1.Introduction

The subject FDEs can be considered as a generalization of the typical ordinary differential equations (ODEs). The advantages of the FDEs become apparent for us to understand real world problems. In fact, the FDEs have attracted significant attention to the past couple of decades due to their relatively much effectiveness than ODEs. There are several definitions of fractional derivatives, as for instance, the Riemann-Liouville derivative, the Caputo derivative, and the conformal fractional derivative [1–3]. Recently, Khalil et al. [4] proposed a compatible definition of fractional derivative called the conformable fractional derivative. Therefore, several properties related to this new definition have been studied. Jarad et al. [5] used conformable type derivatives defined in [6] to generate new type of generalized fractional derivatives with memory effect. In [7, 8], the authors used conformable derivatives and integrals to formulate new generalized Liapunov-type inequality. The exact solutions of nonlinear FDEs play fundamental role in describing different qualitative and quantitative features of nonlinear complex physical phenomena. For this reason, researchers have proposed different methods to obtain exact solutions to nonlinear FDEs such as \(\exp(-\varphi(\xi))\)-expansion method [9–12], the \((G'/G, 1/G)\)-expansion method [13–19], auxiliary equation method [20, 21], \((G'/G, 1/G)\)-expansion method [22–27] the trial equation method [28, 29], fractional sub-equation method [30, 31], modified simple equation method [32], generalized Kudrayshov method [33, 34], and others [35–38].

In this study, we introduce an extension of the \((G'/G, 1/G)\)-expansion method for analyzing nonlinear FDEs in mathematical physics, engineering, and applied mathematics. To demonstrate the reliability and advantages of the suggested extension, the time-fractional CRWP equation, the time fractional STO equation, and the space-time fractional KleinGordon equation are examined and further broad-ranging and new families of exact wave
solutions are established. This new extension can be applied to further nonlinear FDEs which can be done in forthcoming work.

2. Conformable Fractional Derivative and Its Important Properties

In the last years, Khalil et al. [4] introduced a simple, interesting, and compatible with typical definition of derivative named conformable fractional derivative, which can rectify the deficiencies of the other definitions. One can also find several useful studies related to this new definition in [5–8]. In [39], the geometrical and physical interpretations of this definition are investigated and the potential applications in science and engineering are pointed out. The conformable fractional derivative of a function $g$ of order $\beta$ is defined as

$$T_{\beta}^\phi (g)(t) = \lim_{x \to 0} \frac{g(t + x t^{1-\beta}) - g(t)}{x}$$

where $g: [0, \infty) \to \mathbb{R}$, $t > 0$ and $\beta \in (0, 1)$. Some important properties of above definition are given below:

(i) $T_{\beta}^\phi (ag + bf) = aT_{\beta}^\phi (g) + bT_{\beta}^\phi (f), \forall a, b \in \mathbb{R}$
(ii) $T_{\beta}^\phi (t^\mu) = \mu t^{\mu - \beta}, \forall \mu \in \mathbb{R}$
(iii) $T_{\beta}^\phi (\lambda g) = \lambda g(t)$, for each constant function $g(t) = \lambda$
(iv) $T_{\beta}^\phi (g \circ f)(t) = t^{1-\beta} f'(t) g'(f(t))$

3. Methodology

In this section, we will suggest an extension of the $(G'/G, 1/G)$-expansion method to ascertain the analytic solutions to nonlinear FDEs. We begin with considering the second-order linear ODE:

$$G''(\xi) + \lambda G(\xi) - \mu = 0. \tag{2}$$

We choose

$$\phi = \frac{G'}{G}, \tag{3}$$

$$\psi = \frac{1}{G}.$$ 

Thus, from equation (2) and (3), it is found

$$\left(\frac{1}{\phi}\right)' = \lambda \left(\frac{1}{\phi}\right)^2 - \mu \psi \left(\frac{1}{\phi}\right) + 1,$$

$$\psi' = \lambda \left(\frac{1}{\phi}\right) - \mu \psi^2.$$ 

From the different general solutions of the linear ODE (2), we attain the following:

Case 1: when $\lambda < 0$, the hyperbolic function solution is

$$G(\xi) = A_1 \sinh \sqrt{-\lambda} \xi + A_2 \cosh \sqrt{-\lambda} \xi + \frac{\mu}{\lambda}$$ 

and thus we obtain

$$\psi' = -\frac{\lambda}{\mu^2 + \mu} \left[\lambda \left(\frac{1}{\phi}\right)^2 - \mu \psi \left(\frac{1}{\phi}\right) + 1\right], \tag{6}$$

where $\sigma = A_1^2 - A_2^2$ and $A_1, A_2$ are arbitrary constants.

Case 2: when $\lambda > 0$, the trigonometric function solution is

$$G(\xi) = A_1 \sin \sqrt{\lambda} \xi + A_2 \cos \sqrt{\lambda} \xi + \frac{\mu}{\lambda}, \tag{7}$$

and corresponding relation is

$$\psi^2 = \frac{\lambda}{\mu^2 + \mu} \left[\lambda \left(\frac{1}{\phi}\right)^2 - \mu \psi \left(\frac{1}{\phi}\right) + 1\right], \tag{8}$$

where $\sigma = A_1^2 + A_2^2$ and $A_1$ and $A_2$ are arbitrary constants.

Case 3: when $\lambda = 0$, the rational function solution is

$$G(\xi) = \frac{\mu^2 \xi^2 + A_1 \xi + A_2}{2}, \tag{9}$$

and thus it is found

$$\psi^2 = \frac{1}{A_1^2 - 2\mu A_2} \left[\frac{2}{\mu^2 + \mu} \psi \left(\frac{1}{\phi}\right) - 1\right], \tag{10}$$

where $A_1$ and $A_2$ are arbitrary constants.

Let us consider a general nonlinear FDE:

$$P(u, D^\alpha_x u, D^\alpha_y u, D^\alpha_t u, D^\alpha_t D^\alpha_t u, \ldots) = 0, \quad 0 < \alpha < 1, \tag{11}$$

where $D^\alpha_x u, D^\alpha_y u$ and $D^\alpha_t u$ are the conformable fractional derivatives of the wave function $u$ with respect to spatial variables $x$ and $y$ and the temporal variable $t$, and $P$ is a polynomial of $u = u(x, y, t, \ldots)$ and its various partial derivatives.

