Evidence-based management (EBMgt), which refers to using the best-quality evidence from different sources in decision-making, is becoming an imperative for managers in both profit and non-profit sectors. Yet, the competencies underlying EBMgt have not yet received much attention. Therefore, the aim of this study is to identify the foundational and functional competencies of evidence-driven managers working in hospital settings and develop an empirically based competency model for evidence-driven managers. We collected qualitative data using semi-structured interviews and the critical incident technique from 36 executive managers from 11 hospitals in Lebanon about the competencies of managers who use EBMgt when approaching problems and making decisions. Using inductive coding, we identified 13 competencies that we grouped into four dimensions: technical, cognitive, interpersonal and intrapersonal. We further classified the specific competencies underlying each of the dimensions into foundational and functional, and highlighted those that are critical for the practice of EBMgt in hospital settings, including open mindedness, research knowledge and skills, ethicality in research, resourcefulness and relationship management.

Introduction

With the growing volatility, uncertainty, complexity and ambiguity surrounding businesses today (Bennett and Lemoine, 2014), exploiting data is key to creating competitive advantage (Provost and Fawcett, 2013). Yet, many decisions are still being made primarily based on experience and without reliance on other sources of data (Barends et al., 2017). In fact, many management practices are influenced by fads without consideration of their credibility (e.g. management by objectives, 360-degree feedback, value-based healthcare; see Miller and Hartwick, 2002; Porter and Teisberg, 2006) and many decisions continue to be made despite a body of evidence suggesting that they will have no positive impact or will be harmful (Starkey, Hatchuel and Tempest, 2009). Whilst organizational environments continue to change vastly and rapidly, management practices are not evolving as fast as the increasingly data-driven business environment (e.g. Prahalad and Hamel, 1990). Within this context, evidence-based management (EBMgt) has been proposed...
as an approach to encourage greater reliance on data in decision-making (Briner, Denyer and Rousseau, 2009). EBMgt is defined as the ‘explicit, judicious, and conscientious’ use of the best available evidence in management decision-making (Barends et al., 2014, p. 4). Evidence may come from different sources, including professionals’ experience, scientific evidence, organizational data and stakeholder concerns (Briner, Denyer and Rousseau, 2009). The ‘best available’ evidence is evidence that is collected from these different sources and is appraised to be reliable. It depends on the context of each organization, because the sources of evidence available to managers and the relevance of the available evidence depend on the organizational context.

The EBMgt approach has gained considerable attention as the managerial approach that is most congruent with today’s working environment (Rousseau, 2006a, 2006b), which is characterized by an increase in the access to and availability of data. As EBMgt seeks to encourage the use of practices supported by strong evidence for their effectiveness, it can lead to improving decisions (Barends et al., 2014). When adopting an EBMgt approach, it is managers who must identify, gather or mobilize the evidence, collaboratively with other stakeholders, and incorporate it in their decision-making (Swan et al., 2012). Accordingly, insight into the personal knowledge, skills, abilities and other characteristics (KSAOs), or competencies, of managers who adopt an EBMgt approach can help organizations develop the right capabilities among their managers. In the EBMgt literature, Rousseau and Gunia (2016) conceptualized EBMgt competencies as foundational and functional, with foundational referring to competencies required for engaging in all EBMgt activities and functional referring to competencies required for engaging in specific EBMgt activities. Therefore, in this study, our aim was to empirically identify the foundational and functional competencies necessary for the practice of EBMgt in hospital settings and develop an empirically based competency model for evidence-driven managers. We were guided by the research question: What are the individual-level foundational and functional competencies necessary for managers to practice EBMgt in hospital settings? We will first shed light on the healthcare sector and the EBMgt literature in this field, and then present the theoretical framing adopted in this study.

EBMgt in the healthcare context

Healthcare organizations are complex and dynamic systems (Begun and Thygeson, 2015) that foster interactions between multiple factors related to patients, healthcare practitioners, healthcare teams, physical and social environments, organizational contexts, legislation and accreditation, to name a few, all of which impact the quality and outcomes of care (de Jonge, Huyse and Stiefel, 2006). With the wide array of problems facing the healthcare sector today (Porter and Teisberg, 2006), such as the increase in the medical needs of the community and the decrease in funding (Futurescan, 2008), healthcare managers’ roles and the decisions they have to make are becoming increasingly challenging (Baker, 2001). Furthermore, technology has had a huge impact on the availability of and accessibility to data for healthcare managers to leverage. For example, the widespread adoption of electronic medical records has allowed the proliferation and capture of unprecedented amounts and types of data, while open source platforms have made scientific literature more easily accessible (Mennemeyer et al., 2016).

The adoption of EBMgt in this context is being seen as a timely strategic step that could enable managers to better cope with the complexity of healthcare organizations by relying on the best available evidence to improve their decision-making, and consequently achieve better organizational outcomes (Kovner and Rundall, 2006). However, the EBMgt literature has been critiqued for having a narrow view of evidence; privileging scientific evidence and quantitative research (Morrell, 2008; Morrell and Learmonth, 2015). Evidence, however, is not only quantitative scientific evidence, rather different types of scientific evidence, intra-organizational data (i.e. quality, effectiveness), professionals’ experience and stakeholders’ concerns (Osborne and Strokosch, 2013) are also critical sources of evidence. Additionally, the best available evidence depends on the context of each organization. For example, a hospital that utilizes electronic medical records will have access to different types of evidence than one that relies on paper documentation. What is ‘best’ in one context may be mediocre in another. Highlighting the importance of the context is also critical given that EBMgt has been critiqued for neglecting contextual complexities, such as ethics, power and politics (Morrell, Learmonth and Heracleous, 2015).
By not explicitly considering these issues, EBMgt has erroneously assumed that managers are impartial experts who will welcome evidence and use it to serve employee and client interests (Morrell and Learmonth, 2015; Tourish, 2012). Research has shown, however, that managers can be driven by self-interest and might choose to ignore evidence that contradicts their beliefs, knowledge and assumptions (Rynes, Colbert and O’Boyle, 2018).

