Abstract

Four new species of the genus *Otacilia* Thorell, 1897 are reported from Hunan Province, China: *Otacilia hippocampa* sp. n., *Otacilia yangmingensis* sp. n., *Otacilia curvata* sp. n., and *Otacilia submicrostoma* sp. n. All new species are described based on both sexes. In addition, the 55 known *Otacilia* species are divided into four species groups.

Keywords

Description, diagnosis, etymology, morphology, taxonomy

Introduction

Phrurolithidae Banks, 1892 was elevated to family rank by Ramírez (2014), consistent with the suggestion of Deeleman-Reinhold (2001). The family is currently represented by 211 species belonging to 14 genera worldwide. Of these, four genera and 65 species are recorded from China (World Spider Catalog 2016, Fu et al. 2015, Fu et al. 2016a, b). The Phrurolithidae are mostly ground-dwelling spiders living in leaf litter, especially bamboo leaves, woody debris or on the forest floor, very few species are found in the canopy (Deeleman-Reinhold 2001; Fu et al. 2014).
Otacilia Thorell, 1897 is one of the species-rich genera of the family comprising 55 species distributed in south-east Asia and east Asia. Among these Otacilia species, 35 are reported from China (Fu et al. 2015, Fu et al. 2016a, Fu et al. 2016b). The genus Otacilia was established by Thorell (1897) with description of O. armatissima based on a single female specimen from Myanmar.

The genus Otacilia is closely related to Phrurolithus C. L. Koch, 1839, comprising 74 species mostly distributed in the holarctic region. Until now, there is no clear way to differentiate between Otacilia and Phrurolithus. The diagnostic characters provided by Kamura (2005) were inaccurate (Wang et al. 2015), and the differences listed by Jäger and Wunderlich (2012) were also not distinct with the addition of more new species of these two genera.

Wang et al. (2015) listed ten Chinese Otacilia species in two groups. Subsequently, Fu et al. (2016b) reviewed the 31 Chinese Otacilia species and agreed with Wang et al.’s (2015) assignment and also established a third species group to accommodate the Otacilia species: the armatissima group, the revoluta group, and the pseudostella group.

While examining the collections from Hunan Province, China, some Otacilia specimens were found that differed from the currently known Otacilia species. They are identified as four new species, Otacilia hippocampa sp. n., Otacilia yangmingensis sp. n., Otacilia curvata sp. n., and Otacilia submicrostoma sp. n., and are described and illustrated here.

**Material and methods**

The terminology used follows Jäger and Wunderlich (2012). All measurements given in the text are in millimeters. Total length is the sum of the carapace and abdomen lengths, regardless of the pedicel. Eye sizes were measured as the maximum diameter in dorsal or frontal view. Leg measurements are shown as: total length (femur, patella, tibia, metatarsus, tarsus). Epigyne were removed and cleared in a warm solution of 10% potassium hydroxide (KOH), transferred to ethanol and temporarily mounted for drawing. All specimens are preserved in 75% alcohol and were examined, drawn, and measured under a Leica M205A stereomicroscope equipped with an Abbe drawing device. Photographs were taken using a Leica M205A stereomicroscope equipped with a DFC450 CCD. The specimens are deposited in the Museum of Hebei University, Baoding, China (MHBU).

Taxonomy

Phrurolithidae Banks, 1892

Otacilia Thorell, 1897

Diagnosis. Chelicerae each with two bristles (rarely with one bristle) on anterior side; leg formula: 4123 (rarely 1423); spination: femora I–II d 0–2, III–IV d 0–1, I pl 3–6, II pl 0–3; tibiae I–II usually with 6–8 pairs of ventral spines; tibia I always one more rv than pv spine and tibia II always one more pv than rv spine; metatarsi I–II usually with 3–4 pairs of ventral spines, and always one more pv than rv spine.

Male palp: femur with ventral apophysis or hump; tibia usually with single strong RTA, some species with BTA or DTA; embolus hook-shaped or needle-like, originating antero-prolaterally; tegular apophysis sclerotized or transparent, present or absent, antero-retrolaterally located; conductor membranous, well developed or absent. Female genitalia: epigynal median plate distinct or absent; vulva with pair of transparent bursae anteriorly and pair of strongly sclerotized spermathecae posteriorly.