The main steps of the new extension of the $(G'/G, 1/G)$-expansion method to seek exact solutions of nonlinear FDEs are as follows:

Step 1: we estimate the new form of the fractional wave variable:

$$u(x, y, t) = U(\xi),$$

$$\xi = k \frac{x^a}{\alpha} + l \frac{y^a}{\alpha} + v \frac{t^a}{\alpha}, \tag{12}$$

where $k$ and $l$ are nonzero constants and $v$ is the wave velocity to be determined later. The complex wave transformation (12) translates equation (11) into an ODE as follows:
Step 2: suppose that the general solution of nonlinear ODE (13) can be expressed by a polynomial in \((1/\phi)\) and \(\psi\) as

\[
U(\xi) = \sum_{i=0}^{N} a_i \left( \frac{1}{\phi} \right)^i + \sum_{i=0}^{N} b_i \left( \frac{1}{\phi} \right)^i \psi,
\]

where \(G = G(\xi)\) satisfies the auxiliary linear ODE (2) and \(a_i\) and \(b_i\) are arbitrary constants to be determined later, and balancing the highest order derivative with the nonlinear terms in equation (13), we can find the positive integer \(N\).

Step 3: inserting solution (14) into equation (13) and utilizing (4) and (6) (here case 1 is selected as an example), the left-hand side of equation (13) can be converted into a polynomial in \((1/\phi)\) and \(\psi\), where the degree of \(\psi\) is not more than one. Equating all coefficients of this polynomial to zero yield a set of algebraic equations for \(a_i, b_i, k, l, v, A_1, A_2, \lambda\ (\lambda < 0)\), and \(\mu\).

Step 4: the solution of the algebraic equations found in the step 3 can be found with the aid of Maple software package. Making use of the values of \(a_i, b_i, k, l, v, A_1, A_2, \lambda\) and \(\mu\) into (14), we might determine exact solutions expressed by hyperbolic functions of equation (13).

Step 5: similar to step 3 and step 4, substituting (14) into equation (13) and utilizing equation (4) and (6) (or equation (4) and (10)), we can get the exact solutions of equation (13) expressed by the trigonometric functions (or expressed by the rational functions).

4. Determination of Solutions

In this paragraph, we will search out solutions to three conformable FDEs as appertain to the new extension of the \((G'/G, 1/G)\)-expansion method.

4.1. Time Fractional CRWP Equation. First, we consider the time fractional CRWP equation [22, 40]:

\[
D^\alpha_0 u - u_x + 2uu_x + u_{xx} = 0, \quad 0 < \alpha \leq 1.
\]

The ensuing wave transformation is

\[
u(x, t) = U(\xi),
\]

\[
\xi = kx - c \frac{t^\alpha}{\alpha},
\]

where \(k\) is the wave number and \(c\) is the velocity; reducing the equation (15) into the subsequent ODE, we get

\[
-(c + k)U' + 2kU + k^2U'' = 0.
\]

Integrating (17) once, we find

\[
-(c + k)U + ku^2 + k^2U^2 + \xi_0 = 0,
\]

where \(\xi_0\) is a constant of integration. It is clear that the homogeneous balance between \(U^2\) and \(U'\) present in equation (18) gives \(N = 1\). Therefore, the shape of the exact solution of equation (18) is

\[
U(\xi) = a_0 + a_1 \left( \frac{1}{\phi} \right) + b_1 \psi.
\]

There are three cases to be considered:

Case 1: when \(\lambda < 0\), substituting solution (19) into equation (18) and utilizing (4) and (6), equation (18) can be transmuted to a polynomial in \((1/\phi)\) and \(\psi\). Equalizing its coefficients to zero yields a set of algebraic equations in \(a_0, a_1, b_1, k, c, \sigma, \lambda, \mu\), and \(\xi_0\):

\[
\begin{align*}
(1) & \quad b_1 k^2 \mu \lambda^2 = \frac{b_1 k^2 \lambda^2}{\lambda^2 \sigma + \mu^2} + a_1^2 k + a_1^2 \lambda = 0, \\
(2) & \quad (1) \psi: 2b_1^2 \lambda^2 \mu = 2b_1 k^2 \lambda^2 - a_1 k^2 \mu + b_1 k^2 \lambda + 2a_1 b_1 k = 0, \\
(3) & \quad (1) \phi: a_1 k - a_1 c + 2a_1 a_1 k = 0, \\
(4) & \quad \psi: b_1 k + 2a_1 b_1 k - b_1 c = 0, \\
(5) & \quad \psi: b_1 k^2 \lambda = b_1 k^2 \lambda - b_1^2 \mu k^2 - a_1^2 k - a_1 c + a_1 k + a_1 k^2 + \xi_0 = 0.
\end{align*}
\]

Resolving these algebraic equations by Maple software package, we attain the following values:

\[
\begin{align*}
a_0 & = \frac{c + k}{2k}, \\
a_1 & = -k\lambda, \\
b_1 & = \mu k, \\
\xi_0 & = \frac{4k^4 \mu + c^2 + 2ck + k^2}{4k}.
\end{align*}
\]

\[
\begin{align*}
a_0 & = \frac{c + k}{2k}, \\
a_1 & = \frac{1}{2} k\lambda, \\
b_1 & = \frac{1}{2} k(\mu + \lambda \sqrt{-\sigma}), \\
\xi_0 & = \frac{k^4 \lambda + c^2 + 2ck + k^2}{4k}.
\end{align*}
\]

where \(k\) and \(c\) are free constants.
Inserting the values of the parameters assembled in (21) into solution (19) along with (6) and (16), the following wide-ranging hyperbolic function solution is ascertained:

\[ u_1(x, t) = \frac{c + k}{2k} + k\sqrt{-\lambda}(\frac{A_1\cosh\sqrt{-\lambda} \xi + A_2\sinh\sqrt{-\lambda} \xi}{A_1\sinh\sqrt{-\lambda} \xi + A_2\cosh\sqrt{-\lambda} \xi + (\mu/\lambda)})^{-1} + \frac{\mu k}{\sqrt{-\lambda}}(\frac{1}{A_1\cosh\sqrt{-\lambda} \xi + A_2\sinh\sqrt{-\lambda} \xi}). \]  