In response to these critiques, the literature has called for developing a more in-depth understanding of EBMgt in practice (Currie, 2013; Reay, Berta and Kohn, 2009; Rynes and Bartunek, 2017; Walshe and Rundall, 2001) and for better understanding the role of the manager in EBMgt. To this end, some have focused on the competencies of managers, and in fact EBMgt has emerged relatively consistently, directly or indirectly, in recent generic competency models for healthcare managers. For example, among the five competency domains identified by the Healthcare Leadership Alliance (HLA), two domains – ‘knowledge of the healthcare environment’ and ‘business skills & knowledge’ – included references to EBMgt, specifically to using research findings to establish practice models and teaching others to use research (Stefl and Bontempo, 2008).

Similarly, Liang and colleagues (Liang, Howard and Wollersheim, 2017; Liang et al., 2013) identified evidence-informed decision-making as one of the core competencies for managers working in hospital settings. Moreover, McCarthy and Fitzpatrick (2009) identified promoting evidence-based decision-making, though referring mainly to clinical practice, as one of the competencies for nurse managers.

Other research specifically explored the competencies of evidence-driven healthcare managers. Liang, Howard and Wollersheim (2017) translated the competency of evidence-informed decision-making into behavioural descriptors, which were primarily process-oriented and did not refer to personal characteristics. Wright et al. (2016), in contrast, focused on understanding the characteristics of evidence-driven managers through a case study where a manager approached an operational hospital problem in an evidence-based manner. This study, however, was based on the analysis of only one manager in one specific hospital. Other researchers exploring the barriers to EBMgt have also identified certain competencies that are necessary for EBMgt practice, such as knowledge in research methods and acquiring/appraising research evidence (Barends et al., 2017; Liang and Howard, 2011; Niedzwiedzka, 2003). Therefore, as EBMgt is being promoted in healthcare management, research is being conducted on the competencies necessary for its practice. This existing research, however, has been scant, has not systematically delineated all necessary competencies and has not been driven by a theoretical framework. To overcome these limitations and achieve our aims, in this study we adopted a conceptual framework proposed by Rousseau and Gunia (2016), which we describe below, as our guiding theoretical framework.

Theoretical framing

In the EBMgt literature, Rousseau and Gunia (2016) proposed a conceptual categorization of the EBMgt competencies into foundational and functional. Foundational competencies refer to general skills and knowledge required for engaging in all EBMgt activities, such as domain knowledge, while functional competencies refer to skills and knowledge associated with specific EBMgt activities, such as acquiring the best available evidence, which is specific to the ‘acquiring evidence’ aspect of the EBMgt process. Furthermore, the foundational competencies form the basis for the development of functional competencies and support their application (Rodolfa et al., 2005). For example, Rousseau and Gunia (2016) note that EBMgt functional competencies include the ability to structure one’s thinking about a problem and about the information needed to solve a problem. They highlight that this functional ability is supported by the foundational competency of domain knowledge because it provides the necessary mental models that allow managers to organize problems and recognize incomplete information (Rousseau and Gunia, 2016). While this framework offers a promising basis for conceptualizing EBMgt competencies, these foundational and functional competencies still need to be empirically identified and situated within the overall literature on managerial competencies.

Therefore, using this conceptualization as our guiding theoretical framework, and leveraging existing classifications of managerial skills in the management literature (Hogan and Warrenfeltz, 2003; Katz, 1955), our aim is to empirically...
identify the foundational and functional competencies necessary for the practice of EBMgt and to develop an empirically based competency model for evidence-driven managers in hospital settings. Competency models include a collection of KSAOs combined into a set of core competencies necessary for effective performance (Campion et al., 2011). Competency models focus on the worker rather than the work, and are the roots that drive the success of organizations (Prahalad and Hamel, 1990; Schippmann et al., 2000). To develop this model, we collected qualitative data from executive managers, working in multiple hospitals across Lebanon, about the competencies of managers who adopt an EBMgt approach to decision-making. Based on this data, we developed the EBMgt competency model for managers in hospital settings.

Methodology

Context

In organizational research, contextualization is strongly encouraged, considering the diverse nature of work settings and how that influences the phenomenon being studied (Rousseau and Fried, 2001). In this study, we focused on the hospital setting as the larger umbrella for our investigation, considering the uniqueness of this business context and the impact it may have on the manifestation of EBMgt in practice, particularly in Lebanon.

Lebanon is a middle-income country with a population estimated at around 4 million, of which more than 90% live in urban areas (Kronfol, 2006). Lebanon has 165 hospitals and a ratio of 3.73 beds per 1,000 population (Harb, 2016). Healthcare expenditure in Lebanon constitutes 7.4% of the national gross domestic product (Miller and Wei, 2018), which is higher than the average healthcare expenditure in the Middle East and North Africa region, and of middle-income countries (World Health Organization, 2016). Moreover, in Lebanon hospitals account for 40% of this expenditure (World Health Organization, 2010).

The private sector dominates healthcare service provision, with 88% of the total number of hospitals and 90% of the total number of beds (Ammar et al., 2000). This is due to the long history of conflict in Lebanon, which weakened the public sector and led to the unregulated growth of the private sector. To combat the resulting issues, the Ministry of Public Health (MoPH) introduced a hospital accreditation scheme, which was developed in line with international standards (Ammar, 2009). The scheme enhanced quality on the one hand, but increased expenses on all hospitals on the other hand (Saleh et al., 2013). Additional challenges relate to controlling the quality and quantity of physicians as well as increasing the retention of nurses, who are increasingly leaving Lebanon for better job offers in the Gulf region (see Kronfol, 2006). Additionally, since 2011, and due to the conflict in neighbouring Syria, there has been an influx of an estimated 1.5 million Syrian refugees to Lebanon, corresponding to a 30% increase in Lebanon’s population (United Nations High Commissioner for Refugees, 2019). This is threatening the continuity of service delivery in the Lebanese healthcare system, destabilizing governance and limiting access to care (Refaat and Mohanna, 2013). These factors highlight the unique challenges facing hospital managers in Lebanon today.

While the refugee influx has influenced healthcare outcomes in Lebanon, including increases in maternal mortality rates, mental health conditions and vaccine-preventable and water-borne disease outbreaks, other indicators, including life expectancy at birth and infant mortality rate, have improved (World Health Organization, 2018). Furthermore, a handful of international healthcare indices indicate that healthcare coverage and performance in Lebanon is improving (Fullman et al., 2018; Miller and Wei, 2018). Lebanon ranked 23rd on the Bloomberg Health-Efficiency Index, which calculates the cost-efficiency of medical care based on national life expectancy and healthcare expenditure (Miller and Wei, 2018).