Species groups of Otacilia. After reviewing 59 Otacilia species (including the four new Chinese species described in this paper), the grouping was revised and the current species assigned to four groups based on assessment of Fu et al. (2016b). The revoluta group was divided into two new groups, the longituba group (16 species) and the ambon group (two species). The armatissima group (29 species) and the pseudostella group (nine species) were preserved and updated. Three species were not assigned to any group because of their poor original description and figures or peculiar structure: Otacilia luzonica (Simon, 1898) (female is unknown; description and figures are not
diagnostic), *O. papilla* Dankittipakul & Singtripop, 2014 (male is unknown; epigyne medially with lobe and absence of bursae) and *O. paracymbium* Jäger & Wunderlich, 2012 (female is unknown; cymbium with paracymbium).

Here the male and female diagnostic characters are listed for each species group, followed by a list of all of the included *Otacilia* species (Table 1).

**Otacilia hippocampa** sp. n.
http://zoobank.org/C336230A-1FD5-435C-BA9C-13657E682F6F
Figs 1–3

**Type material.** Holotype ♂, China, Hunan Province: Dao County, Qingtang Town, Dajiangyuan Village, Mt. Jiucailing (25°27'37.678"N, 111°21'12.499"E), 448 m a.s.l., 29 September 2015, Chi Jin leg. Paratypes: 2♀ 2♂, same data as for holotype.

**Etymology.** The species name is taken from the Latin generic name of the sea-horse, “*Hippocampus*”, referring to the seahorse-shaped internal ducts (copulatory duct, connecting tube and spermatheca) in the female epigyne; adjective.

**Diagnosis.** The male can be distinguished from all other *armatissima* group species, except *O. bicolor* Jäger & Wunderlich, 2012, *O. onoi* Deeleman-Reinhold, 2001 and *O. truncata* Dankittipakul & Singtripop, 2014, by having a long DTA and can be distinguished from these three species by the absence of conductor (Figs 2A–D, 3A–C). The female of the new species can be easily distinguished from all of the other *armatissima* group species by the seahorse-shaped internal ducts (except the bursae), whereas they are S-shaped or crescent-shaped in the other congeners (Figs 2E–G, 3D–E).

**Description.** Male (Fig. 1A–B). Total length 2.17–2.65 (n = 3). Holotype: body 2.65 long; carapace 1.28 long, 1.12 wide; abdomen 1.37 long, 0.90 wide. Carapace yellowish brown, with black marginal bands; fovea longitudinal, brown. Eye diameters: AME 0.08, ALE 0.09, PME 0.08, PLE 0.09. Eye interdistances: AME–AME 0.02, AME–ALE 0.01, PME–PME 0.09, PME–PLE 0.05, ALE–PLE 0.07. MOA 0.19 long, front 0.17 wide, back 0.25 wide. Clypeus 0.14 high. Chelicerae with two strong anterior bristles; promargin with three well-separated teeth, and retromargin with two teeth close to each other. Labium and sternum dark yellow. Legs light yellowish brown; all femora with distal black distal annulus; patellae I–II black, patellae III–IV with distal black annulus; tibiae I–II almost all black, tibiae III–IV with one dorsal spine, femora I with two dorsal spines and three prolateral spines, femur II with one dorsal spine and two prolateral spines, femur III lacks dorsal spine, femur IV with one dorsal spine; tibia I with six proventral spines and seven retroventral spines, tibia II with six pairs of ventral spines; metatarsus I with four pairs of ventral spines, metatarsus II with four proventral spines and three retroventral spines. Femora I–III lack dorsal spines, femur IV four with one dorsal spine, femur I

**Table 1.** Definition of species groups of *Otacilia* species, together with lists of included species (species marked with an asterisk are reported from China).