(23)

In particular, if we set \( A_1 = 0, A_2 \neq 0, \) and \( \mu = 0 \) (or \( A_2 = 0, A_1 \neq 0 \) and \( \mu = 0 \)) into the solution (23), we obtain the successive singular kink and kink soliton solutions to the CRWP equation (15), respectively:

\[ u_{1_1} = \frac{c + k}{2k} + k\sqrt{-\lambda}\coth\sqrt{-\lambda} \xi, \]  

(24)

\[ u_{1_2} = \frac{c + k}{2k} + k\sqrt{-\lambda}\tanh\sqrt{-\lambda} \xi, \]  

(25)

where \( \xi = kx - c(t^\alpha/\alpha). \)

Furthermore, by means of the parameter values gathered in (22), we derive

\[ u_2(x, t) = \frac{c + k}{2k} + \frac{k}{2\sqrt{-\lambda}}(\frac{A_1\cosh\sqrt{-\lambda} \xi + A_2\sinh\sqrt{-\lambda} \xi}{A_1\sinh\sqrt{-\lambda} \xi + A_2\cosh\sqrt{-\lambda} \xi + (\mu/\lambda)})^{-1} + \frac{\mu k}{2\sqrt{-\lambda}}(\frac{1}{A_1\cosh\sqrt{-\lambda} \xi + A_2\sinh\sqrt{-\lambda} \xi}). \]  

(26)

Since \( A_1 \) and \( A_2 \) are integral constants, one might select their values spontaneously. Thus, if we select \( A_1 = 0, A_2 > 0, \) and \( \mu = 0 \) (or \( A_2 = 0, A_1 > 0, \) and \( \mu = 0 \)) into solution (26), we gain the following solitary wave solutions to the CRWP equation, respectively:

\[ u_{3_1} = \frac{c + k}{2k} + k\sqrt{-\lambda}(\coth\sqrt{-\lambda} \xi \pm \csc h\sqrt{-\lambda} \xi), \]  

(27)

\[ u_{3_2} = \frac{c + k}{2k} + \frac{k}{2\sqrt{-\lambda}}(\tanh\sqrt{-\lambda} \xi \pm i \sec h\sqrt{-\lambda} \xi), \]  

(28)

where \( \xi = kx - c(t^\alpha/\alpha). \)

Case 2: when \( \lambda > 0, \) embedding solution (19) into (18) and putting in use (4) and (8), equation (18) becomes polynomial in and \( \varphi. \)

Computing the action similar to case 1 and after resolving the algebraic equations, we ascertain the following values:

\[ a_0 = \frac{c + k}{2k}, \]  

(29)

\[ a_1 = -k\lambda, \]  

\[ b_1 = \mu k, \]  

\[ \xi_0 = \frac{4k^4\lambda + c^2 + 2ck + k^2}{4k}, \]  

(30)

where \( k \) and \( c \) are arbitrary constants.

Substituting the values scheduled in (29) into solution (19) along with (8) and (16), the succeeding trigonometric solution to the CRWP equation (15) is established:

\[ u_3(x, t) = \frac{c + k}{2k} + k\sqrt{-\lambda}(\frac{A_1\cos\sqrt{-\lambda} \xi - A_2\sin\sqrt{-\lambda} \xi}{A_1\sin\sqrt{-\lambda} \xi + A_2\cos\sqrt{-\lambda} \xi + (\mu/\lambda)})^{-1} + \frac{\mu k}{\sqrt{-\lambda}}(\frac{1}{A_1\cos\sqrt{-\lambda} \xi - A_2\sin\sqrt{-\lambda} \xi}). \]  

(31)

Since \( A_1 \) and \( A_2 \) are free constants, we may set \( A_1 = 0, A_2 \neq 0, \) and \( \mu = 0 \) (or \( A_2 = 0, A_1 \neq 0, \) and \( \mu = 0 \)) into solution (31), we derive the undermentioned periodic wave solutions to the CRWP equation:

\[ u_{3_1} = \frac{c + k}{2k} + k\sqrt{-\lambda}\cot\sqrt{-\lambda} \xi, \]  

(32)

\[ u_{3_2} = \frac{c + k}{2k} - k\sqrt{-\lambda}\tan\sqrt{-\lambda} \xi, \]  

(33)
A(\kappa \lambda ^{2} + \kappa ) = \frac{k \mu \lambda ^{2}}{\mu \lambda + A_1}

\xi = kx - c(t^{\alpha}/\alpha),

where \( \xi = kx - c(t^{\alpha}/\alpha) \).

By means of the values organized in (30), we extract the following solution:

\[
u(t, x) = \frac{c + k}{2k} \left[ 1 + \frac{k}{\sqrt{\mu}} \right] \left( A_1 \cos(\sqrt{\mu} \xi - A_2 \sin(\sqrt{\mu} \xi)) \right)^{-1} + \frac{k}{2\sqrt{\mu}} \frac{\mu + \lambda}{A_1 \cos(\sqrt{\mu} \xi - A_2 \sin(\sqrt{\mu} \xi))}
\]

(34)

Now, if we set \( A_1 = 0, A_2 > 0, \) and \( \mu = 0 \) (or \( A_2 = 0, A_1 > 0, \) and \( \mu = 0 \)) into solution (34), we obtain other periodic wave solutions to the CRWP equation:

\[
u_1(t, x) = \frac{c + k}{2k} + \frac{k}{2\sqrt{\mu}} (\cot(\sqrt{\mu} \xi + \frac{\pi i}{2}) \csc(\sqrt{\mu} \xi)), \]

(35)

\[
u_2(t, x) = \frac{c + k}{2k} - \frac{k}{2\sqrt{\mu}} (\tan(\sqrt{\mu} \xi + \frac{\pi}{2}) \sec(\sqrt{\mu} \xi)),
\]

(36)

where \( \xi = kx - c(t^{\alpha}/\alpha) \).

