WELL-POSEDNESS OF A MODIFIED DEGENERATE CAHN-HILLIARD MODEL FOR SURFACE DIFFUSION

XIAOHUA NIU∗, YANG XIANG †, AND XIAODONG YAN‡

Abstract. We study the well-posedness of a modified degenerate Cahn-Hilliard type model for surface diffusion. With degenerate phase-dependent diffusion mobility and additional stabilizing function, this model is able to give the correct sharp interface limit. We introduce a notion of weak solutions for the nonlinear model. The existence result is obtained by approximations of the proposed model with nondegenerate mobilities. We also employ this method to prove existence of weak solutions to a related model where the chemical potential contains a nonlocal term originated from self-climb of dislocations in crystalline materials.

Key words. Phase field model, degenerate Cahn-Hilliard equation, surface diffusion, well-posedness, weak solutions

AMS subject classifications. 35A01, 35G20, 35K25, 74N20, 82C26

1. Introduction. We consider the following modified degenerate Cahn-Hilliard type model

\begin{align}
  g(u)\partial_t u & = \nabla \cdot (M(u)\nabla \frac{\mu}{g(u)}), \quad x \in \Omega \subset \mathbb{R}^2, t \in [0, \infty) \\
  \mu & = -\Delta u + \frac{1}{\varepsilon^2}q'(u).
\end{align}

When $g \equiv 1$, (1.1)-(1.2) becomes Cahn-Hilliard (CH) equation with degenerate mobility. The degenerate Cahn-Hilliard equation has been widely studied as a diffuse-interface model for phase separation in binary system [2, 3, 4, 5, 7, 10]. Over the years, the interface motion in the sharp limit has caught a lot of attention for various choice of mobility $M(u)$ and homogeneous free energy $q(u)$. When $M(u) = 1 - u^2$ and $q$ being either the logarithmic free energy

$$q(u) = \frac{\theta}{2} \left[ (1 + u) \ln(1 + u) + (1 - u) \ln(1 - u) \right] + \frac{1}{2} (1 - u^2)$$

with temperature $\theta = O(\varepsilon^\alpha)$ or the double obstacle potential

$$q(u) = 1 - u^2 \text{ for } |u| \leq 1, \quad q(u) = \infty \text{ otherwise},$$

Cahn, Elliott, and Novick-Cohen [19] showed via asymptotic expansions that the sharp-interface limit in the time scale $O(\varepsilon^{-2})$ is interface motion by surface diffusion. Sharp interface limits for different time scales were discussed in [5] for highly disparate diffusion mobility $M(u) = 1 + u$ and smooth double well $q(u) = \frac{1}{4}(1 - u^2)^2$. In particular, the system evolves in $t = O(\varepsilon^{-2})$ time scale according to the combination of a one-sided modified Mullins–Sekerka problem in the phase with nonzero constant mobility and a nonlinear diffusion process that solves a quasi-stationary porous medium equation in the phase with small mobility. A later work by the same authors [6] derived sharp
interface limit for $O(\varepsilon^{-2})$ time scale with diffusion mobility $M(u) = |1 - u^2|$ and smooth double well potential $q(u)$, noting the effect of the diffusion field on the interface motion as a jump of fluxes. The analysis was done on the (unphysical) solution branch with $|u| > 1$ on some region. For $M(u) = 1 - u^2$ and $q = \frac{1}{4}(1 - u^2)^2$, Lee, Münch and Stili [14] considered the physical branch of solution where $|u| < 1$ everywhere and showed that there is an additional nonlinear bulk diffusion term appearing to leading order of the sharp interface limit. Further study in [15] indicates that the leading order sharp-interface motion depends sensitively on the choice of mobility.

The existence of weak solutions for degenerate Cahn-Hilliard equation was proved by Elliott and Garcke [10] (see [24] for 1D case). Their results include the case $M(u) = 1 - u^2$ and $q$ being the logarithmic free energy. Dai and Du [7] introduced a different notion of weak solutions for degenerate Cahn-Hilliard equation with mobility $M(u) = |1 - u^2|^m$ and smooth double well potentials; they showed that their model accommodates the Gibbs-Thomson effect, which was not by the method in [10].

There is a critical issue in modeling surface diffusion by the degenerate Cahn-Hilliard model [11, 21], due to the presence of incompatibility in the asymptotic matching between the outer and inner expansions. Rätz, Ribalta, and Voigt (RRV) [21] fixed this incompatibility by introducing a singular factor $1/g(u)$ in front of the chemical potential $\mu$ to force it to vanish in the far field. Their model essentially consists of equations (1.1)-(1.2) without the $g(u)$ term on the left side of (1.1), and other terms for modeling heteroepitaxial growth of thin films. The RRV model with the stabilizing function $g(u)$ has been validated by numerical simulations [21] and asymptotic analyses [11, 21]. It has been successfully generalized to many applications, e.g., growth of nanoscale membranes [1], dewetting of ultrathin films [17], and grain boundary formation in nanoporous metals [9]. Recently, a phase field model for dislocation self-climb by vacancy pipe diffusion was developed based on degenerate Cahn-Hilliard model with such stabilizing function [20]. However, to the best of our knowledge, well-posedness of these degenerate Cahn-Hilliard models with singular factor that give the correct sharp interface limit for surface diffusion has not been established in the literature.

In this paper, in order to prove the well-posedness of the RRV type Cahn-Hilliard model with correct sharp interface limit for surface diffusion, we propose a modified degenerated Cahn-Hilliard model as given in (1.1)-(1.2), and discuss its well-posedness and sharp interface limit. In particular, we have modified the original RRV model so that the equation can be written in the form of gradient flow of the total energy.

Our first result is a sharp interface limit equation for (1.1) and (1.2) via formal asymptotic analysis. We obtain the following sharp interface equation

\begin{equation}
\dot{v} = \lambda \partial_{ss}(\alpha\kappa)
\end{equation}

as $\varepsilon \to \infty$. Here $\lambda < 0$, $\alpha < 0$ are constants whose exact forms are derived in section 2. This validates this equation as a diffuse-interface model for surface diffusion.

Our main result concerns the well-posedness of the initial value problem of (1.1)-(1.2). For this purpose, we set $\Omega = [0, 2\pi]^n$ and consider the following problem in a periodic setting when $n \leq 2$.

\begin{equation} g(u)\partial_t u = \nabla \cdot \left( M(u) \nabla \frac{\mu}{g(u)} \right), \quad \text{for } x \in \Omega, t \in [0, \infty)
\end{equation}

\begin{equation} \mu = -\Delta u + q'(u).
\end{equation}

Here $g(u) = |1 - u^2|^m$ for $2 \leq m < \infty$, $M(u) = M_0 g(u)$ for some constant $M_0 > 0$ and $q(u)$ satisfies the following assumptions.
(i) $q(u) \in C^2(\mathbb{R}, \mathbb{R})$ and there exist constants $C_i > 0$, $i = 1, \ldots, 10$ such that for all $u \in \mathbb{R}$ and some $1 \leq r < \infty$, the following growth assumptions hold.

\begin{align}
(1.6) \quad & C_1 |u|^{r+1} - C_2 \leq q(u) \leq C_3 |u|^{r+1} + C_4, \\
(1.7) \quad & |q'(u)| \leq C_5 |u|^r + C_6, \\
(1.8) \quad & C_i |u|^{r-1} - C_8 \leq q''(u) \leq C_9 |u|^{r-1} + C_{10}.
\end{align}

We see that the classical double well potential $q(u) = (1 - u^2)^2$ satisfies (1.6)-(1.8) with $r = 3$.

Our existence proof is obtained via approximations of the proposed model (1.4)-(1.5) with positive mobilities. Given any $\theta > 0$, we define

\begin{equation}
M_\theta(u) := M_0 g_\theta(u)
\end{equation}

with

\begin{equation}
g_\theta(u) := \begin{cases}
|1 - u^2|^m & \text{if } |1 - u^2| > \theta, \\
\theta^m & \text{if } |1 - u^2| \leq \theta.
\end{cases}
\end{equation}

Our first step is to find a sufficiently regular solution for (1.4)-(1.5) with mobility $M_\theta(u)$ and stabilizing function $g_\theta(u)$ together with a smooth potential $q(u)$.

**Theorem 1.1.** Let $M_\theta, g_\theta$ be defined by (1.9) and (1.10), under the assumptions (1.6)-(1.8), for any $u_0 \in H^1(\Omega)$ and any $T > 0$, there exists a function $u_\theta$ such that

a) $u_\theta \in L^\infty(0,T;H^1(\Omega)) \cap C([0,T];L^p(\Omega)) \cap L^2(0,T;W^{1,s}(\Omega))$, where $1 \leq p < \infty$,

b) $\partial_t u_\theta \in L^2(0,T;W^{1,q}(\Omega))'$ for $q > 2$,

c) $u_0(x,0) = u_0(x)$ for all $x \in \Omega$, which satisfies (1.4)-(1.5) in the following weak sense

\begin{equation}
\int_0^T < \partial_t u_\theta, \phi >_{(W^{1,q}(\Omega))',W^{1,q}(\Omega)} dt
= - \int_0^T \int_\Omega M_\theta(u_\theta) \nabla \frac{-\Delta u_\theta + q'(u_\theta)}{g_\theta(u_\theta)} \cdot \nabla \phi \frac{\phi}{g_\theta(u_\theta)} dx dt
\end{equation}

for all $\phi \in L^2(0,T;W^{1,q}(\Omega))$ with $q > 2$. In addition, the following energy inequality holds for all $t > 0$.

\begin{equation}
\begin{aligned}
&\int_\Omega \left(\frac{1}{2} |\nabla u_\theta(x,t)|^2 + q(u_\theta(x,t))\right) dx \\
&+ \int_0^t \int_\Omega M_\theta(u_\theta(x,\tau)) \left| \nabla \frac{-\Delta u_\theta(x,\tau) + q'(u_\theta(x,\tau))}{g_\theta(u_\theta(x,\tau))} \right|^2 dx d\tau \\
&\leq \int_\Omega \left(\frac{1}{2} |\nabla u_0(x)|^2 + q(u_0(x))\right) dx.
\end{aligned}
\end{equation}

Proof of theorem 1.1 is based on Galerkin approximations. Due to the presence of the stabilizing function $g_\theta$, it is not obvious how to pass to the limit in the nonlinear term of the Galerkin approximations. Our key observation in this step is strong convergence of $\nabla u^N$ (up to a subsequence) in $L^2(\Omega_T)$ where $\Omega_T = \Omega \times [0,T]$ which allows us to pass to the limit in the nonlinear term.
To obtain the weak solution to (1.4), we consider the limit of \( u_\theta \) for a sequence \( \theta_i \downarrow 0 \). The key challenge is how to pass to the limit in both sides of (1.11). In the degenerate Cahn-Hilliard case, the estimates for the positive mobility approximations yield a uniform bound for \( \partial_t u_\theta \), and it is straightforward to pass to the limit on the left hand side in the approximating equations. Moreover, the bound on \( \partial_t u_\theta \), together with bound on \( u_\theta \), yields strong convergence of \( \sqrt{M_i(u_\theta)} \) in \( C(0,T;L^p(\Omega)) \). By this and the weak convergence of \( \sqrt{M_i(u_\theta)} \) in \( L^2(\Omega_T) \), Dai and Du [7] showed (up to a subsequence) that \( M_\theta(u_\theta)\nabla \mu_\theta \rightharpoonup \sqrt{M(u)}\xi \) weakly in \( L^2(0,T;L^\infty(\Omega)) \) where \( \xi \) is the weak limit of \( \sqrt{M_i(u_\theta)}\nabla \mu_\theta \). The main task left is to show \( \sqrt{M(u)}\xi = M(u)(-\nabla \Delta u + q''(u)\nabla u) \) and the limit equation becomes a weak form Cahn-Hilliard equation. They [7] proved that this is almost true in the set where \( u \neq \pm 1 \). Their main idea is the following. For small numbers \( \delta_j \) monotonically decreasing to 0, they consider the limit in a subset \( B_j \) of \( \Omega_T \) where approximate solutions converges uniformly and \( |\Omega_T \setminus B_j| < \delta_j \). By decomposing \( B_j = D_j \cup \bar{D}_j \) where mobility is bounded from below uniformly in \( D_j \) and controlled above in \( \bar{D}_j \) by suitable multiples of \( \delta_j \), they obtain the weak form equation for the limit function by passing to the limit on the right hand side of (1.1). Finally, we identify an explicit expression for \( \xi \) in the weak form of the equation.