Sample

We invited 56 executive managers from 15 hospitals, via email, to participate in the study and 36 individuals from 11 hospitals operating in major cities across Lebanon agreed to participate (response rate of 64.28%). These 11 hospitals had received the highest level of accreditation by the Lebanese MoPH (Ministry of Public Health
Lebanon, 2014), and around 36% of these hospitals had received accreditation from different international accrediting bodies. As can be seen in Table 1, the majority of the hospitals were private (72.73%), approximately half were academic hospitals (54.55%) and almost half were large in size, with more than 200 beds (45.5%).

On average, three executives participated from each of the hospitals. Participants (Table 2) were mostly 40 to 49 years old (38.9%) and half of the participants were male (52.8%). Although information regarding gender distribution in healthcare management positions in Lebanon is not available, gender representation in this sample is comparable to that in healthcare managerial positions in other countries. For example, in the USA women make up 50% of senior management in healthcare companies (Krivkovich et al., 2018) and 34% of leadership teams in hospitals (Tecco, 2017). The majority of participants had MA degrees (41.70%), MD degrees (16.67%) or both (16.67%). Their education was mostly in the domains of business (22.2%) and healthcare management (22.2%), with
many also having clinical backgrounds (13.90% medicine, 5.60% nursing), or both clinical and non-clinical backgrounds (healthcare management and medicine 16.70%, nursing 2.80%). This representation of clinical professionals in leadership positions is reflective of recent changes in healthcare management and comparable to most countries of the OECD, where medical doctors are part of the hospital top structure (Rotar et al., 2016). Participants occupied various positions within the hospitals, with most in positions of CEO or Hospital Director (25%), Human Resources Director (13.9%) and Chief Quality and Safety Officer (13.9%). They had occupied their positions for an average of 9.01 years (SD 6.19 years) and half of them had 20–29 years of experience in healthcare management (50.0%).

**Materials**

We collected data using (1) semi-structured interviews and (2) the critical incident technique (CIT) (Flanagan, 1954) as part of a larger study examining how evidence-based decision-making is practiced by managers in hospital settings. We defined evidence-based decision-making for participants as involving ‘the use of best available evidence/data in managerial practice and decision-making’.

In this study, we focused on analysing participants’ responses to two questions from the semi-structured interview: ‘What do you think are the knowledge, skills, abilities and other characteristics needed by managers who demonstrate evidence-based management practice in their day-to-day work?’ and ‘How would you distinguish between good experience that yields good decisions and bad experience that yields bad decisions?’ We also used the two CIT questions where we asked participants to describe in detail a scenario where a manager (1) used an evidence-based approach to decision-making and (2) did not use an evidence-based approach to decision-making.

**Procedures**

Interviews were conducted between December 2016 and November 2017 at the participants’ offices and lasted approximately 50 minutes each. One of the authors, a bilingual in English and Arabic languages, conducted the interviews in English and either audio-recorded or took notes. Some participants, however, sometimes used certain words in Arabic. The interviewer transcribed the interviews in their original language and translated the Arabic segments in parentheses next to the original text. The transcriptions were analysed in their original language using QSR Nvivo version 11 software.

**Analysis**

We analysed the data using an inductive coding approach (Lincoln and Guba, 1985). We used an iterative process, which included four steps: (1) initial open coding of the data; (2) developing the initial coding template; (3) developing the initial thematic template; (4) expert vetting to develop the final competencies.

**Initial open coding**

We started the analysis with initial open coding. One of the authors thoroughly read each participant’s responses, then, guided by the research question, coded words, phrases, sentences or paragraphs (hereafter utterances) into categories to capture the ideas conveyed. For example, the utterance ‘to have an inquisitive mind’ was coded as Being Inquisitive. This author applied line-by-line coding initially to 15% of the interviews (five interviews) and generated a list of categories.

**Developing initial coding template**

The above author then vetted these categories collaboratively with another author. We re-examined the categories against the utterances they were referring to, as well as against other categories. Accordingly, we merged some categories and added new ones. For example, Knowing How to Search the Literature and Understanding and Knowing How to Do a Literature Search were merged. This led to the development of an initial coding template.

**Developing initial thematic template**

After coding 50% of the interviews (18 interviews) using the initial coding template, we examined the categories for accuracy and duplication, and reduced them to a more manageable number. We then began assembling the categories into sub-themes and themes. For example, we grouped the categories Data Analysis Skills and Knowledge of Comparing Numbers under a sub-theme (hereafter sub-competencies) labelled Analysing Data.
We further grouped multiple sub-competencies into themes (hereafter competencies) reflecting the KSAOs emerging from the data. For example, we grouped the sub-competencies Analysing Data, Searching the Literature, Collecting Data and Applying Data under the competency Research Knowledge and Skills. Furthermore, we grouped competencies under aggregate dimensions based on the type of KSAOs they reflected. For example, we grouped Research Knowledge and Skills, General Business Knowledge and Domain Knowledge under the dimension Technical Knowledge and Skills. As further illustration of our progress from categorization to dimension, we labelled the utterances ‘I have to think about the problems a decision might cause in the future (…) I have to think ahead’ and ‘In 3 months one of the head nurses leaves, so I have to plan ahead, starting today I need to think who should replace this nurse and start training them’ under the first-order category Short and Long-Term Implications. We then grouped this category with Considering Larger Context under the sub-competency Long-Term Thinking because they both revolved around considering the implications of decisions within the context of current systems and over time. We then grouped this sub-competency with the sub-competency Holistic Thinking under the competency Systems Thinking, because both sub-competencies dealt with considering the overall implications of decisions. Finally, since the competencies Systems Thinking, Critical Thinking and Creativity all reflect cognitive abilities, we grouped them under Cognitive Dimension. This grouping led to the development of an initial thematic template.

Expert vetting

After completing the full analysis using the initial thematic template, we formed a vetting panel including all three authors and re-examined the template. Guided by the literature on EBMgt and competencies of evidence-driven managers (Gioia, Corley and Hamilton, 2013), we refined the categorization and developed the final template situated in the larger EBMgt literature.