Case 3: when \( \lambda = 0 \), introducing (19) into equation (18) and executing (4) and (10), equation (18) becomes a polynomial in \((1/\phi)\) and \(\psi\). Vanishing the coefficients yields a set of algebraic equations, and solving this system the following results are obtained:

\[
a_0 = \frac{c + k}{2k},
\]

(37)

\[
a_1 = 0,
\]

\[
b_1 = \mu k,
\]

\[
\xi_0 = \frac{(c + k)^2}{4k}.
\]

Setting the values gathered in (37) into solution (19) along with (10) and (16), we carry out the next rational function solution to the CRWP equation:

\[
u_3 = \frac{c + k}{2k} + \frac{k \mu}{\mu \xi + A_1},
\]

(38)

where \( \xi = kx - c(t^{\alpha}/\alpha) \).

The obtained solutions can be compared with the solutions accessible in the literature. We detect that, by setting \( c = -k^2 \lambda + 2a_0 k - k \) and \( \mu = -(\lambda^2/4) \), the obtained solutions (24) and (25) fully agree with the corresponding solutions (3.19) and (3.20) established in [22], while the other solutions are different.

4.2. General Time Fractional STO Equation. The conformable general time fractional STO equation [41–43] is

\[
D_t^\alpha u + 3\beta u_x^2 + 3\beta u_x u_{xx} + 3\beta u_{xxx} + \beta u_{xxxx} = 0, \quad t > 0, 0 < \alpha \leq 1,
\]

(39)

where \( \beta \) is nonzero constant. The wave transformation is as follows:

\[
u(t, x) = U(\xi),
\]

(40)

\[
\xi = x + \omega t^{\alpha}/\alpha,
\]

where \( \omega \) is the velocity of the travelling wave; converting equation (39) into an ODE, we get

\[
\omega U'' + 3\beta (U')^2 + 3\beta U^2 U' + 3\beta U U'' + \beta U''' = 0.
\]

(41)

Integrating equation (41) once, we find

\[
\omega U + 3\beta U^2 U' + \beta U^3 + \beta U' = 0.
\]

(42)

Balancing \( U' \) and \( U^3 \) obtained from equation (42), we get \( N = 1 \) Thus, the solution structure of equation (42) is same of solution (19). Three cases as described in Section 3 will be discussed further:

Case 1: when \( \lambda < 0 \), placing the solution (19) into (42) and utilizing (4) and (6), equation (42) modifies to a polynomial in \((1/\phi)\) and \(\psi\). Setting each coefficient of the polynomial to zero yields a set of algebraic equations in \(a_0, a_1, b_1, \sigma, \lambda, \mu, \beta, \) and \( \omega \). From these equations with the help of Maple algebra software, we find the ensuing results of constants:

\[
a_0 = \frac{1}{2} \sqrt{-\lambda},
\]

(43)

\[
a_1 = -\frac{1}{2} \lambda,
\]

\[
b_1 = \frac{1}{2} (\mu + \lambda \sqrt{-\sigma}),
\]

\[
\omega = \beta \lambda,
\]

\[
a_0 = 0,
\]

(44)

\[
a_1 = -\frac{1}{2} \lambda,
\]

\[
b_1 = \frac{1}{2} (\mu + \lambda \sqrt{-\sigma}),
\]

\[
\omega = -\frac{1}{4} \beta \lambda,
\]

\[
a_0 = 0,
\]

(45)

\[
a_1 = -\lambda,
\]

\[
b_1 = \mu + \lambda \sqrt{-\sigma},
\]

\[
\omega = \beta \lambda,
\]
\[ a_0 = \pm \sqrt{-\lambda}, \]
\[ a_1 = -\lambda, \]
\[ b_1 = \mu, \]
\[ \omega = 4\beta, \]
\[ a_0 = 0, \]
\[ a_1 = -2\lambda, \]
\[ b_1 = 2\mu, \]
\[ \omega = 4\beta. \]

(46)

(47)

(48)

By means of parameter values sorted out in (43), along with (6) and (40), the following hyperbolic function solutions of the general time fractional STO equation are obtained:

\[
u_i(x, t) = \pm \frac{1}{2} \sqrt{-\lambda} + \frac{1}{2} \sqrt{-\lambda} \left( \frac{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi}{\sinh \sqrt{-\lambda} \xi + \cosh \sqrt{-\lambda} \xi + (\mu/\lambda)} \right)^{-1} - \frac{1}{2} \sqrt{-\lambda} \left( \frac{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi}{\sinh \sqrt{-\lambda} \xi + \cosh \sqrt{-\lambda} \xi + (\mu/\lambda)} \right).
\]

(49)

In solution (49), \( A_1 \) and \( A_2 \) are free parameters; therefore, we freely can choose our values. Thus, if we choose \( A_1 = 0, A_2 > 0, \) and \( \mu = 0 \) or \( A_2 = 0, A_1 > 0, \) and \( \mu = 0, \) from solution (49), we obtain the under-mentioned soliton solutions to the general time fractional STO equation:

\[
u_1(x, t) = \frac{1}{2} \sqrt{-\lambda} (1 \pm \coth \sqrt{-\lambda} \xi \pm \csc h \sqrt{-\lambda} \xi),
\]

(50)

\[
u_2(x, t) = \frac{1}{2} \sqrt{-\lambda} (1 \pm \tanh \sqrt{-\lambda} \xi) \pm \frac{1}{2} \sqrt{-\lambda} \sec h \sqrt{-\lambda} \xi,
\]

(51)

where \( \xi = x + \beta \lambda (t^\alpha/\alpha). \)

Furthermore, by means of the values scheduled in (44), we establish

\[
u_2(x, t) = \frac{1}{2} \sqrt{-\lambda} \left( \frac{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi}{\sinh \sqrt{-\lambda} \xi + \cosh \sqrt{-\lambda} \xi + (\mu/\lambda)} \right)^{-1} + \frac{1}{2} \sqrt{-\lambda} \left( \frac{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi}{\sinh \sqrt{-\lambda} \xi + \cosh \sqrt{-\lambda} \xi + (\mu/\lambda)} \right).
\]

(52)