In this paper, we adapt their idea to our model. There are two main difficulties. The first obstacle is the bound estimate on \( \partial_t u_\theta \) blows up when \( \theta_i \) goes to zero and we cannot pass to the limit on the left hand side of (1.11); secondly, due to the presence of the stabilizing function \( g \) on the right hand side, it is more complicated to derive an explicit expression of the weak limit of \( M_i(u_\theta)\nabla \mu_\theta \) in terms of \( u \) on the right hand side of the limit equation. In order to overcome the first difficulty, we derive an alternative form of (1.11) by multiplying \( g_\theta(u_\theta) \) to both sides (valid due to regularity of \( u_\theta \), c.f. section 3.4 and equation (3.44)). From this, we obtain uniform estimates on \( g_\theta(u_\theta)\partial_t u_\theta \) which enables us to pass to the limit on the right hand side of the alternate equation (3.44). To find limit form on the right hand side of (3.44), we need convergence of \( \sqrt{M_\theta(u_\theta)} \) in \( C(0,T;L^p(\Omega)) \). Due to the lack of control on \( \partial_t u_\theta \), this convergence can not be derived directly using Aubin-Lions Lemma [7]. Instead, we apply Aubin-Lions lemma to \( G_i(u) = \int_u^u g_\theta(s)ds \) and derive convergence of \( g_\theta(u_\theta) \) (consequently on \( M_\theta(u_\theta) \)) from convergence of \( G_i \) through characterization of compact sets [22] in \( L^p[0,T;B] \). We then follow the idea in [7] to pass to the limit on the right hand side of (3.44). Finally, we identify an explicit expression of the weak limit of \( \nabla \mu_\theta^{\gamma,\mu} \) in terms of the weak limit \( u \) under additional integrability assumptions on derivatives of \( u \).

**Theorem 1.2.** For any \( u_0 \in H^1(\Omega) \) and \( T > 0 \), there exists a function \( u : \Omega_T = \Omega \times [0,T) \rightarrow \mathbb{R} \) satisfying

i) \( u \in L^\infty(0,T;H^1(\Omega)) \cap C([0,T];L^s(\Omega)) \), where \( 1 \leq s < \infty \),

ii) \( g(u)\partial_t u \in L^p(0,T;W^{1,q}(\Omega)) \) for \( 1 \leq p < 2 \) and \( q > 2 \).

iii) \( u(x,0) = u_0(x) \) for all \( x \in \Omega \),

which solves (1.4)-(1.5) in the following weak sense

a) There exists a set \( B \subset \Omega_T \) with \( |\Omega_T \setminus B| = 0 \) and a function \( \zeta : \Omega_T \rightarrow \mathbb{R}^n \) satisfying \( \chi_{\bar{B} \cap \Omega} M(u)\zeta \in L^{\frac{n}{p-1}}(0,T;L^{\frac{n}{q-1}}(\Omega,\mathbb{R}^n)) \) such that

\[
\int_0^T g(u)\partial_t u, \phi >_{(W^{1,q}(\Omega))'} <(W^{1,q}(\Omega))', \phi > dt = -\int_{B \cap \Omega} M(u)\zeta \cdot \nabla \phi dx dt
\]
We also expand chemical potential and rewrite equation (2.2) as

\[ \mu = \frac{1}{\varepsilon} \left( \mu^{(0)} + \mu^{(1)} \varepsilon + \mu^{(2)} \varepsilon^2 + \cdots \right). \]

and rewrite equation (1.1) as

\[ g(u) \partial_t u = M_0 \nabla \cdot (\nabla \mu - \mu \frac{g'(u)}{g(u)} \nabla u). \]
Set
\[ w = -\mu \frac{g'(u)}{g(u)} = \frac{1}{\varepsilon^2} \left( w^{(0)} + w^{(1)}\varepsilon + w^{(2)}\varepsilon^2 + \ldots \right). \]

Plugging the expansions into (2.3) and (1.2) and matching the coefficients of \( \varepsilon \) powers in both equations, the \( O(\frac{1}{\varepsilon}) \) of (2.3) and (1.2) yields

(2.4) \[ 0 = \nabla \cdot \left( \nabla \mu^{(0)} + w^{(0)} \nabla u^{(0)} \right) \]
(2.5) \[ \mu^{(0)} = g'(u^{(0)}). \]

Since
\[ w^{(0)} = \mu^{(0)} \frac{g'(u^{(0)})}{g(u^{(0)})}, \]
then \( u^{(0)} = 1 \) or \( u^{(0)} = -1 \) satisfies equations (2.4)-(2.5). In particular, such choice of \( u^{(0)} \) implies \( \mu^{(0)} = 0. \)

The \( O(\frac{1}{\varepsilon}) \) equation of (2.3) and (1.2) reduces to

(2.6) \[ 0 = \nabla \cdot \left( \nabla \mu^{(1)} + w^{(0)} \nabla u^{(1)} + w^{(1)} \nabla u^{(0)} \right), \]
(2.7) \[ \mu^{(1)} = \frac{q''(u^{(0)}) u^{(1)}}{g(u^{(0)})}. \]

Since \( u^{(0)} = 1 \) or \( -1, \) \( u^{(1)} = 0 \) satisfies (2.6)-(2.7). Moreover, such choice of \( u^{(1)} \) guarantees \( \mu^{(1)} = 0. \)

The \( O(1) \) equation of (2.3) and (1.2), taking into account of the fact \( u^{(0)} = \pm 1, \mu^{(0)} = \mu^{(1)} = 0, \) reduces to

(2.8) \[ 0 = \nabla \cdot \left( \nabla \mu^{(2)} + w^{(0)} \nabla u^{(2)} \right), \]
(2.9) \[ \mu^{(2)} = \frac{q''(u^{(0)}) u^{(2)}}{g(u^{(0)})}. \]

Thus \( u^{(2)} = 0 \) satisfies (2.8)-(2.9). Moreover, such choice of \( u^{(1)} \) guarantees \( \mu^{(2)} = 0. \)

In general, if \( u^{(0)} = \pm 1, u^{(1)} = u^{(2)} = \ldots = u^{(k+1)} = 0, \) the \( O(\varepsilon^k) \) for \( k \geq 1 \) equation of (2.3) and (1.2) yields

(2.10) \[ 0 = \nabla \cdot \left( \nabla \mu^{(k+2)} + w^{(0)} \nabla u^{(k+2)} \right), \]
(2.11) \[ \mu^{(k+2)} = \frac{q''(u^{(0)}) u^{(k+2)}}{g(u^{(0)})}. \]

Thus \( u^{(k+2)} = 0 \) satisfies (2.10) and (2.11).

In summary, the \( u = 1 \) or \( u = -1 \) in the outer region.

2.2. Inner expansions. For the small inner regions near the dislocations, we introduce local coordinates near the dislocations. Considering a dislocation \( C \) parameterized by arc length parameter \( s. \) We denote a point on the dislocation by \( r_0(s) \) with tangent unit vector \( t(s) \) and inward normal vector \( n(s). \) A point near the dislocation \( C \) is expressed as
\[ r(s, d) = r_0(s) + d n(s), \]
where \( d \) is the signed distance from point \( r \) to the dislocation. Since the gradients fields are of order \( O(\frac{1}{\varepsilon}), \) we introduce \( \rho = \frac{d}{\varepsilon} \) and use coordinates \((s, \rho)\) in the inner
region. Under this setting, we write \( u(x, y, t) = U(s, \rho, t) \) and equation (1.1) can be written as

\[
(2.12) g(U) \left( \partial_t U + \frac{1}{\varepsilon} v_n \partial_q U \right) = \frac{M_0}{1 - \varepsilon \rho \kappa} \partial_s \left( \frac{1}{1 - \varepsilon \rho \kappa} \left( \partial_s \mu - \mu \frac{g'(U)}{g(U)} \partial_s U \right) \right) + \frac{1}{\varepsilon^2} \frac{M_0}{1 - \varepsilon \rho \kappa} \partial_{\rho} \left( (1 - \varepsilon \rho \kappa) \left( \partial_{\rho} \mu - \mu \frac{g'(U)}{g(U)} \partial_{\rho} U \right) \right),
\]

\[
(2.13) \quad \mu = -\frac{1}{1 - \varepsilon \rho \kappa} \partial_s \left( \frac{1}{1 - \varepsilon \rho \kappa} \partial_s U \right) - \frac{1}{\varepsilon^2} \frac{1}{1 - \varepsilon \rho \kappa} \partial_{\rho} \left( (1 - \varepsilon \rho \kappa) \partial_{\rho} U \right) + \frac{1}{\varepsilon^2} q'(U).
\]

Assume \( \mu \) takes the same form expansion as (2.2) and the following expansions hold for \( U \) within dislocation core region:

\[
(2.14) \quad U(s, \rho, t) = U^{(0)}(\rho) + \varepsilon U^{(1)}(s, \rho, t) + \varepsilon^2 U^{(2)} + \ldots.
\]

Here we assume the leading order solution \( U^{(0)} \), which describes the dislocation core profile, remains the same at all points on the dislocation at any time.

Set

\[
W = \mu \frac{g'(U)}{g(U)} = \frac{1}{\varepsilon^2} \left( W^{(0)} + W^{(1)} \varepsilon + W^{(2)} \varepsilon^2 + \ldots \right),
\]

the leading order for equation (2.12) and (2.13) is \( O(\frac{1}{\varepsilon^2}) \), which yields

\[
(2.15) \quad 0 = \partial_{\rho} \left( \partial_{\rho} U^{(0)} - W^{(0)} \partial_{\rho} U^{(0)} \right),
\]

\[
(2.16) \quad \mu^{(0)} = -\partial_{\rho} U^{(0)} + q'(U^{(0)}).
\]

Substituting \( W^{(0)} = \mu^{(0)} \frac{g'(U^{(0)})}{g(U^{(0)})} \) into (2.15), we can rewrite (2.15) as

\[
0 = \partial_{\rho} \left( \partial_{\rho} \mu^{(0)} - \mu^{(0)} \partial_{\rho} \ln g(U^{(0)}) \right).
\]

Integrating this equation, we have

\[
(2.17) \quad \partial_{\rho} \mu^{(0)} - \mu^{(0)} \partial_{\rho} \ln g(U^{(0)}) = C_0(s).
\]

Since \( \mu^{(0)} = 0 \) in the outer region, we must have \( \mu^{(0)} \to 0 \) and \( \partial_{\rho} \mu^{(0)} \to 0 \) as \( \rho \to \pm \infty \). Therefore \( C_0(s) = 0 \). Dividing (2.17) by \( \mu^{(0)} \) and integrating, we have \( \mu^{(0)} = \hat{C}_0(s) g(U^{(0)}) \). Since \( \mu^{(0)} \) is independent of \( s \) and is 0 in the outer region, we must have \( \hat{C}_0(s) = 0 \). Thus

\[
(2.18) \quad \mu^{(0)} = -\partial_{\rho} U^{(0)} + q'(U^{(0)}) = 0.
\]

Solution \( U^{(0)} \) to (2.18) subject to far field condition \( U^{(0)}(+\infty) = -1 \) and \( U^{(0)}(-\infty) = 1 \) can be found numerically (see [20] for example). In particular, \( \partial_{\rho} U^{(0)} < 0 \) for all \( \rho \).

