We present a study of electroweak excitations of nucleon resonances with higher spins, in a soft-wall AdS/QCD model, comparing our results with existing data from the CLAS Collaboration at JLab, from MAMI, and other experiments.

I. INTRODUCTION

Investigation of electroweak excitations of nucleon resonances provides important information about their structure and basic properties [1-3]. For this reason, recent experiments at JLab [4-6] and at MAMI [7,8] aim for a precise determination of the electroweak couplings of nucleon resonances and nucleons, supported by theoretical studies of these quantities [3,8]. In fact, the strong and electroweak structure of nucleon resonances has been studied in detail in many different theoretical approaches, such as in the MAID, SAID, and Bonn-Gatchina partial-wave analysis [8-12], isobar model [13], constituent quark models [14-29], chiral approaches [30-32], light-cone [33] and QCD [34] sum rules, many different theoretical approaches, such as in the MAID, SAID, and Bonn-Gatchina partial-wave analysis [8-12], isobar model [13], constituent quark models [14-29], chiral approaches [30-32], light-cone [33] and QCD [34] sum rules, light-front quark models [2,5,35-37], approaches based on solutions of Bethe-Salpeter and Faddeev equations [38-43], isobar model [13], constituent quark models [14-29], chiral approaches [30-32], light-cone [33] and QCD [34] sum rules, light-front quark models [2,5,35-37], approaches based on solutions of Bethe-Salpeter and Faddeev equations [38-43], approaches used semirelativistic approximation and empirical parametrizations [44,45], holographic QCD [46]-[53].

In the past decade significant progress in the study of nucleon resonances has been achieved through the soft-wall AdS/QCD [47]-[53] formalism. For example, AdS/QCD is able to study the electromagnetic structure of nucleon and provides the correct power scaling description of form factors and helicity amplitudes of all hadrons at large $Q^2$ [53], while it is also able to give good agreement with data at low and intermediate $Q^2$. In Refs. [47]-[53] soft-wall AdS/QCD was focused on the study of form factors and helicity amplitudes of electroexcitations of the Roper $N(1440)$ (first radial excitation of the nucleon) and the negative-parity state $N^*(1535)$. In particular, in Refs. [48,51-53] we proposed and developed a soft-wall AdS/QCD framework for the study of nucleon resonances with adjustable quantum numbers and successfully applied it to the unified description of electromagnetic structure of three states — nucleon, Roper, and $N^*(1535)$. In the present manuscript we apply this theoretical approach for the study of the electromagnetic structure of nucleon resonances with higher spins.

The paper is organized as follows. In Sec. II we briefly discuss our formalism. In Sec. III we present the analytical calculation and the numerical analysis of electromagnetic form factors and helicity amplitudes of the transitions between nucleon and nucleon resonances. Finally, Sec. IV contains our summary.

II. FORMALISM

In this section we discuss the basic principles of our approach [56]-[62] and focus on its application to nucleon resonances [48,51,53,54,58] with higher spins. First, we define the conformal Poincaré metric, which is used in our formalism:

$$g_{MN} x^M x^N = \epsilon^a_M(z) \epsilon^b_N(z) \eta_{ab} x^M x^N = \frac{1}{z^2} (dx_\mu dx^\mu - dz^2),$$

where $\epsilon^a_M(z) = \delta^a_M/z$ is the vielbein, $g = |\det(g_{MN})| = 1/z^{10}$.

Next we discuss the construction of the effective action in terms of the 5D AdS fermion fields $\psi_{i,\tau}$ and the vector field $V_M(x,z)$, where $\tau = N + L$ is the twist, defined as the number of partons plus angular orbital momentum. The vector field is dual to the electromagnetic field, while the fermion fields are duals to the left- and right-handed chiral doublets of the nucleon and the nucleon resonances, with $O_L = (B^1_L, B^2_L)^T$ and $O_R = (B^1_R, B^2_R)^T$ where $B_1 = p, N_1^p$ and $B_2 = n, N_2^n$. These AdS fields are in the fundamental representations of the chiral $SU_L(2)$ and $SU_R(2)$ subgroups and are holographic analogs of the nucleon $N$ and $N^*$ resonance, respectively. They have constrained (confined) dynamics in AdS space, due to the presence of dilaton field $\varphi(z) = k^2 z^2$, where $k$ is its scale.
parameter. The action $S$ for the description of electroexcitations of nucleon resonances contains a free part $S_0$, describing the dynamics of AdS fields, and an interaction part $S_{\text{int}}$, describing the interactions of fermions with the vector field dual to electromagnetic field

$$S = S_0 + S_{\text{int}},$$

$$S_0 = \int d^4xdz \sqrt{g} e^{-\varphi(z)} \left\{ \mathcal{L}_N(x,z) + \mathcal{L}_{N^*}(x,z) + \mathcal{L}_V(x,z) \right\},$$

$$S_{\text{int}} = \int d^4xdz \sqrt{g} e^{-\varphi(z)} \mathcal{L}_{VNN^*}(x,z),$$

where $\mathcal{L}_N$, $\mathcal{L}_{N^*}$, $\mathcal{L}_V$, and $\mathcal{L}_{VNN^*}$ are the free and interaction Lagrangians, respectively, given by

$$\mathcal{L}_N(x,z) = \sum_{i=\pm,\tau} c_\tau \bar{\psi}_{i,\tau} \partial \mathcal{D}_i(x,z),$$

$$\mathcal{L}_{N^*}(x,z) = \sum_{i=\pm,\tau} c_\tau \bar{\psi}_{i,\tau^*} \mathcal{D}_i(x,z),$$

$$\mathcal{L}_V(x,z) = -\frac{1}{4} V_{MN}(x,z) \mathcal{V}^M(x,z),$$

$$\mathcal{L}_{VNN^*}(x,z) = \sum_{i,M} \sum_{\tau,\tau^*} g_{ij}^{(iM)} J^{(iM)}_{ij}(x,z) + \text{H.c.}.$$ (2)

Here $\tau$ and $\tau^*$ are the twists of both the nucleon and nucleon resonance, which run from their minimal possible value.

