ON ENDOMORPHISM ALGEBRAS OF SEPARABLE MONOIDAL FUNCTORS

BRIAN DAY AND CRAIG PASTRO

Abstract. We show that the (co)endomorphism algebra of a sufficiently separable "fibre" functor into \textbf{Vect}_k, for \( k \) a field of characteristic 0, has the structure of what we call a "unital" von Neumann core in \textbf{Vect}_k. For \textbf{Vect}_k, this particular notion of algebra is weaker than that of a Hopf algebra, although the corresponding concept in \textbf{Set} is again that of a group.

1. Introduction

Let \( (\mathcal{C}, \otimes, I, c) \) be a symmetric (or just braided) monoidal category. Recall that an algebra in \( \mathcal{C} \) is an object \( A \in \mathcal{C} \) equipped with a multiplication \( \mu: A \otimes A \rightarrow A \) and a unit \( \eta: I \rightarrow A \) satisfying \( \mu_3 = \mu(1 \otimes \mu) = \mu(\mu \otimes 1): A^{\otimes 3} \rightarrow A \) (associativity) and \( \mu(\eta \otimes 1) = 1 = \mu(1 \otimes \eta): A \rightarrow A \) (unit conditions). Dually, a coalgebra in \( \mathcal{C} \) is an object \( C \in \mathcal{C} \) equipped with a comultiplication \( \delta: C \rightarrow C \otimes C \) and a counit \( \epsilon: C \rightarrow I \) satisfying \( \delta_3 = (1 \otimes \delta)\delta = (\delta \otimes 1)\delta: C \rightarrow C^{\otimes 3} \) (coassociativity) and \( (\epsilon \otimes 1)\delta = 1 = (1 \otimes \epsilon)\delta: C \rightarrow C \) (counit conditions).

A very weak bialgebra in \( \mathcal{C} \) is an object \( A \in \mathcal{C} \) with both the structure of an algebra and a coalgebra in \( \mathcal{C} \) related by the axiom

\[
\delta \mu = (\mu \otimes \mu)(1 \otimes c \otimes 1)(\delta \otimes \delta): A \otimes A \rightarrow A \otimes A.
\]

For example, any \( k \)-bialgebra or weak \( k \)-bialgebra is a very weak bialgebra in this sense (for \( \mathcal{C} = \text{Vect}_k \)). The structure \( A \) is then called a von Neumann core in \( \mathcal{C} \) if it also has an antipode \( S: A \rightarrow A \otimes A \) satisfying the axiom

\[
\mu_3(1 \otimes S \otimes 1)\delta_3 = 1 : A \rightarrow A.
\]

For example, the set of all finite paths of edges in a (row-finite) graph algebra \[\text{[8]}\] forms a von Neumann core in \( \mathcal{C} = \text{Set} \), and so does any group in \( \text{Set} \).

Since groups \( A \) in \( \text{Set} \) are characterized by the (stronger) axiom

\[
(\dagger) \quad 1 \otimes \eta = (1 \otimes \mu)(1 \otimes S \otimes 1)(\delta \otimes 1): A \rightarrow A \otimes A,
\]

a very weak bialgebra \( A \) satisfying (\dagger), in the general \( \mathcal{C} \), will be called a unital von Neumann core in \( \mathcal{C} \). Such a unital core \( A \) always has a left inverse, namely \( (1 \otimes \mu)(1 \otimes S \otimes 1)(\delta \otimes 1) \), to the "fusion" operator

\[
(1 \otimes \mu)(\delta \otimes 1): A \otimes A \rightarrow A \otimes A,
\]

and the latter satisfies the fusion equation \[\text{[9]}\]. Any Hopf algebra in \( \mathcal{C} \) satisfies the axiom (\dagger), and in this article we are mainly interested in producing a unital von

\[\text{Date: February 2, 2008.}\]

The first author gratefully acknowledges partial support of an Australian Research Council grant while the second gratefully acknowledges support of an international Macquarie University Research Scholarship.
Neumann core, namely \( \text{End}^V U \), associated to a certain type of monoidal functor \( U \) into \( \text{Vect}_k \). However, it will not be the case that all unital von Neumann cores in \( \text{Vect}_k \) can be reproduced as such.

We will tacitly assume throughout the article that the ground category \([7]\) is \( \text{Vect} = \text{Vect}_k \), for \( k \) a field of characteristic 0, so that the categories and functors considered here are all \( k \)-linear (although any reasonable category \([\mathcal{D}, \text{Vect}]\) of parameterized vector spaces would suffice). We denote by \( \text{Vect}_f \) the full subcategory of \( \text{Vect} \) consisting of the finite dimensional vector spaces, and we further suppose that \((\mathcal{C}, \otimes, I, c)\) is a braided monoidal category with a “fibre” functor

\[
U : \mathcal{C} \longrightarrow \text{Vect}
\]

which has both a monoidal structure \((U, r, r_0)\) and a comonoidal structure \((U, i, i_0)\). We call \( U \) separable\(^1\) if \( ri = 1 \) and \( i_0 r_0 = \dim(U I) \cdot 1 \); i.e., for all \( A, B \in \mathcal{C} \), the diagrams

\[
\begin{array}{ccc}
U(A \otimes B) & \xrightarrow{i} & U A \otimes U B \\
1 & \downarrow{r} & \downarrow{r} \\
U(A \otimes B) & & \\
\end{array}
\quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \quan
for which the comonoidal transformation components
\[ i = i_{C,D} : d(C \otimes D) \longrightarrow dC \times dD \]
are injective functions, while the unique map \( i_0 : dI \longrightarrow 1 \) is surjective. Various
examples are described at the conclusion of the paper.