Inter-rater reliability and member check

To assess the reliability of the categorization, two independent coders, who were unfamiliar with the study, assigned sample codes to competencies and a sample of competencies to dimensions. We assessed inter-rater reliability by comparing their categorization with ours using Fleiss’s kappa (Fleiss, 1971). We found moderate agreement in the categorization of codes to competencies ($\kappa = 0.58$) and substantial agreement in the categorization of competencies to dimensions ($\kappa = 0.66$; Landis and Koch, 1997). We then met to discuss the discrepancies and made some very minor adjustments to the definitions of some codes and competencies. Finally, we conducted member checks by sharing our results with the participants, who were mainly in support of our categorization, with minor suggested amendments.

**Results**

**Evidence-based management competency model**

We captured participants’ 657 utterances and followed an iterative process of data analysis (Table 3).

The final outcome was the template (Table 4) comprising four dimensions, 13 competencies, 35 sub-competencies and 68 categories. To identify these four overarching dimensions, we leveraged existing managerial skills classifications, including Katz’s (1955) three-skills approach and its elaborations by Mann (1965) and Yukl (2013) and Hogan and Warrenfaltz’s (2003) domains. Accordingly, we identified the following dimensions: (I) technical, (II) cognitive, (III) interpersonal and (IV) intrapersonal.

(1) **Technical dimension.** This dimension includes skills and knowledge of methods, procedures and techniques related to the profession being practiced (Ericsson and Lehmann, 1996). It encompasses four competencies and 12 sub-competencies.

The first competency, General Business Knowledge, refers to knowledge and skills necessary for managing organizational activity (Hogan and Kaiser, 2005). Here, participants emphasized general management, which allows for the planning, execution and monitoring of organizational activity. They also emphasized financial management, which allows for the budgeting and financial planning of organizational activity, ‘Budgeting, feasibility studies, and priority setting are mandatory points’ (P8). Finally, participants emphasized
Table 3. Count of categories, sub-competencies, competencies and dimensions throughout the analysis

| Data analysis step                                      | Count of categories | Count of sub-competencies | Count of competencies | Count of dimensions |
|---------------------------------------------------------|---------------------|---------------------------|-----------------------|---------------------|
| **Open coding**                                         |                     |                           |                       |                     |
| Coding 15% of interviews (5 interviews)                 | 70                  | –                         | –                     | –                   |
| **Developing initial coding template**                  |                     |                           |                       |                     |
| Vetting codes                                           | 59                  | –                         | –                     | –                   |
| **Developing initial thematic template**                |                     |                           |                       |                     |
| Coding 50% of interviews (18 interviews)               | 201                 | –                         | –                     | –                   |
| Grouping into initial thematic template                 | 108                 | 20                        | 16                    | 3                   |
| **Coding 100% of interviews and refining grouping**    |                     |                           |                       |                     |
| Grouping into initial thematic template                 | 80                  | 19                        | 16                    | 4                   |
| **Expert vetting**                                      |                     |                           |                       |                     |
| Refining initial thematic template and developing final competency model | 68                  | 35                        | 13                    | 4                   |

Table 4. Evidence-based management competency template

| Category                                           | Sub-competency         | Competency                | Dimension               |
|----------------------------------------------------|------------------------|---------------------------|-------------------------|
| Administrative knowledge                           | General Management     | General Business Knowledge| Technical               |
| Project management                                 |                        |                           |                         |
| Knowledge of financial procedures                  | Financial Management   |                           |                         |
| Financial systems knowledge                         |                        |                           |                         |
| Computer skills                                    | Digital Skills         |                           |                         |
| Writing capabilities                               |                        |                           |                         |
| Knowledge of relevant national and international standards | National & International Standards | Industry Knowledge |                         |
| Knowledge of benchmarking                          |                        |                           |                         |
| Lean management                                    | Process Management     |                           |                         |
| Process design                                     |                        |                           |                         |

| Transparency                                        |                        |                           |                         |
| Confidentiality                                    |                        |                           |                         |
| Fairness                                           |                        |                           |                         |
| Objectivity                                        |                        |                           |                         |
| Transparency in research                           | Ethicality in Research  |                           |                         |
| Objectivity in research                            |                        |                           |                         |

digital skills, referring to having the skills to use relevant tools that support the management function, including software such as Microsoft Excel and statistical software, as well as having the proper writing skills when using these tools, such as when writing analysis reports and proposals.

The second competency, *Industry Knowledge*, refers to the knowledge and skills necessary for coordinating the activities of healthcare facilities (Thompson, Buchbinder and Shanks, 2012). Here, participants emphasized national and international standards, referring to knowledge of the relevant norms and standards of practice. Participants also emphasized quality assurance, referring to knowledge of quality metrics, and tools and techniques for auditing and controlling of healthcare safety and quality. Finally, participants emphasized process management, referring