We have introduced the following shortened notations

$$\mathcal{D}_k(z) = \frac{i}{2} \Gamma^M \partial_M - \frac{i}{8} \Gamma^M \omega^a_b [\Gamma_a, \Gamma_b] \mp (\mu + U_F(z)),$$

$$\bar{\psi}_{x,z}^{N^*}(x,z) = Q \Gamma^M \mathcal{V}_M(x,z),$$ (4)

c, $c_\tau$, $g_{ij}^{(iM)}$ and $J^{(iM)}_{ij}(x,z)$ are the sets of effective couplings and currents. The currents $J^{(iM)}_{ij}(x,z)$ with $i = 1, 2, 3, 4$ and $M = A, B, C, D, E, F$ are given, in terms of AdS fermion and vector fields, by

$$J^{(iM)}_{ij}(x,z) = J^{(iM)}_{j,+,-}(x,z) + J^{(iM)}_{j,-,+}(x,z),$$

$$J^{(iM)}_{j,\tau,+}(x,z) = J^{(iM)}_{j,+,\tau}(x,z) - J^{(iM)}_{j,-,\tau}(x,z),$$

$$J^{(iM)}_{j,\tau^*,+}(x,z) = J^{(iM)}_{j,+,\tau^*}(x,z) + J^{(iM)}_{j,-,\tau^*}(x,z),$$

$$J^{(iM)}_{j,\tau^*,\tau}(x,z) = J^{(iM)}_{j,\tau,\tau^*}(x,z) - J^{(iM)}_{j,\tau^*,\tau}(x,z),$$

where

$$J^{(A)}_{ij,\tau,+}(x,z) = \tilde{\psi}_{i,\tau^*}^{MM_1...M_{l-1}}(x,z) \mathcal{V}^{(1)}_{MM_1...M_{l-1}}(x,z) \psi_{j,\tau}(x,z),$$

$$J^{(B)}_{ij,\tau+,\tau^*}(x,z) = \partial \psi_{i,\tau^*}^{MM_1...M_{l-1}}(x,z) \mathcal{V}^{(2)}_{MM_1...M_{l-1}}(x,z) \psi_{j,\tau}(x,z),$$

$$J^{(C)}_{ij,\tau^*+}(x,z) = \tilde{\psi}_{i,\tau^*}^{MM_1...M_{l-1}}(x,z) \mathcal{V}^{(3)}_{MM_1...M_{l-1}}(x,z) \psi_{j,\tau}(x,z),$$

$$J^{(D)}_{ij,\tau^*,\tau}(x,z) = \tilde{\psi}_{i,\tau^*}^{MM_1...M_{l-1}}(x,z) \partial \mathcal{V}^{(1)}_{MM_1...M_{l-1}}(x,z) \psi_{j,\tau}(x,z),$$

$$J^{(E)}_{ij,\tau^*,\tau^*}(x,z) = \partial \tilde{\psi}_{i,\tau^*}^{MM_1...M_{l-1}}(x,z) \partial \mathcal{V}^{(2)}_{MM_1...M_{l-1}}(x,z) \psi_{j,\tau}(x,z),$$

$$J^{(F)}_{ij,\tau^*,\tau}(x,z) = \tilde{\psi}_{i,\tau^*}^{MM_1...M_{l-1}}(x,z) \partial \mathcal{V}^{(3)}_{MM_1...M_{l-1}}(x,z) \psi_{j,\tau}(x,z)$$

and

$$\mathcal{V}^{(1)}_{MM_1...M_{l-1}}(x,z) = \partial M_1 \ldots \partial M_{l-1} \partial K \mathcal{V}_K(x,z),$$

$$\mathcal{V}^{(2)}_{MM_1...M_{l-1}}(x,z) = \partial M_1 \ldots \partial M_{l-1} \mathcal{V}_K(x,z),$$

$$\mathcal{V}^{(3)}_{MM_1...M_{l-1}}(x,z) = \partial M_1 \ldots \partial M_{l-1} \partial K \mathcal{V}_K(x,z),$$

(6)
Here $\mu$ is the five-dimensional mass of the spin-$\frac{1}{2}$ AdS fermion with $\mu = 3/2 + L$ ($L$ is the orbital angular momentum); $U_F(z) = \varphi(z)$ is the dilaton potential; $Q = \text{diag}(1,0)$ is the charge matrix corresponding to doublets of nucleon (nucleon resonances); $V_{MN} = \partial_M V_N - \partial_N V_M$ is the stress tensor for the vector field; $\omega_{a}^{\mu} = (\delta_{M}^{a} \delta_{\bar{M}}^{\bar{a}} - \delta_{\bar{M}}^{a} \delta_{M}^{\bar{a}})/z$ is the spin connection term; while $\Gamma^{M} = \epsilon_{a}^{M} \Gamma^{a}$ and $\Gamma^{a} = (\gamma^{\mu}, -i\gamma^{5})$ are the Dirac matrices in AdS space, $[\Gamma_{a}, \Gamma_{b}] = \Gamma_{a} \Gamma_{b} - \Gamma_{b} \Gamma_{a}$.