We suppose the reader is familiar to some extent with the standard references
on the problem when restricted to the case of \( U \) strong monoidal.

We would like to thank Ross Street for several helpful comments.

2. The algebraic structure on \( \text{End}^\vee U \)

If \( \mathcal{C} \) is a \((k\text{-linear})\) monoidal category and
\[ U : \mathcal{C} \longrightarrow \text{Vect} \]
has a monoidal structure \((U, r, r_0)\) and a comonoidal structure \((U, i, i_0)\), then \( \text{End}^\vee U \)
has an associative and unital \( k \)-algebra structure whose multiplication \( \mu \) is the
composite map
\[
\int^C U^* \otimes UC \otimes \int^D U^* \otimes UD \xrightarrow{\mu} \int^B U^* \otimes UB
\]
while the unit \( \eta \) is given by
\[
k \xrightarrow{\eta} \int^C U^* \otimes UC
\]
The associativity and unit axioms for \(( \text{End}^\vee U, \mu, \eta)\) now follow directly from the
corresponding associativity and unit axioms for \((U, r, r_0)\) and \((U, i, i_0)\). An augmentation \( \epsilon \) is given by
\[
\int^C U^* \otimes UC \xrightarrow{\epsilon} k
\]
in \( \text{Vect} \), where \( \epsilon \eta = \dim UI \cdot 1 \).

We also observe that the coend
\[ \text{End}^\vee U = \int^C U^* \otimes UC \]
actually exists in $\text{Vect}$ if $\mathcal{C}$ contains a small full subcategory $\mathcal{A}$ with the property that the family
\[\{Uf : UA \to UC \mid f \in \mathcal{C}(A, C), A \in \mathcal{A}\}\]
is epimorphic in $\text{Vect}$ for each object $C \in \mathcal{C}$. In fact, we shall use the stronger condition that the maps
\[\alpha_C : \int^{A \in \mathcal{A}} \mathcal{C}(A, C) \otimes UA \to UC\]
should be isomorphisms, not just epimorphisms. This stronger condition implies that we can effectively replace $\int^{C \in \mathcal{C}}$ by $\int^{A \in \mathcal{A}}$ since
\[\int^{C} U^{*} \otimes UC \cong \int^{C} U^{*} \otimes (\int^{A} \mathcal{C}(A, C) \otimes UA) \cong \int^{A} U^{*} \otimes UA\]
by the Yoneda lemma.

If we furthermore ask that each value $UA$ be finite dimensional for $A$ in $\mathcal{A}$, then $\text{End}^{\mathcal{V}} U \cong \int^{A \in \mathcal{A}} UA^{*} \otimes UA$ is canonically a $k$-coalgebra with counit the augmentation $\epsilon$, and comultiplication $\delta$ given by
\[\int^{A} U^{*} \otimes UA \quad \delta \rightarrow \int^{A} U^{*} \otimes UA \otimes \int^{A} U^{*} \otimes UA\]
where $n$ denotes coevaluation in $\text{Vect}_{f}$.

**Proposition 2.1.** If $U$ is separable then $\text{End}^{\mathcal{V}} U$ satisfies the $k$-bialgebra axiom
\[\text{End}^{\mathcal{V}} U \otimes \text{End}^{\mathcal{V}} U \xrightarrow{\delta \otimes \delta} (\text{End}^{\mathcal{V}} U)^{\otimes 4} \xrightarrow{1 \otimes \mu \otimes 1} (\text{End}^{\mathcal{V}} U)^{\otimes 4} \xrightarrow{\mu \otimes \mu} \text{End}^{\mathcal{V}} U \otimes \text{End}^{\mathcal{V}} U.\]

**Proof.** Let $\mathcal{B}$ denote the monoidal full subcategory of $\mathcal{C}$ generated by $\mathcal{A}$ (we will essentially replace $\mathcal{C}$ by this small category $\mathcal{B}$). Then, for all $C, D$ in $\mathcal{B}$, we have, by induction on the tensor lengths of $C$ and $D$, that $U(C \otimes D)$ is finite dimensional since it is a retract of $UC \otimes UD$. Moreover, we have
\[\int^{A \in \mathcal{A}} UA^{*} \otimes UA \cong \int^{B \in \mathcal{B}} UB^{*} \otimes UB\]
by the Yoneda lemma, since the natural family
\[ \alpha_B : \int_{A \in \mathcal{A}} \mathcal{C}(A, B) \otimes U A \to U B \]
is an isomorphism for all \( B \in \mathcal{B} \). Since \( ri = 1 \), the triangle