| Category                                      | Sub-competency                        | Competency      | Dimension   |
|-----------------------------------------------|----------------------------------------|-----------------|-------------|
| Searching for data and literature             | Knowledge in Searching for & Understanding Data | Research Knowledge and Skills |             |
| Reading and understanding                     |                                        |                 |             |
| Data collection methods                        | Knowledge in Collecting Data           |                 |             |
| Auditing accuracy                              |                                        |                 |             |
| Warehousing and documenting                    |                                        |                 |             |
| Basic mathematics knowledge                    | Knowledge in Analysing Data            |                 |             |
| Statistical analysis                           |                                        |                 |             |
| Incorporating data in decisions                | Applying to Practice                   |                 |             |
| Applying theory to practice                    |                                        |                 |             |
| Intellectual curiosity                         | Inquisitiveness                        | Critical Thinking | Cognitive   |
| Asking questions                               |                                        |                 |             |
| Breaking down problems                         | Analytical Thinking                    |                 |             |
| Comparing and synthesizing                    |                                        |                 |             |
| Being methodical and organized                 | Systematic Thinking                    |                 |             |
| Being goal-oriented                            |                                        |                 |             |
| Considering impact on others                  | Holistic Thinking                      | Systems Thinking |             |
| Considering perspectives of others            |                                        |                 |             |
| Considering short & long-term implications    | Long-Term Thinking                     |                 |             |
| Considering larger context                    |                                        |                 |             |
| New ways of working                            | Innovativeness                         | Creativity      |             |
| New ways of solving problems                  |                                        |                 |             |
| Ideas around scarcity of resources             | Resourcefulness                        |                 |             |
| Establishing professional relationships        | Building Relationships                  | Relationship Management | Interpersonal |
| Understanding others and their needs and      |                                        |                 |             |
| motivations                                    |                                        |                 |             |
| Regulating one’s own and others’ emotions     | Emotional Intelligence                  |                 |             |
| Solving problems between people                |                                        |                 |             |
| Refraining from taking sides                  |                                        |                 |             |
| Serving as an example                          | Role Modelling                         | Team Leadership  |             |
| Motivating team to get results                 |                                        |                 |             |
| Willingness to share information               | Motivating Others                      |                 |             |
| Directing to relevant resources                | Sharing Information & Experiences      |                 |             |
| Content                                        |                                        |                 |             |
| Verbal and non-verbal skills                   |                                        |                 |             |
| Being available for employees                  | Open Door Policy                        | Management Style |             |
| Providing opportunity to share mistakes       |                                        |                 |             |
| Providing chance to fix mistakes               | Accepting Others’ Mistakes             |                 |             |
| Seeking field information                      |                                        |                 |             |
| Being part of practice                         | Hands-On Management                     |                 |             |
| Adapting decisions to fit new situations      |                                        |                 |             |
| Adapting behaviours to fit new situations     | Adapting Priorities                    |                 |             |
| Prioritizing stakeholders’ interests based on  |                                        |                 |             |
| the situation                                  |                                        |                 |             |
| Self-awareness                                 |                                        |                 |             |
| Ability to learn from experiences             |                                        |                 |             |
| Taking initiatives to learn and grow          |                                        |                 |             |

to knowledge of methods, tools and techniques necessary for improving the quality of healthcare delivery processes (Taylor et al., 2014), ‘the skills of doing a PDCA [plan–do–check–act] how to look at a process and break it down into steps’ (P6).

The third competency, Ethicality, refers to the use of appropriate judgements in line with ethical standards guided by the benefit of patients, employees, the organization and society (Kanungo, 2001). We categorized ethicality as a technical competency because it refers to a manager’s knowledge and practice of ethics as it relates to their profession rather than their ethical orientation as a person. Participants emphasized ethicality in management, referring to managing with transparency, upholding confidentiality and treating others with fairness and objectivity. They also emphasized ethicality in research, referring to transparency and honesty about the data used in decision-making, ‘being transparent with the numbers and the data you use’ (P15), and objectivity in terms of being unbiased and letting the data rather than initial judgements guide decision-making.

The fourth competency, Research Knowledge and Skills, refers to the knowledge and skills necessary for conducting research. Here, participants emphasized knowledge in searching for and understanding data, whether within the organization or in the literature. Participants also emphasized knowledge in collecting data, from methods of data collection to recording the data and assessing its accuracy. They also emphasized knowledge in analysing data, referring to knowledge of different statistical analysis methods. As a participant stated, ‘You cannot be evidence based if you don’t know the basics behind comparison and some form of statistics analysis’ (P1). Finally, participants emphasized the skills of applying data to practice, as in this example: ‘Knowledge by itself is not enough if you don’t know how to apply (…) how can I move that theory to reality?’ (P23).

(II) Cognitive dimension. This dimension includes skills and abilities related to the way managers organize and process information (Messick, 1984) and understand relationships between different factors, (Katz, 1955; Yukl, 2013). This dimension includes three competencies and seven sub-competencies.

The first competency, Critical Thinking, refers to the ability to purposefully reflect on, evaluate, analyse and synthesize information, and structure an argument to arrive at conclusions (Moon, 2007). Here, participants emphasized core elements of the construct (Facione, Facione and Sanchez, 1994), including inquisitiveness, referring to having intellectual curiosity and frequently asking questions, ‘they are always curious, always asking’ (P34). They also emphasized being analytical, referring to breaking down problems into more manageable components and comparing and synthesizing information (Amer, 2005). Finally, participants emphasized systematic thinking, referring to being methodical, following an approach marked by regularity (Facione, Facione and Sanchez, 1994), and being ‘oriented towards goals’ (P8), referring to setting goals and working to complete them.

The second competency, Systems Thinking, refers to the ability to see the organization as a whole, recognizing the different parts that make it up and how they interact together (Katz, 1955). To this end, participants emphasized holistic thinking, referring to considering the implications of decisions for the different stakeholders within and outside the organization, ‘people who are going...’
to apply your decision (...) you should think in their perspective’ (P17). Participants also stressed the importance of long-term thinking, referring to thinking of both the short and long-term implications of decisions, ‘even in times of crisis I have to think about the problems a decision might cause in the future... we have to think ahead’ (P23).

The last competency, Creativity, refers to the ability to generate original ideas (Amabile, 1988) and to find creative solutions even in the face of resource scarcity. Participants emphasized innovativeness, referring to coming up with new ways of conducting work processes and solving problems. They also emphasized resourcefulness, referring to the ability to generate original ideas vis-à-vis a scarcity in resources, ‘If you don’t have the financial or other resources (...) then you need creativity to find a way around such shortages’ (P15).

(III) Interpersonal dimension. This dimension refers to the skills and abilities necessary for working with and leading people (Hogan and Warrenfeltz, 2003; Katz, 1955) and includes three competencies and 10 sub-competencies.

The first competency, Relationship Management, refers to the ability to initiate, cultivate and maintain relationships with colleagues. Participants stressed building relationships, being able to establish professional relationships with individuals inside or outside the organization, so as to facilitate access to information and expert opinion, ‘he [evidence-driven manager] has public relations with other people who can help him in specific subjects’ (P33). They also stressed emotional intelligence, focusing on core elements of the construct (Petrides and Furnham, 2001), including understanding others’ needs and motivations, and regulating one’s own and others’ emotions, ‘[W]hen there is a problem you have to be very understanding of [others’ feelings] without getting emotional and getting into the problem’ (P22). Participants also emphasized conflict management skills, referring to how managers approach and handle conflicts in the workplace, and the importance of refraining from taking sides (Wilson, 2004).