Next, the \( O(\frac{1}{\varepsilon^2}) \) equation of (2.12) and (2.13) yields, using \( \mu^{(0)} = 0 \), that

\[
(2.19) \quad 0 = \partial_{\rho} \left( \partial_{\rho} U^{(1)} - W^{(1)} \partial_{\rho} U^{(0)} \right),
\]

\[
(2.20) \quad \mu^{(1)} = -\partial_{\rho} U^{(1)} + \kappa \partial_{\rho} U^{(0)} + q''(U^{(0)}) U^{(1)}.
\]

When \( \mu^{(0)} = 0 \), we have \( W^{(1)} = \mu^{(1)} \frac{g'(U^{(0)})}{g(U^{(0)})} \). Substituting into (2.19) and integrating, we have
\(\frac{\partial \mu^{(1)}}{\partial \rho} - \mu^{(1)} \frac{\partial \ln g(U^{(0)})}{\partial \rho} = C_1(s).\)

Matching with the outer solutions \(\left(\frac{\partial \mu^{(1)}}{\partial \rho}, \mu^{(1)}\right) \rightarrow 0\) as \(\rho \rightarrow \pm \infty\), we conclude that \(C_1(s) = 0\). Dividing (2.21) by \(\mu^{(1)}\) and integrating, we have \(\mu^{(1)} = \frac{C_1(s) g(U^{(0)})}{\partial \rho}\). Thus (2.20) can be written as

\[\int_{-\infty}^{+\infty} \left(\frac{\partial}{\partial \rho} U^{(0)} + \frac{\partial}{\partial \rho} \tilde{C}_1(s) g(U^{(0)})\right) d\rho = 0.\]

From this, we conclude
\[\tilde{C}_1(s) = \alpha \kappa,\]

where positive constants \(\alpha\) and \(\beta\) are given by
\[\alpha = \frac{\int_{-\infty}^{+\infty} \left(\frac{\partial}{\partial \rho} U^{(0)}\right)^2 d\rho}{\int_{-\infty}^{+\infty} g(U^{(0)}) d\rho} < 0.\]

Therefore
\[\mu^{(1)} = \alpha \kappa g(U^{(0)}).\]

Letting \(\tilde{\mu} = \frac{\mu}{g(U)}\), (2.12) can be written as
\[g(U) \left(\frac{\partial}{\partial s} U + \frac{1}{\varepsilon} v_n \frac{\partial}{\partial \rho} U\right)\]
\[= \frac{M_0}{1 - \varepsilon \rho \kappa} \frac{\partial}{\partial \rho} \left(g(U) \left(1 - \varepsilon \rho \kappa \right) \frac{\partial}{\partial \rho} \tilde{\mu}\right) + \frac{1}{\varepsilon^2} \frac{M_0}{1 - \varepsilon \rho \kappa} \frac{\partial}{\partial \rho} \left((1 - \varepsilon \rho \kappa) g(U) \frac{\partial}{\partial \rho} \tilde{\mu}\right)\]

Using \(\mu^{(0)} = 0, \partial \rho \tilde{\mu}^{(1)} = \partial \rho \frac{\mu^{(1)}}{g(U^{(0)})} = 0\), the \(O(\frac{1}{\varepsilon})\) order equation of (2.24) reduces to
\[\frac{\partial}{\partial \rho} \left(g(U^{(0)}) \frac{\partial}{\partial \rho} U^{(2)}\right) = 0.\]

Integrating with respect to \(\rho\), we have \(g(U^{(0)}) \frac{\partial}{\partial \rho} U^{(2)} = C_2(s)\). Matching with outer solutions, we must have \(C_2(s) = 0\). Thus \(\frac{\partial}{\partial \rho} U^{(2)} = 0\) which gives \(U^{(2)} = \tilde{C}_2(s)\).

Next we look at the \(O(1)\) equation of (2.24). Using \(\mu^{(0)} = 0, \partial \rho \tilde{\mu}^{(1)} = 0\) and \(\partial \rho \tilde{\mu}^{(2)} = 0\), we have
\[g(U^{(0)}) v_n \frac{\partial}{\partial \rho} U^{(0)} = M_0 \frac{\partial}{\partial s} \left(g(U^{(0)}) \frac{\partial}{\partial \rho} \tilde{\mu}^{(1)}\right) + M_0 \frac{\partial}{\partial \rho} \left(g(U^{(0)}) \frac{\partial}{\partial \rho} \tilde{\mu}^{(3)}\right)\]

Integrating this equation with respect to \(\rho\) and matching with outer solutions yields
\[v_n = \lambda \partial \rho \tilde{\mu}^{(1)},\]

where we used the fact that \(g(U^{(0)})\) is independent of \(s\) and
\[\lambda = -\frac{M_0 \int_{-\infty}^{+\infty} g(U^{(0)}) d\rho}{\int_{-\infty}^{+\infty} g(U^{(0)}) d\rho} < 0.\]
By (2.23), we have $\overline{p}^{(1)} = \alpha \kappa$, substitute this into (2.25), we obtain the sharp interface limit equation

$$v_n = \lambda \partial_{ss}(\alpha \kappa).$$

**Remark 2.1.** Notice here the outer and inner expansions are similar to the expansions in [20]. We wrote out all details here for readers’ convenience.

### 3. Weak solution for phase field model with positive mobilities.

In this section we prove existence of weak solutions for phase field model with positive mobilities. Let $\mathbb{Z}_+$ be the set of nonnegative integers and $\Omega = [0, 2\pi]^n$ with $n \leq 2$. We pick an orthonormal basis for $L^2(\Omega)$ as

$$\{\phi_j : j = 1, 2, \ldots\} = \{(2\pi)^{-n/2}, \Re(\pi^{-n/2}e^{i\xi \cdot x}), \Im(\pi^{-n/2}e^{i\xi \cdot x}) : \xi \in \mathbb{Z}_+^n \setminus \{0, \ldots, 0\}\}.$$

Observe $\{\phi_j\}$ is also orthogonal in $H^k(\Omega)$ for any $k \geq 1$. Here and throughout the paper, we denote $\Omega_T = (0, T) \times \Omega$.

#### 3.1. Galerkin approximations.

Define

$$u^N(x, t) = \sum_{j=1}^{N} c^N_j(t) \phi_j(x), \quad \mu^N(x, t) = \sum_{j=1}^{N} d^N_j(t) \phi_j(x),$$

where $\{c^N_j, d^N_j\}$ satisfy

$$\int_\Omega \partial_t u^N \phi_j dx = - \int_\Omega M_\theta(u^N) \nabla \left( \frac{\mu^N}{g_\theta(u^N)} \right) \cdot \nabla \phi_j dx,$$

$$\int_\Omega \mu^N \phi_j dx = \int_\Omega \left( \nabla u^N \cdot \nabla \phi_j + q'(u^N) \phi_j \right) dx,$$

$$u^N(x, 0) = \sum_{j=1}^{N} \left( \int_\Omega u_0 \phi_j dx \right) \phi_j(x).$$

(3.1)-(3.3) is an initial value problem for a system of ordinary equations for $\{c^N_j(t)\}$. Since right hand side of (3.1) is continuous in $c^N_j$, the system has a local solution.

Define energy functional

$$E(u) = \int_\Omega \left\{ \frac{1}{2} |\nabla u|^2 + q(u) \right\} dx.$$

Direct calculation yields

$$\frac{d}{dt} E(u^N(x, t)) = - \int_\Omega M_\theta(u^N) \left| \nabla \left( \frac{\mu^N}{g_\theta(u^N)} \right) \right|^2 dx,$$

integration over $t$ gives the following energy identity.

$$\int_\Omega \left( \frac{1}{2} |\nabla u^N(x, t)|^2 + q(u^N(x, t)) \right) dx$$

$$+ \int_0^t \int_\Omega M_\theta(u^N(x, \tau)) \left| \nabla \left( \frac{\mu^N(x, \tau)}{g_\theta(u^N(x, \tau))} \right) \right|^2 dx d\tau$$

$$= \int_\Omega \left( \frac{1}{2} |\nabla u^N(x, 0)|^2 + q(u^N(x, 0)) \right) dx$$

$$\leq \|\nabla u_0\|_{L^2(\Omega)}^2 + C \left( \|u_0\|_{H^1(\Omega)}^2 + \|\kappa\| \right) \leq C < \infty$$
Here and throughout the paper, $C$ represents a generic constant possibly depending only on $T$, $\Omega$, $u_0$ but not on $\theta$. Since $\Omega$ is bounded region, by growth assumption assumption (1.6) and Poincare’s inequality, the energy identity (3.4) implies $u^N \in L^\infty(0, T; H^1(\Omega))$ with

\begin{equation}
\|u^N\|_{L^\infty(0, T; H^1(\Omega))} \leq C \text{ for all } N,
\end{equation}

and

\begin{equation}
\left\| \sqrt{M_0(u^N)} \nabla \frac{\mu^N}{g_0(u^N)} \right\|_{L^2(\Omega_T)} \leq C \text{ for all } N.
\end{equation}

By (3.5), the coefficients $\{c^N_j(t)\}$ are bounded in time, thus the system (3.1)-(3.3) has a global solution. In addition, by Sobolev embedding theorem and growth assumption (1.7) on $q'(u)$, we have

$$q'(u^N) \in L^\infty(0, T; L^p(\Omega)), \quad M_0(u^N) \in L^\infty(0, T; L^p(\Omega))$$

for any $1 \leq p < \infty$ with

\begin{equation}
\|q'(u^N)\|_{L^\infty(0, T; L^p(\Omega))} \leq C \text{ for all } N,
\end{equation}

\begin{equation}
\|M_0(u^N)\|_{L^\infty(0, T; L^p(\Omega))} \leq C \text{ for all } N.
\end{equation}

3.2. Convergence of $u^N$. Given $q > 2$ and any $\phi \in L^2(0, T; W^{1,q}(\Omega))$, let $\Pi_N \phi(x, t) = \sum_{j=1}^N \left( \int_{\Omega} \phi(x, t) \phi_j(x) dx \right) \phi_j(x)$ be the orthogonal projection of $\phi$ onto span$\{\phi_j\}_{j=1}^N$. Then

$$\left| \int \partial_t u^N \phi dx \right| = \left| \int \partial_t u^N \Pi_N \phi dx \right| = \left| \int M_0(u^N) \nabla \frac{\mu^N}{g_0(u^N)} \cdot \nabla \Pi_N \phi g_0(u^N) dx \right|$$

$$\leq \left( \int M_0(u^N) \left| \nabla \frac{\mu^N}{g_0(u^N)} \right|^2 dx \right)^{\frac{1}{2}} \left( \int M_0(u^N) \left| \nabla \Pi_N \phi g_0(u^N) \right|^2 dx \right)^{\frac{1}{2}}.$$ 

Since

$$\nabla \frac{\Pi_N \phi}{g_0(u^N)} = \frac{1}{g_0(u^N)} \nabla \Pi_N \phi - \Pi_N \phi \frac{g_0'(u^N)}{g_0^2(u^N)} \nabla u^N,$$

we have

$$\int M_0(u^N) \left| \nabla \frac{\Pi_N \phi}{g_0(u^N)} \right|^2 dx$$

$$\leq 2M_0 \int \left( \frac{1}{g_0(u^N)} |\nabla \Pi_N \phi|^2 + \frac{|g_0'(u^N)|^2}{g_0^2(u^N)} \Pi_N \phi^2 |\nabla u^N|^2 \right) dx$$

$$\leq C(M_0, \theta) \left( \|\nabla \Pi_N \phi\|_{L^2(\Omega)}^2 + \|\Pi_N \phi\|_{L^\infty(\Omega)}^2 \|\nabla u^N\|_{L^2(\Omega)}^2 \right)$$

here is where we need $q > 2$

$$\leq C(M_0, \theta) \left( \|\Pi_N \phi\|_{W^{1,q}(\Omega)}^2 \right) \leq C(M_0, \theta) \|\phi\|_{W^{1,q}(\Omega)}^2.$$

Therefore

\begin{equation}
\|\partial_t u^N\|_{L^2(0, T; W^{1,q}(\Omega))} \leq C(M_0, \theta) \text{ for all } N.
\end{equation}
For $1 \leq s < \infty$, since $n \leq 2$, by Sobolev embedding theorem and Aubin-Lions Lemma (see [22] and Remark 3.1), the following embeddings are compact:

$$\{ f \in L^2(0,T;H^1(\Omega)) : \partial_t f \in L^2(0,T;(W^{1,q}(\Omega))') \} \rightarrow L^2(0,T;L^s(\Omega)),$$

and

$$\{ f \in L^\infty(0,T;H^1(\Omega)) : \partial_t f \in L^2(0,T;(W^{1,q}(\Omega))') \} \rightarrow C([0,T];L^s(\Omega)).$$

From this and the boundedness of $\{u^N\}$ and $\{\partial_t u^N\}$, we can find a subsequence, and $u_\theta \in L^\infty(0,T;H^1(\Omega))$ such that as $N \rightarrow \infty$,

(3.10) $\quad u^N \rightharpoonup u_\theta$ weakly-* in $L^\infty(0,T;H^1(\Omega))$,

(3.11) $\quad u^N \rightarrow u_\theta$ strongly in $C([0,T];L^s(\Omega))$,

(3.12) $\quad u^N \rightharpoonup u_\theta$ strongly in $L^2(0,T;L^s(\Omega))$ and a.e. in $\Omega_T$,

(3.13) $\quad \partial_t u^N \rightharpoonup \partial_t u_\theta$ weakly in $L^2(0,T;(W^{1,q}(\Omega))')$

for $1 \leq s < \infty$. In addition

$$\|u_\theta\|_{L^\infty(0,T;H^1(\Omega))} \leq C, \quad \|\partial_t u_\theta\|_{L^2(0,T;(W^{1,q}(\Omega))')} \leq C(M_0,\theta).$$

By (3.11), growth assumption (1.7) on $q'(u^N)$, and general dominated convergence Theorem, we have for any $1 \leq s < \infty$,

(3.14) $\quad M_\theta(u^N) \rightharpoonup M_\theta(u_\theta)$ strongly in $C([0,T];L^s(\Omega))$,

(3.15) $\quad \sqrt{M_\theta(u^N)} \rightharpoonup \sqrt{M_\theta(u_\theta)}$ strongly in $C([0,T];L^s(\Omega))$,

(3.16) $\quad q'(u^N) \rightharpoonup q'(u_\theta)$ strongly in $C([0,T];L^s(\Omega))$.