\[ \begin{array}{c}
\text{k} \\
\text{n}
\end{array} \quad \frac{(U C \otimes U D) \otimes (U C \otimes U D)^*}{U(C \otimes D) \otimes U(C \otimes D)^*} \]

commutes in \( \text{Vect}_f \), where \( n \) denotes the coevaluation maps. The asserted bialgebra axiom then holds on \( \text{End}^\vee U \) since it reduces to the following diagram on filling in the definitions of \( \mu \) and \( \delta \) (where, for the moment, we have dropped the symbol “\( \otimes \)”:)

\[ \begin{array}{c}
\text{UC} U C^* U D U D^* \\
\approx \quad 1 \quad n \quad 1 \quad 1 \quad n \quad 1 \\
\text{UC} U D U C^* U D^* \\
\approx \quad 1 \quad n \quad 1 \\
\text{UC} U D (U C U D)^* \\
\approx \quad 1 \quad n \quad 1 \\
\text{U(C D) U(C D)*} \\
\end{array} \]

\[ \begin{array}{c}
\text{UC} (U C U C^*) U C^* U D (U D U D^*) U D^* \\
\approx \quad 1 \quad n \quad 1 \quad 1 \quad n \quad 1 \\
\text{UC} U D U C U D U C^* U D^* U C^* U D^* \\
\approx \quad 1 \quad n \quad 1 \\
\text{UC} U D (U C U D)^* (U C U D)^* \\
\approx \quad 1 \quad n \quad 1 \\
\text{U(C D) U(C D)*} \\
\end{array} \]

for all \( C, D \in \mathcal{B} \).

Notably the bialgebra axiom

\[ \begin{array}{c}
\text{End}^\vee U \otimes \text{End}^\vee U \\
\mu \quad \text{End}^\vee U \\
\epsilon \otimes \epsilon \quad \epsilon \\
\text{k} \\
\end{array} \]

does not hold in general, while the form of the axiom

\[ \begin{array}{c}
\text{End}^\vee U \\
\delta \quad \text{End}^\vee U \otimes \text{End}^\vee U \\
\eta \quad \eta \otimes \eta \\
\text{k} \\
\end{array} \]

holds where we multiply \( \delta \) by \( \text{dim} U I \).

The \( k \)-bialgebra axiom established in the above proposition implies that the “fusion” operator \( (1 \otimes \mu)(\delta \otimes 1) : A \otimes A \to A \otimes A \) satisfies the fusion equation (see [9] for details).
The $k$-linear dual of $\text{End}^γ U$ is of course $$[\int^C UC^* \otimes UC, k] \cong \int_C [UC^*, UC^*]$$ which is the endomorphism $k$-algebra of the functor $$U(−)^* : \mathcal{C}^{\text{op}} \to \text{Vect}.$$ If $\text{ob} \mathcal{A}$ is finite, so that $$\int^A UA^* \otimes UA$$ is finite dimensional, then $$\int_C [UC^*, UC^*] \cong \int_A [UA^*, UA^*]$$ is also a $k$-coalgebra.

3. The unital von Neumann antipode

We now take $(\mathcal{C}, \otimes, I, c)$ to be a braided monoidal category and $\mathcal{A} \subset \mathcal{C}$ to be a small full subcategory of $\mathcal{C}$ for which the monoidal and comonoidal functor $U : \mathcal{C} \to \text{Vect}$ induces $$U : \mathcal{A} \to \text{Vect}_f$$ on restriction to $\mathcal{A}$. We suppose that $\mathcal{A}$ is such that

- the identity $I$ of $\otimes$ lies in $\mathcal{A}$, and each object of $A \in \mathcal{A}$ has a $\otimes$-dual $A^*$ lying in $\mathcal{A}$.

With respect to $U$, we suppose $\mathcal{A}$ has the properties

- “$U$-irreducibility”: $\mathcal{A}(A, B) \neq 0$ implies $\dim UA = \dim UB$ for all $A, B \in \mathcal{A}$;
- “$U$-density”: the canonical map
  $$\alpha_C : \int^{A \in \mathcal{A}} \mathcal{C}(A, C) \otimes UA \to UC$$
  is an isomorphism for all $C \in \mathcal{C}$,
- “$U$-trace”: each object of $\mathcal{A}$ has a $U$-trace in $\mathcal{C}(I, I)$, where by $U$-trace of $A \in \mathcal{A}$ we mean an isomorphism $d(A)$ in $\mathcal{C}(I, I)$ such that the following two diagrams commute.

$$\begin{array}{ccc}
I & \xrightarrow{d(A)} & I \\
\downarrow n & & \downarrow e \\
A \otimes A^* & \xrightarrow{c} & A^* \otimes A
\end{array} \quad \begin{array}{ccc}
k & \xrightarrow{\dim UA} & k \\
r_0 & \downarrow & r_0 \\
UI & \xrightarrow{\dim UU(d(A))} & UI
\end{array}$$

We shall assume $\dim UI \neq 0$ so that the latter assumption implies $\dim UA \neq 0$, for all $A \in \mathcal{A}$.

