SCALE INVARIANT EFFECTIVE HAMILTONIANS FOR A GRAPH WITH A SMALL COMPACT CORE

CLAUDIO CACCIAPUOTI

Abstract. We consider a compact metric graph of size $\varepsilon$, and attach to it several edges (leads) of length of order one (or of infinite length). As $\varepsilon$ goes to zero, the graph $\mathcal{G}^\varepsilon$ obtained in this way looks like the star-graph formed by the leads joined in a central vertex.

On $\mathcal{G}^\varepsilon$ we define an Hamiltonian $H^\varepsilon$, properly scaled with the parameter $\varepsilon$. We prove that there exists a scale invariant effective Hamiltonian on the star-graph that approximates $H^\varepsilon$ (in a suitable norm resolvent sense) as $\varepsilon \to 0$.

The effective Hamiltonian depends on the spectral properties of an auxiliary $\varepsilon$-independent Hamiltonian defined on the compact graph obtained by setting $\varepsilon = 1$. If zero is not an eigenvalue of the auxiliary Hamiltonian, in the limit $\varepsilon \to 0$, the leads are decoupled.

Keywords: Metric graphs; scaling limit; Krein formula; point interactions.

1. Introduction

One nice feature of quantum graphs (metric graphs equipped with differential operators) is that they are simple objects. In many cases, for example in the framework of the analysis of self-adjoint realizations of the Laplacian, it is possible to write down explicit formulae for the relevant quantities, such as the resolvent or the scattering matrix (see, e.g., [23] and [24]).

If the graph is too intricate though, it can be difficult, if not impossible, to perform exact computations. In such a situation, one may be interested in a simpler, effective model which captures only the most essential features of a complex quantum graph.

If several edges of the graph are much shorter than others, an effective model should rely on a simpler graph obtained by shrinking the short edges into vertices. These new vertices should keep track of at least some of the spectral or scattering properties of the shrinking edges, and perform as a black box approximation for a small, possibly intricate, network.

Our goal is to understand under what circumstances this type of effective models can be implemented. In this report we give some preliminary results showing that under certain assumptions such approximation is possible.

To fix the ideas, consider a compact metric graph $\mathcal{G}^{in,\varepsilon}$ of size (total length) $\varepsilon$, and attach to it several edges of length of order one (or of infinite length), the leads. Clearly, when $\varepsilon$ goes to zero, the graph obtained in this way (let us denote it by $\mathcal{G}^\varepsilon$) looks like the star-graph formed by the leads joined in a central vertex. Let us denote by $\mathcal{G}^{out}$ such star-graph and by $v_0$ the central vertex.

Given a certain Hamiltonian (self-adjoint Schrödinger operator) $H^\varepsilon$ on $\mathcal{G}^\varepsilon$, we want to show that there exists an Hamiltonian $H^{out}$ on $\mathcal{G}^{out}$ such that, for small $\varepsilon$, $H^{out}$ approximates (in a sense to be specified) $H^\varepsilon$. Of course, one main issue is to understand what boundary conditions in the vertex $v_0$ characterize the domain of $H^{out}$.

It turns out that, under several technical assumptions, the boundary conditions in $v_0$ are fully determined by the spectral properties of an auxiliary, $\varepsilon$-independent Hamiltonian defined on the graph $\mathcal{G}^{in} = \mathcal{G}^{in,\varepsilon=1}$.

Below we briefly discuss these technical assumptions, and refer to Section 2 for the details.

(i) The Hamiltonian $H^\varepsilon$ on $\mathcal{G}^\varepsilon$ is a self-adjoint realization of the operator $-\Delta + B^\varepsilon$ on $\mathcal{G}^\varepsilon$, where $B^\varepsilon$ is a potential term.

(ii) To set up the graph $\mathcal{G}^\varepsilon$ we select $N$ distinct vertices in $\mathcal{G}^{in,\varepsilon}$ (we call them connecting vertices) and attach to each of them one lead, which is either a finite or an infinite length edge. The domain of $H^\varepsilon$ is characterized by Kirchhoff (also called standard or free) boundary conditions.

The author is grateful to Gregory Berkolaiko and Andrea Posilicano for enlightening discussions. The author also thanks the anonymous referees for many useful comments that helped to improve the quality of the paper.
at the connecting vertices, i.e., in each connecting vertex functions are continuous and the sum of the
outgoing derivatives equals zero.

(iii) (Scale Invariance) The small (or inner) part of the graph scales uniformly in \( \varepsilon \), i.e., \( G^{in,\varepsilon} = \varepsilon G^{in} \).
The Hamiltonian \( H^\varepsilon \) has a specific scaling property with respect to the parameter \( \varepsilon \): loosely
speaking, up to a multiplicative factor, the “restriction” of \( H^\varepsilon \) to \( G^{in,\varepsilon} \) is unitarily equivalent
to an \( \varepsilon \)-independent operator on \( G^{in} \). The scale invariance property can be made precise by
reasoning in terms of Hamiltonians on the inner graph \( G^{in,\varepsilon} \). This is done in Section 4 below.
Here we just mention that this assumption forces the scaling on the in component of the potential
\( B^{in,\varepsilon}(x) = \varepsilon^{-2} B^{in}(x/\varepsilon), x \in G^{in,\varepsilon} \), and, in the vertices of \( G^{in,\varepsilon} \), the Robin-type vertex conditions
(if any) also scale with \( \varepsilon \) accordingly.

(iv) The “restriction” of \( H^\varepsilon \) to the leads does not depend on \( \varepsilon \). In particular, \( B^{out} \), the out component
of the potential, does not depend on \( \varepsilon \).

We prove that it is always possible to identify an Hamiltonian \( H^{out} \) on \( G^{out} \) that approximates
the Hamiltonian \( H^\varepsilon \). The Hamiltonian \( H^{out} \) is a self-adjoint realization of the operator \( -\Delta + B^{out} \) on \( G^{out} \),
and it is characterized by scale invariant vertex conditions in \( v_0 \), i.e., vertex conditions with no Robin
part (see [4 Sec. 1.4.2]); in our notation, scale invariant means \( \Theta_\varepsilon = 0 \) in Eq. (2.1). The precise form of
the possible effective Hamiltonians is given in Defs 2.10 and 2.11 below.

The convergence of \( H^\varepsilon \) to \( H^{out} \) is understood in the following sense. We look at the resolvent operator
\( R^\varepsilon_z := (H^\varepsilon - z)^{-1}, z \in \mathbb{C} \backslash \mathbb{R} \), as an operator in the Hilbert space \( L^2(G^\varepsilon) = L^2(G^{out}) \oplus L^2(G^{in,\varepsilon}) \). In the
limit \( \varepsilon \to 0 \), the bounded operator \( R^\varepsilon_z \) converges to an operator which is diagonal in the decomposition
\( L^2(G^{out}) \oplus L^2(G^{in,\varepsilon}) \). The out/out component of the limiting operator is the resolvent of a self-adjoint
operator in \( L^2(G^{out}) \), which we identify as the effective Hamiltonian on the star-graph.

Additionally, we characterize the limiting boundary conditions in the vertex \( v_0 \) in terms of the spectral
properties of an auxiliary Hamiltonian on the (compact) graph \( G^{in} = G^{in,\varepsilon=1} \). We distinguish two
mutually exclusive cases: in one case that we callGeneric zero is not an eigenvalue of the auxiliary
Hamiltonian; in the other case (we call it Non-Generic) zero is an eigenvalue of the auxiliary Hamiltonian.

In the Generic Case the effective Hamiltonian, denoted by \( H^{out} \), is characterized by Dirichlet (also
called decoupling) boundary conditions in the vertex \( v_0 \), i.e., functions in its domain are zero in \( v_0 \), see
Def. 2.10. From the point of view of applications this is the less interesting case, since the leads are
decoupled (no transmission through \( v_0 \) is possible).

In the Non-Generic Case the situation is more involved. If zero is an eigenvalue of the auxiliary
Hamiltonian one can identify a corresponding set of orthonormal eigenfunctions (in general eigenvalues
may have multiplicity larger than one, included the zero eigenvalue). In the domain of the effective
Hamiltonian \( H^{out} \), the boundary conditions in \( v_0 \) are associated to the values of these eigenfunctions in
the connecting vertices, see Def. 2.11. In this case, the boundary conditions in the vertex \( v_0 \) are scale
invariant but, in general, not of decoupling type. For example, if the multiplicity of the zero eigenvalue
is one, and the corresponding eigenfunction assumes the same value in all the connecting vertices, the
boundary conditions are of Kirchhoff type.

The proof of the convergence is based on a Krein-type formula for the resolvent \( R^\varepsilon_z \). This formula
allows us to write \( R^\varepsilon_z \) as a block matrix operator in the decomposition \( L^2(G^\varepsilon) = L^2(G^{out}) \oplus L^2(G^{in,\varepsilon}) \)
(see Eq. 3.13). In the formula, the first term, \( R^\varepsilon_{\|} \), is block diagonal and contains the resolvents of \( H^{out} \)
and \( H^{in,\varepsilon} \) (a scaled down version of the Auxiliary Hamiltonian, see Section 2.4); the second term is non-
trivial, and couples the out and in components to reconstruct the resolvent of the full Hamiltonian \( H^\varepsilon \).
As \( \varepsilon \) goes to zero, the off-diagonal components in \( R^\varepsilon_{\|} \) converge to zero, hence, the out and in components are always decoupled in the limit. A careful analysis of the non-trivial term in formula 3.13 shows that it
converges to zero in the Generic Case. In the Non-Generic Case, instead, the out/out component of the non-trivial term converges to a finite operator, and the whole out/out component of \( R^\varepsilon_{\|} \) reconstructs the resolvent of the effective Hamiltonian \( H_0 \).

The limiting behavior of \( H^\varepsilon \) is essentially determined by the small \( \varepsilon \) asymptotics of the spectrum of the
inner Hamiltonian \( H^{in,\varepsilon} \). The scale invariance assumption implies that the eigenvalues of \( H^{in,\varepsilon} \) are given by
\( \lambda_{\varepsilon} = \lambda_\varepsilon/\varepsilon^2 \), where \( \lambda_\varepsilon \) are the eigenvalues of the (scaled up) auxiliary Hamiltonian \( H^{in} \). Obviously,
all the non-zero eigenvalues move to infinity as \( \varepsilon \to 0 \); the zero eigenvalue instead, if it exists, persists,
for this reason it plays a special rôle in the analysis.

Closely related to our work is the paper by G. Berkolaiko, Y. Latushkin, and S. Sukhtaiev [5], to which
we refer also for additional references. In [5] the authors analyze the convergence of Schrödinger operators
on metric graphs with shrinking edges. Our setting is similar to the one in [5] with several differences. In
there are no restrictions on the topology of the graph, i.e., $G^{\text{out}}$ is not necessarily a star-graph; outer edges can form loops, be connected among them or to arbitrarily intricate finite length graphs. In [5], moreover, the scale invariance assumption is missing. With respect to our work, however, the potential terms in [5] do not play an essential rôle in the limiting problem (because they are uniformly bounded in the scaling parameter).

As it was done in [5], to analyze the convergence of $H^\varepsilon$ to $H^{\text{out}}$, since they are operators on different Hilbert spaces, one could use the notion of $\delta$-quasi unitary equivalence (or generalized norm resolvent convergence) introduced by P. Exner and O. Post in the series of works [16, 17, 18, 31, 32]. In Ths. 2.12 and 2.13 we state our main results in terms of the expansion of the resolvent in the decomposition $L^2(G^\varepsilon) = L^2(G^{\text{out}}) \oplus L^2(G^{\text{in},\varepsilon})$; and comment on the $\delta^3$-quasi unitary equivalence of the operators $H^\varepsilon$ and $H^{\text{out}}$ (or $\tilde{H}^{\text{out}}$) in Rem. 2.15.

Our analysis, with the scaling on the potential $B^{\text{in},\varepsilon}(x) = \varepsilon^{-2}B^{\text{in}}(x/\varepsilon)$, is also related to the problem of approximating point-interactions on the real line through scaled potentials in the presence of a zero energy resonance, see, e.g., [20]. The same type of scaling arises naturally also in the study of the convergence of Schrödinger operators in thin waveguides to operators on graphs, see, e.g., [1, 9, 10, 11].

Problems on graphs with a small compact core have been studied in several papers in the case in which $G^\varepsilon$ is itself a star-graph, see, e.g., [14, 15, 25, 26, 27]. In particular, in the latter series of works, the authors point out the rôle of the zero energy eigenvalue.

Also related to our work is the problem of the approximation of vertex conditions through “physical Hamiltonians”. In [12] (see also references therein), it is shown that all the possible self-adjoint boundary conditions at the central vertex of a star-graph, can be obtained as the limit of Hamiltonians with $\delta$-interactions and magnetic field terms on a graph with a shrinking inner part.

Instead of looking at the convergence of the resolvent, a different approach consists in the analysis of the time dependent problem. This is done, e.g., in [3], for a tadpole-graph as the circle shrinks to a point.

The paper is structured as follows. In Section 2 we introduce some notation, our assumptions and present the main results, see Ths. 2.12 and 2.13. In Section 3 we discuss the Krein formulae for the resolvents of $H^\varepsilon$ and $\tilde{H}^{\text{out}}$ (the limiting Hamiltonian in the Non-Generic Case). These formulae are the main tools in our analysis. In Section 4 we discuss the scale invariance properties of the auxiliary Hamiltonian, and other relevant operators. In Section 5 we prove Ths. 2.12 and 2.13. In doing so we present the results with a finer estimate of the remainder, see Ths. 5.4 and 5.9. We conclude the paper with two appendices: in Appendix A we briefly discuss the proofs of the Krein resolvent formulae from Section 3 in Appendix B we prove some useful bounds on the eigenvalues and eigenfunctions of $H^{\text{in}}$.

Index of notation. For the convenience of the reader we recall here the notation for the Hamiltonians used in our analysis. For the definitions we refer to Section 2 below.

- $H^\varepsilon$ full Hamiltonian.
- $H^{\text{in}}$ auxiliary Hamiltonian.
- $H^{\text{in},\varepsilon}$ scaled down auxiliary Hamiltonian (see Definition 2.5 and Section 4).
- $\tilde{H}^{\text{out}}$ effective Hamiltonian in the Generic Case.
- $H^{\text{out}}$ effective Hamiltonian in the Non-Generic Case.
- $H^\varepsilon$ diagonal Hamiltonian $H^\varepsilon = \text{diag}(\tilde{H}^{\text{out}}, H^{\text{in},\varepsilon})$ in the decomposition $L^2(G^\varepsilon) = L^2(G^{\text{out}}) \oplus L^2(G^{\text{in},\varepsilon})$ (see Section 4).

2. Preliminaries and main result

For a general introduction to metric graphs we refer to the monograph [4]. Here, for the convenience of the reader, we introduce some notation and recall few basic notions that will be used throughout the paper.

2.1. Basic notions and notation. To fix the ideas we start by selecting a collection of points, the vertices of the graph, and a connection rule among them. The bonds joining the vertices are associated to oriented segments and are the finite-length edges of the graph. Other edges can be of infinite length, these edges are connected only to one vertex and are associated to half-lines. In this way we obtained a metric graph, see, e.g., Fig. 1. Given a metric graph $G$ we denote by $\mathcal{E}$ the set of its edges and by $\mathcal{V}$ the set of its vertices. We shall also use the notation $|\mathcal{E}|$ and $|\mathcal{V}|$ to denote the cardinality of $\mathcal{E}$ and $\mathcal{V}$ respectively. We shall always assume that both $|\mathcal{E}|$ and $|\mathcal{V}|$ are finite.

For any $e \in \mathcal{E}$, we identify the corresponding edge with the segment $[0, \ell_e]$ if $e$ has finite length $\ell_e > 0$, or with $[0, +\infty)$ if $e$ has infinite length.
Given a function $\psi : \mathcal{G} \to \mathbb{C}$, for $e \in \mathcal{E}$, $\psi_e$ denotes its restriction to the edge $e$. With this notation in mind one can define the Hilbert space
\[ \mathcal{H} := \bigoplus_{e \in \mathcal{E}} L^2(e), \]
with scalar product and norm given by
\[ (\phi, \psi)_{\mathcal{H}} := \sum_{e \in \mathcal{E}} (\phi_e, \psi_e)_{L^2(e)} \quad \text{and} \quad \|\psi\|_{\mathcal{H}} := (\psi, \psi)_{\mathcal{H}}^{1/2}. \]
In a similar way one can define the Sobolev space $\mathcal{H}_2 := \bigoplus_{e \in \mathcal{E}} H^2(e)$, equipped with the norm
\[ \|\psi\|_{\mathcal{H}_2} := \left( \sum_{e \in \mathcal{E}} \|\psi_e\|_{H^2(e)}^2 \right)^{1/2}. \]
Note that functions in $\mathcal{H}_2$ are continuous in the edges of the graph but do not need to be continuous in the vertices.