The second competency, Team Leadership, refers to the ability to direct individual and group activities towards a shared goal (Yukl, 2013). Participants emphasized the importance of role mod-
dynamic work situations (Johnson, 2001). Here, participants emphasized adapting to change by changing behaviours and decisions: ‘To adapt... Even if you don’t change your decisions... But maybe some fine tuning; maybe you can change some things’ (P17). They also emphasized adapting priorities, referring to adjusting priorities based on stakeholders’ interests, such as in cases where patients’ needs are determined to be of higher priority than hospital policy.

The second competency, *Self-initiated Improvement*, positions the evidence-driven manager as an agent actively seeking to create change. Improvement can be geared towards self-development, referring to developing personal skills, learning from mistakes, and taking initiatives to learn and grow, ‘being self-motivated, interested in constantly reading, learning, and improving themselves’ (P12). In parallel, self-initiated improvement also entails process and quality improvement, which requires identifying problems and finding solutions for them: ‘people who come to their managers, and tell them “in doing this I discovered that we have a flaw and I did an analysis and I suggest we do this to fix it”’ (P11).

The final competency, *Open Mindedness*, refers to being tolerant of divergent views (Facione, Facione and Sanchez, 1994). Here, participants stressed that managers must have openness to receiving input from stakeholders, referring to being receptive to information from stakeholders at different levels and considering their input when making decisions: ‘You have to show them [employee] that everything that [they] reported will end up being considered in your decision-making process’ (P35). Participants also emphasized the importance of openness to changing one’s mind, referring to being receptive to changing one’s ideas or decisions even after decisions have been made if new evidence points in a different direction. As a participant described an incident with a non-employee: ‘I would] show them articles, designs and the benefits of these... but there is no openness to changing [their] idea’ (P2).

**Mapping onto Rousseau and Gunia’s (2016) framework**

To explore whether these competencies could fit into Rousseau and Gunia’s (2016) conceptual framework, we mapped our findings onto this framework. The distinguishing feature between the foundational and functional competencies is that the former are required to engage in all aspects of EBMgt, while the latter are required to engage in specific EBMgt activities (Rousseau and Gunia, 2016). Considering that the two core EBMgt activities are acquiring and critically appraising evidence, we categorized competencies specifically necessary for engaging in acquisition and appraisal of evidence as functional and the rest of the competencies as foundational. In doing this mapping, we found that the foundational–functional division is, in some cases, better expressed at the level of the sub-competencies rather than the competencies. We identified seven functional competencies and/or sub-competencies and present below their link to the core activities of EBMgt (Figure 1).

Within the technical dimension, the competency Research Knowledge and Skills can be considered functional as it encompasses sub-competencies that can help managers search for existing evidence and design data collection methods to gather evidence. Additionally, these sub-competencies can help managers assess the quality of evidence, depending for example on how the data was collected and what sample it was collected from vis-à-vis the context it will be applied to. These are critical activities of EBMgt, no matter the type of evidence (Barends et al., 2014; Swan et al., 2012). Furthermore, the sub-competency ethicality in research, under the Ethicality competency, can also be considered functional because it allows managers to be ethical and uphold ethical principles when acquiring and appraising the evidence. It allows managers to be transparent about the data they acquire and use as the basis of decision-making, and to be objective in appraising the quality of the data and interpreting its meaning. Within the cognitive dimension, under the Critical Thinking competency, the inquisitiveness sub-competency can be considered functional because it drives the individual to ask questions to better understand the problem and thus acquire the best available evidence. It also drives the individual to ask questions to assess the quality of this evidence. Moreover, under the Creativity competency, the resourcefulness sub-competency can be considered functional. In the EBMgt context, resourcefulness refers to managers’ ability to generate and acquire evidence in novel ways when it is not easily available due to organizational and other constraints. For example, in one hospital, internal information about
Evidence-based Management Competency Model

**FOUNDATIONAL SUB-COMPETENCIES**
- General Management
- Financial Management
- Digital Skills
- National & International Standards
- Process Management
- Quality Assurance
- Ethicality in Management

**FUNCTIONAL SUB-COMPETENCIES**
- Ethicality in Research
- Knowledge in Searching for & Understanding Data
- Knowledge in Collecting Data
- Knowledge in Analyzing Data
- Applying to Practice

**TECHNICAL**
- Industry Knowledge
- General Business Knowledge
- Ethicality
- Research Knowledge & Skills

**COGNITIVE**
- Systems Thinking
- Critical Thinking
- Innovation
- Inquisitiveness
- Resourcefulness

**INTERPERSONAL**
- Team Leadership
- Role Modeling
- Motivating Others
- Sharing Information & Experiences
- Effectively Delivering Information
- Emotional Intelligence
- Conflict Management Skills
- Building Relationships
- Open-door Policy
- Accepting Others’ Mistakes
- Hands-on Management

**INTRAPERSONAL**
- Self-Initiated Improvement
- Process & Quality Improvement
- Openness
- Adapting to Change
- Adapting Priorities
- Openness to Receiving Input from Stakeholders
- Openness to Change One’s Mind

*Figure 1. Evidence-based management competency model: mapping onto Roussau and Gunia (2016)*
the average processing time of laboratory tests was not available because of a lack of documentation. To collect this data, the manager decided to conduct observations over a 1-month period; however, considering the limited human and financial resources, the manager partnered with a career service at a university and hired student volunteers.

Within the interpersonal dimension, the building relationship sub-competency under Relationship Management and the Management Style competency can be considered functional as they may facilitate access to information from employees, colleagues and patients. Both of these represent an ability to develop relationships and create an atmosphere where employees can safely share information with a manager who has a hands-on approach and is accepting of mistakes. Such an atmosphere allows the acquisition of information, and accurate information at that, of events that are happening within the organization.

Finally, within the intrapersonal dimension, the competency Open Mindedness can be considered functional because in the EBMgt context, it involves being receptive to information and accordingly open to changing one's mind. Such openness is critical to EBMgt, given how managers' beliefs, knowledge and interests might come into play in determining what information they take into account and utilize in decision-making (Rynes, Colbert and O'Boyle, 2018).