We require also a natural isomorphism $$u = u_A : U(A^*) \xrightarrow{\approx} UA^*$$
such that
\[
\begin{array}{ccc}
  k & \xrightarrow{r_0} & UI \\
  n & \downarrow & U_n \\
(n, r, r_0) & & \\
UA \otimes U A^* & \xrightarrow{1 \otimes u^{-1}} & U A \otimes U A^* \\
& \xrightarrow{r} & U A \otimes U(A^*) \\
\end{array}
\]
commutes, and
\[
\begin{array}{ccc}
  UI & \xrightarrow{i_0} & k \\
  U e & \downarrow & e \\
(e, i, i_0) & & \\
U(A^* \otimes A) & \xrightarrow{u \otimes 1} & U(A^*) \otimes U A \\
& \xrightarrow{\copr} & U(A^*) \otimes U(A^*) \\
\end{array}
\]
commutes. This means that \(U\) “preserves duals” when restricted to \(\mathfrak{A}\).

An endomorphism
\[
\sigma : \text{End}^\forall U \longrightarrow \text{End}^\forall U
\]
may be defined by components
\[
\int^A U A^* \otimes U A \xrightarrow{\sigma} \int^A U A^* \otimes U A \\
\xrightarrow{\copr} \xrightarrow{\copr}
\]

Each \(\sigma_A\) being given by commutativity of
\[
\begin{array}{ccc}
  U A^* \otimes U A & \xrightarrow{\sigma_A} & U(A^*)^* \otimes U(A^*) \\
  1 \otimes \rho & \downarrow & \epsilon \\
  U A^* \otimes U A^{**} & \xrightarrow{u^{-1} \otimes u^*} & U(A^*) \otimes U(A^*)^*
\end{array}
\]

where \(\rho\) denotes the canonical isomorphism from a finite dimensional vector space to its double dual. Clearly each component \(\sigma_A\) is invertible.

**Theorem 3.1.** Let \(\mathcal{C}, \mathfrak{A}\), and \(U\) be as above, and suppose that \(U\) is braided and separable as a monoidal functor. Then there is an invertible antipode \(S\) on \(\text{End}^\forall U\) such that \((\text{End}^\forall U, \mu, \eta, \delta, \epsilon, S)\) is a unital von Neumann core in \(\text{Vect}_k\).

**Proof.** A family of maps \(\{S_A | A \in \mathfrak{A}\}\) is defined by
\[
S_A = \dim UI \cdot (\dim UA)^{-1} \cdot \sigma_A.
\]
Then, by the \(U\)-irreducibility assumption on the category \(\mathcal{A}\), this family induces an invertible endomorphism \(S\) on the coend
\[
\text{End}^V U \cong \sum_{n=1}^{\infty} \int_{\mathcal{A} \in \mathcal{A}_n} U A^* \otimes U A,
\]
where \(\mathcal{A}_n\) is the full subcategory of \(\mathcal{A}\) determined by \(\{A \mid \dim U A = n\}\). We now take \(S\) to be the antipode on \(\text{End}^V U\) and check that
\[
1 \otimes \eta = (1 \otimes \mu)(1 \otimes S \otimes 1)\delta_3.
\]
From the definition of \(\mu\) and \(\delta\), we require commutativity of the exterior of the following diagram (where, again, we have dropped the symbol “\(\otimes\)"

\[
\begin{array}{c}
\text{UA}^* U A U A^* U A U A^* U A \\
\text{UA}^* U A U A^* U A U A^* U A \\
\text{UA}^* U A U A^* U A U A^* U A \\
\text{UA}^* U A U A^* U A U A^* U A \\
\text{UA}^* U A U A^* U A U A^* U A \\
\text{UA}^* U A U A^* U A U A^* U A \\
\text{UA}^* U A U A I \\
\end{array}
\]

The region labelled by (1) commutes on composition with \(1 \otimes n \otimes 1\) since

\[
\begin{array}{c}
k \\
\text{UA} \otimes U A^* \\
\text{UA} \otimes U A \otimes U A^* \otimes U A^* \\
\text{UA} \otimes U A \otimes U A^* \otimes U A^* \\
\text{UA} \otimes U A \otimes U A^* \otimes U A^* \\
\end{array}
\]
commutes (choose a basis for $U A$). The region labelled by (2) now commutes by inspection of:

\[
\begin{align*}
UA \otimes UA^* \otimes UA \otimes UA^* & \quad \xrightarrow{1 \otimes \sigma_A \otimes 1} \quad UA \otimes U(A^*)^* \otimes U(A^*) \otimes UA^* \\
UA \otimes UA \otimes UA^* \otimes UA & \quad \xrightarrow{1 \otimes 1 \otimes \rho \otimes 1} \quad UA \otimes U(A^*) \otimes U(A^*)^* \otimes UA^* \\
UA \otimes UA \otimes UA^* & \quad \xrightarrow{1 \otimes 1 \otimes \rho \otimes 1} \quad UA \otimes UA^* \otimes UA^{**} \otimes UA^* \\
UA \otimes UA^* & \quad \xrightarrow{1 \otimes 1 \otimes \rho \otimes 1} \quad UA \otimes UA^{**} \otimes UA^* \otimes UA^* \\
UA \otimes UA^* & \quad \xrightarrow{1 \otimes 1 \otimes \rho \otimes 1} \quad UA \otimes UA^{**} \otimes UA^* \otimes UA^*
\end{align*}
\]

where the top leg of (2) has been rescaled by a factor of $(\dim U I)^{-1} \cdot \dim U A$.