For any vertex $v \in \mathcal{V}$ we denote by $d(v)$ the degree of the vertex, this is the number of edges having one endpoint identified by $v$, counting twice the edges that have both endpoints coinciding with $v$ (loops). Let $\mathcal{E}_v \subseteq \mathcal{E}$ be the set of edges which are incident to the vertex $v$. For any vertex $v$ we order the edges in $\mathcal{E}_v$ in an arbitrary way, counting twice the loops. In this way, for an arbitrary function $\psi \in \mathcal{H}_2$, one can define the vector $\Psi(v) \in \mathbb{C}^{d(v)}$ associated to the evaluation of $\psi$ in $v$, i.e., the components of $\Psi(v)$ are given by $\psi_e(0)$ or $\psi_e(\ell_e)$, $e \in \mathcal{E}_v$, depending whether $v$ is the initial or terminal vertex of the edge $e$, or by both values if $e$ is a loop.

In a similar way one can define the vector $\Psi'(v) \in \mathbb{C}^{d(v)}$ with components $\psi_e'(0)$ and $-\psi_e'(\ell_e)$, $e \in \mathcal{E}_v$. Note that in the definition of $\Psi'(v)$, $\psi_e'$ denotes the derivative of $\psi_e(x)$ with respect to $x$, and the derivative in $v$ is always taken in the outgoing direction with respect to the vertex.

We are interested in defining self-adjoint operators in $\mathcal{H}$ which coincide with the Laplacian, possibly plus a potential term.

We denote by $B$ the potential term in the operator, so that $B : \mathcal{G} \to \mathbb{R}$ is a real-valued function on the graph; and denote by $B_v$ its restriction to the edge $e$. Additionally we assume that $B$ is bounded and compactly supported on $\mathcal{G}$.

For every vertex $v \in \mathcal{V}$ we define a projection $P_v : \mathbb{C}^{d(v)} \to \mathbb{C}^{d(v)}$ and a self-adjoint operator $\Theta_v$ in $\text{Ran} P_v$, both $P_v$ and $\Theta_v$ can be identified with Hermitian $d(v) \times d(v)$ matrices.

It is well known, see, e.g., [4] and [30, Example 5.2], that the operator $H_{P,\Theta}$ defined by:
\[ D(H_{P,\Theta}) := \{ \psi \in \mathcal{H}_2 \mid P_v \Psi(v) = 0, P_v \Psi'(v) = 0 \quad \forall v \in \mathcal{V} \} \quad (2.1) \]
\[ (H_{P,\Theta})_e \psi_e := -\psi_e'' + B_e \psi_e \quad \forall e \in \mathcal{E} \quad (2.2) \]
is self-adjoint. Instead of Eq. (2.2), we shall write
\[ H_{P,\Theta} \psi := -\psi'' + B \psi, \quad (2.3) \]
to be understood componentwise.

We remark that for every $P_v$ and $\Theta_v$ as above, $H_{P,\Theta}$ is a self-adjoint extension of the symmetric operator $H_{\text{min}}$
\[ D(H_{\text{min}}) := \{ \psi \in \mathcal{H}_2 \mid \Psi(v) = 0, \Psi'(v) = 0 \quad \forall v \in \mathcal{V} \} \quad H_{\text{min}} \psi := -\psi'' + B \psi. \]
2.2. Graphs with a small compact core. We consider a graph \( G^\varepsilon \) obtained by attaching several edges to a small compact core (a compact metric graph of size \( \varepsilon \)).

We denote the compact core of the graph by \( G^{in,\varepsilon} \). The graph \( G^{in,\varepsilon} \) is obtained by shrinking a compact graph \( \tilde{G}^{in} \) by means of a parameter \( 0 < \varepsilon < 1 \), more precisely, we set
\[
G^{in,\varepsilon} = \varepsilon \tilde{G}^{in}.
\]

We denote by \( E^{in} \) the set of edges of the graph \( G^{in} \) and by \( E^{in,\varepsilon} \) the set of edges of the graph \( G^{in,\varepsilon} \).

In the graph \( G^{in} \) (or, equivalently, in \( G^{in,\varepsilon} \)) we select \( N \) distinct vertices that we label with \( v_1, ... , v_N \), and refer to them as connecting vertices. We shall denote by \( \mathcal{C} \) the set of connecting vertices. We denote by \( V^{in} \) the set of all the remaining vertices, and call the elements of \( V^{in} \) inner vertices (note that the set \( V^{in} \) may be empty).

To construct the graph \( G^\varepsilon \), we attach to each connecting vertex one additional edge which can be an half-line or an edge of finite length (not dependent on \( \varepsilon \)). We shall call these additional edges outer edges and denote by \( E^{out} \) the corresponding set of edges; obviously \( |E^{out}| = N \). When needed, we shall denote these edges by \( e_1, ... , e_N \), so that the edge \( e_j \) is connected to the vertex \( v_j, j = 1, ..., N \). Moreover we shall use the notation
\[
\psi_{e_j} \equiv \psi_j \quad e_j \in E^{out}, \; j = 1, ..., N.
\]

Note that if \( e \in E^{out} \) is of finite length the endpoint which does not coincide with the connecting vertex is of degree one (all the finite length outer edges are pendants).

We shall always assume, without loss of generality, that for each edge in \( E^{out} \) the connecting vertex is identified by \( x = 0 \).

We denote by \( E^{\varepsilon} \) and \( V \) the sets of edges and vertices of the graph \( G^{\varepsilon} \). We note that \( E^{\varepsilon} = E^{out} \cup E^{in,\varepsilon} \) and \( V = V^{out} \cup \mathcal{C} \cup V^{in} \), where \( V^{out} \) is the set of vertices in \( G^{\varepsilon} \) which are neither connecting nor inner vertices.

Remark 2.1. For any \( v \in \mathcal{C} \) we denote by \( d^{in}(v) \) its degree as a vertex of the graph \( G^{in,\varepsilon} \), so that its degree as a vertex of the graph \( G^{\varepsilon} \) is \( d(v) = d^{in}(v) + 1 \).

As \( \varepsilon \to 0 \), the inner graph shrinks to one point, in the limit all the connecting vertices merge in one vertex which we identify with the point \( x_j = 0 \), \( x_j \) being the coordinate along the edge \( e_j \in E^{out}, \; j = 1, ..., N \). In the limit the graph \( G^{\varepsilon} \) looks like a star-graph with \( N \) edges connected in the origin, see Fig. 2; we denote the star-graph by \( G^{out} \).

![Figure 2](image-url)

Figure 2. The dashed lines represent the edges of \( G^{in,\varepsilon} \), the large dots the connecting vertices. The graph \( G^{out} \) is obtained by merging the connecting vertices. In the example in the picture, \( G^{out} \) has three infinite edges and one edge of finite length.

We define the Hilbert spaces:
\[
H^{\varepsilon} := \bigoplus_{e \in E^{\varepsilon}} L^2(e), \quad H^{out} := \bigoplus_{e \in E^{out}} L^2(e), \quad H^{in,\varepsilon} := \bigoplus_{e \in E^{in,\varepsilon}} L^2(e).
\]

We remark that one can always think of \( H^{\varepsilon} \) as the direct sum
\[
H^{\varepsilon} = H^{out} \oplus H^{in,\varepsilon}, \quad \text{(2.5)}
\]
and decompose each function \( \psi \in H^{\varepsilon} \) as \( \psi = (\psi^{out}, \psi^{in}) \) with \( \psi^{out} \in H^{out} \) and \( \psi^{in} \in H^{in,\varepsilon} \). When no misunderstanding is possible, we omit the dependence on \( \varepsilon \), moreover we simply write \( \psi \) instead of \( \psi^{out} \) or \( \psi^{in} \).

In a similar way we introduce the Sobolev spaces
\[
H^2 := \bigoplus_{e \in E^{\varepsilon}} H^2(e), \quad H^2 := \bigoplus_{e \in E^{out}} H^2(e), \quad H^{in,\varepsilon} := \bigoplus_{e \in E^{in,\varepsilon}} H^2(e).
\]
2.3. Full Hamiltonian. Next we define an Hamiltonian $H^\varepsilon$ in $\mathcal{H}$ (of the form given in Eq.s. (2.3)); this is the object of our investigation.

- Recall that if $v \in \mathcal{V}^{\text{out}}$, then $d(v) = 1$. For any $v \in \mathcal{V}^{\text{out}}$ we fix an orthogonal projection $P_v^{\text{out}} : \mathcal{C} \rightarrow \mathcal{C}$, and a self-adjoint operator $\Theta_v^{\text{out}}$ in $\text{Ran}(P_v^{\text{out}})$. Since vertices in $\mathcal{V}^{\text{out}}$ have degree one, $P_v^{\text{out}}$ is either 1 or 0; whenever $P_v^{\text{out}} = 1$ it makes sense to define $\Theta_v^{\text{out}}$ which turns out to be the operator acting as the multiplication by a real constant. In other words, the boundary conditions in $v \in \mathcal{V}^{\text{out}}$ (of the form given in the definition of $D(H_{R,\Theta})$) can be of Dirichlet type, $\psi_v(v) = 0$; of Neumann type $\psi'_v(v) = 0$; or of Robin type $\psi'_v(v) = \alpha \psi_v(v)$ with $\alpha \in \mathbb{R}$.

- We fix an orthogonal projection (see Rem. 2.1 for the definition of $d(v)$):

$$
K_v : \mathbb{C}^{d(v)} \rightarrow \mathbb{C}^{d(v)}, \quad K_v := 1_{d(v)} \left(1_{d(v)}, \cdot \right)_{\mathbb{C}^{d(v)}} \quad \forall v \in \mathcal{C},
$$

where $1_{d(v)}$ denotes the vector (of unit norm) in $\mathbb{C}^{d(v)}$ defined by $1_{d(v)} = (d(v))^{-1/2}(1, \ldots, 1)$. In a similar way, we define the orthogonal projection

$$
K_v^{\text{in}} : \mathbb{C}^{d^{\text{in}}(v)} \rightarrow \mathbb{C}^{d^{\text{in}}(v)}, \quad K_v^{\text{in}} := 1_{d^{\text{in}}(v)} \left(1_{d^{\text{in}}(v)}, \cdot \right)_{\mathbb{C}^{d^{\text{in}}(v)}} \quad \forall v \in \mathcal{C},
$$

where $1_{d^{\text{in}}(v)} \in \mathbb{C}^{d^{\text{in}}(v)}$ is defined by $1_{d^{\text{in}}(v)} = (d^{\text{in}}(v))^{-1/2}(1, \ldots, 1)$. Both $K_v$ and $K_v^{\text{in}}$ have one-dimensional range given by the span of the vectors $1_{d(v)}$ and $1_{d^{\text{in}}(v)}$ respectively.

- A function $\psi$ satisfies Kirchhoff conditions in the vertex $v$ (it is continuous in $v$ and the sum of the outgoing derivatives in $v$ equals zero) if and only if $K_v^{\text{in}} \psi(v) = 0$ and $K_v \psi'(v) = 0$.

- We fix an $\varepsilon$-dependent real-valued function $B^\varepsilon : \mathcal{G}^\varepsilon \rightarrow \mathbb{R}$, such that in the out/in decomposition (2.4) one has $B^\varepsilon = (B^{\text{out}}, B^{\text{in}, \varepsilon})$. With $B^{\text{out}} : \mathcal{G}^{\text{out}} \rightarrow \mathbb{R}$ bounded and compactly supported.

- (Scale Invariance) Recall that $G^{\varepsilon} = \varepsilon G^{\text{in}}$, see Eq. (2.4). We assume additionally: that $B^{\text{in}, \varepsilon}(x) = \varepsilon^{-2} B^{\text{in}}(x/\varepsilon)$, where $B^{\text{in}} : \mathcal{G}^{\text{in}} \rightarrow \mathbb{R}$ is bounded; and that $\Theta^{\text{in}, \varepsilon} = \varepsilon^{-1} \Theta^{\text{in}}$, for all $v \in \mathcal{V}^{\text{in}}$. For a discussion on the meaning and the main consequences of these assumptions we refer to Section 3.

**Definition 2.2** (Hamiltonian $H^\varepsilon$). We denote by $H^\varepsilon$ the self-adjoint operator in $\mathcal{H}$ defined by

$$
D(H^\varepsilon) := \{ \psi \in \mathcal{H}_2^{\varepsilon} | P_v^{\text{in}} \Psi(v) = 0, P_v^{\text{in}} \Psi'(v) - \Theta_v^{\text{in}, \varepsilon} P_v^{\text{in}} \Psi(v) = 0 \ \forall v \in \mathcal{V}^{\text{in}}; \ P_v^{\text{out}} \Psi(v) = 0, P_v^{\text{out}} \Psi'(v) - \Theta_v^{\text{out}} P_v^{\text{out}} \Psi(v) = 0 \ \forall v \in \mathcal{V}^{\text{out}}; \ K_v^{\text{in}} \Psi(v) = 0, K_v \Psi'(v) = 0 \ \forall v \in \mathcal{C} \}
$$

$$
H^\varepsilon \psi := -\psi'' + B^\varepsilon \psi \quad \forall \psi \in D(H^\varepsilon).
$$

**Remark 2.3.** In the out/in decomposition one has

$$
(H^\varepsilon \psi)^{\text{out}} = -\psi''^{\text{out}} + B^{\text{out}} \psi^{\text{out}}
$$

$$
(H^\varepsilon \psi)^{\text{in}} = -\psi''^{\text{in}} + B^{\text{in}, \varepsilon} \psi^{\text{in}}.
$$

Note that the action of the outer component of $H^\varepsilon$ does not depend on $\varepsilon$.

**Remark 2.4.** By the definition of $K_v$, in each connecting vertex boundary conditions in $D(H^\varepsilon)$ are of Kirchhoff-type: the function $\psi$ is continuous in $v \in \mathcal{C}$ and

$$
\sum_{e \sim v} \psi'_v(v) = 0 \quad v \in \mathcal{C},
$$

where the sum is taken on all the edges incident on $v$ (counting loops twice) and the derivative is understood in the outgoing direction from the vertex.
2.4. Auxiliary Hamiltonian. We are interested in the limit of the operator $H^\varepsilon$ as $\varepsilon \to 0$. We shall see that the limiting properties of $H^\varepsilon$ are strongly related to spectral properties of the Hamiltonian $\hat{H}^{m,\varepsilon}$:

**Definition 2.5** ( Auxiliary Hamiltonian, scaled down version).

\[
D(\hat{H}^{m,\varepsilon}) := \{ \psi \in H^2_2 | P_v^{m,\varepsilon} \Psi(v) = 0, P_v^{m,\varepsilon} \Phi(v) - \Theta_v^{m,\varepsilon} P_v^{m} \Psi(v) = 0 \quad \forall v \in V^m; \\
K_v^{m} \Psi(v) = 0, K_v^{m} \Phi(v) = 0 \quad \forall v \in C \}
\]

(2.6)

Let $\mathcal{H}^m = \mathcal{H}^{m,\varepsilon = 1}$, and define the unitary scaling group

\[
U^{m,\varepsilon} : \mathcal{H}^m \to \mathcal{H}^{m,\varepsilon}, \quad (U^{m,\varepsilon} \psi)(x) := \varepsilon^{-1/2} \psi(x/\varepsilon);
\]

its inverse is

\[
U^{-1,m,\varepsilon} : \mathcal{H}^{m,\varepsilon} \to \mathcal{H}^m, \quad (U^{m,\varepsilon}^{-1} \psi)(x) = \varepsilon^{1/2} \psi(x) x.
\]

By the scaling properties $\Theta_v^{m,\varepsilon} = \varepsilon^{-1} \Theta_v^{m}$ and $B_v^{m,\varepsilon}(x/\varepsilon) = \varepsilon^{-2} B_v^{m}(x)$, one infers the unitary relation

\[
\hat{H}^{m,\varepsilon} = \varepsilon^{-2} U^{m,\varepsilon} \hat{H}^{m} U^{m,\varepsilon}^{-1}
\]

(2.7)

with $\hat{H}^{m}$ defined on $\mathcal{H}^\varepsilon$ and given by $\hat{H}^{m} = \mathcal{H}^{m,\varepsilon = 1}$. One consequence of Eq. (2.7) is that the spectrum of $\hat{H}^{m,\varepsilon}$ is related to the spectrum of $\hat{H}^{m}$ by the relation $\sigma(\hat{H}^{m,\varepsilon}) = \varepsilon^{-2} \sigma(\hat{H}^{m})$ (see Section 3 for more comments on the implications of the scale invariance assumption). For this reason, we prefer to formulate the results in terms of the spectral properties of the $\varepsilon$-independent Hamiltonian $\hat{H}^{m}$ instead of the spectral properties of $\hat{H}^{m,\varepsilon}$.

**Definition 2.6** (Auxiliary Hamiltonian $\hat{H}^m$). We call Auxiliary Hamiltonian the Hamiltonian $\hat{H}^m = \hat{H}^{m,\varepsilon = 1}$ defined on $\mathcal{H}^m$.