Having identified the competencies and sub-competencies necessary for acquiring and appraising evidence as functional, what remained were the foundational competencies and sub-competencies. These included the competencies General Business Knowledge, Industry Knowledge, Systems Thinking, Team Leadership, Self-initiated Improvement and Adaptability. They also included the sub-competencies ethicality in management under Ethicality, analytical and systems thinking under Critical Thinking, innovativeness under Creativity and emotional intelligence and conflict management skills under Relationship Management. These are necessary to engage in all aspects of EBMgt practice. To illustrate, General Business Knowledge and Industry Knowledge are foundational because they provide managers with the mental models that allow them to anticipate and recognize problems, identify necessary and relevant solutions, and the best way to apply those solutions (Ericsson and Lehmann, 1996; Rousseau and Gunia, 2016). Furthermore, Adaptability and Self-initiated Improvement are foundational because the overall process of EBMgt can be long and arduous (Barends et al., 2014), and these competencies give managers the drive and capacity to initiate processes of continuous improvement and adapt to changes throughout the process.

**Discussion**

The aim of this study was to empirically identify the foundational and functional competencies necessary for EBMgt practice in hospital settings and develop an empirically based competency model for evidence-driven managers in hospital settings. The outcome was the formulation of the EBMgt competency model comprising four dimensions, 13 competencies and 35 sub-competencies, categorized into foundational and functional competencies according to Rousseau and Gunia's (2016) conceptualization. The model developed in this study is the first attempt to empirically delineate the competencies necessary for the practice of EBMgt among managers in a hospital setting. The model builds on and contributes empirically and theoretically to Rousseau and Gunia's (2016) conceptualization by identifying the EBMgt competencies that fall under their conceptualization, and by situating the EBMgt competencies within the overall literature on managerial competencies. The value of the proposed model lies in its contribution to understanding the specific competencies necessary for the practice of core EBMgt activities, examined in both the general management as well as the healthcare management literatures.

**Competencies unique to the EBMgt competency model**

Several of the competencies we identified in the proposed model overlapped with existing competency models in the healthcare management literature (Calhoun et al., 2008; Garman et al., 2004; Liang and Howard, 2010; Liang et al., 2013; McCarthy and Fitzpatrick, 2009), although some of these overlapping competencies contribute uniquely to the practice of EBMgt. For example, ethicality as a competency has been highlighted in many existing managerial models in healthcare and outside. However, its emergence in
the proposed model is critical because the EBMgt literature has been criticized for ignoring issues of power, politics and ethics and the role they play in EBMgt practice. Therefore, although ethicality has not been at the centre of discussions in the EBMgt literature, it is an integral part of its practice and requires more in-depth investigations. Additionally, some other competencies were unique to our model, and some other popularly cited competencies were not mentioned by our informants. Here we will discuss the competencies that were unique to the current model, or had unique contributions. These potentially provide an indication of the skills that are critical to the practice of EBMgt and its core activities, and extend our ideas about the practice of EBMgt in hospital settings.

**Unique competencies.** The competency Research Knowledge and Skills was not prominent in the existing literature, and even when it was identified, it tended to be subsumed under other competencies such as Business Knowledge and Skills (Steffl and Bontempo, 2008). This supports the existing EBMgt literature, where the scarcity of such skills has been identified as a barrier to EBMgt (Barens et al., 2017; Liang and Howard, 2011; Niedzwiedzka, 2003) and our identification of these skills as a standalone competency highlights its central role for acquiring and assessing evidence in EBMgt. Open Mindedness was also unique to this model, referring not to the personality trait, but rather to being open to changing one’s mind even after having made a decision, in case the evidence proves otherwise. The EBMgt literature has tended to associate poor decision-making, or non-evidence-based decision-making, with an absence of knowledge (Rynes, Colbert and O’Boyle, 2018). Research has shown, however, that managers’ lack of reliance on evidence might be a choice to ignore evidence that contradicts one’s beliefs, knowledge and self-interest (Rynes, Colbert and O’Boyle, 2018). Thus, our identification of this competency is in line with the EBMgt literature pinpointing the necessity of managers being receptive to evidence (Rynes, Colbert and O’Boyle, 2018).

**Competencies uniquely contributing to EBMgt practice.** Relationship Management has been identified in several existing models of healthcare management competencies (Calhoun et al., 2008; Garman et al., 2004; Liang and Howard, 2010; Liang et al., 2013; McCarthy and Fitzpatrick, 2009). However, its contribution to the practice of EBMgt is unique, in that it plays a critical role in enabling managers to establish and maintain positive relationships with different stakeholders. These relationships, according to the informants, facilitate access to and acquisition of data. This is also true of the Management Style competency (McCarthy and Fitzpatrick, 2009), which plays a critical role in facilitating EBMgt practice. It contributes to creating a working environment where healthcare professionals feel safe to share information (Katz, 1955), thus allowing managers direct access to more valid data from their subordinates. These skills might be especially important in the healthcare context, where fostering relationships has been challenging given the environment that has traditionally encouraged autonomy but where work is highly interdependent (Hoffer Gittell, 2016).

The acquisition of evidence is also facilitated by the competency Creativity, which is prominent in the healthcare management competencies literature (Calhoun et al., 2008; Garman et al., 2004). However, its contribution to EBMgt practice is unique because it might help managers adapt evidence-based solutions to fit the organizational context. It might also help managers find solutions in the absence of certain resources, such as accessing evidence when it is not easily accessible and collecting evidence when it is absent. Therefore, creativity can help managers overcome challenges to EBMgt, including the dearth of evidence, its applicability to the organization and the lack of resources to create or access evidence (Barens et al., 2017; Liang and Howard, 2011; Niedzwiedzka, 2003).

The dynamic nature of the EBMgt competency model. The EBMgt competency model proposed in this study can be considered dynamic, whereby the foundational competencies form the basis for the development of functional competencies (Rodolfa et al., 2005). Most importantly, not only can the foundational competencies be considered prerequisites to the development of functional competencies within the same dimension, but also to the development of some competencies under other dimensions. To illustrate, the foundational technical competencies can be considered necessary prerequisites to the technical and cognitive functional competencies. That is, having general management and industry knowledge

© 2020 The Authors. British Journal of Management published by John Wiley & Sons Ltd on behalf of British Academy of Management.
(foundational technical competencies) can be considered prerequisites for managers to know what data to search for or collect and how to interpret it (functional technical competencies). These foundational technical competencies may also be considered prerequisites for managers to know all the resources they can tap into to generate evidence in resource-scarce settings (functional cognitive competencies). Similarly, the foundational cognitive competencies can be considered necessary prerequisites to the cognitive, technical and interpersonal functional competencies. That is, being creative (foundational cognitive competency) can be a prerequisite to the acquisition of resources in resource-scarce settings (functional cognitive competency), and to designing research to acquire necessary evidence (functional technical competency). Additionally, being systematic could be a prerequisite to searching for and collecting data. Indeed, it has been found that in order to formulate a question in a way that would allow searching for and collecting information, one must think in a systematic way, organizing and structuring this thinking (Chi, Glaser and Farr, 1988). Furthermore, thinking holistically and considering long-term goals could be prerequisites to realizing the value of building and maintaining relationships with key stakeholders (functional interpersonal competency). Overall, these examples illustrate that the foundational competencies can be prerequisites to the development of functional competencies within and across dimensions, and that to develop EBMgt competencies, both functional and foundational competencies might be targeted. Future research can focus on more specifically exploring these relationships across the four dimensions.