By (3.7) and (3.16), we have

(3.17) $\quad q'(u^N) \rightharpoonup q'(u_\theta)$ weakly-* in $L^\infty([0,T];L^s(\Omega))$.

**Remark 3.1.** Let $X$, $Y$, $Z$ be Banach spaces with compact embedding $X \hookrightarrow Y$ and continuous embedding $Y \hookrightarrow Z$. Then the embeddings

(3.18) $\quad \{ f \in L^p(0,T;X) : \partial_t f \in L^1(0,T;Z) \} \rightarrow L^p(0,T;Y)$

and

(3.19) $\quad \{ f \in L^\infty(0,T;X) : \partial_t f \in L^r(0,T;Z) \} \rightarrow C([0,T];Y)$

are compact for any $1 \leq p < \infty$ and $r > 1$ (Corollary 4, [22], see also [16]). For convergence of $u^N$, we apply this for $p = 2 = r$ with $X = H^1(\Omega)$, $Y = L^s(\Omega)$ for $1 \leq s < \infty$ and $Z = W^{1,q}(\Omega)'$.

**3.3. Weak solution.** By (3.6) and the lower bound on $M_\theta$, we have

(3.20) $\quad \left\| \nabla \frac{\mu^N}{g_\theta(u^N)} \right\|_{L^2(\Omega_T)} \leq C \theta^{-\frac{\alpha}{4}}.$
By (3.2), (3.5) and (3.7), we have

\[ \left| \int_{\Omega} \frac{\mu^N \phi_1}{g_\theta(u^N)} \right| \, dx = \left| \int_{\Omega} \mu^N \Pi_N \left( \frac{\phi_1}{g_\theta(u^N)} \right) \right| \, dx 
\]

\[ = \left| \int_{\Omega} \nabla u^N \cdot \nabla \Pi_N \left( \frac{\phi_1}{g_\theta(u^N)} \right) \, dx + \int_{\Omega} q'(u^N) \Pi_N \left( \frac{\phi_1}{g_\theta(u^N)} \right) \, dx \right| \]

\[ \leq C \left( \theta^{-m-1} \left\| \nabla u^N \right\|_{L^2(\Omega)}^2 + \theta^{-m} \left\| q'(u^N) \right\|_{L^2(\Omega)} \left\| \phi_1 \right\|_{L^2(\Omega)} \right) \]

\[ \leq C \theta^{-m-1}. \]

(3.20), (3.21) and Poincare’s inequality yield

\[ \left\| \frac{\mu^N}{g_\theta(u^N)} \right\|_{L^2(0,T;H^1(\Omega))} \leq C(\theta^{-m-1} + 1). \]

Thus there exists a \( w_\theta \in L^2(0,T;H^1(\Omega)) \) and a subsequence of \( \frac{\mu^N}{g_\theta(u^N)} \), not relabeled, such that

\[ \frac{\mu^N}{g_\theta(u^N)} \to w_\theta \text{ weakly in } L^2(0,T;H^1(\Omega)). \]

Therefore by (3.14), (3.22) and Sobolev embedding theorem, we have

\[ \mu^N = g_\theta(u^N) \cdot \frac{\mu^N}{g_\theta(u^N)} \quad \mu_\theta = g_\theta(u_\theta)w_\theta \text{ weakly in } L^2(0,T;W^{1,s}(\Omega)) \]

for any \( 1 \leq s < 2 \). Combining (3.15), (3.22) and (3.23), we have

\[ \sqrt{M_\theta(u^N)} \nabla \frac{\mu^N}{g_\theta(u^N)} \to \sqrt{M_\theta(u_\theta)} \nabla \frac{\mu_\theta}{g_\theta(u_\theta)} \text{ weakly in } L^2(0,T;L^q(\Omega)) \]

for any \( 1 \leq q < 2 \). By (3.6), we can improve this convergence to

\[ \sqrt{M_\theta(u^N)} \nabla \frac{\mu^N}{g_\theta(u^N)} \to \sqrt{M_\theta(u_\theta)} \nabla \frac{\mu_\theta}{g_\theta(u_\theta)} \text{ weakly in } L^2(0,T;L^2(\Omega)). \]

By (3.2), we have

\[ \int_{\Omega} \mu^N u^N \, dx = \int_{\Omega} \left( \left\| \nabla u^N \right\|^2 + q'(u^N)u^N \right) \, dx. \]

Integrating with respect to \( t \) from 0 to \( T \), we have on \( \Omega_T = \Omega \times [0,T] \),

\[ \int_{\Omega_T} \mu^N(x,t)u^N(x,t) \, dx \, dt = \int_{\Omega_T} \left( \left\| \nabla u^N(x,t) \right\|^2 + q'(u^N(x,t))u^N(x,t) \right) \, dx \, dt. \]

Passing to the limit in the equation above, by (3.12), (3.16) and (3.23), we have

\[ \int_{\Omega_T} \mu_\theta u_\theta \, dx \, dt = \lim_{N \to \infty} \int_{\Omega_T} \left( \left\| \nabla u^N \right\|^2 + q'(u_\theta)u_\theta \right) \, dx \, dt \]

\[ = \int_{\Omega_T} \mu^N u^N \, dx \, dt. \]
On the other hand,
\begin{equation}
\int_{\Omega_T} \mu^N(x,\tau)u_\theta(x,\tau)dxd\tau = \int_{\Omega_T} \mu^N(x,\tau)\Pi_N u_\theta(x,\tau)dxd\tau
\end{equation}
\begin{equation}
= \int_{\Omega_T} \nabla u^N \cdot \nabla \Pi_N u_\theta(x,\tau) + q'(u^N)\Pi_N u_\theta(x,\tau)dxd\tau
\end{equation}
\begin{equation}
= \int_{\Omega_T} \nabla u^N \cdot \nabla u_\theta(x,\tau) + q'(u^N)\Pi_N u_\theta(x,\tau)dxd\tau.
\end{equation}

Since $\Pi_N u_\theta \to u_\theta$ strongly in $L^2(\Omega_T)$, by \((3.10),(3.17)\) and \((3.23)\), as $N \to \infty$, \((3.27)\) yields
\begin{equation}
\int_{\Omega_T} \mu_\theta u_\theta dxd\tau = \int_{\Omega_T} (|\nabla u_\theta|^2 + q'(u_\theta))u_\theta dxd\tau.
\end{equation}
\((3.26)\) and \((3.28)\) gives

\begin{equation}
\lim_{N \to \infty} \int_{\Omega_T} |\nabla u^N|^2 dxd\tau = \int_{\Omega_T} |\nabla u_\theta|^2 dxd\tau.
\end{equation}

By \((3.5)\), $\nabla u^N \rightharpoonup \nabla u_\theta$ weakly in $L^2(\Omega_T)$, thus \((3.29)\) implies

\begin{equation}
\nabla u^N \to \nabla u_\theta \text{ strongly in } L^2(\Omega_T).
\end{equation}

Since $g_\theta \geq \theta^m$, \((3.12)\) implies

\begin{equation}
\frac{g'(u^N)}{g_\theta^2(u^N)} \to \frac{g'(u_\theta)}{g_\theta^2(u_\theta)} \text{ a.e in } \Omega_T.
\end{equation}

In addition, $\frac{g'(u^N)}{g_\theta^2(u^N)}$ is bounded by

\begin{equation}
\left| \frac{g'(u^N)}{g_\theta^2(u^N)} \right| \leq C\theta^{-1-\frac{m}{2}}.
\end{equation}

It follows from \((3.30), (3.31), (3.32)\) and generalized dominated convergence theorem (see Remark 3.2) that

\begin{equation}
\frac{g'(u^N)}{g_\theta^2(u^N)} \nabla u^N \rightharpoonup \frac{g'(u_\theta)}{g_\theta^2(u_\theta)} \nabla u_\theta \text{ strongly in } L^2(\Omega_T).
\end{equation}

Let
\begin{equation}
f^N(t) = \left\| \frac{g'(u^N(x,t))}{g_\theta^2(u^N(x,t))} \nabla u^N(x,t) - \frac{g'(u_\theta(x,t))}{g_\theta^2(u_\theta(x,t))} \nabla u_\theta(x,t) \right\|_{L^2(\Omega)},
\end{equation}
by \((3.33)\), we can extract a subsequence of $f^N$, not relabeled, such that $f^N(t) \to 0$ a.e. in $(0,T)$. By Egorov’s theorem, for any given $\delta > 0$, there exists $T_\delta \subset [0,T]$ with $|T_\delta| < \delta$ such that $f^N(t)$ converges to 0 uniformly on $[0,T]\setminus T_\delta$.

Given $\alpha(t) \in L^2(0,T)$, for any $\varepsilon > 0$, there exists $T_\delta \subset [0,T]$ with $|T_\delta| < \delta$ such that
\begin{equation}
\int_{T_\delta} \alpha^2(t)dt < \varepsilon.
\end{equation}
Multiplying (3.1) by \( \alpha(t) \) and integrating in time yield

\[
(3.35) \quad \int_0^T \alpha(t) \int_\Omega \partial_t u^N \phi_j \ dx \ dt = \int_0^T \alpha(t) \int_\Omega \partial_t M_\theta(u^N) \nabla \frac{\mu^N}{g_\theta(u^N)} \cdot \nabla \phi_j \ dx \ dt
\]

\[
= \int_{\Omega_T} \alpha \nabla \frac{\mu^N}{g_\theta(u^N)} \cdot \nabla \phi_j \ dx \ dt
\]

\[
- \int_{\Omega_T} \alpha(t) \frac{g_\theta'(u^N)}{g_\theta(u^N)} \nabla u^N \cdot \nabla M_\theta(u^N) \ nabla \frac{\mu^N}{g_\theta(u^N)} \ dx \ dt
\]

\[
= I - II.
\]

Since \( \alpha(t) \nabla \phi_j \in L^2(0,T;L^2(\Omega)) \), by (3.22) and (3.23), we have

\[
(3.36) \quad I = \int_{\Omega_T} \alpha \frac{\mu^N}{g_\theta(u^N)} \cdot \nabla \phi_j \ dx \ dt \rightarrow \int_{\Omega_T} \alpha \frac{\mu^N}{g_\theta(u^\theta)} \cdot \nabla \phi_j \ dx \ dt.
\]

To prove convergence on \( II \), observe

\[
(3.37) \quad \int_{\Omega_T} \alpha(t) \phi_j \frac{g_\theta'(u^N)}{g_\theta(u^N)} \nabla u^N \nabla M_\theta(u^N) \ nabla \frac{\mu^N}{g_\theta(u^N)} \ dx \ dt
\]

\[
- \int_{\Omega_T} \alpha(t) \phi_j \frac{g_\theta'(u^\theta)}{g_\theta(u^\theta)} \nabla u^\theta \nabla M_\theta(u^\theta) \ nabla \frac{\mu^N}{g_\theta(u^\theta)} \ dx \ dt
\]

\[
= \int_{\Omega_T} \alpha(t) \phi_j \left( \frac{g_\theta'(u^N)}{g_\theta(u^N)} \nabla u^N - \frac{g_\theta'(u^\theta)}{g_\theta(u^\theta)} \nabla u^\theta \right) \nabla M_\theta(u^N) \ nabla \frac{\mu^N}{g_\theta(u^N)} \ dx \ dt
\]

\[
+ \int_{\Omega_T} \alpha(t) \phi_j \frac{g_\theta'(u^\theta)}{g_\theta(u^\theta)} \nabla u^\theta \ \left( \nabla M_\theta(u^N) \ nabla \frac{\mu^N}{g_\theta(u^N)} - \nabla M_\theta(u^\theta) \ nabla \frac{\mu^\theta}{g_\theta(u^\theta)} \right) \ dx \ dt
\]

\[
= II_1 + II_2
\]