Letting $\mathcal{H}^m_2 = \mathcal{H}^{m,\varepsilon = 1}$, the domain and action of $\hat{H}^m$ are given by

\[
D(\hat{H}^m) := \{ \psi \in H^2_2 | P_v^{m} \Psi(v) = 0, P_v^{m} \Phi(v) - \Theta_v^{m} P_v^{m} \Psi(v) = 0 \quad \forall v \in V^m; \\
K_v^{m} \Psi(v) = 0, K_v^{m} \Phi(v) = 0 \quad \forall v \in C \}
\]

(2.8)

The spectrum of $\hat{H}^m$ consists of isolated eigenvalues of finite multiplicity, see, e.g., [3, Th. 3.1.1]. For $n \in \mathbb{N}$, we denote by $\lambda_n$ the eigenvalues of $\hat{H}^m$ (counting multiplicity) and by $\{\varphi_n\}_{n \in \mathbb{N}}$ a corresponding set of orthonormal eigenfunctions.

**Definition 2.7** (Generic/Non-Generic Case). In the analysis of the limit of $H^\varepsilon$ we distinguish two cases:

(1) Generic (or Non-Resonant, or Decoupling) Case. $\lambda = 0$ is not an eigenvalue of the operator $\hat{H}^m$.

(2) Non-Generic (or Resonant) Case. $\lambda = 0$ is an eigenvalue of the operator $\hat{H}^m$.

In the Non-Generic Case we denote by $\{\hat{\varphi}_k\}_{k=1,...,m}$ a set of (orthonormal) eigenfunctions corresponding to the zero eigenvalue. By Eq. (2.8), functions in $D(\hat{H}^m)$ are continuous in the connecting vertices (see also Rem. 2.7). We denote by $\hat{\varphi}_k(v), v \in \mathcal{C}$, the value of $\hat{\varphi}_k$ in $v$, and define the vectors

\[
\hat{\omega}_k := (\hat{\varphi}_k(v_1), \ldots, \hat{\varphi}_k(v_N)) \in \mathbb{C}^N, \quad k = 1, \ldots, m, v_j \in \mathcal{C}, j = 1, \ldots, N.
\]

(2.9)

**Definition 2.8** ($\hat{C}$ – $\hat{P}$). In the Non-Generic Case, let $\hat{C}$ be the operator

\[
\hat{C} := \sum_{k=1}^m \hat{\omega}_k (\hat{\omega}_k, \cdot)_{\mathbb{C}^N} : \mathbb{C}^N \to \mathbb{C}^N.
\]

$\hat{C}$ is a bounded self-adjoint operator (it is an $N \times N$ Hermitian matrix). Denote by $\text{Ran} \hat{C} \subseteq \mathbb{C}^N$ and $\text{Ker} \hat{C} \subseteq \mathbb{C}^N$, the range and the kernel of $\hat{C}$ respectively. One has that the subspaces $\text{Ran} \hat{C}$ and $\text{Ker} \hat{C}$ are $\hat{C}$-invariant. Moreover, $\mathbb{C}^N = \text{Ran} \hat{C} \oplus \text{Ker} \hat{C}$. In what follows we denote by $\hat{P}$ the orthogonal projection (Riesz projection, see, e.g., [13, Section 1.2]) on $\text{Ran}(\hat{C})$, and by $\hat{P}^\perp = \mathbb{1}_N - \hat{P}$ the orthogonal projection on $\text{Ker}(\hat{C})$. 

Remark 2.9. We note that \( q \in \text{Ker } \hat{C} \) if and only if \((\hat{\xi}_k, q)_{CN} = 0\) for all \( k = 1, \ldots, m \). To see that this indeed the case, observe that if \( q \in \text{Ker } \hat{C} \) then it must be \((q, \hat{C}q)_{CN} = 0\), hence, \( \sum_{k=1}^{m} |(\hat{\xi}_k, q)_{CN}|^2 = 0 \), which in turn implies \((\hat{\xi}_k, q)_{CN} = 0\) for all \( k = 1, \ldots, m \). The other implication is trivial.

Since \( \hat{\xi}_k \in \text{Ker } \hat{C} \), we infer \( 0 = (\hat{\xi}_k, \hat{P}_+ \hat{\xi}_k)_{CN} = (\hat{P}_+ \hat{\xi}_k, \hat{P}_- \hat{\xi}_k)_{CN} = \|\hat{P}_+ \hat{\xi}_k\|_{CN}^2 \) for all \( k = 1, \ldots, m \); hence, \( \hat{P}_+ \hat{\xi}_k = 0 \), or, equivalently, \( \hat{\xi}_k \in \text{Ran}(\hat{C}) \).

2.5. Effective Hamiltonians. We shall see that the definition of the limiting operator (effective Hamiltonian in \( H^{\text{out}} \)) depends on presence of a zero eigenvalue for \( \hat{H}^{\text{in}} \) (the occurrence of the Generic Case vs. the Non-Generic Case).

Recall that for \( \psi \in H^{\text{out}} \), we used \( \psi_1 \) to denote the component of \( \psi \) on the edge \( e_j \) attached to the connecting vertex \( v_j \). Moreover, we assumed that the vertex \( v_j \) is identified by \( x = 0 \). With this remark in mind, given a function \( \psi \in H^2_0 \), we define the vectors

\[
\Psi(0) := (\psi_1(0), \ldots, \psi_N(0))^T \in \mathbb{C}^N, \quad \Psi'(0) := (\psi'_1(0), \ldots, \psi'_N(0))^T \in \mathbb{C}^N.
\]

These correspond to \( \Psi(v_0) \) and \( \Psi'(v_0) \), as defined in Section 2.3, where \( v_0 \) is the central vertex of the star-graph \( G^{\text{out}} \).

In the limit \( \varepsilon \to 0 \), the connecting vertices in \( G^{in,\varepsilon} \) coincide, and can be identified with the vertex \( v_0 \equiv 0 \).

We distinguish two possible effective Hamiltonians in \( H^{\text{out}} \).

Definition 2.10 (Effective Hamiltonian, Generic Case). We denote by \( \hat{H}^{\text{out}} \) the self-adjoint operator in \( H^{\text{out}} \) defined by

\[
D(\hat{H}^{\text{out}}) := \{ \psi \in H^2_0 \mid P_v^{\text{out}} \Psi(0) = 0, P_v^{\text{out}} \Psi'(0) = 0 \forall \psi \in V^{\text{out}}; \Psi(0) = 0 \}
\]

\[
\hat{H}^{\text{out}} \psi := -\psi'' + P^{\text{out}} \psi \quad \forall \psi \in D(\hat{H}^{\text{out}}).
\]

Definition 2.11 (Effective Hamiltonian, Non-Generic Case). Let \( \hat{P} \) be the orthogonal projection given in Def. 2.3. We denote by \( \hat{H}^{\text{out}} \) the self-adjoint operator in \( H^{\text{out}} \) defined by

\[
D(\hat{H}^{\text{out}}) := \{ \psi \in H^2_0 \mid P_v^{\text{out}} \Psi(0) = 0, P_v^{\text{out}} \Psi'(0) = 0 \forall \psi \in V^{\text{out}}; \hat{P} \Psi(0) = 0 \hat{P} \Psi'(0) = 0 \}
\]

\[
\hat{H}^{\text{out}} \psi := -\psi'' + P^{\text{out}} \psi \quad \forall \psi \in D(\hat{H}^{\text{out}}).
\]

The boundary conditions in \( 0 \) in the definitions of \( D(\hat{H}^{\text{out}}) \) and \( D(\hat{H}^{\text{out}}) \) are scale invariant (see [4, Sec. 1.4.2]).

2.6. Main result. In what follows \( C \) denotes a generic positive constant independent on \( \varepsilon \). Given two Hilbert spaces \( X \) and \( Y \), we denote by \( B(X, Y) \) (or simply by \( B(X) \) if \( X = Y \)) the space of bounded linear operators from \( X \) to \( Y \), and by \( \| \cdot \|_{B(X, Y)} \) the corresponding norm. For any \( a \in \mathbb{R} \), we use the notation \( \mathcal{O}(B(X, Y)) (\varepsilon^a) \) to denote a generic operator from \( X \) to \( Y \) whose norm is bounded by \( C\varepsilon^a \) for \( \varepsilon \) small enough.

Given a bounded operator \( A \) in \( H^2 \) we use the notation

\[
A = \begin{pmatrix}
A^{\text{out}, \text{out}} & A^{\text{out}, \text{in}} \\
A^{\text{in}, \text{out}} & A^{\text{in}, \text{in}}
\end{pmatrix}
\]

(2.11)

to describe its action in the \( \text{out/in} \) decomposition [2.3]: here \( A^{u,v} : H^u \to H^u \), \( u, v = \text{out/in} \), are operators defined according to

\[
(A^{u})^{\text{out}} = A^{\text{out}, \text{out}} v^{\text{out}} + A^{\text{out}, \text{in}} v^{\text{in}}
\]

\[
(A^{u})^{\text{in}} = A^{\text{in}, \text{out}} v^{\text{out}} + A^{\text{in}, \text{in}} v^{\text{in}}.
\]

(2.12)

Theorem 2.12. Let \( z \in \mathbb{C} \setminus \mathbb{R} \). In the Generic Case (see Def. 2.7)

\[
(H^\varepsilon - z)^{-1} = \begin{pmatrix}
(H^{\text{out}} - z)^{-1} & 0 \\
0 & \mathcal{O}(H^{\text{out}}) (\varepsilon)
\end{pmatrix}
\]

(2.13)

where the expansion has to be understood in the \( \text{out/in} \) decomposition (2.11),
Theorem 2.13. Let \(z \in \mathbb{C} \setminus \mathbb{R}\). In the Non-Generic Case (see Def. 2.7), let \(\hat{C}_0\) be the restriction of \(\hat{C}\) to \(\text{Ran} \hat{P}\).

(i) If \(\text{Ker} \hat{C} \subset \mathbb{C}^N\), \(\hat{C}_0\) is invertible as an operator in \(\hat{P}\mathbb{C}^N\), and

\[
(H^z - z)^{-1} = \left( \begin{array}{lr}
\hat{H}^{\text{out}} - z & 0 \\
0 & z - \sum_{k',\epsilon}^m \left( \hat{C}_{k'} - (\hat{C}_0^{-1} \hat{C}_{k'})_{\mathbb{C}^N} \right) \phi_k^{*}(\hat{C}_{k'}^{*}, \cdot)_{\mathbb{H}^{\text{in},\epsilon}} + \mathcal{O}_B(\mathcal{H}^z)(\varepsilon^{1/2}),
\end{array} \right)
\]

where the expansion has to be understood in the \(\text{out/in}^\text{decomposition}\) (2.11).

(ii) If \(\text{Ker} \hat{C} = \mathbb{C}^N\), then \(\hat{P} = 0\), and expansion (2.14) holds true with \(\hat{H}^{\text{out}} = \hat{H}^{\text{out}}\), \((\hat{C}_{k'} - (\hat{C}_0^{-1} \hat{C}_{k'})_{\mathbb{C}^N}) = 0\) for all \(k, k' = 1, \ldots, m\), and the error term changed in \(\mathcal{O}_B(\mathcal{H}^z)(\varepsilon)\).

(iii) If the vectors \(\hat{C}_{k}, k = 1, \ldots, m\), are linearly independent, then \((\delta_{k,k'} - (\hat{C}_0^{-1} \hat{C}_{k'})_{\mathbb{C}^N}) = 0\) for all \(k, k' = 1, \ldots, m\), and

\[
(H^z - z)^{-1} = \left( \begin{array}{lr}
\hat{H}^{\text{out}} - z & 0 \\
0 & z + \mathcal{O}_B(\mathcal{H}^z)(\varepsilon^{1/2}).
\end{array} \right)
\]

Remark 2.14. Finer estimates on the remainders in Eq.s (2.13) and (2.14) are given in Th.s 5.4 and 5.7 below.

Remark 2.15. We recall and adapt to our setting the notion of \(\delta^\text{quasi}\)-unitary equivalence of operators acting on different Hilbert spaces introduced by P. Exner and O. Post, see in particular [32] Ch. 4. See also [5] Sec. 5 for a discussion on the application of this approach to the analysis of operators on graphs with shrinking edges.

Let \(J\) be the operator

\[
J : \mathbb{H}^{\text{out}} \to \mathbb{H}^{\text{in}}, \quad J \psi = (\psi, 0)
\]

where \((\psi, 0)\) is understood in the decomposition (2.25). Its adjoint \(J^*\) maps \(\mathbb{H}^{\text{in}}\) in \(\mathbb{H}^{\text{out}}\), and is given by:

\[
J^* : \mathbb{H}^{\text{in}} \to \mathbb{H}^{\text{out}}, \quad J^* \psi = \psi^\text{out} \quad \text{for all } \psi = (\psi, \psi^\text{in}) \in \mathbb{H}^{\text{in}}.
\]

Note that \(J^* J = I_{\mathbb{H}^{\text{out}}}\), where \(I_{\mathbb{H}^{\text{out}}}\) is the identity in \(\mathbb{H}^{\text{out}}\).

The operator \(H^z\) is \(\delta^\text{quasi}\)-unitarily equivalent to a self-adjoint operator \(H^z\) in \(\mathbb{H}^{\text{out}}\) if

\[
|| (I - J J^*) (H^z - z)^{-1} ||_{\mathcal{B}(\mathbb{H}^z)} \leq C \delta^z \quad \text{and} \quad || J (H^z - z)^{-1} - (H^z - z)^{-1} J ||_{\mathcal{B}(\mathbb{H}^{\text{out}}, \mathbb{H}^{\text{in}})} \leq C \delta^z,
\]

for some \(z \in \mathbb{C} \setminus \mathbb{R}\).

Note that in the decomposition (2.12), one has

\[
(I - J J^*) (H^z - z)^{-1} \psi = ((H^z - z)^{-1})^{\text{in, out}} \psi^\text{out} + ((H^z - z)^{-1})^{\text{in, in}} \psi^\text{in}
\]

and

\[
(J (H^z - z)^{-1} - (H^z - z)^{-1} J) \psi^\text{out} = \left( ((H^z - z)^{-1} - ((H^z - z)^{-1})^{\text{out, out}}) \psi^\text{out}, -((H^z - z)^{-1})^{\text{in, out}} \psi^\text{out} \right).
\]

Hence:

By Th. 2.13, in the Generic Case the operator \(H^z\) is \(\varepsilon\)-quasi unitarily equivalent to the operator \(H^{\text{out}}\).

By Th. 2.13, (iii), in the Non-Generic Case, if the vectors \(\hat{C}_{k}, k = 1, \ldots, m\), are linearly independent, the operator \(H^z\) is \(\varepsilon^{1/2}\)-quasi unitarily equivalent to the operator \(H^{\text{out}}\). More precisely, the second condition in Eq. (2.10) always holds true, while the first one holds true only under the additional assumption that the vectors \(\hat{C}_{k}\) are linearly independent.

We refer to [32] for a comprehensive discussion on the comparison between operators acting on different spaces.

3. Krein resolvent formulae

In this section we introduce the main tools in our analysis: the Krein-type resolvent formulae for the resolvents of \(H^z\) and \(H^{\text{out}}\). The proofs are postponed to App. A.

Given the Hilbert spaces \(X^{\text{out}}, Y^{\text{out}}, X^{\text{in}}, \) and \(Y^{\text{in}},\) and a couple of operators \(A^{\text{out}} : X^{\text{out}} \to Y^{\text{out}}\) and \(A^{\text{in}} : X^{\text{in}} \to Y^{\text{in}}\), we denote by \(A := \text{diag}(A^{\text{out}}, A^{\text{in}})\), the operator \(A : X \to Y,\) with \(X := X^{\text{out}} \oplus X^{\text{in}}\) and \(Y := Y^{\text{out}} \oplus Y^{\text{in}},\) acting as \(A f := (A^{\text{out}} f^{\text{out}}, A^{\text{in}} f^{\text{in}})\), for all \(f = (f^{\text{out}}, f^{\text{in}}) \in X, f^{\text{out}} \in X^{\text{out}}\) and \(f^{\text{in}} \in X^{\text{in}}\).
We set
\[ D(\hat{H}^c) := D(\hat{H}^{\text{out}}) \oplus D(\hat{H}^{\text{in},\varepsilon}) \quad \text{and} \quad \hat{H}^c := \text{diag}(\hat{H}^{\text{out}}, \hat{H}^{\text{in},\varepsilon}), \]
with \( \hat{H}^{\text{out}} \) and \( \hat{H}^{\text{in},\varepsilon} \) given as in Defs. 2.10 and 2.5.

Given an operator \( A \), we denote by \( \rho(A) \) its resolvent set; the resolvent of \( A \) is defined as \( (A - z)^{-1} \) for all \( z \in \rho(A) \).