**Practical implications**

**Selecting and developing evidence-driven managers.** The adoption of EBMgt in practice has been challenging. Several barriers have been identified at different levels, including the individual level (Barends et al., 2017; Liang and Howard, 2011; Niedzwiedzka, 2003). With the advent of technology and digitization in the workplace, managers will surely be surrounded with more data that can be critical for optimizing their decision-making. EBMgt is a promising management approach that can allow managers to make better use of this data. The EBMgt competency model proposed here can aid in refining managerial selection processes, whereby organizations can move beyond the job and more into the managerial competencies that are needed in today’s data-driven world.

Many of the competencies necessary for EBMgt can be developed through organizational training programmes. This is an important safeguard, for management training programmes can be designed to target the competencies identified in this model. Furthermore, this competency model can serve as a blueprint to identify which EBMgt practice aspects managers struggle with and direct training initiatives to develop them specifically.

**Necessary versus sufficient for the adoption EBMgt practice.** While developing managers’ ability is necessary for their adoption of EBMgt, it is not sufficient alone since there are also individual, organizational and institutional-level factors that influence the use of data in decision-making (Baba and HakemZadeh, 2012; Wang et al., 2019). That is, the adoption of EBMgt is predicated on a fit between the personal characteristics of the decision-maker and the demands of the context (Wright et al., 2016). So not only do the managers need to possess the EBMgt competencies, they also need to be provided with the opportunity to practice EBMgt from their organization (Rousseau and Gunia, 2016). In order to promote the practice of EBMgt within their context, organizations need to take a proactive approach that transcends developing skills to include creating a supportive culture and structure.

**Limitations and future direction**

This study has several limitations and opens opportunities for future research. First, while it is limited by the inclusion of only executives, rather than evidence-driven managers who are the main focus of the study, it is important to note that there is a scarcity of tools that can be used to identify evidence-driven hospital managers. Additionally, taking the perspective of ‘other’ managers may have been beneficial in controlling for self-report bias. Future research can focus on developing assessment methods to evaluate current managers on their level of EBMgt competencies and to direct the design of EBMgt development programmes.

Second, the competency model developed in the current study was based on managers working in
hospital settings in Lebanon. This context might have influenced the competencies identified and defined (Campion et al., 2011). To illustrate, building relationships as a KSAO seems core to the work of healthcare managers generally; it might be even more central in Lebanon given the lack of updated census and norms (Hamdan, 2014). In such cases, managers noted the necessity of building professional relationships with key players in the field to gain access to information. Despite this limitation, the depth of the data led to the identification of competencies which overlapped with the literature, as well as others unique to the current model. Additionally, the fact that the data was collected from 11 hospitals provided a variety of perspectives that takes into account multiple organizational contexts.

Third, several healthcare management competencies from the literature, such as negotiation skills and professionalism, were not identified in the proposed model (Calhoun et al., 2008; Garman et al., 2004; Liang and Howard, 2010; Liang et al., 2013; McCarthy and Fitzpatrick, 2009; Stefl and Bontempo, 2008). More research is needed to elucidate whether these are general managerial competencies and, as such, not core to EBMgt practice or whether their lack of identification is a function of the current study context.

Conclusion

In the current study, we set out to identify the foundation and functional competencies necessary for EBMgt practice and develop an empirically based competency model for evidence-driven managers in hospital settings. We developed the EBMgt competency model, which included a conglomerate of 13 different KSAOs grouped into four dimensions; the first attempt to empirically delineate the competencies necessary for EBMgt practice in a hospital setting. Taking the Rousseau and Gunia (2016) conceptualization as our theoretical framework, and building on it, we empirically identified the EBMgt competencies that fall under their foundational and functional conceptualization, depending on their contribution to EBMgt practice. We also situated these competencies within the overall literature on managerial competencies by grouping the competencies under four dimensions that represent a widely used approach to classifying managerial skills. We also built on their framework by arguing that the model could be considered dynamic, whereby the foundational competencies form the basis for the development of functional competencies within and across the dimensions. The value of the proposed model lies in its contribution to understanding the specific competencies necessary for the practice of core EBMgt activities. Its value also lies in that it can serve as a blueprint, to develop training initiatives for healthcare managers. While this study was conducted in a healthcare setting, its implications extend to general management, considering the exponential growth in data that has been witnessed across all industries.

Lina Daouk-Öyry is Associate Professor of Organizational Behaviour and Human Resources Management at the Olayan School of Business, American University of Beirut and Director of the Evidence-Based Healthcare Management Unit at the American University of Beirut Medical Center. She specializes in employee assessment, development and retention and is interested in individual differences at work in relation to variables relevant to today’s business context (attendance behaviour, job crafting, evidence-based management).

Tina Sahakian is a PhD candidate in the Department of Culture Studies at Tilburg University, Netherlands and a researcher at the Evidence-Based Healthcare Management Unit, American University of Beirut Medical Center. She specializes in studying healthcare management from an organizational behaviour perspective. Her research addresses the practice of evidence-based management – especially the decision-making process and the competencies and personality of the decision-maker.

The late Professor Fons van de Vijver held a Chair in Cross-Cultural Psychology at Tilburg University, Netherlands, an Extraordinary Chair at North-West University, South Africa and the University of Queensland, Australia and was Senior Researcher at the Higher School of Economics, Moscow, Russia. He passed away unexpectedly on 1 June 2019. We would like to ensure he continues to get all the credit he deserves for the work that he has done.