From bound

\[
\int_{\Omega_T} \left( \alpha(t) \phi_j \frac{g_\theta'(u^\theta)}{g_\theta(u^\theta)} \nabla u^\theta \right)^2 \ dx \ dt
\]

\[
\leq C \theta^{-2m} ||\nabla u^\theta||^2_{L^\infty(0,T;L^2(\Omega))} \int_0^T \alpha^2(t)^2 \ dx \ dt,
\]

we conclude that \( \alpha(t) \phi_j \frac{g_\theta'(u^\theta)}{g_\theta(u^\theta)} \nabla u^\theta \in L^2(\Omega_T) \). By (3.25), we can pass to the limit in \( II_2 \) and conclude

\[
II_2 = \int_{\Omega_T} \alpha(t) \phi_j \frac{g_\theta'(u^\theta)}{g_\theta(u^\theta)} \nabla u^\theta \ \left( \nabla M_\theta(u^N) \ nabla \frac{\mu^N}{g_\theta(u^N)} - \nabla M_\theta(u^\theta) \ nabla \frac{\mu^\theta}{g_\theta(u^\theta)} \right) \ dx \ dt \rightarrow 0.
\]
To pass to the limit in $I_{11}$, we write

$$I_{11} = \int_{\Omega_T} \alpha(t) \phi_j \left( \frac{g_{\theta}^{\prime}(u)}{g_{\theta}(u)} \nabla u \cdot \nabla \phi_j \right) \left( 12 \nabla \phi_j \nabla \phi_j \right) \cdot \sqrt{M_{\theta}(u)} \nabla \frac{\mu_{\theta}}{g_{\theta}(u)} dx dt$$

$$= \int_{T} \int_{\Omega} \alpha(t) \phi_j \left( \frac{g_{\theta}^{\prime}(u)}{g_{\theta}(u)} \nabla u \cdot \nabla \phi_j \right) \left( 12 \nabla \phi_j \nabla \phi_j \right) \cdot \sqrt{M_{\theta}(u)} \nabla \frac{\mu_{\theta}}{g_{\theta}(u)} dx dt$$

$$+ \int_{[0,T]} \int_{\Omega} \alpha(t) \phi_j \left( \frac{g_{\theta}^{\prime}(u)}{g_{\theta}(u)} \nabla u \cdot \nabla \phi_j \right) \left( 12 \nabla \phi_j \nabla \phi_j \right) \cdot \sqrt{M_{\theta}(u)} \nabla \frac{\mu_{\theta}}{g_{\theta}(u)} dx dt$$

$$= I_{111} + I_{112}.\]
where

$$J_1 = \int_{\Omega_T} M_0 \nabla \frac{\mu_\theta}{g_\theta(u_\theta)} \cdot \nabla (\phi - \Pi_N \phi) dx dt \to 0$$

by (3.22), (3.23) and strong convergence of $\Pi_N \phi$ to $\phi$ in $L^2(0,T;H^1(\Omega))$. We can bound $J_2$ by

$$|J_2| = \left| \int_{\Omega_T} (\phi - \Pi_N \phi) \sqrt{M_0} \frac{g'_\theta(u_\theta)}{g^{\frac{3}{2}}_\theta(u_\theta)} \nabla u_\theta \cdot \sqrt{M_0} \frac{\mu_\theta}{g_\theta(u_\theta)} \nabla \phi \ dx dt \right|$$

$$\leq \sqrt{M_0} \int_0^T \| \phi - \Pi_N \phi \|_{L^\infty(\Omega)} \left\| \frac{g'_\theta(u_\theta)}{g^{\frac{3}{2}}_\theta(u_\theta)} \nabla u_\theta \right\|_{L^2(\Omega)} \left\| \sqrt{M_0} \frac{\mu_\theta}{g_\theta(u_\theta)} \nabla \phi \right\|_{L^2(\Omega)}$$

$$\leq \sqrt{M_0} \left\| \frac{g'_\theta(u_\theta)}{g^{\frac{3}{2}}_\theta(u_\theta)} \nabla u_\theta \right\|_{L^\infty(0,T;L^2(\Omega))} \left\| \sqrt{M_0} \frac{\mu_\theta}{g_\theta(u_\theta)} \nabla \phi \right\|_{L^2(\Omega_T)} \| \phi - \Pi_N \phi \|_{L^2(0,T;W^{1,2}(\Omega))} \to 0 \ as \ N \to \infty.$$

Consequently (3.38) and (3.39) imply

$$\int_0^T (\partial_t u_\theta, \phi)_{(W^{1,q}(\Omega))',W^{1,q}(\Omega)} \ dt = - \int_{\Omega_T} M_0(u_\theta) \nabla \frac{\mu_\theta}{g_\theta(u_\theta)} \cdot \frac{\phi}{g_\theta(u_\theta)} dx dt$$

for all $\phi \in L^2(0,T;W^{1,q}(\Omega))$ with $q > 2$. Moreover, since $u^N(x,0) = \Pi_N u_0(x) \to u_0(x)$ in $H^1(\Omega)$, we see that $u_\theta(x,0) = u_0(x)$ by (3.11).

**Remark 3.2.** (Generalized dominated convergence theorem) Assume $E \subset \mathbb{R}^n$ is measurable, $g_\theta \to g$ strongly in $L^q(E)$ for $1 \leq q < \infty$ and $f_n, f: E \to \mathbb{R}^n$ are measurable functions satisfying

$$f_n \to f \ a.e. \ in \ E; \ |f_n|^p \leq |g_n|^q \ a.e. \ in \ E$$

with $1 \leq p < \infty$, then $f_n \to f$ in $L^p(E)$.

### 3.4. Regularity of $u_\theta$

We now consider the regularity of $u_\theta$. Given any $a_j(t) \in L^2(0,T), \ a_j(t) \phi_j \in L^2(0,T;C(\Omega))$. Integrating (3.2) from 0 to $T$, by (3.17), (3.23) and (3.30), we have

$$\int_{\Omega_T} \mu_\theta(x,t)a_j(t)\phi_j(x) dx dt = \int_{\Omega_T} (\nabla u_\theta \cdot a_j(t) \nabla \phi_j + q'(u_\theta) a_j(t) \phi_j) dx dt$$

for all $j \in \mathbb{N}$. Given any $\phi \in L^2(0,T;H^1(\Omega))$, its Fourier series strongly converges to $\phi$ in $L^2(0,T;H^1(\Omega))$, therefore

$$\int_{\Omega_T} \mu_\theta(x,t)\phi(x) dx dt = \int_{\Omega_T} (\nabla u_\theta \cdot \nabla \phi + q'(u_\theta) \phi) dx dt.$$

Recall $\mu_\theta \in L^2(0,T;L^p(\Omega))$ and $q'(u_\theta) \in L^\infty(0,T;L^p(\Omega))$ for any $1 \leq p < \infty$, regularity theory implies $u_\theta \in L^2(0,T;W^{2,p}(\Omega))$. Hence

$$\mu_\theta = -\Delta u_\theta + q'(u_\theta) \ a.e. \ in \ \Omega_T.$$
Since growth assumption on $q$ implies $|q''(u)| \leq C(1 + |u|^{r-1})$, pick $p > 2$, we have
\[
\int_\Omega |\nabla q'(u_\theta)|^2 dx = \int_\Omega |q''(u_\theta)|^2 |\nabla u_\theta|^2 dx
\leq \|q''(u_\theta)\|_{L^\infty(\Omega)}^2 \|\nabla u_\theta\|^2_{L^p(\Omega)}
\leq C \left(1 + \|u_\theta\|^2_{L^\infty(0, T; H^1(\Omega))}\right) \|\nabla u_\theta\|^2_{L^p(\Omega)}
\leq C \left(1 + \|u_\theta\|^2_{L^\infty(0, T; H^1(\Omega))}\right) \|\nabla u_\theta\|^2_{L^p(\Omega)}
\]
Therefore $\nabla q'(u_\theta) = q''(u_\theta)\nabla u_\theta \in L^2(\Omega_T)$ with
\[
\int_{\Omega_T} |\nabla q'(u_\theta)|^2 dx dt \leq \left(1 + \|u_\theta\|^2_{L^\infty(0, T; H^1(\Omega))}\right) \|\nabla u_\theta\|^2_{L^2(0, T; L^p(\Omega))}.
\]
Hence $q'(u_\theta) \in L^2(0, T; H^1(\Omega))$, combined with $\mu_\theta \in L^2(0, T; W^{1,s}(\Omega))$ for any $1 \leq s < 2$, we have $u_\theta \in L^2(0, T; W^{3,s}(\Omega))$ and
\begin{equation}
\nabla \mu_\theta = -\nabla \Delta u_\theta + q''(u_\theta)\nabla u_\theta \text{ a.e. in } \Omega_T.
\end{equation}
Regularity of $u_\theta$ implies $\nabla u_\theta \in L^\infty(0, T; L^2(\Omega)) \cap L^2(0, T; L^\infty(\Omega))$. A simple interpolation shows $\nabla u_\theta \in L^{\frac{2n}{n-2}}(0, T; L^\mu(\Omega))$ for any $\mu > 2$. Given any $\phi \in L^p(0, T; W^{1,q}(\Omega))$ with $p > 2$ and $q > 2$, we have $g_\theta(u_\theta)\phi \in L^2(0, T; W^{1,1}(\Omega))$ for any $r < \min(p, q)$. From this, we can pick $g_\theta(u_\theta)\phi$ as a test function in (3.40), we have
\begin{equation}
\int_{\Omega_T} \partial_t u_\theta g_\theta(u_\theta) dx dt = -\int_{\Omega_T} M_\theta(u_\theta) \nabla \frac{\mu_\theta}{g_\theta(u_\theta)} \cdot \nabla \phi dx dt
\end{equation}
for any $\phi \in L^p(0, T; W^{1,q}(\Omega))$ with $p, q > 2$.

Remark 3.3. In fact, since $M_\theta(u_\theta) \in L^\infty(0, T; L^p(\Omega))$ for $1 \leq p < \infty$, the right hand side of (3.44) is well defined for any $\phi \in L^2(0, T; W^{1,q}(\Omega))$ for $q > 2$ and we can extend (3.44) to hold for all $\phi \in L^2(0, T; W^{1,q}(\Omega))$.

3.5. Energy Inequality. Since $u^N$ and $\mu^N$ satisfies energy identity (3.4), passing to the limit as $N \to \infty$ and using strong convergence of $u^N(x, 0)$ to $u_0$ in $H^1(\Omega)$, together with the weak convergence of $u^N, q'(u^N)$ and $\sqrt{M_\theta(u^N)}\nabla \frac{u^N}{g_\theta(u^N)}$, the energy inequality (1.12) follows.

4. Phase field model with degenerate mobility. In this section, we prove theorem 1.2. Fix initial data $u_0 \in H^1(\Omega)$. We pick a montone decreasing positive sequence $\theta_i$ with $\lim_{i \to \infty} \theta_i = 0$. By theorem 1.1 and (3.44), for each $\theta_i$, there exists
\[
u \in L^\infty(0, T; H^1(\Omega)) \cap L^2(0, T; W^{3,s}(\Omega)) \cap C([0, T]; L^p(\Omega))
\]
with weak derivative
\[
\partial_t \nu \in L^2(0, T; (W^{1,q}(\Omega))'),
\]
where $1 \leq p < \infty$, $1 \leq s < 2$, $q > 2$ such that $u_{\theta_i}(x, 0) = u_0(x)$ and for all $\phi \in L^2(0, T; W^{1,q}(\Omega))$, 
\begin{align}
\int_0^T \int_\Omega \partial_t \nu \phi dx dt &= -\int_0^T \int_\Omega M_i(u_{\theta_i}) \nabla \frac{\mu_i}{g_i(u_{\theta_i})} \cdot \nabla \phi dx dt,
\mu_i &= -\Delta \nu + q'(\nu).
\end{align}
Moreover, for all $\psi \in L^p(0, T; W^{1,q}(\Omega))$ with $p,q > 2$, the following holds:

\begin{equation}
\int_0^T \int_\Omega g_i(u_i) \partial_t u_i \psi \, dx \, dt = - \int_0^T \int_\Omega M_i(u_i) \nabla \frac{\mu_i}{g_i(u_i)} \nabla \psi \, dx \, dt
\end{equation}

Here we write $u_i = u_{\theta_i}$, $M_i(u_i) = M_{\theta_i}(u_{\theta_i})$, $g_i(u_i) = g_{\theta_i}(u_{\theta_i})$ for simplicity of notations.