For the resolvents of the relevant operators we introduce the shorthand notation
\[ R^c_z := (H^c - z)^{-1} \quad z \in \rho(H^c); \]
\[ \hat{R}^{\text{out}}_z := (\hat{H}^{\text{out}} - z)^{-1} \quad z \in \rho(\hat{H}^{\text{out}}) \cap \rho(\hat{H}^{\text{in},\varepsilon}); \]
\[ \hat{R}^{\text{in},\varepsilon}_z := (\hat{H}^{\text{in},\varepsilon} - z)^{-1} \quad z \in \rho(\hat{H}^{\text{in},\varepsilon}); \]
\[ \hat{R}^{\text{out}}_z := (\hat{H}^{\text{out}} - z)^{-1} \quad z \in \rho(\hat{H}^{\text{out}}); \]
\[ \hat{R}^{\text{in},\varepsilon}_z := (\hat{H}^{\text{in},\varepsilon} - z)^{-1} \quad z \in \rho(\hat{H}^{\text{in},\varepsilon}). \]

Obviously, all the operators in Eq.s. (3.2) - (3.5) are well-defined and bounded for \( z \in \mathbb{C} \setminus \mathbb{R} \), moreover \( \hat{R}^c_z = \text{diag}(\hat{R}^{\text{out}}_z, \hat{R}^{\text{in},\varepsilon}_z) \).

Our aim is to write the resolvent difference \( R^c_z - \hat{R}^c_z \) in a suitable block matrix form, associated to the off-diagonal matrix \( \Theta \) in Eq. (3.13). To do so we follow the approach of Posilicano [29, 30]. All the self-adjoint extensions of the symmetric operator obtained by restricting a given self-adjoint operator to the kernel of a given map \( \tau \) are parametrized by a projection \( P \) and a self-adjoint operator \( \tilde{\Theta} \) in \( \text{Ran} \, P \). We choose the reference operator \( \hat{H}^c \) and the map \( \tau \) so that the Hamiltonian of interest \( H^c \) is the self-adjoint extension parametrized by the identity and the self-adjoint operator given by the off-diagonal matrix \( \Theta \). The Krein formula for the resolvent difference \( \hat{R}^c_z - \hat{R}^c_z \), see Lemma 3.2, is obtained within the approach from [29, 30].

We define the maps:
\[ \tau^{\text{out}} : \mathcal{H}^{\text{out}}_2 \rightarrow \mathbb{C}^N \quad \tau^{\text{out}} \psi := \Psi'(0); \]
\[ \tau^{\text{in}} : \mathcal{H}^{\text{in},\varepsilon}_2 \rightarrow \mathbb{C}^N \quad \tau^{\text{in}} \psi := \left( \frac{1}{\sqrt{d^{\text{in}}(v_1)}} (1, \psi(v_1))_{\mathcal{C}^{\text{in}}(v_1)}, \ldots, \frac{1}{\sqrt{d^{\text{in}}(v_N)}} (1, \psi(v_N))_{\mathcal{C}^{\text{in}}(v_N)} \right)^T. \]

Moreover we set,
\[ \tau : \mathcal{H}^c_2 = \mathcal{H}^{\text{out}}_2 \oplus \mathcal{H}^{\text{in},\varepsilon}_2 \rightarrow \mathbb{C}^{2N} \quad \tau := (\tau^{\text{out}}, \tau^{\text{in}}). \]

Note that we are using the identification \( \mathbb{C}^{2N} = \mathbb{C}^N \oplus \mathbb{C}^N \).

The following maps are well-defined and bounded
\[ \hat{G}^{\text{out}}_z : \mathcal{H}^{\text{out}} \rightarrow \mathbb{C}^N \quad \hat{G}^{\text{out}}_z := \tau^{\text{out}} \hat{R}^{\text{out}}_z \quad z \in \rho(\hat{H}^{\text{out}}) \quad \text{and} \quad \hat{G}^{\text{in},\varepsilon}_z : \mathcal{H}^{\text{in},\varepsilon} \rightarrow \mathbb{C}^N \quad \hat{G}^{\text{in},\varepsilon}_z := \tau^{\text{in}} \hat{R}^{\text{in},\varepsilon}_z \quad z \in \rho(\hat{H}^{\text{in},\varepsilon}). \]

Moreover we set
\[ \hat{G}^c_z : \mathcal{H}^c \rightarrow \mathbb{C}^{2N} \quad \hat{G}^c_z := (\hat{G}^{\text{out}}_z, \hat{G}^{\text{in},\varepsilon}_z), \]
for \( z \in \rho(\hat{H}^{\text{out}}) \cap \rho(\hat{H}^{\text{in},\varepsilon}) \). Note that \( \hat{G}^c_z = \tau \hat{R}^c_z \) and that all the maps above are well-defined bounded operators for \( z \in \mathbb{C} \setminus \mathbb{R} \).

The adjoint maps (in \( \hat{z} \)) are denoted by
\[ G^{\text{out}}_z : \mathbb{C}^N \rightarrow \mathcal{H}^{\text{out}} \quad G^{\text{out}}_z := \hat{G}^{\text{out},*}_z, \]
\[ G^{\text{in},\varepsilon}_z : \mathbb{C}^N \rightarrow \mathcal{H}^{\text{in},\varepsilon} \quad G^{\text{in},\varepsilon}_z := \hat{G}^{\text{in},\varepsilon,*}_z, \]
\[ G^c_z : \mathbb{C}^{2N} \rightarrow \mathcal{H}^c \quad G^c_z := \hat{G}^{*,c}_z. \]

Obviously \( G^c_z = \text{diag}(G^{\text{out}}_z, G^{\text{in},\varepsilon}_z) \) to be understood as an operator from \( \mathbb{C}^{2N} = \mathbb{C}^N \oplus \mathbb{C}^N \) to \( \mathcal{H}^c = \mathcal{H}^{\text{out}} \oplus \mathcal{H}^{\text{in},\varepsilon} \).

We note that, see Rem. A.2 \( G^{\text{out}}_z : \mathbb{C}^N \rightarrow \mathcal{H}^{\text{out}}_2 \) and \( G^{\text{in},\varepsilon}_z : \mathbb{C}^N \rightarrow \mathcal{H}^{\text{in},\varepsilon}_2 \), for all \( z \in \rho(\hat{H}^{\text{out}}) \) and \( z \in \rho(\hat{H}^{\text{in},\varepsilon}) \) respectively, so that the maps \( (N \times N, \varepsilon\)-dependent matrices)
\[ M^{\text{out}}_z : \mathbb{C}^N \rightarrow \mathbb{C}^N, \quad M^{\text{out}}_z := \tau^{\text{out}} G^{\text{out}}_z \quad z \in \rho(\hat{H}^{\text{out}}). \]
\[ M_{z}^{in,\varepsilon} : C^{N} \rightarrow C^{N}, \quad M_{z}^{out,\varepsilon} := \tau^{in} G_{z}^{in,\varepsilon}, \quad z \in \rho(\hat{H}_{z}^{in,\varepsilon}), \]  
(3.11)

are well defined. Moreover, we set
\[ M_{\varepsilon} : C^{2N} \rightarrow C^{2N}, \quad M_{\varepsilon} := \text{diag}(M_{z}^{out}, M_{z}^{in,\varepsilon}) \quad z \in \rho(\hat{H}^{out}) \cap \rho(\hat{H}^{in,\varepsilon}) = \rho(\hat{H}^{\varepsilon}); \]
(3.12)

obviously \( M_{\varepsilon} = \tau G^{\varepsilon}(z). \)

In the following Lemmata we give two Krein-type resolvent formulae: one allows to express the resolvent of \( \hat{H}^{out} \) in terms of the resolvent of \( H^{out} \); the other gives the resolvent of \( H^{\varepsilon} \) in terms of the resolvent of \( \hat{H}^{\varepsilon} \). For the proofs we refer to App. \( \overline{A} \) Section \( \overline{A}.1 \)

**Lemma 3.1.** Let \( \hat{P} \) be an orthogonal projection in \( C^{N} \), and \( \hat{H}^{out} \) and \( \hat{H}^{out} \) be the Hamiltonians defined according to Defs. 3.11 and 2.11. Then, for any \( z \in \rho(\hat{H}^{out}) \cap \rho(\hat{H}^{out}) \), the map \( \hat{P} M_{\varepsilon}^{out} \hat{P} : \hat{P} C^{N} \rightarrow \hat{P} C^{N} \) is invertible and
\[ \hat{R}_{\varepsilon}^{out} = \hat{R}_{\varepsilon}^{out} - G_{\varepsilon}^{\hat{P}}(\hat{P} M_{\varepsilon}^{out} \hat{P})^{-1} \hat{P} G_{\varepsilon}^{out}. \]

**Lemma 3.2.** Let \( \Theta \) be the \( 2N \times 2N \) block matrix
\[ \Theta = \begin{pmatrix} \Theta_{1} & 0_{N} \\ 0_{N} & \Theta_{2} \end{pmatrix}. \]
(3.13)

Then, for any \( z \in \rho(H^{\varepsilon}) \cap \rho(\hat{H}^{\varepsilon}) \), the map \( (M_{\varepsilon}^{\varepsilon} - \Theta) : C^{2N} \rightarrow C^{2N} \) is invertible and
\[ R_{\varepsilon}^{\epsilon} = R_{\varepsilon}^{\epsilon} - G_{\varepsilon}^{z}(M_{\varepsilon}^{\varepsilon} - \Theta)^{-1} G_{\varepsilon}^{\epsilon}. \]

We conclude this section with an alternative formula for the resolvent \( R_{\varepsilon}^{\epsilon} \). We refer to App. \( \overline{A} \) Section \( \overline{A}.2 \) for the proof.

**Lemma 3.3.** Let \( z \in C \setminus \mathbb{R} \), then the maps \((N \times N, \varepsilon\)-dependent matrices\)
\[ M_{z}^{in,\varepsilon} M_{z}^{out} - I_{N} : C^{N} \rightarrow C^{N} \quad \text{and} \quad M_{z}^{out} M_{z}^{in,\varepsilon} - I_{N} : C^{N} \rightarrow C^{N} \]
(3.14)

are invertible. Moreover,
\[ R_{\varepsilon}^{\epsilon} = R_{\varepsilon}^{\epsilon} - G_{\varepsilon}^{z} \left( (M_{z}^{in,\varepsilon} M_{z}^{out} - I_{N})^{-1} (M_{z}^{in,\varepsilon} M_{z}^{out} - I_{N})^{-1} \right) G_{\varepsilon}^{\epsilon}. \]
(3.15)

4. **Scale invariance**

In this section we discuss the scale invariance properties of \( \hat{H}_{z}^{in,\varepsilon} \) and collect several formulae concerning the operators \( \hat{R}_{in,\varepsilon}^{\varepsilon}, \hat{G}_{in,\varepsilon}^{\varepsilon}, G_{in,\varepsilon}^{\varepsilon}, \) and \( M_{in,\varepsilon}^{\varepsilon} \).

Recall that we have denoted by \( \lambda_{n} \) and \( \{\varphi_{n}\}_{n \in N} \) the eigenvalues and a corresponding set of orthonormal eigenfunctions of \( H_{z}^{in} \).

The eigenvalues of \( H_{z}^{in,\varepsilon} \) (counting multiplicity) and a corresponding set of orthonormal eigenfunctions are given by
\[ \lambda_{n}^{\varepsilon} = \varepsilon^{-2} \lambda_{n}; \quad \varphi_{n}^{\varepsilon}(x) = \varepsilon^{-1/2} \varphi_{n}(x/\varepsilon), \]
(4.1)

where \( \lambda_{n} \) are the eigenvalues of \( H_{z}^{in} \), and \( \varphi_{n} \) the corresponding (orthonormal) eigenfunctions.

By the spectral theorem and by the scaling properties (4.1), \( \hat{R}_{in,\varepsilon}^{\varepsilon} \) is given by
\[ \hat{R}_{in,\varepsilon}^{\varepsilon} = \sum_{n \in N} \frac{\varphi_{n}^{\varepsilon}(\varphi_{n}^{\varepsilon} H_{z}^{in,\varepsilon})^{\lambda_{n}^{\varepsilon}}}{\lambda_{n}^{\varepsilon} - z} \varepsilon^{2} \sum_{n \in N} \frac{\varphi_{n}^{\varepsilon}(\varphi_{n}^{\varepsilon} H_{z}^{in,\varepsilon})^{\lambda_{n}^{\varepsilon}}}{\lambda_{n}^{\varepsilon} - z}. \]
(4.2)

Hence, its integral kernel can be written as
\[ \hat{R}_{in,\varepsilon}^{\varepsilon}(x,y) = \varepsilon \sum_{n \in N} \frac{\varphi_{n}(x/\varepsilon) \varphi_{n}(y/\varepsilon)}{\lambda_{n}^{\varepsilon} / \lambda_{n}^{\varepsilon} - \varepsilon^{2} z} \quad x, y \in G_{in,\varepsilon}^{in,\varepsilon}. \]
(4.3)

Since there exists a positive constant \( C \) such that \( sup_{x \in G_{in,\varepsilon}} |\varphi_{n}(x)| \leq C \) and \( \lambda_{n} \geq C n^{2} \) for \( n \) large enough (see App. \( \overline{B} \)), the series in \( \text{Eq.} \ (4.3) \) is uniformly convergent for \( x, y \in G_{in,\varepsilon}^{in,\varepsilon} \). Hence, we can write the operators \( G_{in,\varepsilon}^{in,\varepsilon} \) and \( G_{in,\varepsilon}^{out,\varepsilon} \), and the matrix \( M_{in,\varepsilon}^{in,\varepsilon} \) in a similar way, see Eq. (4.1) and (4.5) below.

Note that, since functions in \( D(H_{z}^{in,\varepsilon}) \) are continuous in the connecting vertices, the eigenfunctions \( \varphi_{n}^{\varepsilon} \) can be evaluated in the connecting vertices, and by the definition of \( \tau^{in} \) (see Eq. (3.7)), one has
\[ \tau^{in} \varphi_{n}^{\varepsilon} = (\varphi_{n}(v_{1}), \ldots, \varphi_{n}(v_{N}))^{T}. \]
So that, for any eigenfunction $\varphi^e_n$, we can define the vector $\xi^e_n$ as

$$\xi^e_n := \tau^{in} \varphi^e_n.$$  

We note that $L_n^e = \varepsilon^{-1/2} L_n$, with

$$L_n = (\varphi_n(v_1), \ldots, \varphi_n(v_N))^T,$$

and that the vectors $\xi_n^e$ are defined in the same way as the vectors $\xi_n$ in Eq. 2.10.

**Remark 4.1.** In the Non-Generic Case, zero is an eigenvalue of $\hat{H}^{in,\varepsilon}$. We denote by $\{\hat{\varphi}_k^e\}_{k=1,...,m}$ the corresponding set of (orthonormal) eigenfunctions given by $\hat{\varphi}_k(x) = \varepsilon^{-1/2} \hat{\varphi}_k(x/\varepsilon)$ where $\hat{\varphi}_k$ are the eigenfunctions corresponding to the eigenvalue zero of $\hat{H}^{in}$. The vectors $\xi^e_n := \tau^{in} \hat{\varphi}_k^e$ are related to the vectors $\xi_n$ by the identity $\xi_n^e = \varepsilon^{-1/2} \xi_n$.

By the discussion above, and by the definitions 3.8, 3.9, and 3.11, we obtain

$$\hat{\xi}^{in,\varepsilon}_n = \varepsilon^{3/2} \sum_{n \in N} \xi_n^e (\tilde{\varphi}_n^e)^{H^{in,\varepsilon}}; \quad C^{in,\varepsilon}_n = \varepsilon^{3/2} \sum_{n \in N} \frac{\tilde{\varphi}_n^e (\tilde{\varphi}_n^e)^{CN}}{\lambda_n - \varepsilon^2 z},$$

and

$$M^{in,\varepsilon}_n = \varepsilon \sum_{n \in N} \xi_n^e (\tilde{\varphi}_n^e)^{CN}.$$  

5. **Proof of Theorems 2.12 and 2.13**

This section is devoted to the proofs of Ths 2.12 and 2.13. Actually, we shall prove a finer version of the results with more precise estimates of the remainders, see Ths 5.6 and 5.9 below.

**Remark 5.1.** By Eq. 3.13, it follows that, in the out/in decomposition 2.11, the resolvent $R^{\varepsilon}_z$ can be written as

$$R^{\varepsilon}_z = \begin{pmatrix} R^{\text{out}} & 0 \\ 0 & R^{\text{in}} \end{pmatrix} - \begin{pmatrix} R^{\text{out, out}} & R^{\text{out, in}} \\ R^{\text{in, out}} & R^{\text{in, in}} \end{pmatrix},$$

with

$$R^{\text{out, out}} = G^{\text{out}} (M^{in,\varepsilon} M^{out} - I_N)^{-1} G^{\text{out}}; \quad \lambda_n - \varepsilon^2 z,$$

$$R^{\text{out, in}} = G^{\text{out}} (M^{in,\varepsilon} M^{out} - I_N)^{-1} G^{\text{out}}; \quad \lambda_n - \varepsilon^2 z,$$

$$R^{\text{in, out}} = G^{\text{out}} (M^{in,\varepsilon} M^{out} - I_N)^{-1} G^{\text{out}};$$

$$R^{\text{in, in}} = G^{\text{out}} (M^{in,\varepsilon} M^{out} - I_N)^{-1} G^{\text{out}}.$$  

Note that since $M = M^{\varepsilon}_z$ holds true both for the “out” and “in” M-matrices (see Eq. 4.12), one infers $R^{\text{out, out}} = R^{\text{out, in,\varepsilon}}$.