| Species group name | Diagnostic Character | Included Species |
|--------------------|---------------------|------------------|
| armatissima | 1) Palpal organ with a distinct sclerotized TA or membranous conductor; embolus hook-shaped.  
2) Epigyne with a distinct median plate, without concavity; CO slocated anteriorly or medially, higher than the spermathecae; CD (the left one from the ventral view) anti-clockwise from the CO; connecting tube usually crescent-shaped; spermathecae separated by more than half a spermatheca’s diameter. | 1) *O. armatissima* Thorell, 1897  
2) *O. bawangling* Fu, Zhang & Zhu, 2010*  
3) *O. bicotata* Fu, He & Zhang, 2015*  
4) *O. bicolor* Jäger & Wunderlich, 2012  
5) *O. florifera* Fu, He & Zhang, 2015*  
6) *O. forcipata* Yang, Wang & Yang, 2013*  
7) *O. foveata* (Song, 1990)*  
8) *O. fujiana* Fu, Jin & Zhang, 2014*  
9) *O. hengshan* (Song, 1990)*  
10) *O. jiannfengling* Fu, Zhang & Zhu, 2010*  
11) *O. kao* Jäger & Wunderlich, 2012  
12) *O. komunai* (Yaginuma, 1952)*  
13) *O. limushan* Fu, Zhang & Zhu, 2010*  
14) *O. liupan* Hu & Zhang, 2011*  
15) *O. luna* (Kamura, 1994)  
16) *O. lynx* (Kamura, 1994)*  
17) *O. macrospora* Fu, Zhang & Zhu, 2016*  
18) *O. obesa* Fu, Zhang & Zhang, 2016*  
19) *O. onoi* Deeleman-Reinhold, 2001  
20) *O. papilion* Fu, Zhang & Zhang, 2016*  
21) *O. pyriformis* Fu, Zhang & Zhang, 2016*  
22) *O. sinifera* Deeleman-Reinhold, 2001  
23) *O. songi* Wang et al., 2015*  
24) *O. subliupan* Wang et al., 2015*  
25) *O. taiwrichta* (Hayashi & Yoshida, 1993)*  
26) *O. truncata* Dankittipakul & Singtripop, 2014  
27) *O. yang* Zhang, Fu & Zhu, 2009*  
28) *O. hippocampa* sp. n.*  
29) *O. yangningensis* sp. n.* |
| ambon | 1) Palpal organ without a distinct TA; the bulb is not pyriform but oval; embolus claw-like.  
2) Epigyne without median plate and concavity; CO slocated posterior, lower than the spermathecae; spermathecae well separated from each other by more than three spermatheca’s diameter. | 1) *O. ambon* Deeleman-Reinhold, 2001  
2) *O. revoluta* (Yin et al., 2004)* |
| longituba | 1) Palpal organ without a distinct TA; conductor well developed or degenerated; embolus needle-like.  
2) Epigyne without median plate and concavity; CO slocated medially, higher than the spermathecae; CD (the left one from the ventral view) straight or slightly clockwise from the CO; spermathecae close together or separated by less than half a spermatheca’s diameter. | 1) *O. bifurcata* Dankittipakul & Singtripop, 2014  
2) *O. christae* Jäger & Wunderlich, 2012

Four new species of the genus *Otacilia* Thorell, 1897 from Hunan Province, China...

| Species group name | Diagnostic Character | Included Species |
|-------------------|----------------------|-------------------|
| **longituba**     | 1) Palpal organ without a distinct TA; an apophysis present near embolic base (PEA); embolus needle-like.  2) Epigyne without indistinct median plate, but with a pair of shallow concavities; Cos located anteriorly or medially, higher than the spermathecae; spermathecae separated by more than one spermatheca’s diameter. | 10) *O. namkhan* Jäger & Wunderlich, 2012  11) *O. parva* Deeleman-Reinhold, 2001  12) *O. simianshan* Zhou, Wang & Zhang, 2013*  13) *O. vangvieng* Jäger & Wunderlich, 2012  14) *O. zebra* Deeleman-Reinhold, 2001  15) *O. curvata* sp. n.*  16) *O. submicrostoma* sp. n.* |
| **pseudostella**  | 1) *O. acuta* Fu, Zhang & Zhang, 2016*  2) *O. aurita* Fu, Zhang & Zhang, 2016*  3) *O. digitata* Fu, Zhang & Zhang, 2016*  4) *O. leibo* Fu, Zhang & Zhang, 2016*  5) *O. ovata* Fu, Zhang & Zhang, 2016*  6) *O. pseudostella* Fu, Jin & Zhang, 2014*  7) *O. stella* Kamura, 2005  8) *O. vulpes* (Kamura, 2001)  9) *O. zhangi* Fu, Jin & Zhang, 2014* |
| the others        | 1) *O. luzonica* (Simon, 1898)  2) *O. papilla* Dankittipakul & Singtripop, 2014  3) *O. paracymbium* Jäger & Wunderlich, 2012* |

with three prolateral spines; tibia I with six proventral spines and seven retroventral spines; tibia II with six proventral spines and five retroventral spines; metatarsus I with four pairs of ventral spines, metatarsus II with four proventral spines and three retroventral spines. Abdomen oval, dorsum light grey, with several chevron-like black stripes, anterior half with a small dorsal scutum; venter light grey.