## 4.1. Convergence of $u_i$ and equation for the limit function

Noticing the bound in (3.5) and (3.6) only depends on $u_0$, we can find a constant $C$, independent of $\theta_i$, such that

\begin{align}
\|u_i\|_{L^\infty(0,T; H^1(\Omega))} &\leq C, \\
\left\| \left( \frac{\mu_i}{g_i(u_i)} \right)^{\frac{1}{2}} \right\|_{L^2(\Omega_T)} &\leq C.
\end{align}

Growth condition on $q_i$ and Sobolev embedding theorem give

\begin{align}
\|q'_i(u_i)\|_{L^\infty(0,T; L^p(\Omega))} &\leq C, \\
\|M_i(u_i)\|_{L^\infty(0,T; L^p(\Omega))} &\leq C
\end{align}

for any $1 \leq p < \infty$. By (4.3), for any $\phi \in L^p(0, T; W^{1,q}(\Omega))$ with $p,q > 2$,

\begin{align}
\left| \int_0^T \int_\Omega g_i(u_i) \partial_t u_i \phi \, dx \, dt \right| &\leq \left| \int_0^T \int_\Omega M_i(u_i) \nabla \frac{\mu_i}{g_i(u_i)} \nabla \phi \, dx \, dt \right| \\
&\leq \int_0^T \left( \left\| \frac{\mu_i}{g_i(u_i)} \right\|_{L^2(\Omega)} \left\| \nabla \phi \right\|_{L^p(\Omega)} \right) \, dt \\
&\leq C \left\| \phi \right\|_{L^p(0,T; W^{1,q}(\Omega))}.
\end{align}

Let

\begin{equation}
G_i(u_i) = \int_0^{u_i} g_i(a) \, da.
\end{equation}

Thus (4.6) yields $\partial_t G_i(u_i) = g_i(u_i) \partial_t u_i \in L^{p'}(0, T; (W^{1,q}(\Omega))')$ with $p' = \frac{p}{p-1}$ and

\begin{equation}
\|\partial_t G_i(u_i)\|_{L^{p'}(0,T; (W^{1,q}(\Omega))')} \leq C
\end{equation}

for all $i$.

Moreover, by growth assumption on $g$ and estimates on $u_i$, we have

\begin{equation}
\|G_i(u_i)\|_{L^\infty(0,T; W^{1,s}(\Omega))} \leq C.
\end{equation}

for $1 \leq s < 2$. By (4.4), (4.5), (4.8)-(4.9) and Remark 3.1 we can find a subsequence, not relabeled, a function $u \in L^\infty(0, T; H^1(\Omega))$, a function $\xi \in L^2(\Omega_T)$ and a function $\eta \in L^\infty(0, T; W^{1,s}(\Omega))$ such that as $i \to \infty$,

\begin{align}
&u_i \rightharpoonup u \text{ weakly-* in } L^\infty(0, T; H^1(\Omega)), \\
&\sqrt{M_i(u_i)} \nabla \frac{\mu_i}{g_i(u_i)} \rightharpoonup \xi \text{ weakly in } L^2(\Omega_T), \\
&G_i(u_i) \rightharpoonup \eta \text{ weakly-* in } L^\infty(0, T; W^{1,s}(\Omega)), \\
&G_i(u_i) \rightharpoonup \eta \text{ strongly in } L^\infty(0, T; L^2(\Omega)), \text{ and a.e. in } \Omega_T, \\
&G_i(u_i) \rightharpoonup \eta \text{ strongly in } C[0,T; L^2(\Omega)], \\
&\partial_t G_i(u_i) \to \partial_t \eta \text{ weakly in } L^{p'}(0, T; (W^{1,q}(\Omega))').
\end{align}
where \(1 \leq \alpha, \beta < \infty\). By (4.14) and (4.20) from Remark 4.1, we have

\[
\|G_i(u_i(t+h)) - G_i(u_i(t))\|_{C([0,T]; L^\beta(\Omega))} \to 0 \quad \text{uniformly in } i \text{ as } h \to 0.
\]

Thus given any \(\varepsilon > 0\), there exists \(h_\varepsilon > 0\) such that for all \(0 < h < h_\varepsilon\) and all \(i\),

\[
\|G_i(u_i(t+h)) - G_i(u_i(t))\|_{C([0,T]; L^\beta(\Omega))} < \varepsilon.
\]

Given any \(\delta > 0\), let \(I_\delta = (1 - \delta, 1 + \delta) \cup (-1 - \delta, -1 + \delta)\). Consider the interval having \(u_i(t, x)\) and \(u_i(x, t + h)\) as end points. Denote this interval by \(J_i(x, t; h)\). We consider three cases.

**Case I:** \(J_i(x, t; h) \cap I_\delta = \emptyset\).
In this case, \(g_i(s) \geq \max(\theta_i^m, \delta^2 m)\) for any \(s \in J_i(x, t; h)\) and by (4.7)

\[
|G_i(u_i(t+h)) - G_i(u_i(t))| = \left| \int_{u_i(x,t)}^{u_i(x,t+h)} g_i(s) \, ds \right| \geq \delta^2 m |u_i(x,t+h) - u_i(x,t)|.
\]

**Case II:** \(J_i(x, t; h) \cap I_\delta \neq \emptyset\) and \(|u_i(x, t + h) - u_i(x, t)| \geq 3\delta\).
In this case, we have

\[
|J_i(x, t; h) \cap I_\delta| \geq \frac{1}{3}|J_i(x, t; h)|
\]

and

\[
|G_i(u_i(x,t+h)) - G_i(u_i(x,t))| \geq \left[ \int_{J_i(x,t;h) \cap I_\delta} g_i(s) \, ds \right] \geq \frac{\delta^2 m}{3} |u_i(x,t+h) - u_i(x,t)|.
\]

**Case III:** \(J_i(x, t; h) \cap I_\delta \neq \emptyset\) and \(|u_i(x, t + h) - u_i(x, t)| < 3\delta\).
In this case, we have

\[
g_i(s) \leq \max\{(8\delta + 16\delta^2)^m, \theta_i^m\} \quad \text{for any } s \in J_i(x, t; h).
\]

Thus

\[
|G_i(u_i(x,t+h)) - G_i(u_i(x,t))| \leq 3\delta \max\{(8\delta + 16\delta^2)^m, \theta_i^m\}.
\]

Pick \(\delta = \varepsilon \frac{1}{3\max(\theta_i^m)}\) and fix \(t\). Let

\[
\Omega_\delta^i = \{x \in \Omega: J_i(x, t; h) \text{ satisfies case I or II}\}.
\]

Then

\[
\int_{\Omega_\delta^i} |u_i(x,t+h) - u_i(x,t)|^\beta \, dx
= \frac{1}{3} \int_{\Omega_\delta^i} |u_i(x,t+h) - u_i(x,t)|^\beta \, dx + \int_{\Omega \setminus \Omega_\delta^i} |u_i(x,t+h) - u_i(x,t)|^\beta \, dx
\leq 3\delta \varepsilon \frac{1}{3\max(\theta_i^m)}
\leq 3\delta \varepsilon + C\varepsilon \frac{1}{\max(\theta_i^m)}
\]
Taking maximum on the left side, we have for all $i$, any $h < h_\varepsilon$,
\[
\|u_i(x, t + h) - u_i(x, t)\|_{C([0,T];L^\beta(\Omega))}^\beta \leq 3^\beta \varepsilon^\frac{1}{\alpha} + C\varepsilon. 
\]

Thus
\[
\|u_i(x, t + h) - u_i(x, t)\|_{C([0,T];L^\beta(\Omega))}^\beta \to 0 \text{ uniformly as } h \to 0.
\]

In addition, for any $0 < t_1 < t_2 < T$, (4.4) implies that for $1 \leq \beta < \infty$, we have
\[
\int_{t_1}^{t_2} u_i(x,t)dt \text{ is relatively compact in } L^\beta(\Omega).
\]

Therefore we conclude from Remark 4.1 that
\[
(4.16) \quad u_i \to u(x, t) \text{ strongly in } C([0,T];L^\beta(\Omega)) \text{ for } 1 \leq \beta < \infty.
\]

Similarly, we can prove
\[
(4.17) \quad u_i \to u(x, t) \text{ strongly in } L^\alpha(0,T;L^\beta(\Omega)) \text{ for } 1 \leq \alpha, \beta < \infty \text{ and a.e. in } \Omega_T.
\]

Growth condition on $M(u)$ and (4.16), (4.17) yield
\[
M_i(u_i) \to M(u) \text{ strongly in } C([0,T];L^\beta(\Omega)) \text{ for } 1 \leq \beta < \infty,
\]
\[
M_i(u_i) \to M(u) \text{ strongly in } L^\sigma(0,T;L^\beta(\Omega)) \text{ for } 1 \leq \alpha, \beta < \infty,
\]
\[
\sqrt{M_i(u_i)} \to \sqrt{M(u)} \text{ strongly in } C([0,T];L^\gamma(\Omega)) \text{ for } 1 \leq \gamma < \infty.
\]

Hence $G_i(u_i)$ converges to $G(u)$ a.e. in $\Omega_T$ and $\eta = G(u)$. Passing to the limit in (4.3), we have
\[
(4.18) \quad \int_0^T \langle g(u)\partial_t u, \phi \rangle_{(W^{1,q}(\Omega))'}_{W^{1,q}(\Omega)}dt = -\int_0^T \int_\Omega \sqrt{M(u)}\xi \cdot \nabla \phi dx dt
\]
for any $\phi \in L^p(0,T;W^{1,q}(\Omega))$ with $p, q > 2$.

**Remark 4.1.** (Compactness in $L^p(0,T;B)$) Theorem 1 in [22]) Assume $B$ is a Banach space and $F \subset L^p(0,T;B)$. $F$ is relatively compact in $L^p(0,T;B)$ for $1 \leq p < \infty$, or in $C([0,T],B)$ for $p = \infty$ if and only if
\[
(4.19) \quad \left\{\int_{t_1}^{t_2} f(t)dt : f \in F \right\} \text{ is relatively compact in } B, \forall 0 < t_1 < t_2 < T,
\]
\[
(4.20) \quad \|\tau_h f - f\|_{L^p(0,T;B)} \to 0 \text{ as } h \to 0 \text{ uniformly for } f \in F.
\]

Here $\tau_h f(t) = f(t + h)$ for $h > 0$ is defined on $[-h,T-h]$.

**4.2. Weak convergence of $\nabla \frac{\delta}{\delta u_i}$**. We now look for relation between $\xi$ and $u$. Following the idea in [7], we decompose $\Omega_T$ as follows. Let $\delta_j$ be a positive sequence monotonically decreasing to 0. By (4.11) and Egorov’s theorem, for every $\delta_j > 0$, there exists $B_j \subset \Omega_T$ satisfying $|\Omega \setminus B_j| < \delta_j$ such that
\[
(4.21) \quad u_i \to u \text{ uniformly in } B_j.
\]
We can pick
\begin{equation}
B_1 \subset B_2 \subset \cdots \subset B_j \subset B_{j+1} \subset \cdots \subset \Omega_T. \tag{4.22}
\end{equation}

Define
\[ P_j := \{(x, t) \in \Omega_T : |1 - u^2| > \delta_j \}. \]

Then
\begin{equation}
P_1 \subset P_2 \subset \cdots \subset P_j \subset P_{j+1} \subset \cdots \subset \Omega_T. \tag{4.23}
\end{equation}

Let \( B = \bigcup_{j=1}^\infty B_j \) and \( P = \bigcup_{j=1}^\infty P_j \). Then \( |\Omega_T \setminus B| = 0 \) and each \( B_j \) can be split into two parts:
\[ D_j = B_j \cap P_j, \text{ where } |1 - u^2| > \delta_j, \text{ and } u_i \to u \text{ uniformly}, \]
\[ \bar{D}_j = B_j \setminus P_j, \text{ where } |1 - u^2| \leq \delta_j, \text{ and } u_i \to u \text{ uniformly}. \]

(4.22) and (4.23) imply
\begin{equation}
D_1 \subset D_2 \subset \cdots \subset D_j \subset D_{j+1} \subset \cdots \subset D := B \cap P. \tag{4.24}
\end{equation}

For any \( \Psi \in L^p(0, T; L^q(\Omega, \mathbb{R}^n)) \) with \( p, q > 2 \), we have
\begin{align}
\int_{\Omega_T} M_i(u_i) \nabla \frac{\mu_i}{g_i(u_i)} \cdot \Psi \, dx \, dt &= \int_{\Omega_T \setminus B_j} M_i(u_i) \nabla \frac{\mu_i}{g_i(u_i)} \cdot \Psi \, dx \, dt + \int_{D_j} M_i(u_i) \nabla \frac{\mu_i}{g_i(u_i)} \cdot \Psi \, dx \, dt \\
&\quad + \int_{\bar{D}_j} M_i(u_i) \nabla \frac{\mu_i}{g_i(u_i)} \cdot \Psi \, dx \, dt \tag{4.25}
\end{align}

The left hand side of (4.25) converges to \( \int_{\Omega_T} \sqrt{M(u)} \xi \cdot \Psi \, dx \, dt \). We analyze the three terms on the right hand side separately. To estimate the first term on the right hand side of (4.25), noticing \( |\Omega_T \setminus B_j| \to 0 \) and
\[ \lim_{i \to \infty} \int_{\Omega_T \setminus B_j} M_i(u_i) \nabla \frac{\mu_i}{g_i(u_i)} \cdot \Psi \, dx \, dt = \int_{\Omega_T \setminus B_j} \sqrt{M(u)} \xi \cdot \Psi \, dx \, dt, \]
we have
\[ \lim_{j \to \infty} \lim_{i \to \infty} \int_{\Omega_T \setminus B_j} M_i(u_i) \nabla \frac{\mu_i}{g_i(u_i)} \cdot \Psi \, dx \, dt = 0. \]