### 5.1. **Generic Case. Proof of Th. 2.12**

In this section we study the limit of the relevant quantities in the Generic Case and prove Th. 2.12.

**Proposition 5.2.** Let $z \in \mathbb{C} \setminus \mathbb{R}$. In the Generic Case,

$$\hat{R}^{\text{in}} = O_{B(H^{in,\varepsilon})}(\varepsilon^2); \quad \hat{G}^{\text{in}} = O_{B(H^{in,\varepsilon},CN)}(\varepsilon^{3/2}); \quad \hat{G}^{\text{in}} = O_{B(CN, H^{in,\varepsilon})}(\varepsilon^{3/2}).$$

**Proof.** We prove first Claim 5.6. For any $\psi^{in} \in H^{in,\varepsilon}$, since $\{\varphi_n^e\}_{n \in N}$ is an orthonormal set of eigenfunctions in $H^{in,\varepsilon}$, and by Eq. 1.12, we infer

$$\|\hat{R}^{in} \psi^{in}\|_{H^{in,\varepsilon}} = \varepsilon^2 \left( \sum_{n \in N} |(\varphi^e_n, \psi^{in})_{H^{in,\varepsilon}}|^2 \right)^{1/2} \leq C \varepsilon^2 \|\psi^{in}\|_{H^{in,\varepsilon}},$$

where in the latter inequality we used the bound $|\lambda_n - \varepsilon^2 z|^{-1} \leq 4 |\lambda_n|^{-1} \leq C$, which holds true in the Generic Case because $|\lambda_n - \varepsilon^2 z| \geq |\lambda_n|/2 \geq C$ for all $n \in N$ and $\varepsilon$ small enough.

To prove the first claim in Eq. 5.7, let $\psi^{in} \in H^{in,\varepsilon}$, then

$$\hat{G}^{in} \psi^{in} = \varepsilon^{3/2} \sum_{n \in N} \xi_n^e (\tilde{\varphi}_n^e, \psi^{in})_{H^{in,\varepsilon}}.$$
Hence, from the Cauchy-Schwarz inequality,
\[
\|\tilde{G}^{in,e}_2\psi^{in}\|_{CN} \leq \varepsilon^{3/2} \sum_{n \in \mathbb{N}} \frac{\|C_n\|_{CN} |(\varphi^{\in}_{n}, \psi^{in})_{H^{in,e}}|}{|\lambda_n - \varepsilon^2 z|} \\
\leq \varepsilon^{3/2} \|\psi^{in}\|_{H^{in,e}} \left( \sum_{n \in \mathbb{N}} \frac{\|C_n\|_{CN}^2}{|\lambda_n - \varepsilon^2 z|^2} \right)^{1/2} \leq C \varepsilon^{3/2} \|\psi^{in}\|_{H^{in,e}},
\]
because \( \|C_n\|_{CN}^2 \leq C \) and \( \sum_{n \in \mathbb{N}} |\lambda_n - \varepsilon^2 z|^{-2} \leq C \sum_{n \in \mathbb{N}} |\lambda_n|^{-2} \leq C \). This proves the first Claim in Eq. (5.7); the second one is trivial, being \( \tilde{G}^{in,e}_2 \) the adjoint of \( \tilde{G}^{in,e}_1 \).

**Proposition 5.3.** Let \( z \in \mathbb{C} \setminus \mathbb{R} \). In the Generic Case,
\[
M^{in,e}_2 = \mathcal{O}(CN)(\varepsilon).
\] (5.8)

**Proof.** Recall Eq. (1.5) and note that for any \( q \in \mathbb{C}^N, \)
\[
\|M^{in,e}_2 q\|_{CN} \leq \varepsilon \sum_{n \in \mathbb{N}} \frac{\|C_n\|_{CN} |(\varphi^{in}_{n}, q)_{CN}|}{|\lambda_n - \varepsilon^2 z|} \leq \varepsilon \|q\|_{CN} \sum_{n \in \mathbb{N}} \frac{\|C_n\|_{CN}^2}{|\lambda_n - \varepsilon^2 z|^2} \leq C \varepsilon \|q\|_{CN},
\]
because \( \|C_n\|_{CN} \leq C \) and \( \sum_{n \in \mathbb{N}} |\lambda_n - \varepsilon^2 z|^{-1} \leq C \sum_{n \in \mathbb{N}} |\lambda_n|^{-1} \leq C. \)

**Theorem 5.4.** Let \( z \in \mathbb{C} \setminus \mathbb{R} \). In the Generic Case
\[
R^e_z = \begin{pmatrix} R^{out}_z + \mathcal{O}(\tilde{H}^{out,\varepsilon})(\varepsilon) & \mathcal{O}(\tilde{H}^{in,e},\tilde{H}^{out,\varepsilon})(\varepsilon^{3/2}) \\ \mathcal{O}(\tilde{H}^{in,e},\tilde{H}^{out,\varepsilon})(\varepsilon^{3/2}) & \mathcal{O}(\tilde{H}^{in,e})(\varepsilon^2) \end{pmatrix},
\] (5.9)

where the expansion has to be understood in the out/in decomposition (2.11).

**Proof.** Note that \( (M^{in,e}_2 M^{out}_2 - I_N)^{-1} = \mathcal{O}(CN) \) by Eq. (5.8) and because \( M^{out}_2 \) is bounded and does not depend on \( \varepsilon \). Hence, \( (M^{in,e}_2 M^{out}_2 - I_N)^{-1} M^{in,e}_2 = \mathcal{O}(CN)(\varepsilon) \).

To conclude, by Eqs (5.2) - (5.5), and by expansions (5.7), we infer: \( \mathcal{R}^{out,\varepsilon}_z = \mathcal{O}(\tilde{H}^{out,\varepsilon})(\varepsilon); \mathcal{R}^{out,\varepsilon}_z = \mathcal{O}(\tilde{H}^{in,e},\tilde{H}^{out,\varepsilon})(\varepsilon^{3/2}); \mathcal{R}^{out,\varepsilon}_z = \mathcal{O}(\tilde{H}^{out,\varepsilon})(\varepsilon^{3/2}) \) (this is obvious since it is the adjoint of \( \mathcal{R}^{out,\varepsilon}_z \)); and \( \mathcal{R}^{in,\varepsilon}_z = \mathcal{O}(\tilde{H}^{in,e})(\varepsilon^3) \).

Expansion (5.9) follows by taking into account the bound (5.9), and from Rem. 5.1.

Th. 2.12 is a direct consequence of Th. 5.4.

### 5.2. Non-Generic Case

**Proof of Th. 2.13.** In this section we study the limit of the relevant quantities in the Non-Generic Case and prove Th. 2.13.

Recall that, in the Non-Generic Case, \( \{\hat{\varphi}^{e^*_k}\}_{k=1}^m \) denotes a set of orthonormal eigenfunctions corresponding to the zero eigenvalue, see also Rem. 4.11.

**Proposition 5.5.** Let \( z \in \mathbb{C} \setminus \mathbb{R} \). In the Non-Generic Case
\[
\hat{G}^{in,e}_2 = - \sum_{k=1}^m \frac{\hat{\varphi}^{e^*_k}(\hat{\varphi}^{e^*_k}_{k})_{H^{in,e}}}{z} + \mathcal{O}(\tilde{H}^{in,e})(\varepsilon^2);
\] (5.10)
\[
\hat{G}^{in,e}_1 = - \sum_{k=1}^m \frac{\hat{\varphi}^{e^*_k}(\hat{\varphi}^{e^*_k}_{k})_{H^{in,e}}}{\varepsilon^{1/2} z} + \mathcal{O}(\tilde{H}^{in,e},CN)(\varepsilon^{3/2});
\] (5.11)
\[
\hat{G}^{in,e} = - \sum_{k=1}^m \frac{\hat{\varphi}^{e^*_k}(\hat{\varphi}^{e^*_k}_{k})_{CN}}{\varepsilon^{1/2} z} + \mathcal{O}(\tilde{H}^{in,e},CN)(\varepsilon^{3/2}).
\] (5.12)

**Proof.** We prove first Claim (5.10). By Eq. (1.2) we infer
\[
\hat{G}^{in,e}_2 = - \sum_{k=1}^m \frac{\hat{\varphi}^{e^*_k}(\hat{\varphi}^{e^*_k}_{k})_{H^{in,e}}}{z} + \varepsilon^2 \sum_{n: \lambda_n \neq 0} \frac{\varphi^{e^*_n}(\varphi^{e^*_n})_{H^{in,e}}}{\lambda_n - \varepsilon^2 z}.
\] (5.13)

Note that the second sum runs over \( \lambda_n \neq 0 \), hence one has the bound \( |\lambda_n - \varepsilon^2 z| \geq |\lambda_n|/2 \geq C \), for \( \varepsilon \) small enough. For this reason, the bound in Eq. (5.10) on the second term at the r.h.s. of Eq. (5.13) can be obtained with an argument similar to the one used in the proof of bound (5.6).
To prove Claim \ref{5.1}, we proceed in a similar way. We note that, see Eq. \ref{5.14},
\[
\mathcal{G}_z^{in,\varepsilon} = -\sum_{k=1}^{m} \hat{C}_{z}^{k}(\hat{\mathcal{G}}_{z}^{k,\varepsilon}) + \varepsilon \frac{1}{2} \sum_{n, \lambda_n \neq 0} \frac{\lambda_n}{\lambda_n - \varepsilon z},
\]
and bound the second term at the r.h.s. by reasoning in the same way as in the proof of Prop. \ref{5.2}. Claim \ref{5.12} follows by noticing that \(G_z^{in,\varepsilon}\) is the adjoint of \(\hat{G}_z^{in,\varepsilon}\).

Next we prove a proposition on the expansion of the \(N \times N, z\)-dependent matrix \(M_z^{in,\varepsilon}\). Recall that \(\hat{C}\) was defined in Def. \ref{2.3}.

Proposition 5.6. Let \(z \in \mathbb{C} \setminus \mathbb{R}\). In the Non-Generic Case,
\[
M_z^{in,\varepsilon} = -\frac{1}{\varepsilon z} \hat{C} + \mathcal{O}(\mathbb{C}\mathcal{N})(\varepsilon).
\]

Proof. The claim immediately follows from Eq. \ref{5.14}, after noticing that
\[
M_z^{in,\varepsilon} = -\frac{1}{\varepsilon z} \hat{C} + \varepsilon \sum_{n, \lambda_n \neq 0} \frac{\lambda_n}{\lambda_n - \varepsilon z},
\]
and by treating the second term at the r.h.s. with argument similar to the one used in the proof of Prop. \ref{5.3}.

We set
\[
\overline{M}_z^{in,\varepsilon} := \varepsilon M_z^{in,\varepsilon}
\]
and recall that \(M_z^{out}\) is invertible (see Rem. \ref{A.3}), then
\[
(M_z^{in,\varepsilon} M_z^{out} - I_N)^{-1} = \varepsilon M_z^{out^{-1}} (\overline{M}_z^{in,\varepsilon} - \varepsilon M_z^{out^{-1}})^{-1}.
\]

In the following proposition we give an expansion formula for the term \((\overline{M}_z^{in,\varepsilon} - \varepsilon M_z^{out^{-1}})^{-1}\) in the Non-Generic Case.

Proposition 5.7. Let \(z \in \mathbb{C} \setminus \mathbb{R}\). In the Non-Generic Case, decompose the space \(\mathbb{C}\mathcal{N}\) as \(\mathbb{C}\mathcal{N} = \overline{\mathbb{P}}\mathcal{C}\mathcal{N} \oplus \overline{\mathbb{P}}\perp\mathcal{C}\mathcal{N}\), and denote by \(\hat{C}_0\) the restriction of \(\hat{C}\) to \(\overline{\mathbb{P}}\mathcal{C}\mathcal{N}\). Then, the map \(\overline{\mathbb{P}}\perp M_z^{out^{-1}} \overline{\mathbb{P}}\perp\) is invertible in \(\overline{\mathbb{P}}\perp\mathcal{C}\mathcal{N}\).

Set
\[
N_z := (\overline{\mathbb{P}}\perp M_z^{out^{-1}} \overline{\mathbb{P}}\perp)^{-1} : \overline{\mathbb{P}}\perp\mathcal{C}\mathcal{N} \rightarrow \overline{\mathbb{P}}\perp\mathcal{C}\mathcal{N},
\]
then
\[
(\overline{M}_z^{in,\varepsilon} - \varepsilon M_z^{out^{-1}})^{-1} = \overline{\mathbb{P}}\mathcal{C}\mathcal{N},
\]

\[
\begin{pmatrix}
\hat{C}_0^{-1} + \mathcal{O}(\mathbb{P}\mathcal{C}\mathcal{N})(\varepsilon) & -z\hat{C}_0^{-1} \hat{P} M_z^{out^{-1}} \hat{P} \hat{C}_0^{-1} + \mathcal{O}(\mathbb{P}\mathcal{C}\mathcal{N}, \mathcal{C}\mathcal{N})(\varepsilon) \\
-z N_z \hat{P} M_z^{out^{-1}} \hat{P} \hat{C}_0^{-1} + \mathcal{O}(\mathbb{P}\mathcal{C}\mathcal{N}, \mathcal{C}\mathcal{N})(\varepsilon) & \varepsilon^{-1} N_z + \mathcal{O}(\mathbb{P}\mathcal{C}\mathcal{N})(1)
\end{pmatrix},
\]
to be understood in the decomposition \(\mathbb{C}\mathcal{N} = \overline{\mathbb{P}}\mathcal{C}\mathcal{N} \oplus \overline{\mathbb{P}}\perp\mathcal{C}\mathcal{N}\).

Proof. We postpone the proof of the fact that the map \(\overline{\mathbb{P}}\perp M_z^{out^{-1}} \overline{\mathbb{P}}\perp\) is invertible in \(\overline{\mathbb{P}}\perp\mathcal{C}\mathcal{N}\) to the appendix, see Rem. \ref{A.4}.

Next we prove that the expansion formula \ref{5.17} holds true. We start by noticing that the map \(z^{-1} \hat{C} + \varepsilon M_z^{out^{-1}}\) is invertible. In fact, by Rem. \ref{A.4} and since \((\overline{q}, \overline{q})_{\mathcal{C}\mathcal{N}} = \sum_{k=1}^{m} |\overline{q}_k|^2 \overline{q}_k|^2 \geq 0\), we infer
\[
\text{Im}(\overline{q}, (z^{-1} \hat{C} + \varepsilon M_z^{out^{-1}}) \overline{q})_{\mathcal{C}\mathcal{N}} = -\frac{1}{|z|^2} \text{Im}(\overline{q}, \hat{C}_0)_{\mathcal{C}\mathcal{N}} - \varepsilon \text{Im} z \Vert G_z^{out} M_z^{out^{-1}} \overline{q} \Vert^2_{\mathcal{H}_{out}} 
eq 0,
\]
because it is the sum of two non-positive (or non-negative) terms and \(\Vert G_z^{out} M_z^{out^{-1}} \overline{q} \Vert^2_{\mathcal{H}_{out}} \neq 0\) by the injectivity of \(G_z^{out} M_z^{out^{-1}}\), see Rem. \ref{A.1}.

Moreover we have the a-priori estimate
\[
(\overline{M}_z^{in,\varepsilon} - \varepsilon M_z^{out^{-1}})^{-1} = \mathcal{O}(\mathbb{C}\mathcal{N})(\varepsilon^{-1}).
\]
The latter follows from (see also Eq. \[A.3\])
\[
\|q\|_{CN} \|(\tilde{M}_z^{in,e} - \varepsilon M_z^{out^{-1}})q\|_{CN} \geq |\text{Im}(q, \tilde{M}_z^{in,e} - \varepsilon M_z^{out^{-1}} q)_{CN}|
\]
\[
\geq \varepsilon \|z\|_{H^{2\infty}} \|G_z^{in,e} q\|_{H^{2\infty}} + \|(G_z^{out} M_z^{out^{-1}} \tilde{q})_{H^{2\infty}}\| \geq \varepsilon C_z \|q\|_{CN}^2,
\]
for some positive constant $C_z$, from the injectivity of $G_z^{out} M_z^{out^{-1}}$. Hence, setting $\tilde{q} = (\tilde{M}_z^{in,e} - \varepsilon M_z^{out^{-1}})^{-1} p$, it follows that $\|(\tilde{M}_z^{in,e} - \varepsilon M_z^{out^{-1}})^{-1} p\|_{CN} \leq (\varepsilon C_z)^{-1} \|p\|_{CN}$.