Now, if we use \( A_1 = 0, A_2 > 0, \) and \( \mu = 0 \) or \( A_2 = 0, A_1 > 0, \) and \( \mu = 0, \) in (52), we attain the next soliton solutions to the general time fractional STO equation:

\[
u_{21} = \frac{1}{2} \sqrt{-\lambda} (\coth \sqrt{-\lambda} \xi \pm \csc h \sqrt{-\lambda} \xi),
\]

(53)

\[
u_{22} = \frac{1}{2} \sqrt{-\lambda} \tanh \sqrt{-\lambda} \xi \pm \frac{1}{2} \sqrt{-\lambda} \sec h \sqrt{-\lambda} \xi,
\]

(54)

where \( \xi = x + (1/4)\beta \lambda (t^\alpha/\alpha). \)

Moreover, by means of the values organized in (45), we carry out

\[
u_3(x, t) = \frac{1}{2} \sqrt{-\lambda} \left( \frac{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi}{\cosh \sqrt{-\lambda} \xi + \sinh \sqrt{-\lambda} \xi + (\mu/\lambda)} \right)^{-1}
\]

\[+ \frac{1}{2} \sqrt{-\lambda} \left( \frac{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi}{\sinh \sqrt{-\lambda} \xi + \cosh \sqrt{-\lambda} \xi + (\mu/\lambda)} \right).
\]

(55)

If we consider \( A_1 = 0, A_2 \neq 0, \) and \( \mu = 0 \) or \( A_2 = 0, A_1 \neq 0, \) and \( \mu = 0, \) from solution (55), we derive the solitary wave solutions given underneath:

\[
u_3 = \frac{1}{2} \sqrt{-\lambda} (\coth \sqrt{-\lambda} \xi \pm \csc h \sqrt{-\lambda} \xi),
\]

(56)

\[
u_4 = \frac{1}{2} \sqrt{-\lambda} \tanh \sqrt{-\lambda} \xi \pm \frac{1}{2} \sqrt{-\lambda} \sec h \sqrt{-\lambda} \xi,
\]

(57)

where \( \xi = x + \beta \lambda (t^\alpha/\alpha). \)

Similarly, making use of the values accumulated in (46), we determine

\[
u_4(x, t) = \frac{1}{2} \sqrt{-\lambda} + \frac{1}{2} \sqrt{-\lambda} \left( \frac{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi}{\sinh \sqrt{-\lambda} \xi + \cosh \sqrt{-\lambda} \xi + (\mu/\lambda)} \right)^{-1} + \frac{1}{2} \sqrt{-\lambda} \left( \frac{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi}{\sinh \sqrt{-\lambda} \xi + \cosh \sqrt{-\lambda} \xi + (\mu/\lambda)} \right).
\]

(58)

For \( A_1 = 0, A_2 \neq 0, \) and \( \mu = 0 \) or \( A_2 = 0, A_1 \neq 0, \) and \( \mu = 0, \) the solution (58) generates the kink and singular kink solutions given underneath:

\[
u_4 = \frac{1}{2} \sqrt{-\lambda} (1 \pm \coth \sqrt{-\lambda} \xi),
\]

(59)

\[
u_5 = \frac{1}{2} \sqrt{-\lambda} (1 \pm \tanh \sqrt{-\lambda} \xi),
\]

(60)

where \( \xi = x + 4\beta \lambda (t^\alpha/\alpha). \)
Likewise, with the help of the parametric values amassed in (47), we achieve

\[ u_5(x, t) = \sqrt{-\lambda} \left( \frac{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi}{A_1 \sinh \sqrt{-\lambda} \xi + A_2 \cosh \sqrt{-\lambda} \xi + (\mu/\lambda)} \right)^{-1} \]

\[ + \frac{\mu}{\sqrt{-\lambda}} \left( \frac{1}{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi} \right) \]

(61)

Choosing \( A_1 = 0, A_2 \neq 0, \) and \( \mu = 0 \) or \( A_2 = 0, A_1 \neq 0, \) and \( \mu = 0, \) solution (61) turns into

\[ u_{5_1} = \sqrt{-\lambda} \coth \sqrt{-\lambda} \xi, \]

(62)

\[ u_{5_2} = \sqrt{-\lambda} \tanh \sqrt{-\lambda} \xi, \]

(63)

where \( \xi = x + \beta \lambda (t^a/\alpha). \)

For the values gathered in (48), we found

\[ u_6(x, t) = 2\sqrt{-\lambda} \left( \frac{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi}{A_1 \sinh \sqrt{-\lambda} \xi + A_2 \cosh \sqrt{-\lambda} \xi + (\mu/\lambda)} \right)^{-1} \]

\[ + \frac{2\mu}{\sqrt{-\lambda}} \left( \frac{1}{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi} \right) \]

(64)

In particular, if we set \( A_1 = 0, A_2 \neq 0, \) and \( \mu = 0 \) (or \( A_2 = 0, A_1 \neq 0, \) and \( \mu = 0 \)), the solution (64) reduces to

\[ u_{6_1} = 2\sqrt{-\lambda} \coth \sqrt{-\lambda} \xi, \]

(65)

\[ u_{6_2} = 2\sqrt{-\lambda} \tanh \sqrt{-\lambda} \xi, \]

(66)

where \( \xi = x + 4\beta \lambda (t^a/\alpha). \)

Case 2: when \( \lambda > 0, \) we established by completing the parallel course of algorithms to case 1 and the following values for the constants:

\[ a_0 = \pm \frac{1}{2} i \sqrt{\lambda}, \]

\[ a_1 = \frac{-1}{2} \lambda, \]

(67)

\[ b_1 = \frac{1}{2} (\mu \pm \lambda \sqrt{\sigma}), \]

\[ \omega = \beta \lambda, \]

(68)

\[ a_0 = 0, \]

\[ a_1 = \frac{-1}{2} \lambda, \]

\[ b_1 = \frac{1}{2} (\mu \pm \lambda \sqrt{\sigma}), \]

\[ \omega = \frac{1}{2} \beta \lambda, \]

(69)

\[ a_0 = 0, \]

\[ a_1 = -\lambda, \]

(70)

\[ b_1 = \mu, \]

\[ \omega = 4\beta \lambda, \]

(71)

\[ a_0 = 0, \]

\[ a_1 = -\lambda, \]

\[ b_1 = 2\mu, \]

\[ \omega = 4\beta \lambda. \]