By uniform convergence of \( u_i \) to \( u \) in \( B_j \), we introduce subsequence \( u_{j,k} \) such that \( u_{j,k} \to u \) uniformly in \( B_j \) and there exists \( N_j \) such that for all \( k \geq N_j \),
\begin{equation}
|1 - u_{j,k}^2| > \frac{\delta_j}{2} \text{ in } D_j, \quad |1 - u_{j,k}^2| \leq 2\delta_j \text{ in } \bar{D}_j. \tag{4.26}
\end{equation}

Thus the third term on the right hand side of (4.25) can be estimated by
\begin{align}
&\lim_{j \to \infty} \lim_{k \to \infty} \int_{D_j} M_{j,k}(u_{j,k}) \nabla \frac{\mu_{j,k}}{g_{j,k}(u_{j,k})} \cdot \Psi \, dx \, dt \\
&\leq \lim_{j \to \infty} \lim_{k \to \infty} \left\{ \left( \sup_{\bar{D}_j} \sqrt{M_{j,k}(u_{j,k})} \right) \left\| \Psi \right\|_{L^2(\bar{D}_j)} \left\| \nabla \frac{\mu_{j,k}}{g_{j,k}(u_{j,k})} \right\|_{L^2(\bar{D}_j)} \right\} \\
&\leq \left( \sup_{\bar{D}_j} \sqrt{M_{j,k}(u_{j,k})} \right) \left\| \frac{\partial \Psi}{\partial t} \right\|_{L^2(0,T;L^p(\Omega))} \left\| \nabla \frac{\mu_{j,k}}{g_{j,k}(u_{j,k})} \right\|_{L^2(\bar{D}_j)} \\
&\leq C \lim_{j \to \infty} \lim_{k \to \infty} \max \left\{ (2\delta_j)^{m/2}, \theta_{j,k}^{m/2} \right\} \\
&= 0.
\end{align}
For the second term, we see that
\[
\left(\frac{\delta_j}{2}\right)^m \int_{D_j} |\nabla \frac{\mu_{j,k}}{g_{j,k}(u_{j,k})}|^2 \, dxdt
\leq \int_{D_j} M_{j,k}(u_{j,k}) |\nabla \frac{\mu_{j,k}}{g_{j,k}(u_{j,k})}|^2 \, dxdt
\leq \int_{\Omega^\prime} M_{j,k}(u_{j,k}) |\nabla \frac{\mu_{j,k}}{g_{j,k}(u_{j,k})}|^2 \, dxdt \leq C.
\]

Therefore \(\nabla \frac{\mu_{j,k}}{g_{j,k}(u_{j,k})}\) is bounded in \(L^2(D_j)\) and we can extract a further subsequence, not relabeled, which converges weakly to some \(\tilde{\xi}_j \in L^2(D_j)\). Since \(D_j\) is an increasing sequence of sets with \(\lim_{j \to \infty} D_j = D\), we have \(\tilde{\xi}_j = \xi_{j-1}\) a.e. in \(D_{j-1}\). By setting \(\xi_j = 0\) outside \(D_j\), we can extend \(\tilde{\xi}_j\) to a \(L^2\) function \(\tilde{\xi}_j\) defined in \(D\). Therefore for a.e. \(x \in D\), there exists a limit of \(\tilde{\xi}_j(x)\) as \(j \to \infty\). Let \(\xi(x) = \lim_{j \to \infty} \tilde{\xi}_j(x)\), we see that \(\xi(x) = \xi_j(x)\) for a.e. \(x \in D_j\) and for all \(j\).

By a standard diagonal argument, we can extract a subsequence such that
\[
\nabla \frac{\mu_{k,N_k}}{g_{k,N_k}(u_{k,N_k})} \rightharpoonup \zeta \text{ weakly in } L^2(D_j) \text{ for all } j.
\]

By strong convergence of \(M_i(u_i)\) to \(\sqrt{M(u)}\) in \(C([0,T]; L^3(\Omega))\) for \(1 \leq \beta < 2\), we obtain
\[
\chi_{D_j} \sqrt{M_{k,N_k}(u_{k,N_k})} \frac{\mu_{k,N_k}}{g_{k,N_k}(u_{k,N_k})} \rightharpoonup \chi_{D_j} \sqrt{M(u)} \zeta
\]
weakly in \(L^2(0,T; L^9(\Omega))\) for \(1 \leq q < 2\) and all \(j\). Recall \(\sqrt{M(u)} \nabla \frac{\mu_i}{g_i(u)} \rightharpoonup \xi\) weakly in \(L^2(\Omega_T)\), we have \(\xi = \sqrt{M(u)} \zeta\) in \(D_j\) for all \(j\). Hence \(\xi = \sqrt{M(u)} \zeta\) in \(D\) and consequently
\[
\chi_D M_{k,N_k}(u_{k,N_k}) \nabla \frac{\mu_{k,N_k}}{g_{k,N_k}(u_{k,N_k})} \rightharpoonup \chi_D M(u) \zeta
\]
weakly in \(L^2(0,T; L^9(\Omega))\) for \(1 \leq q < 2\).

Replacing \(u_i\) by subsequence \(u_{k,N_k}\) in \((4.25)\) and letting \(k \to \infty\) then \(j \to \infty\), we have
\[
\int_{\Omega_T} \sqrt{M(u)} \zeta \cdot \Psi \, dxdt = \lim_{j \to \infty} \int_{D_j} M(u) \zeta \cdot \Psi \, dxdt
\]
\[
= \int_D M(u) \zeta \cdot \Psi \, dxdt.
\]

It follows from \((4.18)\) and \((4.28)\) that
\[
\int_0^T \langle g(u) \partial_t u, \phi \rangle_{(L^{1,q}(\Omega)),(W^{1,q}(\Omega))} \, dt = - \int_D M(u) \zeta \cdot \nabla \phi \, dxdt
\]
for all \(\phi \in L^p(0,T; W^{1,q}(\Omega))\) where \(p,q > 2\).

### 4.3. Relation between \(\zeta\) and \(u\).

The desired relation between \(\zeta\) and \(u\) is
\[
\zeta = \frac{1}{g} \nabla \mu - \mu g'(u) \frac{1}{g^2(u)} \nabla u
\]
\[
= \frac{1}{g} (-\nabla \Delta u + q''(u) \nabla u) - \frac{g'(u)}{g^2(u)} \nabla u (-\Delta u + q'(u)).
\]
Given the known regularity \( u \in L^\infty(0,T;H^1(\Omega)) \) and degeneracy of \( g(u) \), the right hand side of (4.30) might not be defined as a function. We can, however, under the additional assumption \( u \in L^2(0,T;H^2(\Omega)) \) and suitable assumptions on integrability of \( \nabla \Delta u \), find an explicit expression of \( \zeta \) in terms of (4.30) in suitable subset of \( \Omega_T \).

Claim I: If \( u \in L^2(0,T;H^2(\Omega)) \) and for some \( j \), the interior of \( D_j \), denoted by \((D_j)^0\), is not empty, then
\[
\nabla \Delta u \in L^1((D_j)^0)
\]

and
\[
\zeta = \frac{-\nabla \Delta u + g''(u)\nabla u}{g(u)} - \frac{g'(u)}{g^2(u)} (-\Delta u + q'(u)) \nabla u \quad \text{a.e. in} \quad (D_j)^0.
\]

Proof of the claim I. Since \( u \in L^2(0,T;H^2(\Omega)) \), we can have a subsequence, not relabeled such that, \( u_{k,N_k} \) converges weakly to \( u \) in \( L^2(0,T;H^2(\Omega)) \). Since
\[
\mu_{k,N_k} = -\Delta u_{k,N_k} + q'(u_{k,N_k}) \quad \text{in} \quad \Omega_T,
\]
the right hand side of (4.31) weakly converges to \( -\Delta u + q'(u) \) in \( L^2(\Omega_T) \). Hence
\[
\mu_{k,N_k} \rightharpoonup \mu = -\Delta u + q'(u) \quad \text{weakly in} \quad L^2(\Omega_T).
\]

On the other hand, using \( u_{k,N_k} \) and \( u \) as test functions in (3.41) yield
\[
\int_{\Omega_T} \mu_{k,N_k} u_{k,N_k} dxdt = \int_{\Omega_T} \left( |\nabla u_{k,N_k}|^2 + q'(u_{k,N_k}) u_{k,N_k} \right) dxdt
\]
\[
\int_{\Omega_T} \mu_{k,N_k} u dxdt = \int_{\Omega_T} (\nabla u_{k,N_k} \cdot \nabla u + q'(u_{k,N_k}) u) dxdt.
\]

Passing to the limit, by (4.17), growth assumptions on \( q' \) and (4.31), we have
\[
\lim_{k \to \infty} \int_{\Omega_T} |\nabla u_{k,N_k}|^2 = \int_{\Omega_T} |\nabla u|^2.
\]

Therefore
\[
\nabla u_{k,N_k} \rightharpoonup \nabla u \quad \text{strongly in} \quad L^2(\Omega_T).
\]

Since \( u_{k,N_k} \in L^2(0,T;W^{3,\alpha}(\Omega)) \), we can differentiate (4.31) and get
\[
\nabla \mu_{k,N_k} = -\nabla \Delta u_{k,N_k} + q''(u_{k,N_k}) \nabla u_{k,N_k},
\]
and
\[
\nabla \frac{\mu_{k,N_k}}{g_{k,N_k}(u_{k,N_k})} = \frac{1}{g_{k,N_k}(u_{k,N_k})} \nabla \mu_{k,N_k} - \frac{\mu_{k,N_k}}{g_{k,N_k}(u_{k,N_k})} \frac{g'(u_{k,N_k})}{g_{k,N_k}^2(u_{k,N_k})} \nabla u_{k,N_k}
\]
on \( D_j^\circ \). Thus
\[
\nabla \mu_{k,N_k} = g_{k,N_k}(u_{k,N_k}) \frac{\mu_{k,N_k}}{g_{k,N_k}(u_{k,N_k})} + \frac{\mu_{k,N_k}}{g_{k,N_k}(u_{k,N_k})} \frac{g'(u_{k,N_k})}{g(u)} \nabla u_{k,N_k}.
\]

Since
\[
g_{k,N_k}(u_{k,N_k}) \to g(u) \quad \text{uniformly in} \quad D_j^\circ,
\]
\[
\frac{g'(u_{k,N_k})}{g(u)} \to g'(u) \quad \text{uniformly in} \quad D_j^\circ,
\]
\[
\nabla \frac{\mu_{k,N_k}}{g_{k,N_k}(u_{k,N_k})} \rightharpoonup \zeta \quad \text{weakly in} \quad L^2(D_j^\circ),
\]
\[
\mu_{k,N_k} \rightharpoonup \mu \quad \text{weakly in} \quad L^2(\Omega_T),
\]
\[
\nabla u_{k,N_k} \rightharpoonup \nabla u \quad \text{strongly in} \quad L^2(\Omega_T),
\]
we have, for any $\phi \in L^\infty(D^q_j)$,

$$
\int_{D^q_j} \phi \left( g_{k,Nk}(u_{k,N}) \nabla \frac{\mu_{k,Nk}}{g_{k,Nk}(u_{k,N})} + \frac{\mu_{k,Nk}}{g_{k,Nk}(u_{k,N})} g_{k,Nk}(u_{k,N}) \nabla u_{k,N} \right) \, dx dt \\
\to \int_{D^q_j} \phi \left( g(u) \zeta + \frac{g'(u)}{g(u)} \mu \nabla u \right) \, dx dt,
$$
i.e.

$$
\nabla \mu_{k,Nk} \rightarrow \eta := g(u) \zeta + \frac{g'(u)}{g(u)} \mu \nabla u \text{ weakly in } L^1(D^q_j).
$$

Passing to the limit in (4.32), we obtain, in the sense of distribution, that

$$
\eta = -\nabla \Delta u + q''(u) \nabla u.
$$

Since $q''(u) \nabla u \in L^2(\Omega_T)$, we have $-\nabla \Delta u \in L^1(D^q_j)$, hence

$$
(4.35) \quad \eta = -\nabla \Delta u + q''(u) \nabla u \text{ a.e. in } D^q_j
$$

Since \( \frac{1}{g_{k,Nk}(u_{k,N})} = \frac{1}{g(u)} \) uniformly in $D_j$, we have

$$
\frac{1}{g_{k,Nk}(u_{k,N})} \nabla \mu_{k,Nk} \rightarrow \frac{1}{g(u)} \eta \text{ weakly in } L^1(D^q_j).
$$

Since \( \frac{g'_{k,Nk}(u_{k,N})}{g_{k,Nk}(u_{k,N})} \mu_{k,Nk} \nabla u_{k,N} \rightarrow \frac{g'(u)}{g^2(u)} \mu \nabla u \) weakly in $L^1(D^q_j)$.