Next we use the expansion (see Eq. \[5.12\])
\[
\tilde{M}_z^{in,e} = -1/z + O(B(CN)) (\varepsilon^2),
\]
which, together with the a-priori estimate \[5.13\], gives
\[
(\tilde{M}_z^{in,e} - \varepsilon M_z^{out^{-1}})^{-1} = -(z^{-1} \tilde{C} + \varepsilon M_z^{out^{-1}})^{-1} - (z^{-1} \tilde{C} + \varepsilon M_z^{out^{-1}})^{-1} O(B(CN)) (\varepsilon^2) (\tilde{M}_z^{in,e} - \varepsilon M_z^{out^{-1}})^{-1}
\]
\[
= -(z^{-1} \tilde{C} + \varepsilon M_z^{out^{-1}})^{-1} - (z^{-1} \tilde{C} + \varepsilon M_z^{out^{-1}})^{-1} O(B(CN)) (\varepsilon).
\]
Here we used the formula $(A + B)^{-1} = A^{-1} - A^{-1} B (A + B)^{-1}$. Note that by using instead the complementary formula $(A + B)^{-1} = A^{-1} - (A + B)^{-1} B A^{-1}$, we obtain
\[
(\tilde{M}_z^{in,e} - \varepsilon M_z^{out^{-1}})^{-1} = -(z^{-1} \tilde{C} + \varepsilon M_z^{out^{-1}})^{-1} + O_B(\varepsilon) (\varepsilon^{-1} \tilde{C} + \varepsilon M_z^{out^{-1}})^{-1}.
\]
Next we analyze the term $(z^{-1} \tilde{C} + \varepsilon M_z^{out^{-1}})^{-1}$.

We start by noticing that the map $z^{-1} \tilde{C}_0 + \varepsilon \tilde{P} M_z^{out^{-1}} \tilde{P} : \hat{P} \mathbb{C}^N \rightarrow \hat{P} \mathbb{C}^N$ is invertible, because $\tilde{C}_0$ is invertible in $\hat{P} \mathbb{C}^N$ and $\varepsilon \tilde{P} M_z^{out^{-1}} \tilde{P} = O(\mathbb{C}^N) (\varepsilon)$.

By the identification (to be understood in the decomposition $\mathbb{C}^N = \hat{P} \mathbb{C}^N \oplus \hat{P} \perp \mathbb{C}^N$)
\[
M_z^{out^{-1}} = \left( \begin{array}{c} \tilde{P} M_z^{out^{-1}} \tilde{P} \\ \tilde{P} \perp M_z^{out^{-1}} \tilde{P} \end{array} \right),
\]
we have the identity
\[
z^{-1} \tilde{C} + \varepsilon M_z^{out^{-1}} = \left( \begin{array}{c} z^{-1} \tilde{C}_0 + \varepsilon \tilde{P} M_z^{out^{-1}} \tilde{P} \\ \varepsilon \tilde{P} M_z^{out^{-1}} \tilde{P} \end{array} \right).
\]
Hence, from the block-matrix inversion formula, we obtain
\[
(z^{-1} \tilde{C} + \varepsilon M_z^{out^{-1}})^{-1} = \left( \begin{array}{cc} D_z^\varepsilon & -D_z^\varepsilon \tilde{P} M_z^{out^{-1}} \tilde{P} \tilde{N}_z \\ -N_z \tilde{P} M_z^{out^{-1}} \tilde{P} D_z^\varepsilon & z^{-1} \tilde{C}_0 + \varepsilon \tilde{P} M_z^{out^{-1}} \tilde{P} \end{array} \right),
\]
with $D_z^\varepsilon : \hat{P} \mathbb{C}^N \rightarrow \hat{P} \mathbb{C}^N$ given by
\[
D_z^\varepsilon := \left( z^{-1} \tilde{C}_0 + \varepsilon \tilde{P} M_z^{out^{-1}} \tilde{P} - \varepsilon \tilde{P} M_z^{out^{-1}} \tilde{P} \tilde{N}_z \tilde{P} M_z^{out^{-1}} \tilde{P} \right)^{-1},
\]
note that $D_z^\varepsilon$ is well-defined because it is the inverse of a map of the form $z^{-1} \tilde{C}_0 + O_B(\hat{P} \mathbb{C}^N) (\varepsilon)$, and $z^{-1} \tilde{C}_0$ is invertible in $\hat{P} \mathbb{C}^N$. Moreover, it holds true,
\[
D_z^\varepsilon = z \tilde{C}_0^{-1} + O_B(\hat{P} \mathbb{C}^N) (\varepsilon).
\]
Hence,
\[
(z^{-1} \tilde{C} + \varepsilon M_z^{out^{-1}})^{-1} = \left( \begin{array}{cc} \tilde{C}_0^{-1} & - \tilde{C}_0^{-1} \tilde{P} M_z^{out^{-1}} \tilde{P} \tilde{N}_z \\ - \tilde{N}_z \tilde{P} M_z^{out^{-1}} \tilde{P} \tilde{C}_0^{-1} & \tilde{C}_0^{-1} \tilde{P} M_z^{out^{-1}} \tilde{P} \tilde{N}_z \end{array} \right) + O_B(\mathbb{C}^N) (\varepsilon).
\]
The latter can also be written as
\[
(z^{-1} \tilde{C} + \varepsilon M_z^{out^{-1}})^{-1} = \left( \begin{array}{cc} \tilde{C}_0^{-1} & - \tilde{C}_0^{-1} \tilde{P} M_z^{out^{-1}} \tilde{P} \tilde{N}_z \\ - \tilde{N}_z \tilde{P} M_z^{out^{-1}} \tilde{P} \tilde{C}_0^{-1} & \tilde{C}_0^{-1} \tilde{P} M_z^{out^{-1}} \tilde{P} \tilde{N}_z \end{array} \right) + O_B(\mathbb{C}^N) (\varepsilon).
Using this expansion formula in Eq. (5.20), we obtain
\[
(M_{z}^{in,e} - \varepsilon M_{z}^{out-1})^{-1} = -\left( \begin{array}{cc}
-\hat{z} \hat{C}_0^{-1} & -z \hat{C}_0^{-1} \hat{P} M_{z}^{out-1} \hat{P} \perp N_z \\
-\hat{z} N_z \hat{P} \perp M_{z}^{out-1} \hat{P} \hat{C}_0^{-1} & \hat{C}_0^{-1} \hat{P} M_{z}^{out-1} \hat{P} \perp N_z \\
\end{array} \right)
\begin{array}{c}
\varepsilon^{-1} N_z + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\varepsilon^{-1} N_z + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\end{array}
\]
\[+ \left( \begin{array}{c}
\hat{z} \hat{C}_0^{-1} \\
-\hat{z} N_z \hat{P} \perp M_{z}^{out-1} \hat{P} \hat{C}_0^{-1} \\
\end{array} \right)
\begin{array}{c}
\hat{C}_0^{-1} \hat{P} M_{z}^{out-1} \hat{P} \perp N_z + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\hat{C}_0^{-1} \hat{P} M_{z}^{out-1} \hat{P} \perp N_z + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\end{array}
\left( \begin{array}{c}
\hat{P} \hat{C}_0^{-1} + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\hat{P} \hat{C}_0^{-1} + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\end{array} \right)
\begin{array}{c}
\varepsilon^{-1} N_z + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\varepsilon^{-1} N_z + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\end{array}
\right)
\]

On the other hand, using Eq. (5.21), we obtain
\[
(M_{z}^{in,e} - \varepsilon M_{z}^{out-1})^{-1} = -\left( \begin{array}{cc}
\hat{z} \hat{C}_0^{-1} & \hat{C}_0^{-1} \hat{P} M_{z}^{out-1} \hat{P} \perp N_z \\
-\hat{z} N_z \hat{P} \perp M_{z}^{out-1} \hat{P} \hat{C}_0^{-1} & \hat{C}_0^{-1} \hat{P} M_{z}^{out-1} \hat{P} \perp N_z \\
\end{array} \right)
\begin{array}{c}
\varepsilon^{-1} N_z + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\varepsilon^{-1} N_z + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\end{array}
\left( \begin{array}{c}
\hat{P} \hat{C}_0^{-1} + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\hat{P} \hat{C}_0^{-1} + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\end{array} \right)
\begin{array}{c}
\varepsilon^{-1} N_z + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\varepsilon^{-1} N_z + O_{\tilde{P} \tilde{B}_{\tilde{C} \tilde{N}}}(1) \\
\end{array}
\right)
\]

Hence Expansion (5.17) must hold true.

Recall that, for \( \text{Im} \; z \neq 0 \), \( \hat{P} M_{z}^{out} \hat{P} \) is invertible in \( \hat{P} \mathcal{C}^N \), see Rem. A.3.

**Proposition 5.8.** Let \( z \in \mathbb{C}[\Re] \). In the Non-Generic Case,
\[
(M_{z}^{in,e} M_{z}^{out} - \mathbb{I}_N)^{-1} M_{z}^{in,e} = \hat{P} (\hat{P} M_{z}^{out} \hat{P})^{-1} \hat{P} + O_{\mathcal{C}^N}(\varepsilon).
\]

**Proof.** Taking into account Expansion (5.19), rewritten in the decomposition \( \mathcal{C}^N = \hat{P} \mathcal{C}^N \oplus \hat{P} \perp \mathcal{C}^N \), one has
\[
\hat{M}_{z}^{in,e} = -\frac{1}{z} \hat{C} + O_{\mathcal{C}^N}(\varepsilon^2) = -\left( \begin{array}{c}
\frac{\hat{P} \mathcal{C}^N}{\hat{P} \perp \mathcal{C}^N} \\
0 \\
\end{array} \right) + O_{\mathcal{C}^N}(\varepsilon^2).
\]

So that, by Eq. (5.17),
\[
(M_{z}^{in,e} - \varepsilon M_{z}^{out-1})^{-1} M_{z}^{in,e} = \left( \begin{array}{c}
\frac{\hat{P} \mathcal{C}^N}{\hat{P} \perp \mathcal{C}^N} \\
-\hat{z} \hat{P} \perp M_{z}^{out-1} \hat{P} \\
\end{array} \right) + O_{\mathcal{C}^N}(\varepsilon).
\]

By the latter expansion and by the identification (5.22) it follows that (recall Eq. (5.19) and the definition of \( N_z \) in Eq. (5.10))
\[
(M_{z}^{in,e} M_{z}^{out} - \mathbb{I}_N)^{-1} M_{z}^{in,e} = \left( \begin{array}{c}
\frac{\hat{P} \mathcal{C}^N}{\hat{P} \perp \mathcal{C}^N} \\
-\hat{z} \hat{P} \perp M_{z}^{out-1} \hat{P} \\
\end{array} \right) + O_{\mathcal{C}^N}(\varepsilon).
\]

To conclude, we apply the block-matrix inversion formula to Eq. (5.22) to obtain
\[
M_{z}^{out} = \left( \begin{array}{c}
\hat{D}_z \\
\hat{D}_z \\
\end{array} \right)
\begin{array}{c}
\hat{P} \hat{M}_{z}^{out-1} \hat{P} \perp N_z \\
\hat{P} \hat{M}_{z}^{out-1} \hat{P} \perp N_z \\
\end{array}
\left( \begin{array}{c}
\hat{P} \hat{D}_z \\
\hat{P} \hat{D}_z \\
\end{array} \right)
\begin{array}{c}
\hat{P} \hat{M}_{z}^{out-1} \hat{P} \perp N_z \\
\hat{P} \hat{M}_{z}^{out-1} \hat{P} \perp N_z \\
\end{array}
\right)^{-1}
\]

with
\[
\hat{D}_z = (\hat{P} \hat{M}_{z}^{out-1} \hat{P} - \hat{P} \hat{M}_{z}^{out-1} \hat{P} \perp N_z \hat{M}_{z}^{out-1} \hat{P})^{-1}.
\]

Hence it must be
\[
\hat{P} \hat{M}_{z}^{out} \hat{P} = \hat{D}_z = (\hat{P} \hat{M}_{z}^{out-1} \hat{P} - \hat{P} \hat{M}_{z}^{out-1} \hat{P} \perp N_z \hat{M}_{z}^{out-1} \hat{P})^{-1},
\]

so that
\[
(\hat{P} \hat{M}_{z}^{out} \hat{P})^{-1} = \hat{P} \hat{M}_{z}^{out-1} \hat{P} - \hat{P} \hat{M}_{z}^{out-1} \hat{P} \perp N_z \hat{M}_{z}^{out-1} \hat{P}.
\]
Which, together with Eq. (5.23), allows us to infer the expansion
\[
(M_z^{\text{in},\varepsilon} M_z^{\text{out}} - I_N)^{-1} M_z^{\text{in},\varepsilon} = \left(\begin{array}{cc} (\hat{P} M_z^{\text{out}} \hat{P})^{-1} & 0 \\ 0 & 0 \end{array} \right) + \mathcal{O}(\mathbb{C}_N)(\varepsilon) = \hat{P}(\hat{P} M_z^{\text{out}} \hat{P})^{-1} \hat{P} + \mathcal{O}(\mathbb{C}_N)(\varepsilon)
\]
and conclude the proof of the proposition.

We are now ready to state and prove the main theorem for the Non-Generic Case. In the statement of the theorem, we assume that \( \text{Ker} \hat{C} \subset \mathbb{C}_N \), i.e., \( \hat{P} \neq 0 \). In this way the quantity \( (\hat{\omega}_c \hat{\omega}_c^{-1} \hat{\omega}_c)^{-1} \mathbb{C}_N \) is certainly well defined. We discuss the case \( \text{Ker} \hat{C} = \mathbb{C}_N \) (i.e., \( \hat{P} = 0 \)) separately in the proof of point (ii) of Th. 2.13 (after the proof of Th. 5.9).

**Theorem 5.9.** Let \( z \in \mathbb{C} \setminus \mathbb{R} \). In the Non-Generic Case assume that \( \text{Ker} \hat{C} \subset \mathbb{C}_N \), then
\[
R_z^\varepsilon = \left( \hat{R}_z^{\text{out}} + \mathcal{O}(\mathbb{C}_N)(\varepsilon) \right) - z^{-1} \sum_{k,k'=1}^m \left( \delta_{kk'} - (\hat{\omega}_c \hat{\omega}_c^{-1} \hat{\omega}_c)^{-1} \mathbb{C}_N \hat{\phi} \hat{\phi}_c \right) \hat{\phi} c \hat{\phi}_c H^{\text{in},\varepsilon} + \mathcal{O}(\mathbb{C}_N)(\varepsilon),
\]
where the expansion has to be understood in the out/in decomposition (2.11).

**Proof.** We analyze term by term the r.h.s. in Eq. (5.1).

**Term out/out.** By Prop. 5.8 and Lemma 3.11 it immediately follows that
\[
\hat{R}_z^{\text{out}} - R_z^{\text{out},\text{out},\varepsilon} = \hat{R}_z^{\text{out}} + \mathcal{O}(\mathbb{C}_N)(\varepsilon).
\]

**Term out/in.** By Eq. (5.15) and by the definition of \( R_z^{\text{out},\text{in},\varepsilon} \), recalling that \( G_z^{\text{out}} \) and \( M_z^{\text{out},\varepsilon} \) are bounded, it is enough to prove that
\[
\varepsilon (M_z^{\text{in},\varepsilon} - \varepsilon M_z^{\text{out},\varepsilon})^{-1} \dot{G}_z^{\text{in},\varepsilon} = \mathcal{O}(\mathbb{C}_N)(\varepsilon)^{1/2}).
\]

Taking into account the fact that for all \( \psi \in \mathbb{H}^{\text{in},\varepsilon}, \| \sum_{k=1}^m \hat{\omega}_k (\hat{\phi}_k^T, \psi) \| \mathbb{C}^{\text{in},\varepsilon} \leq C \| \psi \| \mathbb{C}^{\text{in},\varepsilon} \), and the fact that \( \sum_{k=1}^m \hat{\omega}_k (\hat{\phi}_k^T, \psi) \in \hat{P} \mathbb{C}_N \) (it is a linear combination of vectors in \( \hat{P} \mathbb{C}_N \), see Rem. 2.7) we infer that (see Eq. (5.11)),
\[
\dot{G}_z^{\text{in},\varepsilon} \psi = q^\varepsilon + \hat{p}^\varepsilon
\]
with \( q^\varepsilon \in \hat{P} \mathbb{C}_N \), \( \| q^\varepsilon \| _{\mathbb{C}_N} \leq C \varepsilon^{-1/2} \| \psi \| _{\mathbb{C}^{\text{in},\varepsilon}} \), and \( \| \hat{p}^\varepsilon \| _{\mathbb{C}_N} \leq C \varepsilon^{-3/2} \| \psi \| _{\mathbb{C}^{\text{in},\varepsilon}} \).