Next we split 5D AdS fermion fields $\psi \pm,\tau(x, z)$ and $\psi^{MM_1...M_{l-1}}(x, z)$ into left- and right-chirality components

$$\psi(x, z) = \psi_L(x, z) + \psi_R(x, z), \quad \psi_{L/R}(x, z) = \frac{1 \mp \gamma^5}{2} \psi(x, z)$$

for the nucleon, and

$$\psi^{MM_1...M_{l-1}}(x, z) = \psi_{L}^{MM_1...M_{l-1}}(x, z) + \psi_{R}^{MM_1...M_{l-1}}(x, z), \quad \psi_{L/R}^{MM_1...M_{l-1}}(x, z) = \frac{1 \mp \gamma^5}{2} \psi^{MM_1...M_{l-1}}(x, z)$$

for the nucleon resonances with higher spins and perform the Kaluz a-Klein expansion as:

$$\psi_{L}(x, z) = \frac{1}{\sqrt{2}} \sum_{n} \left[ \pm \psi_{Ln}(x) F_{\tau n}^{L/R}(z) + \psi_{Rn}(x) F_{\tau n}^{R/L}(z) \right],$$

$$\psi_{L}^{MM_1...M_{l-1}}(x, z) = \frac{1}{\sqrt{2}} \sum_{n} \epsilon^{MM_1...M_{l-1}}(z) \left[ \pm \psi_{Ln}^{a_{1}...a_{l-1}}(x) F_{\tau n}^{L/R}(z) + \psi_{Rn}^{a_{1}...a_{l-1}}(x) F_{\tau n}^{R/L}(z) \right],$$

where $n$ is the radial quantum number and

$$\epsilon^{MM_1...M_{l-1}}(z) = \epsilon_{a}^{M}(z) \epsilon_{a_{1}}^{M_1}(z) ... \epsilon_{a_{l-1}}^{M_{l-1}}(z).$$

Here

$$F_{\tau n}^{L/R}(z) = e^{\kappa^2 z^2/2} z^2 f_{\tau n}^{L/R}(z),$$

are the bulk profiles with twist $\tau$ and radial quantum number $n$, which depend on the holographic variable $z$, where

$$f_{\tau n}^{L}(z) = \sqrt{\frac{2\Gamma(n + 1)}{\Gamma(\tau + n)}} \kappa^{\tau} z^{\tau-1/2} e^{-\kappa^2 z^2/2} L_{n-1/2}(\kappa^2 z^2),$$

$$f_{\tau n}^{R}(z) = \sqrt{\frac{2\Gamma(n + 1)}{\Gamma(\tau - 1 + n)}} \kappa^{\tau-1} z^{\tau-3/2} e^{-\kappa^2 z^2/2} L_{n-3/2}(\kappa^2 z^2)$$

and $L_{n}^{m}(x)$ are the generalized Laguerre polynomials. The bulk profiles $f_{\tau n}^{L/R}(z)$ are normalized as

$$1 = \int_{0}^{\infty} dz \left[ f_{\tau n}^{L}(z) \right]^{2} = \int_{0}^{\infty} dz \left[ f_{\tau n}^{R}(z) \right]^{2}.$$  

The nucleon is identified as the ground state with $n = L = 0$, while the nucleon resonance have specific values of $n$ and $L$. In Table II we display the quantum numbers (spin-parity $J^P$, angular orbital moment $L$, radial quantum number $n$, mass) of the baryons considered in the present paper. The action describing transitions $1^+ \gamma^* \rightarrow 1^\pm$ has been derived and discussed in detail in Refs. [48, 51–53]. In Appendix A we briefly specify this action.

For the vector field $V_{\mu}(x, z)$ we apply the axial gauge $V_{z} = 0$ and perform a Fourier transformation with respect to the Minkowski coordinate

$$V_{\mu}(x, z) = \int \frac{d^4 q}{(2\pi)^4} e^{i q x} V_{\mu}(q) V(q, z),$$

where $V(q, z)$ is the vector bulk-to-boundary (dual to the $q^2$-dependent electromagnetic current) obeying the equation of motion

$$\partial_{z} \left( \frac{e^{-\varphi(z)}}{z} \partial_{z} V(q, z) \right) + q^2 \frac{e^{-\varphi(z)}}{z} V(q, z) = 0$$

(17)
TABLE I: Quantum numbers of nucleon and nucleon resonances

| Baryon | $J^P$ | $L$, $\eta$ | Mass (MeV) |
|--------|-------|-------------|-------------|
| $N(938)$ | $\frac{1}{2}^+$ | 0, 0 | 938.27 |
| $N(1440)$ | $\frac{3}{2}^+$ | 1, 0 | 1370 ± 10 |
| $N(1535)$ | $\frac{3}{2}^+$ | 1, 0 | 1510 ± 10 |
| $N(1520)$ | $\frac{3}{2}^-$ | 0, 1 | 1510 ± 5 |
| $N(1650)$ | $\frac{5}{2}^-$ | 1, 0 | 1655 ± 15 |
| $N(1700)$ | $\frac{3}{2}^-$ | 1, 0 | 1700 ± 50 |
| $N(1675)$ | $\frac{7}{2}^-$ | 2, 0 | 1660 ± 5 |
| $N(1720)$ | $\frac{5}{2}^-$ | 2, 0 | 1720 ± 15 |
| $N(1680)$ | $\frac{7}{2}^-$ | 2, 0 | 1675 ± 10 |
| $\Delta(1232)$ | $\frac{3}{2}^+$ | 0, 0 | 1210 ± 1 |
| $\Delta(1620)$ | $\frac{3}{2}^+$ | 1, 0 | 1600 ± 10 |
| $\Delta(1700)$ | $\frac{5}{2}^+$ | 1, 0 | 1665 ± 25 |

with solution in terms of gamma $\Gamma(n)$ and Tricomi $U(a,b,z)$ functions

$$V(q,z) = \Gamma \left(1 - \frac{q^2}{4\kappa^2}\right) U \left(-\frac{q^2}{4\kappa^2}, 0, \kappa^2 z^2\right).$$

(18)

In was shown in Ref. [63] that in the Euclidean region ($Q^2 = -q^2 > 0$) it is convenient to use the integral representation for $V(Q,z)$

$$V(Q,z) = \kappa^2 z^2 \int_0^1 \frac{dx}{(1-x)^2} x^a e^{-\kappa^2 z^2/x}, \quad a = Q^2/(4\kappa^2).$$

(19)

The sets of parameters $c_τ$, $c_τ^*$, and $g_τ^{(iM)}$ induce mixing of the contributions of AdS fields with different twist dimensions. The parameters $c_τ$ and $c_τ^*$ are constrained by the conditions $\sum_τ c_τ = 1$ and $\sum_τ c_τ^* = 1$, to guarantee the correct normalization of the kinetic terms $\bar{\psi}(x)i\hat{D}\psi(x)$ of the four-dimensional spinor fields. This condition is also consistent with electromagnetic gauge invariance (see details in Refs. [48, 58]). Therefore, the masses of the nucleon and nucleon resonance are identified by the expressions [48, 58]

$$M_N = 2\kappa \sum_τ c_τ \sqrt{τ - 1}, \quad M_N^* = 2\kappa \sum_τ c_τ^* \sqrt{τ - 1},$$

(20)

where the leading twist from which the sums start in Eq. (20) is defined as $τ = 3 + L$, where $L$ is the angular orbital moment specified for baryons in Table I.