**Palp (Figs 2A–D, 3A–C).** Femur distally with an inflated hump on ventral side and a retrolateral concavity. RTA basally thick, tapering to a sharp apex, bent prolaterally. DTA shaped similarly to RTA, with one spine basally. Embolus short, needle-like. Conductor absent. Tegular apophysis triangular, sclerotized.

**Female (Fig. 1C–D).** Total length 2.56–2.96 (n = 2). One paratype: body 2.96 long; carapace 1.47 long, 1.22 wide; abdomen 1.49 long, 0.99 wide. Eye diameters: AME 0.07, ALE 0.09, PME 0.08, PLE 0.10. Eye interdistances: AME–AME 0.03, AME–ALE 0.01, PME–PME 0.09, PME–PLE 0.06, ALE–PLE 0.09. MOA 0.22 long, front 0.18 wide, back 0.27 wide. Clypeus 0.13 high. Leg measurements: I 5.40 (1.41, 0.58, 1.54, 1.32, 0.55); II 4.53 (1.21, 0.53, 1.16, 1.04, 0.59); III 3.96 (1.04, 0.46, 0.81, 1.02, 0.63); IV 5.63 (1.46, 0.50, 1.27, 1.60, 0.80). Leg formula: 4123. Leg spination as in male. Abdomen light grey, anterior half lacks dorsal scutum. Other characters as in male.

**Epigyne (Figs 2E–F, 3D):** median plate narrow, with parallel lateral margin; copulatory openings situated centrally, tiny and pore-like. Vulva (Figs 2G, 3E–F): copulatory ducts short, connected with a pair of slender tubes leading to the large, transparent ovoid bursae; spermathecae located posteriorly, small and ovoid, separated by more than one spermatheca’s diameter; connecting tubes curved and sigmoid. Glandular appendages absent.

**Distribution.** Known only from the type locality, Hunan, China (Fig. 13).

process dorsally and by the absent DTA and can be distinguished from it by the long needle-like embolus (embolus stout and hook-shaped in O. macrosora) and the thumb-shaped tegular apophysis (tegular apophysis sickle-shaped in O. macrosora) (Figs 5A–B, 6A–B; Fu et al. 2016a: figs 16, 18, 22–23). The female of the new species can be distinguished from all other armatissima group species, except O. macrosora Fu, Zhang & Zhang, 2016, by the copulatory openings connected with a pair of shallow concavities anteriorly, and the concavities have distinct anterior and inner lateral margins, and can be distinguished from it by the median plate (narrower than that of O. macrosora) and bursae (long ovoid, whereas they are spherical in O. macrosora) (Figs 5E–G, 6D–E; Fu et al. 2016a: figs 20–21, 25–26).

**Description.** Male (Fig. 4A–B). Total length 3.04–3.16 (n = 7). Holotype: body 3.16 long; carapace 1.58 long, 1.31 wide; abdomen 1.58 long, 0.97 wide. Carapace light yellowish brown, lateral margin black, middle with broad longitudinal black stripe, from ocular area to the posterior margin of carapace; fovea longitudinal, distinct. Eye diameters: AME 0.11, ALE 0.12, PME 0.10, PLE 0.10. Eye interdistances: AME–AME 0.03, AME–ALE 0.01, PME–PME 0.10, PME–PLE 0.05, ALE–PLE 0.09. MOA 0.25 long, front 0.23 wide, back 0.27 wide. Clypeus 0.14 high. Chelicerae with two strong anterior bristles; promargin with three well separated teeth and retromargin with six denticles close to each other. Labium and sternum light yellow. Legs light yellowish brown. Leg measurements: leg I 6.65 (1.66, 0.61, 1.89, 1.65, 0.84), II 5.36 (1.42, 0.47, 1.43, 1.29, 0.75), III 4.56 (1.22, 0.49, 1.01, 1.20, 0.64), IV 7.38 (2.00, 0.58, 1.75, 2.08, 0.97). Leg formula: 4123. Femur I with two dorsal spines and four prolateral spines, femur II with one dorsal spine and two prolateral spines, femora III–IV with one dorsal spine; tibia I with seven proventral spines and eight retroventral spines, tibia II with seven pairs of ventral spines; metatarsi I–II with four pairs of ventral spines. Abdomen oval, dorsum black, anterior half with a narrow dorsal scutum, posterior half with several black transversal stripes; venter light grey, with black longitudinal stripes.