Hence, by the expansion (5.17), we infer
\[
\varepsilon (M_z^{\text{in},\varepsilon} - \varepsilon M_z^{\text{out},\varepsilon})^{-1} \dot{G}_z^{\text{in},\varepsilon} \psi
= -\varepsilon (z \bar{\mathcal{C}}_0^{-1} - z N_2 \hat{P} \bar{\mathcal{M}}_z^{\text{out},\varepsilon} \hat{P} \mathcal{C}_0^{-1} + \mathcal{O}(\mathbb{C}_N)(\varepsilon)) \hat{q}^\varepsilon + \varepsilon \bar{\mathcal{M}}_z^{\text{in},\varepsilon} - \varepsilon M_z^{\text{out},\varepsilon})^{-1} \hat{p}^\varepsilon.
\]

Here the leading term is
\[
\varepsilon (z \bar{\mathcal{C}}_0^{-1} - z N_2 \hat{P} \bar{\mathcal{M}}_z^{\text{out},\varepsilon} \hat{P} \mathcal{C}_0^{-1}) \hat{q}^\varepsilon,
\]
and for it we have the bound
\[
\| \varepsilon (z \bar{\mathcal{C}}_0^{-1} - z N_2 \hat{P} \bar{\mathcal{M}}_z^{\text{out},\varepsilon} \hat{P} \mathcal{C}_0^{-1}) \hat{q}^\varepsilon \| _{\mathbb{C}_N} \leq C \varepsilon^{1/2} \| \psi \| _{\mathbb{C}^{\text{in},\varepsilon}}.
\]

The remainder is bounded by
\[
\| \mathcal{O}(\mathbb{C}_N)(\varepsilon^2) \hat{q}^\varepsilon + \varepsilon (\bar{\mathcal{M}}_z^{\text{in},\varepsilon} - \varepsilon M_z^{\text{out},\varepsilon})^{-1} \hat{p}^\varepsilon \| _{\mathbb{C}_N} \leq C \varepsilon^2 \| \hat{q}^\varepsilon \| _{\mathbb{C}_N} + C \| \hat{p}^\varepsilon \| _{\mathbb{C}_N} \leq C \varepsilon^{3/2} \| \psi \| _{\mathbb{C}^{\text{in},\varepsilon}};
\]
in the latter bound we used \( (\bar{\mathcal{M}}_z^{\text{in},\varepsilon} - \varepsilon M_z^{\text{out},\varepsilon})^{-1} = \mathcal{O}(\mathbb{C}_N)(\varepsilon^{-1}) \), see Eq. (5.17) (see also Eq. (5.18)). Hence,
\[
\| \varepsilon (\bar{\mathcal{M}}_z^{\text{in},\varepsilon} - \varepsilon M_z^{\text{out},\varepsilon})^{-1} \hat{G}_z^{\text{in},\varepsilon} \psi \| _{\mathbb{C}_N} \leq C \varepsilon^{1/2} \| \psi \| _{\mathbb{C}^{\text{in},\varepsilon}},
\]
and the bound (5.24) holds true.

The bound on the term in/out follows immediately by noticing that \( R_z^{\text{in},\text{out},\varepsilon} = R_z^{\text{out},\text{in},\varepsilon} \).

**Term in/in.** By Eq. (5.15), we have that
\[
R_z^{\text{in},\text{in},\varepsilon} = \varepsilon G_z^{\text{in},\varepsilon} (\bar{\mathcal{M}}_z^{\text{in},\varepsilon} - \varepsilon M_z^{\text{out},\varepsilon})^{-1} \hat{G}_z^{\text{in},\varepsilon}.
\]
Taking into account Eq. (5.26) and the expansion (5.12), we infer that, for all \( \psi \in \mathcal{H}^{i,n,\varepsilon} \) the leading term in \( R^{i,n,\varepsilon}_z \) is given by

\[
\sum_{k=1}^{m} \frac{\varphi_k^* (\hat{C}_0^{\varepsilon})^N}{\varepsilon^{1/2}} \left( \varepsilon \left( C_0^{-1} - z N_z \hat{P}_z M_z^{\text{out}} \hat{P}_z^{-1} \right) \varphi_k \right) = \varepsilon^{1/2} \sum_{k=1}^{m} \varphi_k^* (\hat{C}_0^{-1} \varphi_k) \in \mathcal{N}
\]

\[
= - \frac{1}{\varepsilon} \sum_{k,k'=1}^{m} \varphi_k^* (\hat{C}_0^{-1} \varphi_{k'}) \in \mathcal{N} \left( \varphi_k, \psi \right) \mathcal{H}^{i,n,\varepsilon}
\]

the remainder being of order \( \varepsilon \). From the latter formula and from the expansion (5.10) we infer

\[
R^{i,n,\varepsilon}_z - R^{i,n,\varepsilon}_z = - \varepsilon^{-1} \sum_{k,k'=1}^{m} \left( \delta_{k,k'} - \left( \hat{C}_0^{-1} \hat{C}_0^{\varepsilon} \right) \right) \varphi_k^* (\hat{\varphi}_{k'}^{\varepsilon}, \psi) \mathcal{H}^{i,n,\varepsilon} + O_{B(\mathcal{H}^{i,n,\varepsilon})}(\varepsilon).
\]

\[\Box\]

**Proof of Th. 2.13 - (ii).** If \( \text{Ker} \hat{C} = \mathbb{C}^N \) then \( \hat{z}_k = 0 \), for all \( k = 1, \ldots, m \), see Rem. 2.4. Hence, expansions (5.11), (5.12), and (5.14) read respectively

\[
\hat{C}_z^{i,n,\varepsilon} = O_{B(\mathcal{H}^{i,n,\varepsilon},\mathcal{C}^N)}(\varepsilon^{3/2}); \quad \hat{C}_z^{i,n,\varepsilon} = O_{B(\mathcal{C}^N,\mathcal{H}^{i,n,\varepsilon})}(\varepsilon^{3/2}); \quad M_z^{i,n,\varepsilon} = O_{B(\mathcal{C}^N)}(\varepsilon).
\]

Reasoning along the lines of the analysis of the Generic Case, see the proof of Th. 5.4 and taking into account the expansion (5.10), one readily infers

\[
R^\varepsilon = \left( \hat{R}_z^{\text{out}} + O_{B(\mathcal{H}^{i,n,\varepsilon})}(\varepsilon) \right) - \sum_{k=1}^{m} \frac{O_{B(\mathcal{H}^{i,n,\varepsilon},\mathcal{H}^{i,n,\varepsilon})}(\varepsilon^{3/2})}{O_{B(\mathcal{C}^N,\mathcal{H}^{i,n,\varepsilon})}(\varepsilon^{3/2})} + O_{B(\mathcal{H}^{i,n,\varepsilon})}(\varepsilon^2),
\]

which implies the statement in Th. 2.13 - (ii). \[\Box\]

**Proof of Th. 2.13 - (iii).** To prove the second part of Th. 2.13 recall that \( \hat{z}_k \in \hat{P}\mathbb{C}^N \) and \( \hat{C}_0^{-1} \hat{z}_k \in \hat{P}\mathbb{C}^N \), hence \( \hat{C} \hat{C}_0^{-1} \hat{z}_k = \hat{0} \). By the definition of \( \hat{C} \) this is equivalent to

\[
\sum_{k=1}^{m} \left( \delta_{k,k'} - \left( \hat{C}_0^{-1} \hat{C}_0^{-1} \hat{z}_k \right) \right) = 0.
\]

If the vectors \( \{\hat{z}_k\}_{k=1}^{m} \) are linearly independent this linear combination is zero if and only if \( \delta_{k,k'} - \left( \hat{C}_0^{-1} \hat{C}_0^{-1} \hat{z}_k \right) = 0 \) for all \( k \). Hence, expansion (2.15) follows from Eq. (2.14). \[\Box\]

**Remark 5.10.** Denote by \( \Lambda \) the operator in \( \mathcal{H}^{i,n,\varepsilon} \) defined by

\[
D(\Lambda) := \mathcal{H}^{i,n,\varepsilon}, \quad \Lambda := \sum_{k,k'=1}^{m} \left( \delta_{k,k'} - \left( \hat{C}_0^{-1} \hat{C}_0^{-1} \hat{z}_k \right) \right) \varphi_k^* (\hat{\varphi}_{k'}^{\varepsilon}, \psi) \mathcal{H}^{i,n,\varepsilon}.
\]

\( \Lambda \) is selfadjoint and \( \Lambda^2 = \Lambda \). The first claim is obvious (recall that \( \hat{C}_0 \) is selfadjoint). To prove the second claim, note that, since \( \left( \hat{\varphi}_{k'}^{\varepsilon}, \varphi_k^{\varepsilon} \right)_{\mathcal{H}^{i,n,\varepsilon}} = \delta_{k',k} \),

\[
\Lambda^2 = \sum_{k,k'=1}^{m} \left( \delta_{l,k} - \left( \hat{C}_0^{-1} \hat{C}_0^{-1} \hat{z}_k \right) \right) \left( \delta_{l,k'} - \left( \hat{C}_0^{-1} \hat{C}_0^{-1} \hat{z}_k \right) \right) \varphi_k^* (\hat{\varphi}_{k'}^{\varepsilon}, \psi) \mathcal{H}^{i,n,\varepsilon},
\]

but

\[
\sum_{k=1}^{m} \left( \delta_{l,k} - \left( \hat{C}_0^{-1} \hat{C}_0^{-1} \hat{z}_k \right) \right) \left( \delta_{l,k'} - \left( \hat{C}_0^{-1} \hat{C}_0^{-1} \hat{z}_k \right) \right) = \delta_{l,k} - \left( \hat{C}_0^{-1} \hat{C}_0^{-1} \hat{z}_k \right) + \sum_{k=1}^{m} \left( \delta_{l,k} - \left( \hat{C}_0^{-1} \hat{C}_0^{-1} \hat{z}_k \right) \right) = \delta_{l,k} - \left( \hat{C}_0^{-1} \hat{C}_0^{-1} \hat{z}_k \right),
\]

where we used the fact that \( \hat{C}_0^{-1} \hat{C}_0^{-1} = \hat{C}_0^{-1} \hat{C}_0^{-1} = \hat{C}_0^{-1} \). Hence,

\[
\Lambda^2 = \sum_{l,k',l',k'=1}^{m} \left( \delta_{l,k'} - \left( \hat{C}_0^{-1} \hat{C}_0^{-1} \hat{z}_k \right) \right) \varphi_k^* (\hat{\varphi}_{k'}^{\varepsilon}, \psi) \mathcal{H}^{i,n,\varepsilon} = \Lambda.
\]

Hence, \( \Lambda \) is an orthogonal projection in \( \mathcal{H}^{i,n,\varepsilon} \).
Appendix A. Proof of the Krein resolvent formulae

We use several known results from the theory of self-adjoint extensions of symmetric operators.

We follow, for the most, the approach and the notation from the papers by A. Posilicano [29, 30]. Other approaches would be possible, such as the one based on the use of boundary triples, see, e.g., [2, 7, 21, 33].

When no misunderstanding is possible, in this appendix we omit the suffixes out, in, and ε.

A.1. Proofs of Lemmata 3.1 and 3.2

We denote by τ the restriction of the maps τ to the domain \( D(\hat{H}) \), by Eq. (3.6) and (3.7) we infer

\[
\hat{\tau} : D(\hat{H}) \rightarrow \mathbb{C}^{2N}, \quad \hat{\tau} = \text{diag}(\hat{\tau}^{\text{out}}, \hat{\tau}^{\text{in}});
\]

\[
\hat{\tau}^{\text{out}} : D(H^{\text{out}}) \rightarrow \mathbb{C}^{N}, \quad \hat{\tau}^{\text{out}} \psi := \Psi(0);
\]

\[
\hat{\tau}^{\text{in}} : D(H^{\text{in}, c}) \rightarrow \mathbb{C}^{N}, \quad \hat{\tau}^{\text{in}} \psi := (\psi(v_1), \ldots, \psi(v_N))^T;
\]

where in \( \hat{\tau}^{\text{in}} \) we used the definition of \( \tau^{\text{in}} \) and the fact that functions in \( D(H^{\text{in}, c}) \) are continuous in the connecting vertices.

Remark A.1. The map \( \hat{\tau} \) is surjective. Hence, the map \( \hat{G}_z^{\tau} = \tau \hat{R}_z^\tau = \hat{\tau} \hat{R}_z^\tau \) is also surjective as a map from \( \mathcal{H}^c \rightarrow \mathbb{C}^{2N} \) (the operator \( \hat{R}_z^\circ : \mathcal{H}^c \rightarrow D(\hat{H}) \) is obviously surjective). We conclude that \( \hat{G}_z^{\tau} = \hat{G}_z^{\tau^*} \) is an injective map from \( \mathbb{C}^{2N} \rightarrow \mathcal{H}^c \) (it is the adjoint of a surjective map). A similar statement holds true also for the corresponding “out” and “in” operators.

Remark A.2. We claim that for all \( z \in \rho(\mathcal{H}^c) \) and \( q \in \mathbb{C}^{2N} \) one has \( \hat{G}_z q \in \mathcal{H}_2^z \) and

\[
-(\Delta + B^c - z)\hat{G}_z q = 0, \quad (A.1)
\]

and similar properties hold true for the “out” and “in” operators (here \( \Delta \) denotes the maximal Laplacian in \( \mathcal{H}^c \), i.e., \( D(\Delta) := \mathcal{H}_2^z, \Delta \psi = \dot{\psi}'' \)).

To prove that \( \hat{G}_z q \in \mathcal{H}_2^z \) and that Eq. (A.1) holds true we start by discussing the case \( B^c = 0 \). In such a case it is possible to obtain an explicit formula for the integral kernel of \( \hat{R}_z^\circ = \hat{R}_z^\circ\vert_{B^c = 0} \), see, e.g., [21, Lemma 4.2]. By this explicit formula it is easily seen that the operator \( \hat{G}_z^{\circ}, 0 = \hat{G}_z^{\circ, B^c = 0} \) maps any vector \( q \in \mathbb{C}^{2N} \) in a function in \( \mathcal{H}_2^z \) and that \( -(\Delta - z)\hat{G}_z^{\circ, B^c = 0} q = 0 \). It is not needed to investigate the detailed properties of the boundary conditions in the vertices of \( \mathcal{G}^c \), it is enough to take into account the dependence on \( x, y \in \mathcal{G}_z \) of the integral kernel \( \hat{R}_z^\circ(x, y) \) (see also [30, Examples 5.1 and 5.2]). That the same is true for \( B^c \neq 0 \) follows immediately from the resolvent identity

\[
\hat{R}_z^\circ = \hat{R}_z^\circ\vert_{B^c = 0} - \hat{R}_z^\circ B^c \hat{R}_z^\circ,
\]

which gives \( \hat{G}_z^c = \hat{G}_z^{\circ, B^c = 0} - \hat{R}_z^\circ B^c \hat{R}_z^\circ \hat{G}_z^c \) and \( \hat{G}_z = \hat{G}_z^{\circ, B^c = 0} - \hat{R}_z^\circ B^c \hat{G}_z^{\circ, B^c = 0} \).

In consideration of the remark above, we infer that the maps \( (N \times N, z\)-dependent matrices) \( M_z \) in Eqs. (3.10), (3.11) and (3.12) are all well defined. Moreover, by the resolvent identities

\[
R_z - R_w = (z - w)R_z R_w \quad \text{and} \quad R_z = R_z^\circ
\]

it follows that

\[
\hat{G}_z - \hat{G}_w = (z - w)\hat{G}_w G_z, \quad G_z - G_w = (z - w)R_w G_z, \quad M_z - M_w = (z - w)\hat{G}_w G_z, \quad M_z = M_z^\circ. \quad (A.2)
\]

Let us denote by \( K \) the space \( \mathbb{C}^{2N} \) or \( \mathbb{C}^N \) depending on if we are reasoning with operators in \( \mathcal{H}^c, \mathcal{H}^{\text{out}} \) or \( \mathcal{H}^{\text{in}, c} \). By Eq. (A.2), it follows that for any projection \( P \in K \) and any self-adjoint operator \( \Theta \) in \( \text{Ran} P \), the map \( M_z^{P, \Theta} := PM_zP - \Theta \) is invertible in \( \text{Ran} P \). To see that this is indeed the case, note that by Eq. (A.2) one has

\[
M_z^{P, \Theta} - M_w^{P, \Theta} = (z - w)P\hat{G}_w G_z P \quad \text{and} \quad M_z^{P, \Theta} = M_z^{P, \Theta^*}.
\]

So that, for \( \text{Im} z \neq 0 \) and for all \( q \in K \), such that \( Pq \neq 0 \), it holds

\[
\text{Im}(q, M_z^{P, \Theta} q)_K = \frac{1}{2i}(q, (M_z^{P, \Theta} - M_w^{P, \Theta})q)_K = \text{Im} z\|G_z P q\|_K^2 \neq 0; \quad (A.3)
\]

because \( G_z \) is injective. Hence, \( M_z^{P, \Theta} \) is invertible in \( \text{Ran} P \) for \( \text{Im} z \neq 0 \).

Remark A.3. By the discussion above, it follows that the maps \( \hat{M}_z^{\text{out}} : \mathbb{C}^N \rightarrow \mathbb{C}^N, \hat{P} \hat{M}_z^{\text{out}} \hat{P} : \hat{P} \mathbb{C}^N \rightarrow \hat{P} \mathbb{C}^N, \) and \( (M_z - \Theta) : \mathbb{C}^{2N} \rightarrow \mathbb{C}^{2N} \) are invertible for all \( \text{Im} z \neq 0 \).
By [30, Th. 2.1] (see also [29, Th. 2.1]) it follows that: for any \( z \in C \setminus R \) the operators \( \tilde{R}^\text{out} \) and \( R^\text{out} \) are the resolvents of a self-adjoint extension of the symmetric operators \( H^\text{out} \mid_{\text{Ker} \tilde{r}^\text{out}} \) and \( H^\varepsilon \mid_{\text{Ker} \tilde{r}} \) respectively.

We are left to prove that such self-adjoint extensions coincide with \( \tilde{H}^\text{out} \) and \( H^\varepsilon \) respectively.