The baryon form factors are determined analytically using the bulk profiles of fermion fields and the bulk-to-boundary propagator $V(Q,z)$ of the vector field (for exact expressions see the next section). The calculational technique was already described in detail in Refs. [48, 51, 58]. The parameter $\kappa = 383$ MeV is universal and was fixed in previous studies (see, e.g., Refs. [48, 58]), while the other parameters are fixed from a fit to the helicity amplitudes of the $\gamma^*N \rightarrow N^*$ transitions.

III. ELECTROMAGNETIC FORM FACTORS AND HELICITY AMPLITUDES OF THE $\gamma^*N \rightarrow N^*$ TRANSITIONS

Due to Lorenz covariance and gauge invariance, the matrix elements of the electromagnetic $\gamma^*N \rightarrow N^*$ transitions can be expressed in terms of their general Lorenz structures as

$$H_{\mu\nu}^{(1)} = g_{\mu\nu} - \gamma_\mu q_\nu, \quad H_{\mu\nu}^{(2)} = p_\mu q_\nu - g_{\mu\nu} p_1 q, \quad H_{\mu\nu}^{(3)} = q_\mu q_\nu - g_{\mu\nu} q^2$$

(21)
and the relativistic form factors \( G_i(Q^2), i = 1, 2, 3 \) as \[ G_1(Q^2) = \pm \frac{h_2(Q^2) + h_3(Q^2)}{2Q_+} M_1 = \pm \frac{M_1}{2Q_+ b} A_{1/2}(Q^2) \pm \frac{l}{\sqrt{3}} A_{3/2}(Q^2), \]
\[ G_2(Q^2) = \frac{1}{Q_+ Q_-} \left[ h_1(Q^2)Q^2 + h_2(Q^2)(Q^2 \mp M_\mp M_2) + h_3(Q^2)M_\mp M_1 \right] \]
\[ G_3(Q^2) = \frac{1}{Q_+ Q_-} \left[ h_1(Q^2)(M_\mp M_- - Q^2) + (h_2(Q^2) - h_3(Q^2))M_2 \right] \]
\[ = \frac{1}{Q_+ Q_- b} \left[ S_{1/2}(Q^2) \frac{M_1}{|p|} (M_\mp M_- - Q^2) + \left( \pm \frac{l}{\sqrt{3}} A_{3/2}(Q^2) - A_{1/2}(Q^2) \right) M_2^2 \right], \] where the structure of the \( \frac{1}{2}^+ \gamma^* \rightarrow \frac{1}{2}^\pm \) is simpler and is given by the form
\[ M^\mu(p_1 \lambda_1, p_2 \lambda_2) = \bar{u}_N(p_1 \lambda_1) \left[ \gamma_\perp^\mu F_1^N N(-q^2) + i \sigma^{\mu\nu} \frac{q_\nu}{M_+} F_2^{\perp N}(q^2) \right] \left( \begin{array}{c} I \\gamma_5 \end{array} \right) u_N(p_2 \lambda_2), \]
where $\gamma_{\perp}^\mu = \gamma^\mu - q^\mu q/q^2$.

The helicity amplitudes defining the $\frac{1}{2}^+ \rightarrow \frac{1}{2}^+$ and $\frac{1}{2}^+ \rightarrow \frac{1}{2}^-$ transitions in terms of form factors are defined, respectively, as:

$$A_{1/2}^{\pm}(Q^2) = \sqrt{\frac{2\pi\alpha Q_\pm}{M_1 M_2 E}} \left[ F_1^{N^*N}(Q^2) + F_2^{N^*N}(Q^2) \frac{M_{\pm}}{M_+} \right],$$

$$S_{1/2}^{\pm}(Q^2) = \pm \frac{|p|}{M_+} \sqrt{\frac{2\pi\alpha Q_\pm}{M_1 M_2 E}} \left[ F_1^{N^*N}(Q^2) \frac{M_{\pm} M_+}{Q^2} - F_2^{N^*N}(Q^2) \right].$$

(30)

In the case of the high-spin resonances, the set of helicity amplitudes $(A_{1/2}, A_{3/2}, S_{1/2})$ is related with the set of the charge $(G_E)$, magnetic $(G_M)$, and Coulomb $(G_C)$ form factors [1–3]:

$$G_E = -F_1^+ \frac{2}{l+1} \left( \frac{l}{\sqrt{3}} A_{3/2} - A_{1/2} \right),$$

$$G_M = -F_1^+ \frac{2l}{l+1} \left( \frac{l+2}{\sqrt{3}} A_{3/2} + A_{1/2} \right),$$

$$G_C = 2\sqrt{2} F_1^+ \frac{M_1}{|p|} S_{1/2}$$

(31)

for abnormal parity transitions $\frac{1}{2}^+ \rightarrow \frac{3}{2}^+, \frac{5}{2}^-, \ldots$.

$$G_E = -F_1^- \frac{2l}{l+1} \left( \frac{l+2}{\sqrt{3}} A_{3/2} + A_{1/2} \right),$$

$$G_M = -F_1^- \frac{2}{l+1} \left( \frac{l}{\sqrt{3}} A_{3/2} - A_{1/2} \right),$$

$$G_C = 2\sqrt{2} F_1^- \frac{M_1}{|p|} S_{1/2}$$

(32)

for normal parity transitions $\frac{1}{2}^+ \rightarrow \frac{3}{2}^-, \frac{5}{2}^+, \ldots$.