Palp (Figs 5A–D, 6A–C). Femur distally with an apophysis on ventral side and retrolateral concavity. RTA broad, with sharp apex, base with a triangular process dorsally. Embolus slender, needle-like, slightly curved. Tegular apophysis sclerotized and thumb-shaped, situated at the apex of the bulb, separate from the embolus base.

Female (Fig. 4C–D). Total length 3.27–4.29 (n = 5). One paratype: body 4.29 long; carapace 1.72 long, 1.44 wide; abdomen 2.57 long, 1.62 wide. Carapace yellowish brown. Eye diameters: AME 0.11, ALE 0.10, PME 0.09, PLE 0.10. Eye interdistances: AME–AME 0.04, AME–ALE 0.01, PME–PME 0.11, PME–PLE 0.05, ALE–PLE 0.11. MOA 0.26 long, front 0.24 wide, back 0.31 wide. Clypeus 0.13 high. Leg measurements: I 6.63 (1.71, 0.65, 1.91, 1.56, 0.80); II 5.48 (1.44, 0.60, 1.42, 1.28, 0.74); III 4.67 (1.24, 0.56, 0.97, 1.20, 0.70); IV 7.29 (1.90, 0.63, 1.76, 2.00, 1.00). Leg formula: 4123. Femur I with two dorsal spines and four prolateral spines, femur II with one dorsal spine and three prolateral spines, femora III–IV with one dorsal spine; tibia I with eight pairs of ventral spines, tibia II with eight proventral spines and seven retroventral spines; metatarsus I with four pairs of ventral spines, metatarsus II with

four proventral spines and three retroventral spines. Abdomen light grey, anterior half without dorsal scutum, posterior half dark with several indistinct chevron-like black stripes dorsally. Other characters as in male.

Epigyne (Figs 5E–F, 6D): median plate narrow, with parallel lateral margin; copulatory openings situated centrally, covered with mating plugs (Fig. 5E), connected with a pair of shallow concavities anteriorly, and the concavities have distinct anterior and inner lateral margins. Vulva (Figs 5G, 6E): copulatory ducts thick, posteriorly swollen, connected to a pair of large, transparent long ovoid bursae; spermathecae located posteriorly and small, close to each other; bursae and spermathecae connected by slender, slightly curved connecting tubes.

**Distribution.** Known only from the type localities, Hunan, China (Fig. 13).
**Otacilia curvata sp. n.**

**Figs** 7–9

**Type material.** Holotype ♂, China, Hunan Province: Shuangpai County, Mt. Yangming, around the Forest Park Service (26°03′36.698″N, 111°56′12.707″E), 539 m a.s.l., 24 September 2015, Chi Jin leg. Paratypes: 5♀3♂, same data as for holotype; 2♀4♂, Shuangpai County, Mt. Yangming, Wanshou Temple (26°06′27.490″N, 111°55′19.186″E), 1375 m a.s.l., 26 September 2015, Chi Jin leg.; 2♀1♂, Shuangpai County, Mt. Yangming, Hongjun Pavilion (26°04′34.924″N, 111°56′19.223″E), 1324 m a.s.l., 27 September 2015, Xiangbo Guo and Jingchao He leg.

**Etymology.** The specific name is derived from the Latin “curvatus”, meaning curved and refers to the shape of the DTA of the male palp; adjective.

**Diagnosis.** The male can be distinguished from all other *longituba* group species, except *O. bifurcata* Dankittipakul & Singtripop, 2014, *O. loriot* Jäger & Wunderlich, 2012 and *O. namkhan* Jäger & Wunderlich, 2012, by having a long RTA and a long DTA and can be distinguished from them by the needle-like embolus (embolus of these three species claw-like, knife-shaped and semicircular respectively) (Figs 8A–D, 9A–C). The female of the new species can be easily distinguished from all of the other *longituba* group species, except *O. microstoma* Wang et al., 2015, by the copulatory ducts longitudinal and close together, and it can be distinguished from *O. microstoma* by the present of glandular appendages and sigmoid connecting tubes (glandular appendages absent and connecting tubes V-shaped in *O. microstoma*) (Figs 8E–G, 9D–E; Wang et al. 2015: figs 1D–E, 2F–G).