From the definition of the $U$-trace $d(A)$ of $A \in \mathcal{A}$, we have that

\[
\begin{align*}
k & \xrightarrow{\dim U I \cdot (\dim U A)^{-1}} \quad k \\
r_0 & \xrightarrow{U(d(A)^{-1})} \quad r_0
\end{align*}
\]

commutes, so that the exterior of

\[
\begin{align*}
UA \otimes UA^* & \quad \xrightarrow{1 \otimes u^{-1}} \quad r \\
UA \otimes UA^* & \quad \xrightarrow{(n,r,r_0)} \quad U(A \otimes A^*) \\
k & \xrightarrow{\dim U I \cdot (\dim U A)^{-1}} \quad k \\
r_0 & \xrightarrow{U(d(A)^{-1})} \quad r_0
\end{align*}
\]

commutes.
Thus the region labelled by (3), with the top leg rescaled by the factor \( \dim UI \cdot (\dim UA)^{-1} \), commutes on examination of the following diagram:

\[
\begin{array}{c}
\xymatrix{
(UA^* \otimes UA)^* \otimes UA^* \otimes UA \\
(k^* \otimes UA^* \otimes UA) \\
1 \otimes U^c \\
1 \otimes (\dim UI - (\dim UA)^{-1}, n) \\
k^* \otimes k \\
\end{array}
\]

whose commutativity depends on the hypothesis that \( (U, r, r_0) \) is braided monoidal in order for

\[
\begin{array}{c}
UA \otimes U(A^*) \\
U(A \otimes A^*) \\
\end{array} \xrightarrow{c} \begin{array}{c}
(UA^*) \otimes UA \\
U(A^* \otimes A) \\
\end{array}
\]

\[
\begin{array}{c}
U(A \otimes A^*) \\
\cup \cup \cup \cup \cup \cup \\
\end{array} \xrightarrow{(*)} \begin{array}{c}
UA \otimes U(A^*) \\
U(A^* \otimes A) \\
\end{array}
\]

\[
\begin{array}{c}
U(A \otimes A^*) \\
\cup \cup \cup \cup \cup \cup \\
\end{array} \xrightarrow{r} \begin{array}{c}
(UA^*) \otimes UA \\
U(A^* \otimes A) \\
\end{array}
\]

\[
\begin{array}{c}
U(A \otimes A^*) \\
\cup \cup \cup \cup \cup \cup \\
\end{array} \xrightarrow{(*)} \begin{array}{c}
UA \otimes U(A^*) \\
U(A^* \otimes A) \\
\end{array}
\]

\[
\begin{array}{c}
U(A \otimes A^*) \\
\cup \cup \cup \cup \cup \cup \\
\end{array} \xrightarrow{r} \begin{array}{c}
UA \otimes U(A^*) \\
U(A^* \otimes A) \\
\end{array}
\]

to commute.

\[\square\]

4. The fusion operator

Let \( E = \text{End}^\vee U \). The unital von Neumann axiom on \( E \) implies that the fusion operator

\[
f = (1 \otimes \mu)(\delta \otimes 1) : E \otimes E \longrightarrow E \otimes E
\]
has a left inverse, namely \( g = (1 \otimes \mu)(1 \otimes S \otimes 1)(\delta \otimes 1) \). For this we consider the following diagram:

\[
\begin{align*}
E \otimes E & \xrightarrow{\delta \otimes 1} E \otimes E & \xrightarrow{1 \otimes \mu} E \otimes E \\
E & \xrightarrow{1 \otimes \mu} E & \xrightarrow{1 \otimes \mu} E
\end{align*}
\]

In particular \( f = (1 \otimes \mu)(\delta \otimes 1) \) is a partial isomorphism, i.e., \( fgf = f \) and \( gfg = g \).

5. Examples of separable monoidal functors in the present context

Unless otherwise indicated, categories, functors, and natural transformations shall be \( k \)-linear, for \( k \) a suitable field.

For these examples we recall that a (small) \( k \)-linear promonoidal category \((\mathcal{A}, p, j)\) (previously called “premonoidal” in \([1]\)) consists of a \( k \)-linear category \( \mathcal{A} \) and two \( k \)-linear functors

\[
p : \mathcal{A}^{\text{op}} \otimes \mathcal{A}^{\text{op}} \otimes \mathcal{A} \to \text{Vect}
\]

\[
j : \mathcal{A} \to \text{Vect}
\]

equipped with associativity and unit constraints satisfying axioms (as described in \([1]\)) analogous to those used to define a monoidal structure on \( \mathcal{A} \). The notion of a symmetric promonoidal category (also introduced in \([1]\)) was extended in \([3]\) to that of a braided promonoidal category.

The main point is that (braided) promonoidal structures on \( \mathcal{A} \) correspond to co-continuous (braided) monoidal structures on the functor category \([\mathcal{A}, \text{Vect}]\). This latter monoidal structure is often called the convolution product of \( \mathcal{A} \) and \( \text{Vect} \).