In terms of the relativistic form factor $h_i$, the charge, magnetic, and Coulomb form factors are expressed as

$$G_E = -\frac{2b}{l+1} F_i^+ (h_2 - h_3),$$

$$G_M = -\frac{2b}{l+1} F_i^+ \left[ l(h_2 + h_3) + 2h_2 \right],$$

$$G_C = 2b F_i^+ h_1$$

(33)

for abnormal parity transitions and

$$G_E = \frac{2b}{l+1} F_i^- \left[ l(h_2 - h_3) + 2h_2 \right],$$

$$G_M = -\frac{2b}{l+1} F_i^- (h_2 - h_3),$$

$$G_C = 2b F_i^- h_1$$

(34)

for normal parity transitions. Here

$$F_i^{\pm} = \frac{M_2}{|p|} \sqrt{\frac{ct+1}{6\pi\alpha M_1 M_2}} \frac{M_{2\pm} Q_\pm}{M_{2\pm}}.$$

(35)

The form factors $G_i^{(n)}(Q^2)$ (here $n$ is the radial quantum number), defining the abnormal parity transitions, are
given by

\[
G_1^{(n)}(Q^2) = \sum_{\tau^+ \tau^-} \left[ g^{(2A)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(1D)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) + g^{(3A)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(4D)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) \right],
\]

\[
G_2^{(n)}(Q^2) = \frac{1}{\kappa} \sum_{\tau^+ \tau^-} \left[ -g^{(1B)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) + g^{(4B)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) + g^{(2E)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(3E)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) \right],
\]

\[
G_3^{(n)}(Q^2) = \frac{1}{\kappa} \sum_{\tau^+ \tau^-} \left[ g^{(2A)}_{\tau^+ \tau^-} M_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(1D)}_{\tau^+ \tau^-} M_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(3A)}_{\tau^+ \tau^-} M_{\tau^+ \tau^-}^{(n)}(Q^2) + g^{(4D)}_{\tau^+ \tau^-} M_{\tau^+ \tau^-}^{(n)}(Q^2)
+ g^{(1B)}_{\tau^+ \tau^-} R_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(4B)}_{\tau^+ \tau^-} R_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(2E)}_{\tau^+ \tau^-} K_{\tau^+ \tau^-}^{(n)}(Q^2) + g^{(3E)}_{\tau^+ \tau^-} K_{\tau^+ \tau^-}^{(n)}(Q^2)
+ g^{(1C)}_{\tau^+ \tau^-} R_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(4C)}_{\tau^+ \tau^-} R_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(2F)}_{\tau^+ \tau^-} R_{\tau^+ \tau^-}^{(n)}(Q^2) + g^{(3F)}_{\tau^+ \tau^-} R_{\tau^+ \tau^-}^{(n)}(Q^2) \right].
\]

\[
G_1^{(n)}(Q^2) = \sum_{\tau^+ \tau^-} \left[ g^{(1A)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(2D)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) + g^{(4A)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(3D)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) \right],
\]

\[
G_2^{(n)}(Q^2) = \frac{1}{\kappa} \sum_{\tau^+ \tau^-} \left[ -g^{(2B)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) + g^{(3B)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) + g^{(1E)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(4E)}_{\tau^+ \tau^-} L_{\tau^+ \tau^-}^{(n)}(Q^2) \right],
\]

\[
G_3^{(n)}(Q^2) = \frac{1}{\kappa} \sum_{\tau^+ \tau^-} \left[ g^{(1A)}_{\tau^+ \tau^-} M_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(2D)}_{\tau^+ \tau^-} M_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(4A)}_{\tau^+ \tau^-} M_{\tau^+ \tau^-}^{(n)}(Q^2) + g^{(3D)}_{\tau^+ \tau^-} M_{\tau^+ \tau^-}^{(n)}(Q^2)
+ g^{(2B)}_{\tau^+ \tau^-} R_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(3B)}_{\tau^+ \tau^-} R_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(1E)}_{\tau^+ \tau^-} K_{\tau^+ \tau^-}^{(n)}(Q^2) + g^{(4E)}_{\tau^+ \tau^-} K_{\tau^+ \tau^-}^{(n)}(Q^2)
+ g^{(2C)}_{\tau^+ \tau^-} R_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(3C)}_{\tau^+ \tau^-} R_{\tau^+ \tau^-}^{(n)}(Q^2) - g^{(1F)}_{\tau^+ \tau^-} R_{\tau^+ \tau^-}^{(n)}(Q^2) + g^{(4F)}_{\tau^+ \tau^-} R_{\tau^+ \tau^-}^{(n)}(Q^2) \right],
\]

where \( F^{(n)}_{\tau^+ \tau^-}(Q^2) \) with \( F = K, L, M, N, R \) are functions calculated in soft-wall model. Functions \( F^{(n)}_{\tau^+ \tau^-}(Q^2) \) are written as

\[
F^{(n)}_{1_{\tau^+ \tau^-}}(Q^2) = \frac{1}{2} \left[ F^{(n)}(Q^2, \tau^+, \tau) \pm F^{(n)}(Q^2, \tau^+, 1, \tau + 1) \right],
\]

\[
F^{(n)}_{2_{\tau^+ \tau^-}}(Q^2) = \frac{1}{2} \left[ F^{(n)}(Q^2, \tau^+, \tau + 1) \pm F^{(n)}(Q^2, \tau^+, 1, \tau) \right],
\]

and

\[
R^{(n)}_{1_{\tau^+ \tau^-}}(Q^2) = \frac{1}{\kappa} \left[ L^{(n)}_{\tau^+ \tau^-}(Q^2) + N^{(n)}_{\tau^+ \tau^-}(Q^2) \right].
\]

