom,” somnolence | Confusion, loss of consciousness, incontinence |

The severity score should be based on the organ system most affected. Hypotension was defined as systolic blood pressure of <70 mmHg (ages, 1 month to 1 year), <(70 mmHg + [2 × age]) (ages, 1–10 years), and <90 mmHg (>11 years). Mild hypotension was defined as systolic blood pressure of <80 mmHg (ages, 1 month to 1 year), <(80 mmHg + [2 × age]) (ages, 1–10 years), and <100 mmHg (>11 years). Total severity scores were defined as the grade of cardiovascular symptoms + the grade of respiratory symptoms + the maximum grade of other symptoms.