**Description.** Male (Fig. 7A–B). Total length 2.51–2.80 (n = 5). Holotype: body 2.67 long; carapace 1.37 long, 1.15 wide; abdomen 1.30 long, 0.96 wide. Carapace yellowish brown, with black marginal bands; middle with broad longitudinal black stripe, from ocular area to the posterior margin of carapace; fovea longitudinal, dark brown. Diameter of eyes: AME 0.08, ALE 0.09, PME 0.06, PLE 0.10. Eye interdistances: AME–AME 0.03, AME–ALE 0.01, PME–PME 0.08, PME–PLE 0.06, ALE–PLE 0.05. MOA 0.19 long, front 0.19 wide, back 0.20 wide. Clypeus 0.12 high. Chelicerae with two strong anterior bristles; promargin with three well-separated teeth and retromargin with five denticles close to each other. Labium and sternum dark yellow. Legs light yellowish brown; all femora with distal black annulus; patellae I–II all black, patellae III–IV absenting black patches; tibia I almost all black, tibiae II–IV with black proximal and distal annulus; metatarsus I distal half part black, metatarsus II–IV with black distal annulus. Measurements of legs: leg I 4.95 (1.31, 0.51, 1.42, 1.21, 0.50), II 3.90 (1.06, 0.40, 1.02, 0.91, 0.51), III 3.36 (0.86, 0.44, 0.68, 0.86, 0.52), IV 4.90 (1.29, 0.45, 1.09, 1.41, 0.66). Leg formula: 1423. Femora I–III lack dorsal spines, femur IV with one dorsal spine, femur I with three prolateral spines; tibia I with six provental spines and seven retroventral spines, tibia II with six provental spines and five retroventral spines; metatarsus I with four pairs of ventral spines, metatarsus II with four provental spines and three retroventral spines. Abdomen oval,

Figure 9. *Otacilia curvata* sp. n. A left male palp, ventral view B same, dorsal view C same, retrolateral view D epigyne, ventral view E vulva, dorsal view F schematic course of internal duct system. Scale bars equal for A and B, equal for D and E.

dorsum black, anterior half with a narrow dorsal scutum, posterior half with several chevron-like black stripes; venter light grey.

Palp (Figs 8A–D, 9A–C). Femur distally with an inflated hump on ventral side. RTA thick in proximal part and abruptly tapering at half of its length. DTA with anterior and posterior margins parallel in proximal part from the dorsal view, then abruptly curved to the prolateral side of bulb, tapering and with an enlarged blunt apex. Embolus short, needle-like. Conductor membranous, close to and as long as the embolus. Tegular apophysis absent but with a tegular ridge.

Female (Fig. 7C–D). Total length 2.77–2.85 (n = 7). One paratype: body 2.77 long; carapace 1.41 long, 1.20 wide; abdomen 1.36 long, 1.01 wide. Eye diameters: AME 0.08, ALE 0.09, PME 0.07, PLE 0.10. Eye interdistances: AME–AME 0.04,
AME–ALE 0.01, PME–PME 0.07, PME–PLE 0.07, ALE–PLE 0.07. MOA 0.21 long, front 0.18 wide, back 0.19 wide. Clypeus 0.11 high. Leg measurements: I 5.11 (1.31, 0.54, 1.46, 1.29, 0.51); II 4.10 (1.10, 0.49, 1.03, 0.97, 0.51); III 3.46 (0.91, 0.43, 0.73, 0.86, 0.53); IV 5.08 (1.35, 0.50, 1.12, 1.41, 0.70). Leg formula: 1423.

Femur II with one dorsal spine and two prolateral spines, tarsus II with six proventral spines and five retroventral spines, other segments with the same spination as male. Abdomen light grey, anterior half lacks dorsal scutum. Other characters as in male.

Epigyne (Figs 8E–F, 9D): median plate absent; copulatory openings situated centrally, tiny and trumpet-shaped. Vulva (Figs 8G, 9E–F): copulatory ducts longitudinal, connecting with a pair of large, transparent, long, ovoid bursae; spermathecae located posteriorly, small and ovoid, close to each other; bursae and spermathecae connected by strong, curved, sigmoid connecting tubes. Glandular appendages present, as long as the diameter of one spermatheca.