For \( n = 0 \) one gets

\[
K^{(0)}(Q^2, \tau^+, \tau) = \frac{(\tau^+ - \frac{3}{2}) K(a, \tau^+, \tau) - K(a, \tau^+ + 2, \tau)}{2\sqrt{\Gamma(\tau^+ - 1)\Gamma(\tau - 1)}},
\]

\[
L^{(0)}(Q^2, \tau^+, \tau) = \frac{L(a, \tau^+, \tau)}{\sqrt{\Gamma(\tau^+ - 1)\Gamma(\tau - 1)}},
\]

\[
M^{(0)}(Q^2, \tau^+, \tau) = \frac{M(a, \tau^+, \tau)}{2\sqrt{\Gamma(\tau^+ - 1)\Gamma(\tau - 1)}},
\]

\[
N^{(0)}(Q^2, \tau^+, \tau) = \frac{K(a, \tau^+, \tau) - 2K(a, \tau^+ + 2, \tau)}{2\sqrt{\Gamma(\tau^+ - 1)\Gamma(\tau - 1)}}.
\]

Here

\[
K(a, \tau^+, \tau) = \Gamma \left( \frac{\tau^+ + \tau}{2} \right) B \left( a + 1, \frac{\tau^+ + \tau}{2} \right),
\]

\[
L(a, \tau^+, \tau) = \Gamma \left( \frac{\tau^+ + \tau + 2}{2} \right) B \left( a + 1, \frac{\tau^+ + \tau}{2} \right),
\]

\[
M(a, \tau^+, \tau) = \Gamma \left( \frac{\tau^+ + \tau + 1}{2} \right) B \left( a + 1, \frac{\tau^+ + \tau + 1}{2} \right),
\]

\[
N(a, \tau^+, \tau) = K(a, \tau^+, \tau) - 2K(a, \tau^+ + 2, \tau).
\]

FIG. 1: Helicity amplitudes $A^{p}_{1/2}(Q^2)$ (left panel) and $S^{p}_{1/2}(Q^2)$ (right panel) for $N\gamma^* \rightarrow N(1710)$ transition up to $Q^2 = 10 \text{ GeV}^2$. Our results are shown with a variation of the parameters of our approach (shaded band), and comparing with data taken from the CLAS Collaboration [68]. Here and in the following superscript ($p$) in the notation of the helicity amplitudes means the proton channel.

FIG. 2: Helicity amplitudes $A^{p}_{1/2}(Q^2)$ (left panel) and $S^{p}_{1/2}(Q^2)$ (right panel) for $N\gamma^* \rightarrow N(1650)$ transition up to $Q^2 = 10 \text{ GeV}^2$. Our results are shown with a variation of the parameters of our approach (shaded band), comparing with data taken from the CLAS Collaboration [6, 69] and compilation of the world analyses of the $N\pi$ electroproduction data [81].

FIG. 3: Helicity amplitudes $A^{p}_{1/2}(Q^2)$ (left panel) and $S^{p}_{1/2}(Q^2)$ (right panel) for $N\gamma^* \rightarrow \Delta(1620)$ transition up to $Q^2 = 10 \text{ GeV}^2$. Our results (shaded band) are compared with data taken from the CLAS Collaboration [6, 69], a compilation of the world analyses of the $N\pi$ electroproduction data [81] and Particle Data Group (PDG) [64].
FIG. 4: Helicity amplitudes $A_{1/2}^p(Q^2)$ (left upper panel), $A_{3/2}^p(Q^2)$ (right upper panel), and $S_{1/2}^p(Q^2)$ (centered lower panel), for $N\gamma^* \rightarrow N(1520)$ transition up to $Q^2 = 10$ GeV$^2$. Our results (shaded band) are compared with data taken from the CLAS Collaboration [4, 6, 71, 72], a compilation of data [81], and PDG [64].

FIG. 5: Helicity amplitudes $A_{1/2}^p(Q^2)$ (left upper panel), $A_{3/2}^p(Q^2)$ (right upper panel), and $S_{1/2}^p(Q^2)$ (centered lower panel), for $N\gamma^* \rightarrow \Delta(1700)$ transition up to $Q^2 = 10$ GeV$^2$. Our results (shaded band) are compared with data taken from the CLAS Collaboration [70, 71], a compilation of data [81], and PDG [64].
FIG. 6: Helicity amplitudes $A_{1/2}^p(Q^2)$ (left upper panel), $A_{3/2}^p(Q^2)$ (right upper panel), and $S_{1/2}^p(Q^2)$ (centered lower panel), for $N\gamma^* \rightarrow N(1700)$ transition up to $Q^2 = 10 \text{ GeV}^2$. Our results (shaded band) are compared with PDG [64].

FIG. 7: Helicity amplitudes $A_{1/2}^p(Q^2)$ (left upper panel), $A_{3/2}^p(Q^2)$ (right upper panel), and $S_{1/2}^p(Q^2)$ (centered lower panel), for $N\gamma^* \rightarrow N(1675)$ transition up to $Q^2 = 10 \text{ GeV}^2$. Our results (shaded band) are compared with data taken from the CLAS Collaboration [68, 71] and PDG [64].
FIG. 8: Helicity amplitudes $A_{1/2}^p(Q^2)$ (left upper panel), $A_{3/2}^p(Q^2)$ (right upper panel), and $S_{1/2}^p(Q^2)$ (centered lower panel), for $N\gamma^* \to N(1720)$ transition up to $Q^2 = 10$ GeV$^2$. Our results (shaded band) are compared with data taken from the CLAS Collaboration [65] and PDG [64].