(72)

Substituting the sets of values ((67)–(72)) into solution (19) along with (8) and (40), we get the trigonometric function solutions for equation (39) as follows:

By means of (67), we obtain
If we consider $A_1 = 0, A_2 > 0$, and $\mu = 0$ (or $A_2 = 0, A_1 > 0$, and $\mu = 0$) in (73), the periodic wave solutions of equation (39) are found as follows:

$$u_{r_1} = \pm \frac{1}{2} \sqrt{\lambda} (i \pm \cot \sqrt{\lambda} \xi - \csc \sqrt{\lambda} \xi),$$  \hspace{1cm} \text{(74)}

$$u_{r_2} = \pm \frac{1}{2} \sqrt{\lambda} (i \mp \tan \sqrt{\lambda} \xi + \sec \sqrt{\lambda} \xi),$$  \hspace{1cm} \text{(75)}

where $\xi = x + \beta \lambda (t^\alpha/\alpha)$.

Through the values of the parameters gathered in (68), we derive

$$u_g (x, t) = \frac{1}{2} \sqrt{\lambda} \left( \frac{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi}{A_1 \sin \sqrt{\lambda} \xi + A_2 \cos \sqrt{\lambda} \xi + (\mu/\lambda)} \right)^{-1} + \frac{1}{\sqrt{\lambda}} \left( \frac{\mu \pm \lambda \sqrt{\sigma}}{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi} \right).$$  \hspace{1cm} \text{(76)}

Since $A_1$ and $A_2$ are subjective constants, one may pick their values freely. Thus, if we pick $A_1 = 0, A_2 \neq 0$, and $\mu = 0$ (or $A_2 = 0, A_1 \neq 0$, and $\mu = 0$), from (76), we found the periodic wave solutions of equation (39) as follows:

$$u_{s_1} = \frac{1}{2} \sqrt{\lambda} \left( \cot \sqrt{\lambda} \xi + \csc \sqrt{\lambda} \xi \right),$$  \hspace{1cm} \text{(77)}

$$u_{s_2} = \frac{1}{2} \sqrt{\lambda} \left( \tan \sqrt{\lambda} \xi + \sec \sqrt{\lambda} \xi \right),$$  \hspace{1cm} \text{(78)}

where $\xi = x + (1/4)\beta \lambda (t^\alpha/\alpha)$.

By virtue of the values scheduled in (69), we obtain

$$u_g (x, t) = -\sqrt{\lambda} \left( \frac{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi}{A_1 \sin \sqrt{\lambda} \xi + A_2 \cos \sqrt{\lambda} \xi + (\mu/\lambda)} \right)^{-1} + \frac{1}{\sqrt{\lambda}} \left( \frac{\mu \pm \lambda \sqrt{\sigma}}{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi} \right).$$  \hspace{1cm} \text{(79)}

If we set $A_1 = 0, A_2 \neq 0$, and $\mu = 0$ (or $A_2 = 0, A_1 \neq 0$, and $\mu = 0$) into solution (79), we ascertain the following periodic wave solutions to the general time fractional STO equation:

$$u_{l_1} = \sqrt{\lambda} \left( \cot \sqrt{\lambda} \xi + \csc \sqrt{\lambda} \xi \right),$$  \hspace{1cm} \text{(80)}

$$u_{l_2} = -\sqrt{\lambda} \left( \tan \sqrt{\lambda} \xi + \sec \sqrt{\lambda} \xi \right),$$  \hspace{1cm} \text{(81)}

where $\xi = x + \beta \lambda (t^\alpha/\alpha)$.

For the values accumulated in (70), we establish

$$u_{t_10} (x, t) = \pm i \sqrt{\lambda} \left( \frac{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi}{A_1 \sin \sqrt{\lambda} \xi + A_2 \cos \sqrt{\lambda} \xi + (\mu/\lambda)} \right)^{-1} + \frac{\mu}{\sqrt{\lambda}} \left( \frac{1}{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi} \right).$$  \hspace{1cm} \text{(82)}

Setting $A_1 = 0, A_2 \neq 0$, and $\mu = 0$ (or $A_2 = 0, A_1 \neq 0$, and $\mu = 0$), the solution (82) transformed to

$$u_{t_{10_1}} = \pm i \sqrt{\lambda} (i \pm \cot \sqrt{\lambda} \xi),$$  \hspace{1cm} \text{(83)}

$$u_{t_{10_2}} = \pm \sqrt{\lambda} (i \mp \tan \sqrt{\lambda} \xi),$$  \hspace{1cm} \text{(84)}

where $\xi = x + 4\beta \lambda (t^\alpha/\alpha)$.

Utilizing the values of the parameters arranged in (71), we obtain

$$u_{t_{11}} (x, t) = -\sqrt{\lambda} \left( \frac{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi}{A_1 \sin \sqrt{\lambda} \xi + A_2 \cos \sqrt{\lambda} \xi + (\mu/\lambda)} \right)^{-1} + \frac{\mu}{\sqrt{\lambda}} \left( \frac{1}{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi} \right).$$  \hspace{1cm} \text{(85)}

Now setting $A_1 = 0, A_2 \neq 0$, and $\mu = 0$ (or $A_2 = 0, A_1 \neq 0$, and $\mu = 0$), the solution (85) becomes

$$u_{t_{11_1}} = \sqrt{\lambda} \cot \sqrt{\lambda} \xi,$$  \hspace{1cm} \text{(86)}

$$u_{t_{11_2}} = -\sqrt{\lambda} \tan \sqrt{\lambda} \xi,$$  \hspace{1cm} \text{(87)}

where $\xi = x + \beta \lambda (t^\alpha/\alpha)$.