Example 5.1. Let \((\mathcal{A}, p, j)\) be a small braided promonoidal category with

\[
\mathcal{A}(I, I) \cong I = k \quad \text{and} \quad j = \mathcal{A}(I, -),
\]

and suppose that each hom-space \( \mathcal{A}(a, b) \) is finite dimensional. Let \( f \in [\mathcal{A}, \text{Vect}] \) be a very weak bialgebra in the convolution \([\mathcal{A}, \text{Vect}]\). Suppose also that \( \mathcal{A} \subset \mathcal{C} \) where \( \mathcal{C} \) is a separable braided monoidal category with

\[
p(a, b, c) \cong \mathcal{C}(a \otimes b, c)
\]

naturally; we suppose the induced maps

\[
(\ddagger) \quad \int^{\mathcal{C}} p(a, b, c) \otimes \mathcal{C}(c, C) \to \mathcal{C}(a \otimes b, C)
\]

are isomorphisms (e.g., \( \mathcal{A} \) monoidal). We also suppose that each \( a \in \mathcal{A} \) has a dual \( a^\ast \in \mathcal{A} \). Then we have maps

\[
\mu : f \ast f \to f \quad \text{and} \quad \eta : k \to f I
\]
and
\[ \delta : f \rightarrow f \ast f \quad \text{and} \quad \epsilon : fI \rightarrow k \]
satisfying associativity and unital axioms.

Define the functor \( U : \mathcal{C} \rightarrow \text{Vect} \) by
\[ U(C) = \int_a f_a \otimes \mathcal{C}(a, C); \]
then, by the Yoneda lemma, \( U(a^*) \cong U(a)^* \) if \( f(a^*) \cong f(a)^* \) for \( a \in \mathcal{A} \). Moreover, \( U \) is monoidal and comonoidal on \( \mathcal{C} \) via the maps \( r \) and \( i \) described in the diagram:

\[
\begin{align*}
UC \otimes UD & \cong \int^{a,b} f_a \otimes f_b \otimes \mathcal{C}(a, C) \otimes \mathcal{C}(b, D) \quad \mathcal{C} \text{ separable} \\
& \downarrow r \downarrow i \\
\int^{a,b} f_a \otimes f_b \otimes \mathcal{C}(a \otimes b, C \otimes D) & \quad \mathcal{C} \text{ separable} \\
& \downarrow \mu \downarrow \delta \\
\int^{a,b} f_a \otimes f_b \otimes \int^c p(a, b, c) \otimes \mathcal{C}(c, C \otimes D) & \\
& \downarrow \mu \downarrow \delta \\
U(C \otimes D) & \cong \int^c f_c \otimes \mathcal{C}(c, C \otimes D),
\end{align*}
\]

Thus, if \( f \) is separable, then so is \( U \) with \( \dim UI = \dim fI \) since
\[ UI = \int_a f_a \otimes \mathcal{C}(a, I) \cong fI \]
by the Yoneda lemma, so that \( i_0 r_0 = \dim UI \cdot 1 \) if and only if \( \epsilon \eta = \dim fI \cdot 1 \).

**Example 5.2.** Suppose that \((\mathcal{A}^{\text{op}}, p, j)\) is a small promonoidal category with \( I \in \mathcal{A} \) such that \( j \cong \mathcal{A}(-, I) \) and with each \( x \in \mathcal{A} \) an “atom” in \( \mathcal{C} \) (i.e., an object \( x \in \mathcal{C} \) for which \( \mathcal{C}(x, -) \) preserves all colimits) where \( \mathcal{C} \) is a cocomplete and cocontinuous braided monoidal category containing \( \mathcal{A} \) and each \( x \in \mathcal{A} \) has a dual \( x^* \in \mathcal{A} \). Suppose that the inclusion \( \mathcal{A} \subset \mathcal{C} \) is dense over \( \text{Vect} \) (that is, the canonical evaluation morphism
\[ \int^a \mathcal{C}(a, C) \cdot a \rightarrow C \]
is an isomorphism for all \( C \in \mathcal{C} \) and
\[ x \otimes y \cong \int^z p(x, y, z) \cdot z \]
so that
\[ C(a, x \otimes y) = C(a, \int^z p(x, y, z) \cdot z) \]
\[ = \int^z p(x, y, z) \otimes C(a, z) \quad \text{since } a \in \mathcal{A} \text{ is an atom in } C, \]
\[ = p(x, y, a) \quad \text{by the Yoneda lemma applied to } z \in \mathcal{A}. \]