FIG. 9: Helicity amplitudes $A_{1/2}^p(Q^2)$ (left upper panel), $A_{3/2}^p(Q^2)$ (right upper panel), and $S_{1/2}^p(Q^2)$ (centered lower panel), for $N\gamma^* \to N'(1720)$ transition up to $Q^2 = 10$ GeV$^2$. Our results (shaded band) are compared with data taken from the CLAS Collaboration [65] and PDG [64].
FIG. 10: Helicity amplitudes $A_{1/2}^p(Q^2)$ (left upper panel), $A_{3/2}^p(Q^2)$ (right upper panel), and $S_{1/2}^p(Q^2)$ (centered lower panel), for $N\gamma^* \rightarrow N(1680)$ transition up to $Q^2 = 10 \text{ GeV}^2$. Our results (shaded band) are compared with data taken from the CLAS Collaboration [68, 70, 71], data analysis [81], and PDG [64].

FIG. 11: Helicity amplitudes $A_{1/2}^p(Q^2)$ (left upper panel), $A_{3/2}^p(Q^2)$ (right upper panel), and $S_{1/2}^p(Q^2)$ (centered lower panel), for $N\gamma^* \rightarrow \Delta(1232)$ transition up to $Q^2 = 10 \text{ GeV}^2$. Our results (shaded band) are compared with data taken from the CLAS Collaboration [4] and PDG [64].
It is important to stress that at large values of $Q^2$ the form factors and helicity amplitudes for the electroexcitation of nucleon resonances are consistent with quark counting rules \cite{55}. In particular, the sets of the form factors $h_i$, $G_i$, $(G_E, G_M, G_C)$ and helicity amplitudes $(A_{1/2}, A_{3/2}, S_{1/2})$ scale as

\begin{align}
    h_i(Q^2) &\sim \frac{1}{Q^{\tau+\tau^*+2}}, \quad G_i(Q^2) \sim \frac{1}{Q^{\tau+\tau^*}}, \\
    G_E(Q^2), G_M(Q^2), G_C(Q^2) &\sim \frac{1}{Q^{\tau+\tau^*+2}}, \\
    A_{1/2}(Q^2), A_{3/2}(Q^2) &\sim \frac{1}{Q^{\tau+\tau^*+1-2l}}, \quad S_{1/2}(Q^2) \sim \frac{1}{Q^{\tau+\tau^*+3-2l}}.
\end{align}
Model parameters (central values) used for each $\gamma^*N \rightarrow N^*$ transition are shown in Tables II and III. As in previous calculations we include the contributions of three leading twists. Also, to reduce a number of free parameters we drop the contribution to the form factors induced by the couplings $g_{17}^{3M}$ and $g_{17}^{4M}$.

### Table II: Model parameters for $\frac{1}{2}^+ \rightarrow \frac{1}{2}^\pm$ transitions

| Transition | Choice of parameters |
|------------|----------------------|
| $N \rightarrow N'(1520)$ | $c_{34} = -0.56, c_{45} = 0.66, c_{56} = 0.50, c_{44} = 1.03, c_{55} = 0.94, \eta = 1.31, \zeta = -0.27, \xi = -0.03$ |
| $N \rightarrow N'(1675)$ | $c_{34} = 0.09, c_{44} = 0.12, c_{55} = -0.05, \eta = 1, \eta = -1.70, \lambda = 0.95, \zeta = 5.24, \xi = -8.22$ |
| $N \rightarrow \Delta(1620)$ | $c_{34} = -1.84, c_{45} = 2.92, c_{56} = -0.73, c_{44} = -1.06, c_{55} = 0.01, \eta = 3.00, \zeta = -0.52, \xi = -0.10$ |

### Table III: Model parameters for $\frac{1}{2}^+ \rightarrow \frac{3}{2}^\pm, \frac{5}{2}^\pm$ transitions

| Transition | Choice of parameters |
|------------|----------------------|
| $N \rightarrow N(1520)$ | $g_{34}^A = -13.79, \eta_{34}^A = -20.87, g_{24}^A = -8.70, g_{34}^D = 1.01, g_{45}^D = -5.71, g_{56}^D = 1.32, g_{34}^E = -15.97, g_{45}^E = -90.70, g_{56}^E = -22.77, g_{56}^F = 40.38, g_{56}^F = -17.29$ |

| $N \rightarrow \Delta(1700)$ | $g_{34}^A = -0.01, g_{45}^A = -0.59, g_{56}^A = 0.40, g_{57}^A = -0.53, g_{56}^B = 0.70, g_{57}^B = -0.27, g_{56}^C = 1.02, g_{57}^C = 2.70, g_{56}^C = -0.97, g_{57}^D = -0.05, g_{56}^D = 3.57, g_{57}^D = -2.44, g_{56}^E = -0.93, g_{57}^E = 1.23, g_{56}^E = -0.47, g_{57}^F = 12.09, g_{56}^F = 32.11, g_{57}^F = -11.49$ |

Our results for the $Q^2$ dependence of the helicity amplitudes in the $\gamma^*N \rightarrow N^*$ transitions including a variation of the parameters (up to 20%) are fully displayed in Figs. I.11 In Figs. I.13 we present the results for the modes with nucleon resonances having spin $\frac{1}{2}$, which were not considered by us before and in addition in Figs. II.13 we display the results for the nucleon resonances with higher spins $\frac{3}{2}$ and $\frac{5}{2}$. We compare our results to data from the CLAS Collaboration (JLab) 44 68 72, other experiments 72 80, and world data analyses 81 83. Also we consider in detail the
observables of the $\gamma^* N \to \Delta(1232)$ transitions: helicity amplitudes (Fig. 11), the $Q^2$ dependence of the magnetic form factor $G_M^*(Q^2)$ divided by the dipole form factor $3D(Q^2)$ (Fig. 12), where $D(Q^2) = 1/(1 + Q^2/0.71\text{GeV}^2)^2$, the $Q^2$ dependence of the $R_{EM} = E/M$ and $R_{SM} = S/M$ ratios (Fig. 13 up to 5 GeV$^2$ and Fig. 12 up to 10 GeV$^2$) magnetic dipole $\mu_{N\Delta}$ and electric quadrupole $Q_{N\Delta}$ moments:

\[
R_{EM}(Q^2) = \frac{A_{1/2}(Q^2) - A_{3/2}(Q^2)/\sqrt{3}}{A_{1/2}(Q^2) + A_{3/2}(Q^2)/\sqrt{3}},
\]

\[
R_{SM}(Q^2) = \frac{S_{1/2}(Q^2)\sqrt{2}}{A_{1/2}(Q^2) + A_{3/2}(Q^2)/\sqrt{3}},
\]

\[
\mu_{N\Delta} = \sqrt{\frac{M_N}{M_{\Delta}}} G_M^*(0),
\]

\[
Q_{N\Delta} = -\frac{6}{M_N E_N} \sqrt{\frac{M_N}{M_{\Delta}}} G_E^*(0).
\]