Embedding the parametric values compiled in (72), we find out

$$u_{t_{12}} (x, t) = -2 \sqrt{\lambda} \left( \frac{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi}{A_1 \sin \sqrt{\lambda} \xi + A_2 \cos \sqrt{\lambda} \xi + (\mu/\lambda)} \right)^{-1} + \frac{2\mu}{\sqrt{\lambda}} \left( \frac{1}{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi} \right).$$  \hspace{1cm} \text{(88)}

Suppose that $A_1 = 0, A_2 \neq 0$, and $\mu = 0$ (or $A_2 = 0, A_1 \neq 0$, and $\mu = 0$), then the solution (88) developed into

$$u_{t_{12_1}} = 2 \sqrt{\lambda} \cot \sqrt{\lambda} \xi,$$  \hspace{1cm} \text{(89)}

$$u_{t_{12_2}} = -2 \sqrt{\lambda} \tan \sqrt{\lambda} \xi,$$  \hspace{1cm} \text{(90)}

where $\xi = x + 4\beta \lambda (t^\alpha/\alpha)$.

From the obtained broad-ranging solutions, it is observed that setting definite values of the associated parameters, we manage to determine some particular solutions which coincide with those accessible in the literature and some fresh solutions are established. It is seen that, by putting $\beta = d$, the obtained solutions (53), (54), (77), and (78) completely agree with the solutions (4.8), (4.7), (4.11),
and (4.10), respectively, found in [43]. In addition to these solutions, we found many more solutions that were not found in any other studies.

4.3. Space-Time Fractional KleinGordon Equation. In this subsection, we extract the closed form solutions to the space-time fractional KleinGordon equation. Let us consider the KleinGordon equation with space-time fractional order [44, 45]:

\[ D^\alpha_x (D^\gamma_t u) - D^\beta_x (D^\delta_t u) - \beta u - \gamma u^3 = 0, \quad t > 0, \quad 0 < \alpha \leq 1, \]

(91)

where \( \beta \) and \( \gamma \) are nonzero constants. We apply the following transformation for reducing equation (91) to an ODE:

\[ u(x, t) = U(\xi), \]

\[ \xi = k \frac{x^\alpha}{\alpha} - c \frac{t^\beta}{\beta}, \]

(92)

where \( k \) and \( c \) are nonzero constants. Thus, the space-time fractional KleinGordon equation turns out as follows:

\[ (k^2 - c^2)U'' + \beta U + \gamma U^3 = 0. \]

(93)

Balancing \( U'' \) and \( U^3 \) in equation (93), we found \( N = 1 \). On account of this, the structure of the solution of equation (93) is identical to the shape of the solution of equation (19) and therefore has not been repeated. There are three cases should be discussed as described in Section 3:

Case 1: when \( \lambda < 0 \), plugging in (19) into equation (93) and utilizing (4) and (6), equation (93) will be converted into a polynomial in \( (1/\phi) \) and \( \psi \). Equalizing the coefficients of this polynomial to zero yields a set of algebraic equations for \( a_0, a_1, b_1, c, k, \sigma, \lambda, \mu, \beta, \) and \( \gamma \). Resolving these equations with the assistance of computer algebra, like Maple software package, we found the following values for the constants:

\[ a_0 = 0, \]
\[ a_1 = \pm \sqrt{\frac{\lambda \beta}{\gamma}}, \]
\[ a_1 = \pm \mu \sqrt{\frac{\beta}{\lambda \gamma}}, \]
\[ b_1 = \pm \frac{\sqrt{2 \lambda k^2 + \beta}}{2 \lambda}, \]
\[ c = \pm \frac{\sqrt{\lambda k^2 - \beta}}{\lambda}, \]

where \( k, \beta, \gamma, \) and \( \mu \) are free parameters.

Inserting the sets of constant values from (94) into solution (19) along with (6) and (92), the following hyperbolic function solutions to the space-time fractional KleinGordon are obtained:

By means of the values assembled in (94), we attain

\[ u_1(x, t) = \pm \sqrt{\frac{\beta}{\gamma}} \left( \frac{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi}{A_1 \sinh \sqrt{-\lambda} \xi + A_2 \cosh \sqrt{-\lambda} \xi + (\mu/\lambda)} \right)^{-1}, \]

\[ + \frac{\mu}{\lambda} \sqrt{\frac{\beta}{\gamma}} \left( \frac{1}{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi} \right), \]

(97)

where \( \xi = k (x^\alpha/\alpha) + \sqrt{(2 \lambda k^2 + \beta/2 \lambda)} \) \((t^\alpha/\alpha)\).

With the help of the values arranged in (95), we carry out

\[ u_2(x, t) = \pm \frac{2 \lambda \sigma}{\gamma} \left( \frac{1}{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi} \right), \]

(98)

where \( \xi = k (x^\alpha/\alpha) + \sqrt{((\lambda k^2 - \beta)/\lambda)} \) \((t^\alpha/\alpha)\).

On the other hand, by means of (96), we derive

\[ u_3(x, t) = \pm \sqrt{\frac{\beta}{\gamma}} \left( \frac{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi}{A_1 \sinh \sqrt{-\lambda} \xi + A_2 \cosh \sqrt{-\lambda} \xi + (\mu/\lambda)} \right)^{-1}, \]

\[ + \frac{1}{\lambda} \sqrt{\frac{\beta}{\gamma}} \left( \frac{\mu + \lambda \sqrt{-\sigma}}{A_1 \cosh \sqrt{-\lambda} \xi + A_2 \sinh \sqrt{-\lambda} \xi} \right), \]

(99)

where \( \xi = k (x^\alpha/\alpha) \pm \sqrt{(\lambda k^2 + 2 \beta/\lambda)} \) \((t^\alpha/\alpha)\).

Case 2: when \( \lambda > 0 \), executing the analogous steps as case 1, a system of algebraic equations can be found and after resolving this system of equations, we obtain three sets of values of the constants as follows:
solution: function solutions to the space-time fractional KleinGordon equation from where scores of periodic solitary wave solutions can be extracted selecting special values for parameters. But, for simplicity, particular solutions are omitted.

In this section, we have established the general solutions (97)–(99) and (103)–(105) to the space-time fractional KleinGordon equation from where scores of periodic solitary wave solutions can be extracted selecting special values for parameters. But, for simplicity, particular solutions are omitted.