Distribution. Known only from the type localities, Hunan, China (Fig. 13).

**Otacilia submicrostoma** sp. n.

Figs 10–12

Type material. Holotype ♂, China, Hunan Province: Sangzhi County, Bamaoxi Town, Mt. Tianping, Watch Tower (29°47’11.854”N, 110°05’28.838”E), 1626 m a.s.l., 15 September 2015, Chi Jin leg. Paratypes: 11♀7♂, same data as for holotype; 19♀19♂, Sangzhi County, Bamaoxi Town, Mt. Tianping (29°46’07.921”N, 110°04’22.159”E), 1330 m a.s.l., 16 September 2015, Xiangbo Guo and Jingchao He leg.; 2♀6♂, Sangzhi County, Bamaoxi Town, Mt. Tianping (29°46’35.332”N, 110°05’54.474”E), 1520 m a.s.l., 17 September 2015, Chi Jin leg.

Etymology. The species is named for its similarity to *O. microstoma* Wang et al., 2015; adjectival.

Diagnosis. The male can be distinguished from all other *longituba* group species, except *O. mira* Fu, Zhang & Zhang, 2016, *O. mustela* Kamura, 2008 and *O. parva* Deeleman-Reinhold, 2001, by having only one tibial apophysis and no conductor and can be distinguished from them by the RTA base with a small triangular process (Figs 11A–D, 12A–C). The female of the new species can be easily distinguished from all of the other *longituba* group species by the long, S-shaped connecting peculiar tubes (Figs 11E–F, 12D).

Description. Male (Fig. 10A–B). Total length 2.65–2.99 (n = 33). Holotype: body 2.99 long; carapace 1.52 long, 1.29 wide; abdomen 1.47 long, 1.04 wide. Carapace yellowish brown, with black marginal bands; fovea longitudinal, brown. Eye diameters: AME 0.09, ALE 0.10, PME 0.09, PLE 0.10. Eye interdistances: AME–AME 0.04, AME–ALE 0.01, PME–PME 0.11, PME–PLE 0.05, ALE–PLE 0.08. MOA

bium retrolaterally, basally with a small triangular process. Embolus slender, needle-like. Tegular apophysis and conductor absent.

Female (Fig. 10C–D). Total length 3.02–3.48 (n = 32). One paratype: body 3.48 long; carapace 1.60 long, 1.36 wide; abdomen 1.88 long, 1.25 wide. Carapace yellowish brown. Eye diameters: AME 0.09, ALE 0.09, PME 0.10, PLE 0.10. Eye interdistances: AME–AME 0.04, AME–ALE 0.01, PME–PME 0.10, PME–PLE 0.06, ALE–PLE 0.09. MOA 0.25 long, front 0.20 wide, back 0.29 wide. Clypeus 0.14 high. Leg measurements: I 5.71 (1.47, 0.59, 1.64, 1.40, 0.61); II 4.87 (1.28, 0.52, 1.20, 1.23, 0.64); III 4.11 (1.09, 0.47, 0.85, 1.04, 0.66); IV 5.98 (1.60, 0.53, 1.33, 1.64, 0.88). Leg formula: 4123. Femur I with two dorsal spines and four prolateral spines, femur II with one dorsal spine and two prolateral spines, femora III–IV with one dorsal spine; tibiae and metatarsi I and II with the same spination as male. Abdomen light grey, anterior half lacking dorsal scutum, posterior half dark with several indistinct chevron-like black stripes dorsally. Other characters as in male.

Epigyne (Figs 11E–F, 12D): median plate absent; copulatory openings situated centrally, tiny and pore-like. Vulva (Figs 11G, 12E–F): copulatory ducts thick and short, connected with a pair of large, transparent, long, ovoid bursae; spermathecae located posteriorly, large and ovoid, close to each other; bursae and spermathecae connected by strongly curved, S-shaped connecting tubes. Glandular appendages present, as long as one spermatheca’s diameter.

**Distribution.** Known only from the type localities, Hunan, China (Fig. 13).
Acknowledgments

Thanks to Xiangbo Guo and Jingchao He for their assistance during the field work in Hunan Province, China. The English of the manuscript was kindly reviewed by Dr J. MacDermott. This work was supported by the National Natural Science Foundation of China (No. 31372154), and by the Program of Ministry of Science and Technology of the Republic of China (2015FY210300).