Let us focus attention on \( R^\varepsilon \) (similar considerations hold true for \( \tilde{R}^\text{out} \)). Since the self-adjoint operator associated to \( R^\varepsilon \) is an extension of \( H^\varepsilon \mid_{\text{Ker} \tilde{r}} \), to prove that \( R^\varepsilon \) is the resolvent of \( H^\varepsilon \), we just need to check that in the connecting vertices functions in \( \text{Ran} \tilde{r} \) holds true for every connecting vertex.

In a similar way one can prove\( \tilde{r} \) evaluate functions only in the connecting vertices.

Define the maps:

\[
\sigma^\text{out} : H^\text{out} \to C^N \\
\sigma^\text{out}^j = \Psi(0);
\]

\[
\sigma^\text{in} : H^\text{in}^\varepsilon \to C^N \\
\sigma^\text{in}^j = - \left( \sqrt{d^\text{in}(v_1)}(1_{d^\text{in}(v_1)}, \Psi'(v_1)), \ldots, \sqrt{d^\text{in}(v_N)}(1_{d^\text{in}(v_N)}, \Psi'(v_N)) \right)_C^N.
\]

and

\[
\sigma : H^\varepsilon \to C^2N \\
\sigma := \text{diag}(\sigma^\text{out}, \sigma^\text{in}).
\]

We recall the following formula which is obtained by integrating by parts.

\[
\chi \in H^\varepsilon \quad \text{and} \quad j \in \{1, \ldots, N\}.
\]

We have proved that for any \( \phi \in H^\varepsilon \) and \( \psi \in G^\varepsilon \).

Let \( \phi = (\phi^\text{out}^j, 0) \in D(\tilde{H}^\varepsilon) \). Then Identity (A.5) gives

\[
(\tau^\text{out} \phi^\text{out}^j, 0)_{C^N} = \sum_{j=1}^{N} \phi^\text{out}^j_{j}(0) \psi^\text{out}^j_{j}(0).
\]

Take \( \phi^\text{out}^j \in D(\tilde{H}^\text{out}) \), such that \( \phi^\text{out}^j_{j}(0) = 1 \) and \( \phi^\text{out}^j_{j} = 0 \) for all \( j = 2, \ldots, N \). Then \( \tau^\text{out} \phi^\text{out}^j_{j} = \delta_{1,j} \), \( j = 1, \ldots, N \) and Eq. (A.6) gives \( \psi^\text{out}^j_{j}(0) = q_{j} \). In a similar way it is possible to show that \( \psi^\text{out}^j_{j}(0) = q_{j} \) for all \( j = 2, \ldots, N \). Hence, \( \sigma^\text{out} \phi^\text{out}^j = q^\text{out}^j \).

Next let \( \phi = (0, \phi^\text{in}) \). Then Identity (A.5) gives

\[
(\tau^\text{in} \phi^\text{in}, 0)_{C^N} = \sum_{v \in C} \left[ (K^\text{in}_v \Phi^\text{in}(v), K^\text{in}_v \Psi^\text{in}(v)) C^N - (K^\text{in}_v \Phi^\text{in}(v), K^\text{in}_v \Psi^\text{in}(v)) C^N \right] + \sum_{v \in C} \delta^\text{in}^j (0) \psi^\text{in}^j (0).
\]

Take \( \phi^\text{in} \) such that \( \phi^\text{in}(v_1) = 1, \Phi^\text{in}(v_1) = 0 \) and \( \Phi^\text{in}(v_j) = \Phi^\text{in}(v_j) = 0 \) for all \( j = 2, \ldots, N \). Hence, \( \tau^\text{in} \phi^\text{in} = \delta_{1,j} \), \( j = 1, \ldots, N \), and \( K^\text{in}_v \Phi^\text{in}(v_1) = (\phi^\text{in}(v_1)) 1^2 \). Hence, Eq. (A.7) gives

\[
q^\text{in}_j = - (\sqrt{d^\text{in}(v_1)}(1_{d^\text{in}(v_1)}, K^\text{in}_v \Phi^\text{in}(v_1)) C^N) = (\sqrt{d^\text{in}(v_1)}(1_{d^\text{in}(v_1)}, \Psi^\text{in}(v_1)) C^N).
\]

In a similar way one can prove \( \phi^\text{in}(v_j) = \delta_{1,j} \), \( j = 2, \ldots, N \), hence, \( \sigma^\text{in} \phi^\text{in} = q^\text{in} \).

We also note that the function \( \psi \) is continuous in the connecting vertices (whenever the vertex degree is larger or equal than two). To see that this is indeed the case, consider in Eq. (A.5) a function \( \phi^\text{in} \) such that \( \phi^\text{in}(v_1) = 0, j = 1, \ldots, N \), \( \Phi^\text{in}(v_1) = (1, -1, 0, \ldots, 0)^T \) := \( \text{e} \). \( \Phi^\text{in}(v_j) = 0, j = 2, \ldots, N \). Since \( K^\text{in}_v \text{e} = \text{e} \), condition (A.7) gives \( \text{e} \Phi^\text{in}(v_j) = 0 \). Repeating the process, moving \( \text{e} \) in the vector \( \text{e} \) on all the positions (from the second one on) one obtains the continuity of \( \psi \) in the vertex \( v_1 \). The same holds true for every connecting vertex.

We have proved that for any \( \chi \in H^\varepsilon \), setting \( \tilde{q} = \left( M^\varepsilon \setminus \Theta \right)^{-1} \hat{G}^\varepsilon_\chi \in C^2N \), one has:

\[
\sigma^\text{out} \tilde{G}^\varepsilon_\chi \tilde{q} = \tilde{q} \;
\sigma^\text{in} \tilde{G}^\varepsilon_\chi \tilde{q} = \tilde{q} \;
\sigma G^\varepsilon \tilde{q} = \tilde{q}.
\]

(A.8)
Let \( \chi \in \mathcal{H}^e \) and set \( \psi = R_z^e \chi \). One has that
\[
\tau \psi = \tau (R_z^e - G_z^e (M_z^e - \Theta)^{-1} \tilde{G}_z^e ) \chi = (\mathbb{I} - M_z^e (M_z^e - \Theta)^{-1}) \tilde{G}_z^e \chi = -\Theta (M_z^e - \Theta)^{-1} \tilde{G}_z^e \chi.
\]
On the other hand, noticing that \( \sigma R_z^e \chi = 0 \), by the definition of \( D(\hat{H}^e) \) (see Eqs. (A.10), (A.11), and (A.1)), and by Eq. (A.8) it follows that
\[
\sigma \psi = -(M_z^e - \Theta)^{-1} \tilde{G}_z^e \chi.
\]
We conclude that \( \psi \) satisfies the condition \( \tau \psi = \Theta \sigma \psi \). Taking into account the fact that \( \psi^{in} \) is continuous in the connecting vertices, it is easy convince oneself that the condition \( \tau \psi = \Theta \sigma \psi \) is equivalent to
\[
\Psi^{out\prime}(0) = -\left( \sqrt{d^{in}(v_1)(1_{\mathcal{A}^{in}(v_1)}, \Psi^{in\prime}(v_1))_{\mathcal{C}^{in}(v_1)}, \ldots, \sqrt{d^{in}(v_N)(1_{\mathcal{A}^{in}(v_N)}, \Psi^{in\prime}(v_N))_{\mathcal{C}^{in}(v_N)}} \right)^T,
\]
and
\[
\psi^{in}(v_j) = \psi_j(0);
\]
which, in turns, is equivalent to the Kirchhoff boundary conditions in \( D(\hat{H}^e) \).

The fact that the resolvent formula holds true for all \( z \in \rho(\hat{H}^e) \cap \rho(\hat{H}^e) \), follows from [3] Th. 2.19).

To prove the resolvent formula for \( \hat{R}_z^e \), let \( \chi \in \mathcal{H}^{out} \) and set \( \psi = \hat{R}_z^e \chi \). By the first formula in (A.5), one has
\[
\Psi(0) = -\hat{P}(\hat{P} \hat{M}^{out} \hat{P})^{-1} \hat{P} \tilde{G}_z^{out \chi},
\]
hence, \( \hat{P}^{-1} \Psi(0) = 0 \). Moreover,
\[
\hat{P} \Psi'(0) = \hat{P} \tau \psi = (\mathbb{I} - \hat{P} M^{out} \hat{P} (\hat{P} M^{out} \hat{P})^{-1}) \hat{P} \tilde{G}_z^{out \chi} = 0.
\]
Hence, the boundary conditions in \( D(\hat{H}^{out}) \) are satisfied, see Def. 2.11.

A.2. Proof of Lemma 3.3. Recall that we are denoting by \( K \) the space \( \mathbb{C}^{2N} \) or \( \mathbb{C}^N \) depending on if we are reasoning with operators in \( \mathcal{H}^e \), \( \mathcal{H}^{out} \) or \( \mathcal{H}^{in,e} \).

Remark A.4. By Identities (A.2) we infer
\[
M^{-1}_w - M^{-1}_z = (z - w) M^{-1}_w G_z M^{-1}_z.
\]
Hence, for \( \Im z \neq 0 \), and for any projection \( P \) in \( K \), and \( q \in PK \)
\[
\Im(q, PM^{-1}_w Pq)_{\mathbb{C}^{2N}} = \frac{1}{2i} \{ q, P(M^{-1}_w - M^{-1}_z) Pq \}_{\mathbb{C}^{2N}} = -\Im z \| G_z M^{-1}_z Pq \|_{\mathbb{C}^{2N}}^2 \neq 0
\]
because \( G_z M^{-1}_z \) is an injective map, being the composition of injective maps.
Hence, the map \( PM^{-1}_w P \) is invertible in \( PK \).

To prove that the map \( M^{in,e}_z M^{out}_z - \mathbb{I}_N \) is invertible (the proof of the second statement in Eq. (A.14) is analogous) note that it is enough to show that \( M^{in,e}_z - M^{out}_z \) is invertible (because \( M^{out}_z \) is). Let \( q \in \mathbb{C}^N \), by Eqs. (A.3) and (A.9)
\[
\Im(q, M^{in,e}_z - M^{out}_z q)_{\mathbb{C}^{2N}} = \Im z (\| G^{in,e}_z q \|_{\mathbb{C}^N}^2 + \| G^{out}_z M^{out}_z q \|_{\mathbb{C}^{2N}}^2) \neq 0.
\]

Formula (A.15), comes from the block matrix inversion formula
\[
\begin{pmatrix}
M^{out}_z & -\mathbb{I}_N \\
-\mathbb{I}_N & M^{in,e}_z
\end{pmatrix}^{-1} = \begin{pmatrix}
M^{out}_z^{-1} + M^{out}_z (M^{in,e}_z - M^{out}_z)^{-1} M^{out}_z^{-1} M^{in,e}_z - M^{out}_z (M^{in,e}_z - M^{out}_z)^{-1} \\
(M^{in,e}_z - M^{out}_z)^{-1} M^{out}_z^{-1} & (M^{in,e}_z - M^{out}_z)^{-1}
\end{pmatrix}
\]
together with the identities
\[
M^{out}_z^{-1} (M^{in,e}_z - M^{out}_z)^{-1} = (M^{in,e}_z M^{out}_z - \mathbb{I}_N)^{-1}
\]
and
\[
M^{out}_z^{-1} + M^{out}_z (M^{in,e}_z - M^{out}_z)^{-1} M^{out}_z^{-1} = (M^{in,e}_z M^{out}_z - \mathbb{I}_N)^{-1} M^{in,e}_z.
\]
Appendix B. Estimates on eigenvalues and eigenfunctions of $\hat{H}^\infty$

In this appendix we prove the following proposition on the asymptotic behavior of eigenvalues and eigenfunctions of $\hat{H}^\infty$.

Proposition B.1. Recall that we denoted by $\{\lambda_n\}_{n\in\mathbb{N}}$ the eigenvalues of the Hamiltonian $\hat{H}^\infty$, and by $\{\varphi_n\}_{n\in\mathbb{N}}$ a corresponding set of orthonormal eigenfunctions. There exists $n_0$ such that for any $n \geq n_0$:

$$\lambda_n > n^2C \quad (B.1)$$

and

$$\sup_{x \in G^\infty} |\varphi_n(x)| \leq C \quad (B.2)$$

for some positive constant $C$ which does not depend on $n$.

Proof. Claim (B.1) is just the Weyl law. For $B^\infty = 0$ a proof can be found in [6, Prop. 4.2] (see also [28]). For $B^\infty \neq 0$ bounded, claim (B.1) can be deduced by a perturbative argument.

To prove the bound (B.2) we follow the lines in the proof of Theorem A.1 in [13]. For $b \in L^\infty(0, \ell)$ and real valued, and $\lambda > 0$ let $f$ be the solution of the equation

$$-f'' + bf = \lambda f, \quad (B.3)$$

with initial conditions $f(0) = f_0$ and $f'(0) = f'_0$. Then $f(x)$ can be written as

$$f(x) = \int_0^x \frac{1}{\sqrt{\lambda}} |b(y)| f(y) dy + f_0 \cos(\sqrt{\lambda} x) + \frac{f'_0}{\sqrt{\lambda}} \sin(\sqrt{\lambda} x), \quad (B.4)$$

from which it immediately follows that

$$|f(x)| \leq M + \int_0^x \frac{1}{\sqrt{\lambda}} |b(y)| |f(y)| dy,$$

with

$$M = |f_0| + \frac{|f'_0|}{\sqrt{\lambda}}.$$

Then from Gronwall’s lemma, see, e.g., [22, pg. 103], one has

$$|f(x)| \leq M \exp \left( \int_0^x \frac{|b(y)|}{\sqrt{\lambda}} dy \right) \leq M \exp \left( \int_0^\ell \frac{|b(y)|}{\sqrt{\lambda}} dy \right), \quad (B.5)$$

where we assumed $\lambda > 1$. By equation (B.4) and by the estimate (B.5) it follows that

$$\left|f(x) - f_0 \cos(\sqrt{\lambda} x) - \frac{f'_0}{\sqrt{\lambda}} \sin(\sqrt{\lambda} x)\right| \leq C \left( \int_0^\ell \frac{|b(y)|}{\sqrt{\lambda}} dy \right) \left|f_0\right| \left( \frac{|f_0|}{\sqrt{\lambda}} + \frac{|f'_0|}{\sqrt{\lambda}} \right) \leq C \left( \int_0^\ell \frac{|b(y)|}{\sqrt{\lambda}} dy \right) \leq C \left( \frac{|f_0|}{\sqrt{\lambda}} + \frac{|f'_0|}{\sqrt{\lambda}} \right),$$

where $C$ is a positive constant which does not depend on $\lambda$, $f_0$ and $f'_0$. We have then proved that

$$f(x) = f_0 \cos(\sqrt{\lambda} x) + \frac{f'_0}{\sqrt{\lambda}} \sin(\sqrt{\lambda} x) + O_{L^\infty((0,\ell))} \left( \frac{|f_0|}{\sqrt{\lambda}} + \frac{|f'_0|}{\sqrt{\lambda}} \right),$$

Any component of the eigenfunction $\varphi_n$ satisfies in the corresponding edge an equation of the form (B.3) with some initial data in $x = 0$. Then the discussion on the function $f(x)$ above applies to all the components of the vector $\varphi_n$. By the normalization condition $\|\varphi_n\|_{H^\infty} = 1$ it follows that it must be $\|f\|_{L^2((0,\ell))} = C$, with $C \leq 1$ (here $f$ denotes a generic component of $\varphi_n$, i.e., the restriction of $\varphi_n$ to a generic edge of $G^\infty$). Hence, from the identity

$$\int_0^\ell \left| f_0 \cos(\sqrt{\lambda} x) + \frac{f'_0}{\sqrt{\lambda}} \sin(\sqrt{\lambda} x) \right|^2 \leq \frac{\ell}{2} \left( |f_0|^2 + \frac{|f'_0|^2}{\lambda} \right) + \frac{\cos(2\sqrt{\lambda} \ell)}{2\sqrt{\lambda}} \left( |f_0|^2 - \frac{|f'_0|^2}{\lambda} \right) + \frac{\Re (f_0 f'_0)}{\lambda} \sin(2\sqrt{\lambda} \ell),$$

one infers

$$C^2 = \|f\|^2_{L^2((0,\ell))} = \frac{\ell}{2} \left( |f_0|^2 + \frac{|f'_0|^2}{\lambda} \right) + O \left( \frac{|f_0|^2}{\lambda}, \frac{|f'_0|^2}{\lambda}, |f_0| |f'_0| \right).$$

The latter estimate implies that there exists $\tilde{\lambda}$ such that, for all $\lambda > \tilde{\lambda}$, the inequalities $|f_0| \leq C_1$ and $|f'_0|/\sqrt{\lambda} \leq C_1$ hold true for some positive constant $C_1$ which does depend on $\lambda$. The bounds $|f_0| \leq C_1$ and $|f'_0|/\sqrt{\lambda} \leq C_1$, together with estimate (B.6) and the fact that $\lambda_n \to +\infty$ for $n \to \infty$, imply (B.3). □