Note the magnetic $G_M^*(Q^2)$ and electric $G_E^*(Q^2)$ form factors are normalized as:

\[
G_M^*(Q^2) = G_M(Q^2) \frac{c_\Delta}{F_{1+}^T} = -c_\Delta \left( A_{1/2}(Q^2) + A_{3/2}(Q^2)/\sqrt{3} \right),
\]

\[
G_E^*(Q^2) = G_E(Q^2) \frac{c_\Delta}{F_{1+}^T} = c_\Delta \left( A_{1/2}(Q^2) - A_{3/2}(Q^2)/\sqrt{3} \right),
\]

where

\[
c_\Delta = \frac{M_N}{|\mathbf{p}|} \sqrt{\frac{M_N E_N}{4\pi\alpha M_\Delta}}.
\]

In Table IV our results for $R_{EM}(0)$ are compared with existing data (PDG [64], MAMI experiment [77], LEGS Collaboration [80]) and some theoretical approaches [model bases on partial-Wave analysis (SAID) [84], approach based on dispersion relations and unitarity (DR) [85] and relativistic quark model (RQM) [22]).

For $R_{SM}(0)$ we get $-5.5 \pm 0.5$. Our predictions for the moments $\mu_{N\Delta}$ and $Q_{N\Delta}$ are in good agreement with data (LEGs Collaboration [80]):

$\mu_{N\Delta} = 3.7 \pm 0.4$, \quad $Q_{N\Delta} = -(0.09 \pm 0.01) \text{fm}^2$.

\[
(47)
\]

with the Mainz multipole analysis [82]:

$\mu_{N\Delta} = 3.46 \pm 0.03$, \quad $Q_{N\Delta} = -(0.0846 \pm 0.0033) \text{fm}^2$.

\[
(48)
\]

IV. SUMMARY

We extended our formalism based on a soft-wall AdS/QCD approach to the description of the electro-couplings of nucleons with nucleon resonances with high spins. All form factors and helicity amplitudes characterizing the electromagnetic transitions between nucleons and nucleon resonances are consistent with quark counting rules [55]. We fix free parameters in our approach using data from the CLAS Collaboration [4–6, 68–72] and a compilation of the world analyses of the $N\pi$ electroproduction data [81]. In our calculations we adopt a variation of free parameters up to 20%. The main success of our approach is based on analytical implementation of quark counting rules [55].

Appendix A: AdS/QCD action for description of the $\gamma + \frac{1}{2}^+ \to \frac{1}{2}^+$ transitions

The AdS/QCD action for description of the $\gamma + \frac{1}{2}^+ \to \frac{1}{2}^+$ transitions contains a free part $S_0$, describing the confined dynamics of AdS fields, and interaction part $S_{int}$, describing interactions of fermions with vector field with

$$ S = S_0 + S_{int}, $$

$$ S_0 = \int d^4xz \sqrt{g} e^{-\varphi(z)} \left\{ L_N(x, z) + L_{N^*}(x, z) + L_V(x, z) \right\}, $$

$$ S_{int} = \int d^4xz \sqrt{g} e^{-\varphi(z)} \left\{ L_{VNN}(x, z) + L_{VNN^*}(x, z) + L_{VNN^*N}(x, z) \right\}, $$

where $L_N$, $L_{N^*}$, $L_V(x, z)$ and $L_{VNN}(x, z)$, $L_{VNN^*}(x, z)$, $L_{VNN^*N}(x, z)$ are the free and interaction Lagrangians, respectively. See details in Refs. [51, 52], term $L_V(x, z)$ is specified in Eq. (3). Below we specify the interaction Lagrangian $L_{VNN^*N}(x, z)$, relevant for the $\gamma + \frac{1}{2}^+ \to \frac{1}{2}^+$ transitions. In particular,

$$ L_{VNN^*N}(x, z) = \sum_{i=+,-; \tau \tau^*} \bar{\psi}_{i, \tau^*}^N(x, z) \tilde{\psi}_{i, \tau}^{N^*N}(x, z) \psi_{i, \tau^*}^N(x, z) + H.c., $$

where

$$ \tilde{\psi}_{i, \tau^*}^{N^*N}(x, z) = c_{\tau\tau^*} Q \Gamma_M V_M(x, z) + d_{\tau\tau^*} \left[ \pm \frac{i}{4} \eta \left[ \Gamma^M, \Gamma^N \right] V_{MN}(x, z) \right. 

\left. + \frac{i}{4} \lambda z^2 \left[ \Gamma^M, \Gamma^N \right] \partial^K \partial_K V_{MN}(x, z) \right. 

\left. + g \Gamma^M i \partial^N V_M(x, z) \right. 

\left. + \zeta z \Gamma^M i \partial^N V_M(x, z) \right] \right]. $$

Here $c_{\tau\tau^*}$, $d_{\tau\tau^*}$, $\eta$, $\lambda$, $g$, $\zeta$, and $\xi$ are the couplings fixed from description of data on the $Q^2$ dependence of the $\gamma + \frac{1}{2}^+ \to \frac{1}{2}^+$ transitions. In case of the $\gamma + \frac{1}{2}^+ \to \frac{1}{2}^+$ transitions we use $c_{\tau\tau^*} \equiv d_{\tau\tau^*}$.