Let \( W : \mathcal{A} \to \text{Vect} \) be a strong promonoidal functor on \( \mathcal{A} \). This means that we have structure isomorphisms
\[ W x \otimes W y \cong \int z C(z, x \otimes y) \otimes W z \]
\[ k \cong W I \]
satisfying suitable associativity and unital coherence axioms. Define the functor \( U : \mathcal{C} \to \text{Vect} \) by
\[ UC = \int^a C(a, C) \otimes Wa. \]
Then
\[ U(x^*) = \int^a C(a, x^*) \otimes Wa \]
\[ \cong W(x^*) \]
\[ \cong W(x)^*, \]
if \( W(x^*) \cong W(x)^* \) for all \( x \in \mathcal{A} \), and
\[ UI = \int^a C(a, I) \otimes Wa \]
\[ \cong W I \]
\[ \cong k, \]
so that \( i_0 r_0 = 1 \) and \( r_0 i_0 = 1 \). Also there are mutually inverse composite maps \( r \) and \( i \) given by:
\[ r : UC \otimes UD \cong \int^{x,y} C(x, C) \otimes C(y, D) \otimes U x \otimes U y \]
\[ \cong \int^{x,y} C(x, C) \otimes C(y, D) \otimes W x \otimes W y \]
\[ \cong \int^{x,y} C(x, C) \otimes C(y, D) \otimes \int^z C(z, x \otimes y) \otimes W z \]
\[ \cong \int^z C(z, C \otimes D) \otimes W z \]
\[ \cong U(C \otimes D), \]
which uses the assumptions that \( C \) is cocontinuous monoidal and \( \mathcal{A} \subset \mathcal{C} \) is dense. Thus \( ri = 1 \) and \( ir = 1 \) so that \( U \) is a strong monoidal functor.

**Example 5.3.** (See [5] Proposition 3.) Let \( \mathcal{C} \) be a braided compact monoidal category and let \( \mathcal{A} \subset \mathcal{C} \) be a full finite discrete Cauchy generator of \( \mathcal{C} \) which contains \( I \) and is closed under dualization in \( \mathcal{C} \). As in the H"aring-Oldenburg case [5], we suppose that each hom-space \( \mathcal{C}(C, D) \) is finite dimensional with a chosen natural isomorphism \( \mathcal{C}(C^*, D^*) \cong \mathcal{C}(C, D)^* \).
Then we have a separable monoidal functor
\[ UC = \bigoplus_{a,b \in \mathcal{A}} \mathcal{C}(a, C \otimes b), \]
whose structure maps are given by the composites
\[
r : UC \otimes UD \cong \bigoplus_{a,b,c,d} \mathcal{C}(c, C \otimes b) \otimes \mathcal{C}(a, D \otimes d)
\]
adjoint\[
\cong \bigoplus_{a,b,c} \mathcal{C}(c, \mathcal{C} \otimes b) \otimes \mathcal{C}(a, \mathcal{D} \otimes c)
\]
adjoint\[
\cong \bigoplus_{a,b} \mathcal{C}(a, \mathcal{D} \otimes (C \otimes b))
\]
adjoint\[
\cong \bigoplus_{a,b} \mathcal{C}(a, (D \otimes C) \otimes b)
\]
adjoint\[
\cong \bigoplus_{a,b} \mathcal{C}(a, (C \otimes D) \otimes b)
\]
adjoint\[
= U(C \otimes D),
\]
and \( r_0 : k \rightarrow UI \) the diagonal, with \( i_0 \) its adjoint. Also
\[
U(C^*) = \bigoplus_{a,b} \mathcal{C}(a, C^* \otimes b)
\]
adjoint\[
\cong \bigoplus_{a,b} \mathcal{C}(a^*, C^* \otimes b^*)
\]
adjoint\[
\cong \bigoplus_{a,b} \mathcal{C}(a, C \otimes b)^*
\]
adjoint\[
\cong U(C^*),
\]
for all \( C \in \mathcal{C} \).

**Example 5.4.** Let \((\mathcal{A}, p, j)\) be a finite braided promonoidal category over \( \text{Set}_f \) with \( I \in \mathcal{A} \) such that \( j \cong \mathcal{A}(I, -) \) and with a promonoidal functor
\[
d : \mathcal{A}^{\text{op}} \longrightarrow \text{Set}_f
\]
for which each structure map
\[
u : \int^z p(x, y, z) \times dz \rightarrow dx \times dy
\]
is an injection, and \( u_0 : dI \longrightarrow 1 \) is a surjection. Then we have corresponding maps
\[
\int^z k[p(x, y, z)] \otimes k[dz] \rightarrow k[dx] \otimes k[dy]
\]
and
\[
k[dI] \rightarrow k[1],
\]
where \( k[s] \) denotes the free \( k \)-vector space on the (finite) set \( s \), in \( \text{Vect}_f \). Define the functor \( U : \mathcal{C} \longrightarrow \text{Vect}_f \) by
\[
Uf = \int^x fx \otimes k[dx]
\]
for $f \in \mathcal{C} = [k_* \mathcal{A}, \mathrm{Vect}_f]$ (with the convolution braided monoidal closed structure) so that

$$r : Uf \otimes Ug = \left( \int^x f_x \otimes k[dx] \right) \otimes \left( \int^y g_x \otimes k[dy] \right)$$

$$\cong \int^{x,y} f_x \otimes g_y \otimes (k[dx] \otimes k[dy])$$

$$\cong \int^z f_x \otimes g_y \otimes \left( \int^z k[p(x, y, z)] \otimes k[dz] \right)$$

$$\cong \int^z (f \otimes g)(z) \otimes k[dz]$$

$$\cong \int^z U(f \otimes g)$$

and

$$i_0 : UI = \int^x k[\mathcal{A}(I, x)] \otimes k[dx]$$

$$\cong k[dI]$$

$$\cong k[1] \cong k.$$

Hence $i_0 r_0 = \dim UI \cdot 1 = |dI| \cdot 1$. Thus, $U$ becomes a separable monoidal functor.

