Meeting Report: Development of Environmental Health Indicators in Brazil and Other Countries in the Americas

Fernando F. Carneiro,1 Mara Lucia C. Oliveira,2 Guilherme F. Netto,1 Luis A.C. Galvão,3 Jacira A. Cancio,2,4 Estela M. Bonini,1 Carlos F. Corvalan,5 and the Participants in the International Symposium on the Development of Indicators for Environmental Health Integrated Management

1General Coordination for Environmental Health Surveillance in Health Surveillance, Secretariat/Ministry of Health of Brazil, Brasília, Brazil; 2Pan-American Health Organization, Office in Brazil, Brasilia, Brazil; 3Pan-American Health Organization, Environmental Health and Sustainable Development, Washington, DC, USA; 4Catholic University, Brasilia, Brazil; 5World Health Organization, Geneva, Switzerland

This report summarizes the Brazilian experience on the design and implementation of environmental health, with contributions from Argentina, Canada, and Cuba, presented at the International Symposium on the Development of Indicators for Environmental Health Integrated Management, held in Recife, Pernambuco, Brazil, on 17–18 June 2004. The methodology for the development of environmental health indicators has been used as a reference in the implementation of environmental health surveillance in Brazil. This methodology has provided tools and processes to facilitate the understanding and to measure the determinants of risks to environmental health, to help decision makers control those risks. Key words: environmental health indicators, environmental health surveillance, integrated management. Environ Health Perspect 114:1407–1408 (2006). doi:10.1289/ehp.8486 available via http://dx.doi.org/1 [Online 16 November 2005]

From 1998 to the present, the Ministry of Health of Brazil has implemented environmental health surveillance (EHS) within the National Public Health System. The methodology for the development of environmental health indicators became one of the key issues for the implementation of EHS. The driving force, pressure, state/situation, exposure, effects, action (DPSEEAA) model approach was applied to develop appropriate indicators (Corvalan et al. 1999). This matrix model is adapted to the relationship cycle process among economic and social dynamics, environmental response, and human health. Thus, the driving forces consist of the economic and social processes, resulting in pressures such as the intensive use of particular natural resources. Both driving forces and pressures contribute to the situation/state scenarios, where the environment is often contaminated or deteriorated, facilitating human exposure to environmental risk factors that might produce effects on health. For each of these categories, indicators and action proposals are developed to gain a more complete understanding of the problem as well as to visualize measures to be taken in each level of complexity of the cycle (Figure 1).

The Regional Experience

An international symposium on the development of indicators for integrated environmental health management, as a prior activity to the VI Brazilian Congress of Epidemiology, took place in Recife, Brazil, on 17–18 June 2004. The symposium involved presentations and discussions on the Brazilian experience with the development of environmental health indicators and exchange of experiences with similar initiatives in Canada, Cuba, and Argentina. The symposium was organized by the Ministry of Health of Brazil under the auspices of the Pan American Health Organization/World Health Organization and the Associação Brasileira de Pós-Graduação em Saúde Coletiva’s Health and Environment Working Group.

The main objectives of the symposium were to assess the use of the indicators for the environmental health integrated management in the countries of the Americas, to present the Brazilian experience in the development of indicators regarding the integrated management of environmental health, and to contribute, through the development of environmental health indicators, to the strengthening of the following initiatives: a) the Health and Environment Ministers of the Americas meeting, b) the Pan American Health Organization Environmental Health Collaborating Centers Network, and c) methodologies for the integrated assessment of environmental health in the Americas.

The experiences in developing indicators in some countries in the American continents were evaluated, with particular attention to their usefulness in the decision-making processes. A summary of the indicators developed and evaluated are shown in Table 1, and national and international examples of the application of indicators are described in Table 2.

Conclusions and Recommendations

The symposium, in addition to presenting the experiences in Brazil and other countries, assessed ways of adopting the proposed

Table 1. Some examples of environmental health indicators in use, selected from applying the DPSEEA matrix to different situations.

| Country/topics | Indicators developed | Matrix categories |
|---------------|----------------------|------------------|
| Brazil Water  | Per capita consumption | Pressure          |
| (Maciel Filho et al. 1999) Water bacteriologic quality | Exposure |
| Residual chlorine | Exposure |
| Water supply services coverage | Situation |
| Water supply regularity | Situation |
| Cuba Healthy residences | Economic policy of healthy residences development | Driving force |
| (Placeres MR et al., unpublished data) Percent of resources for the construction of healthy residences | Situation |
| Percent of households with appropriate lighting | Situation |
| Percent of households with appropriate kitchen installations | Situation |
| Canada Ultraviolet radiation | Release of substances that damage the ozone layer | Pressure |
| Ultraviolet radiation indicators | Exposure |
| Incidence of melanoma | Effects |
| Eye damage | Effects |

Table 2. National and international experiences in the use of indicators.

| Country | Source | Program | Description |
|---------|--------|---------|-------------|
| Brazil | Guimarães MJB, Melo NGO, Lima AAF, Camarão F, Filho JAN, Lyra TM, unpublished data | EHS drinking water program | Good example of the use of environmental health indicators for decision making: Ministry of Health developed database allowing local-level data entry accessible on line at municipal, state, and federal levels. Database can potentially be analyzed together with mortality and morbidity data. Successes include drinking water risk maps generated by the Municipality of Recife that served as a base to restructure and reinforce health surveillance actions to priority areas. Recognized as a useful application and given an award by the Health Surveillance National Secretariat. |
| Cuba | Placeres MR, Rojas MC, Diaz VIP, Toste MA, Melián CMG, unpublished data | DPSEEA | Has been used in the family health program, orienting doctors and nurses to consider social, political, economic, and geographic factors in identifying environmental problems that affect people’s health. Has oriented the establishment of the environmental primary health care strategy by choosing environmental health local indicators to achieve an integration of local health development. |
| Canada | Bartlett S, unpublished data | Environment Canada | Has been reporting on environmental indicators since 1990 in its National Environmental Indicator Series and State of the Environment reports. In the Environment and Sustainable Development Indicators initiative’s final report, the National Round Table on the Environment and the Economy (NRTEE) proposed six new indicators, developed in collaboration with Environment Canada and Statistics Canada (released May 2003): forest cover, freshwater quality, air quality, greenhouse gas emissions, extent of wetlands, and educational attainment. Uses the DPSEEA framework to organize the environmental health indicators currently collaborating with Environment Canada on the development of an air–health indicator (AHI). The potential AHI builds on ongoing work on improved air quality index to develop a multipollutant trend indicator that directly links potential health impacts to exposure to pollution, as recommended by NRTEE. Such an indicator has also helped to assess the effectiveness of pollution mitigation strategies and public health interventions. |