The obtained results can be compared with the exact solutions accessible in the literature. In [45], the exact solutions of the space-time fractional KleinGordon equation are established by using the \((G'/G, 1/G)\)-expansion method. It is seen that the solutions established in this study are different than the solutions found in [45].

\[ u_4(x, t) = \pm \sqrt{\frac{\beta}{\gamma}} \left( \frac{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi}{A_1 \sin \sqrt{\lambda} \xi + A_2 \cos \sqrt{\lambda} \xi + (\mu/\lambda)} \right)^{-1} \]

\[ \pm \frac{\mu}{\lambda} \sqrt{\frac{\beta}{\gamma}} \left( \frac{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi}{A_1 \sin \sqrt{\lambda} \xi + A_2 \cos \sqrt{\lambda} \xi + (\mu/\lambda)} \right), \]

where \( \xi = k(x^a/\alpha) \mp \sqrt{(2\lambda k^2 + \beta)/2\lambda} (t^a/\alpha). \)

Similarly, for the values organized in (101), we accomplish

\[ u_5(x, t) = \pm \frac{\beta}{\gamma} \left( \frac{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi}{A_1 \sin \sqrt{\lambda} \xi + A_2 \cos \sqrt{\lambda} \xi + (\mu/\lambda)} \right), \]

where \( \xi = k(x^a/\alpha) \mp \sqrt{(\lambda k^2 - \beta)/\lambda} (t^a/\alpha). \)

And, for the values laid out in (102), we ascertain

\[ u_6(x, t) = \pm \frac{\beta}{\gamma} \left( \frac{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi}{A_1 \sin \sqrt{\lambda} \xi + A_2 \cos \sqrt{\lambda} \xi + (\mu/\lambda)} \right)^{-1} \]

\[ \pm \frac{1}{\lambda} \sqrt{\frac{\beta}{\gamma}} \left( \frac{\mu \mp \lambda \sqrt{\sigma}}{A_1 \cos \sqrt{\lambda} \xi - A_2 \sin \sqrt{\lambda} \xi} \right), \]

where \( \xi = k(x^a/\alpha) \mp \sqrt{(\lambda k^2 + 2\beta/\lambda)} (t^a/\alpha). \)

For the values arranged in (100), we obtain the general solution:

\[ a_0 = 0, \]
\[ a_1 = \mp \sqrt{\frac{\beta}{\gamma}}, \]
\[ b_1 = \pm \mu \sqrt{\frac{\beta}{\lambda}}, \]
\[ c = \pm \sqrt{\frac{2\lambda k^2 + \beta}{2\lambda}}. \]

For the values in (101), we have:

\[ a_0 = 0, \]
\[ a_1 = 0, \]
\[ b_1 = \pm \sqrt{\frac{2\beta \sigma}{\gamma}}, \]
\[ c = \pm \sqrt{\frac{2\lambda k^2 - \beta}{\lambda}}. \]

For the values in (102), we have:

\[ a_0 = 0, \]
\[ a_1 = \pm \sqrt{\frac{\beta}{\gamma}}, \]
\[ b_1 = \pm \frac{\beta}{\lambda} \left( \mu \mp \sqrt{\sigma} \right), \]
\[ c = \pm \sqrt{\frac{\lambda k^2 + 2\beta}{\lambda}}. \]
5. Physical Explanations

In this section, we put forth the physical explanation and the 2D and 3D graphical representation of the solutions obtained for the time fractional CRWP equation, the general time fractional STO equation, and the space-time fractional KleinGordon equation as follows:

Solutions (25), (28), (51), (54), (57), (60), (63), (66), and (97) are the kink-shape soliton. Kink waves are travelling waves which arise from one asymptotic position to another. Figure 1 shows the shape of the kink solution (63). Other figures are omitted for convenience.

Moreover, solutions (24), (27), (50), (53), (56), (59), (62), (65), and (99) are singular kink solitons. Figure 2 shows the

Figure 2: Singular kink-shape wave of (24) when $c = 1$, $k = -1$, $\lambda = -1$, $\alpha = 0.5$, $-20 \leq x \leq 20$, and $0.1 \leq t \leq 20$.

Figure 3: Singular periodic wave shape of (104) when $\beta = 1$, $k = 1$, $y = -1$, $\lambda = 1$, $\alpha = 0.5$, $-20 \leq x \leq 20$, and $0 \leq t \leq 20$.

Figure 4: Soliton wave shape of (98) when $\beta = 1$, $k = 1$, $y = -1$, $\lambda = -1$, $\alpha = 0.95$, $-10 \leq x \leq 10$, and $0 \leq t \leq 7$.

5. Physical Explanations

In this section, we put forth the physical explanation and the 2D and 3D graphical representation of the solutions obtained for the time fractional CRWP equation, the general time fractional STO equation, and the space-time fractional KleinGordon equation as follows:

Solutions (25), (28), (51), (54), (57), (60), (63), (66), and (97) are the kink-shape soliton. Kink waves are travelling waves which arise from one asymptotic position to another. Figure 1 shows the shape of the kink solution (63). Other figures are omitted for convenience.

Moreover, solutions (24), (27), (50), (53), (56), (59), (62), (65), and (99) are singular kink solitons. Figure 2 shows the
shape of the singular kink solution (24). The residual figures are left for simplicity.

On the other hand, solutions (32), (33), (35), (36), (74), (75), (77), (78), (80), (81), (83), (84), (86), (87), (89), (90), and (103)–(105) are the exact periodic wave solutions. Periodic solutions are travelling wave solutions that are periodic like sin(x – t). Figure 3 shows the singular periodic solution of (104). The remaining graphs are left for minimalism.

Solution (98) is the soliton solution. Figure 4 shows the shape of the exact soliton solution of (98) of the space-time fractional Klein-Gordon equation.

6. Conclusion

In this article, we have introduced an extension of the \((G'/G, 1/G)\)-expansion method to look into nonlinear fractional differential equations in the sense of conformable derivative. Taking the advantage of this extension, the time fractional CRWP equation, the general time fractional STO equation, and the space-time fractional Klein-Gordon equation have been investigated. Scores of broad-ranging combination of hyperbolic, trigonometric, and rational function associated with free parameters. For definite values of these parameters, some known periodic, kink, and solitary wave solutions accessible in the literature are derived from the general solutions and some fresh solutions are originated. This study shows that the proposed extension is quite efficient, useful, direct, and easily computable with the aid of Maple software package and practically well suited to be used in finding analytical exact solutions to many other nonlinear FDEs, and this is our scheme in the future.