**Example 5.5.** Let $\mathcal{A}$ be a finite (discrete) set and give the cartesian product $\mathcal{A} \times \mathcal{A}$ the Set$_f$-promonoidal structure corresponding to bimodule composition (i.e., to matrix multiplication). If

$$d : \mathcal{A} \times \mathcal{A} \longrightarrow \text{Set}_f$$

is a promonoidal functor, then its associated structure maps

$$\sum_{z, z'} p((x, x'), (y, y'), (z, z')) \times d(z, z') = \sum_{z, z'} \mathcal{A}(z, x) \times \mathcal{A}(x', y) \times \mathcal{A}(y', z') \times d(z, z')$$

$$\cong \mathcal{A}(x', y) \times d(x, y')$$

$$\longrightarrow d(x, x') \times d(y, y'),$$

and

$$\sum_{z, z'} j(z, z') \times d(z, z') = \sum_{z, z'} \mathcal{A}(z, z') \times d(z, z')$$

$$\cong \sum_z d(z, z)$$

$$\longrightarrow 1,$$

are determined by components

$$d(x, y') \longrightarrow d(x, y) \times d(y, y')$$

$$d(z, z) \longrightarrow 1$$

which give $\mathcal{A}$ the structure of a discrete cocategory over Set$_f$. 
Define the functor \( U : \mathcal{C} = [k_\alpha(\mathcal{C} \times \mathcal{C})], \text{Vec}_f \to \text{Vec}_f \) by

\[
U f = \bigoplus_{x,y} (f(x, y) \otimes k[d(x, y)]).
\]

Then we obtain monoidal and comonoidal structure maps

\[
U(f \otimes g) \xrightarrow{r} U f \otimes U g
\]

and

\[
UI \xrightarrow{i_0} k \cong k[1]
\]

from the canonical maps

\[
\bigoplus_{x,y,z} f(x, z) \otimes g(z, y) \otimes k[d(x, y)]
\]

adjoint \[ z \mapsto u \]

\[
\bigoplus_{x,u} (f(x, u) \otimes k[d(x, u)]) \otimes \bigoplus_{v,y} (g(v, y) \otimes k[d(v, y)])
\]

and

\[
\bigoplus_{z} k[d(z, z)] \xrightarrow{u} k \cong k[1].
\]

These give \( U \) the structure of a separable monoidal functor on \( \mathcal{C} \).

6. CONCLUDING REMARKS

If the original “fibre” functor \( U \) is faithful and exact then the Tannaka equivalence (duality)

\[
\text{Lex}(\mathcal{C}^{\text{op}}, \text{Vec}) \simeq \text{Comod}(\text{End}^\vee U)
\]

is available. Thus, since \( \mathcal{C} \) is braided monoidal, so is \( \text{Comod}(\text{End}^\vee U) \) with the tensor product and unit induced by the convolution product on \( \text{Lex}(\mathcal{C}^{\text{op}}, \text{Vec}) \); for convenience we recall [2] that, for \( \mathcal{C} \) compact, this convolution product is given by the restriction to \( \text{Lex}(\mathcal{C}^{\text{op}}, \text{Vec}) \) of the coend

\[
F * G = \int^{C,D} FC \otimes GD \otimes \mathcal{C}(-, C \otimes D)
\]

\[
\cong \int^C FC \otimes G(C^* \otimes -)
\]

computed in the whole functor category \( [\mathcal{C}^{\text{op}}, \text{Vec}] \). Moreover, when \( U \) is separable monoidal, the category \( \text{Co}(\text{End}^\vee U) \) of cofree coactions of \( \text{End}^\vee U \) (as constructed in [6] for example) also has a monoidal structure \( (\text{Co}(\text{End}^\vee U), \otimes, k) \), this time obtained from the algebra structure of \( \text{End}^\vee U \). The forgetful inclusion

\[
\text{Comod}(\text{End}^\vee U) \subset \text{Co}(\text{End}^\vee U)
\]

preserves colimits while \( \text{Comod}(\text{End}^\vee U) \) has a small generator, namely \( \{UC \mid C \in \mathcal{C} \} \), and thus, from the special adjoint functor theorem, this inclusion has a right adjoint. The value of the adjunction’s counit at the functor \( F \otimes G \) in \( \text{Co}(\text{End}^\vee U) \) is then a split monomorphism and, in particular, the monoidal forgetful functor

\[
\text{Comod}(\text{End}^\vee U) \longrightarrow \text{Vec},
\]

which is the composite \( \text{Comod}(\text{End}^\vee U) \subset \text{Co}(\text{End}^\vee U) \longrightarrow \text{Vec} \), is a separable monoidal functor extension of the given functor \( U : \mathcal{C} \longrightarrow \text{Vec} \).