Passing to the limit in (4.33), we have

$$
\zeta = \frac{1}{g(u)} \eta - \mu \frac{g'(u)}{g^2(u)} \nabla u = \frac{-\nabla \Delta u + q''(u) \nabla u}{g(u)} - \frac{g'(u)}{g^2(u)} (-\Delta u + q'(u)) \nabla u
$$
on $(D_j)^{\circ}$. Noticing the value of $\zeta$ on $\Omega_T \setminus D$ doesn’t matter since it does not appear on the right hand side of (4.28).

Claim II: For any open set $U \in \Omega_T$ in which $\nabla \Delta u \in L^p(U)$ for some $p > 1$ and $g(u) > 0$, we have

$$
(4.36) \quad \zeta = \frac{-\nabla \Delta u + q''(u) \nabla u}{g(u)} - \frac{g'(u)}{g^2(u)} (-\Delta u + q'(u)) \nabla u.
$$
in $U$.

To prove this, since

$$
(4.37) \quad \nabla \mu_{k,Nk} = -\nabla u_{k,Nk} + q''(u_{k,Nk}) \nabla u_{k,Nk} \text{ in } \Omega_T
$$
and

$$
(4.38) \quad \nabla \frac{\mu_{k,Nk}}{g_{k,Nk}(u_{k,N})} = \frac{1}{g_{k,Nk}(u_{k,N})} \nabla \mu_{k,Nk} + \mu_{k,Nk} \cdot \nabla \frac{1}{g_{k,Nk}(u_{k,N})} \text{ on } D_j.
$$
The right hand side of (4.37) converges weakly to \(-\nabla \Delta u + q''(u) \nabla u\) in \(L^q(U)\) for \(q = \min\{p, 2\} > 1\). Hence
\[
\nabla \mu_{k, N_k} \to \eta = -\nabla \Delta u + q''(u) \nabla u \text{ weakly in } L^q(U).
\]
The right hand side of (4.38) converges weakly to
\[
\eta \frac{g'(u)}{g(u)} \cdot \frac{g'(u)}{g^2(u)} \mu \cdot \nabla u
\]
in \(L^1(U \cap D_j)\) for each \(j\) and therefore
\[
\zeta = \frac{-\nabla \Delta u + q''(u) \nabla u}{g(u)} - \frac{g'(u)}{g^2(u)} (-\Delta u + q'(u)) \nabla u
\]
in \(U \cap D\). The definition of \(\zeta\) can be extended to \(U \setminus D\) by our integrability assumption on \(u\). Define
\[
\tilde{\Omega}_T = \{u \in \Omega_T : g(u) > 0 \text{ on } U \text{ and } \nabla \Delta u \in L^p(U) \text{ for some } p > 1 \text{ depending on } U\}.
\]
Then \(\tilde{\Omega}_T\) is open and \(\zeta\) is defined by (4.36) on \(\tilde{\Omega}_T\). Since \(|\Omega_T \setminus B| = 0\), \(M(u) = 0\) on \(\Omega_T \setminus P\) and
\[
\Omega_T \setminus (D \cup \Omega_T) \in \{\Omega_T \setminus B\} \cup \{\Omega_T \setminus P\},
\]
we can take the value of \(\zeta\) to be zero outside \(D \cup \Omega_T\), and it won’t affect the integral on the right side of (1.13).

Lastly the energy inequality (1.15) follows by taking limit in the energy inequality for \(u_{k, N_k}\).

**Remark 4.2.** In Cahn-Hilliard case, there is convergence of \(\nabla \mu_k\) on \(L^2(D_j)\), and relation between \(\xi\) and \(u\) can be derived directly. Here we only have convergence of \(\nabla \frac{\mu_{g_k(u)}}{g_k(u)}\) on \(L^2(D_j)\). In order to obtain convergence of \(\nabla \mu_k\), we need convergence \(\mu_k\) on \(L^p(\Omega_T)\) for suitable \(p\), this is where we used the additional assumption \(u \in L^2(0, T; H^2(\Omega))\).

### 5. A Modified phase field model for self-climb of prismatic dislocation loops

Dislocations are line defects in crystals [12, 23]. A phase field model [20] was derived based on the pipe diffusion model for self-climb of prismatic dislocation loops [18, 19] that describes the conservative climb of dislocation loops observed in experiments of irradiated materials [13, 12, 8]. In this section, we study the well-posedness of the following modified phase field model for self-climb of prismatic dislocation loops:

\[
\begin{align}
(5.1) & \quad g(u) \partial_t u = \nabla \cdot (M(u) \nabla \frac{\mu}{g(u)}) \quad \text{for } x \in \Omega \subset \mathbb{R}^2, t \in [0, \infty) \\
(5.2) & \quad \mu = -\Delta u + \frac{1}{\varepsilon^2} q'(u) + \frac{1}{\varepsilon} f_{cl}
\end{align}
\]

Where \(M(u) = M_0 g(u)\), \(g(u) = |1 - u|^m\) for \(2 \leq m < \infty\), \(q(u)\) satisfy same assumptions (1.6)-(1.7) as those for Eqs. (1.1)-(1.2). Here \(f_{cl}\) is the total climb force with
\[
f_{cl} = f_{cl}^d + f_{cl}^{app}
\]
where \(f_{cl}^{app}\) is the applied climb force, and

\[
(5.3) \quad f_{cl}^d(x, y, u) = \frac{G b^2}{4\pi(1 - \nu)} \int_{\Omega} \left( \frac{x - \bar{x}}{R^3} u_{\bar{x}} + \frac{y - \bar{y}}{R^3} u_{\bar{y}} \right) dx dy
\]
represents the climb force generated by all the dislocations. Here $\Omega \subset \mathbb{R}^2$ is a bounded domain, $G$ is the shear modulus, $\nu$ is the Poisson ratio, and $R = \sqrt{(x-x')^2 + (y-y')^2}$.

In this model, we assume that the prismatic dislocation loops lie and evolve by self-climb in the $xy$ plane and all dislocation loops have the same Burgers vector $b = (0, 0, b)$.

The chemical potential $\mu$ comes from variations of the classical Cahn-Hilliard energy and the elastic energy due to dislocations, i.e.

\begin{equation}
\mu = \frac{\delta E_{CH}}{\delta u} + \frac{\delta E_{el}}{\delta u},
\end{equation}

where

\begin{align}
E_{CH}(u) &= \int_{\Omega} \left( \frac{1}{2} |\nabla u|^2 + q(u) \right) dx, \\
E_{el} &= \int_{\Omega} \left( \frac{1}{2} u f^d_{cl} + u f^{app}_{cl} \right) dx
\end{align}

are classical Cahn-Hilliard energy and elastic energy, respectively. Under periodic boundary conditions, the climb force generated by the dislocations can be expressed as

\begin{equation}
f^d_{cl}(x, y, u) = \frac{Gb^2}{2(1-\nu)} (-\Delta)^{\frac{1}{2}} u.
\end{equation}

Here $(-\Delta)^{s} u$ is a fractional operator defined by

\begin{equation}
\mathcal{F}((-\Delta)^{s} f) = (\xi^2 + \xi'^2)^{\frac{s}{2}} \mathcal{F}(f)(\xi)
\end{equation}

for $\xi \in \mathbb{Z}^2$. In the analysis below, without loss of generality, we set the coefficient of the climb force $\frac{Gb^2}{2(1-\nu)} = 1$.

System (5.1)-(5.2) is a modified version of the phase field model introduced in [20], which does not have the $g(u)$ term on the left side of (5.1). Putting an extra factor $h = H_0 g$ in front of the nonlocal climb force $f^d_{cl}$, the asymptotic analysis in [20] showed that the proposed phase field model yields accurate dislocation self-climb velocity in the sharp interface limit. Moreover, numerical simulations in [20] showed excellent agreement with experimental observations and discrete dislocation dynamics simulation results. Now we prove the well-posedness of the modified model (5.1)-(5.2).

There is an extra nonlocal term $f^d_{cl}$ in this model compared with the model considered in previous sections.

Define

\begin{align}
\mu^N(x, t) &= \sum_{j=1}^{N} \mu^N_j(t) \phi_j(x), & u^N(x, t) &= \sum_{j=1}^{N} u^N_j(t) \phi_j(x),
\end{align}

where $\{\mu^N_j, u^N_j\}$ satisfy

\begin{align}
\int_{\Omega} \partial_t u^N \phi_j dx &= - \int_{\Omega} M_\theta(u^N) \nabla - \frac{\mu^N}{g_\theta(u^N)} \cdot \nabla \phi_j dx, \\
\int_{\Omega} \mu^N \phi_j dx &= \int_{\Omega} \left( \nabla u^N \cdot \nabla \phi_j + q'(u^N) \phi_j + \phi_j (-\Delta)^{\frac{1}{2}} u^N \right) dx, \\
u^N(x, 0) &= \sum_{j=1}^{N} \left( \int_{\Omega} u^N_0 \phi_j dx \right) \phi_j(x).
\end{align}
(5.8)-(5.10) is an initial value problem for a system of ordinary equations for \(\{c_j^N(t)\}\).

Since right hand side of (5.8) is continuous in \(c_j^N\), the system has a local solution.

Define energy functional

\[
F(u) = \int_\Omega \left\{ \frac{1}{2} |\nabla u|^2 + q(u) + |(-\Delta)^{\frac{3}{2}} u|^2 \right\} \, dx.
\]

Direct calculation yields

\[
\frac{d}{dt} F(u^N(x,t)) = - \int_\Omega M_\theta(u^N) \left| \nabla \frac{\mu^N}{g^\theta(u^N)} \right|^2 \, dx,
\]

integration over \(t\) gives the following energy identity for any \(t > 0\)

\[
\int_\Omega \left\{ \frac{1}{2} |\nabla u^N(x,t)|^2 + q(u^N(x,t)) + u^N(-\Delta)^{\frac{3}{2}} u^N \right\} \, dx
+ \int_0^t \int_\Omega M_\theta(u^N(x,\tau)) \left| \nabla \frac{\mu^N(x,\tau)}{g^\theta(u^N(x,\tau))} \right|^2 \, dx \, d\tau
= \int_\Omega \left\{ \frac{1}{2} |\nabla u^N(x,0)|^2 + q(u^N(x,0)) + u^N(x,0)(-\Delta)^{\frac{3}{2}} u^N(x,0) \right\} \, dx
\leq \int_\Omega \|\nabla u_0\|_{L^2(\Omega)}^2 + C \left( \|u_0\|_{H^1(\Omega)}^2 + |\Omega| \right) + \frac{1}{2} \|u_0\|_{L^2(\Omega)}^2 \leq C < \infty,
\]

where \(C\) represents a generic constant possibly depending only on \(T, \Omega, u_0\) but not on \(\theta\). Since \(\Omega\) is bounded region, by growth assumption assumption (1.6) and Poincare’s inequality, the energy identity (5.11) implies \(u^N \in L^\infty(0,T;H^1(\Omega))\) with

\[
\|u^N\|_{L^\infty(0,T;H^1(\Omega))} \leq C \text{ for all } N,
\]

and

\[
\left\| \sqrt{M_\theta(u^N)} \nabla \frac{\mu^N}{g^\theta(u^N)} \right\|_{L^2(\Omega_T)} \leq C \text{ for all } N.
\]

Repeat the argument in Section 3 and Section 4, replacing energy functional \(F(u)\) by \(E(u)\) when necessary, we can prove the following existence theorem for (5.1)-(5.2) with nondegenerate and degenerate mobilities respectively.

**Theorem 5.1.** Let \(M_\theta, g^\theta\) be defined by (1.9) and (1.10), under the assumptions (1.6)-(1.8), for any \(u_0 \in H^1(\Omega)\) and any \(T > 0\), there exists a function \(u_\theta\) such that

a) \(u_\theta \in L^\infty(0,T;H^1(\Omega)) \cap C([0,T];L^p(\Omega)) \cap L^2(0,T;W^{3,s}(\Omega))\), where \(1 \leq p < \infty\), 
\(1 \leq s < 2\),

b) \(\partial_t u_\theta \in L^2(0,T;(W^{1,q}(\Omega))^\prime)\) for \(q > 2\),

c) \(u_\theta(x,0) = u_0(x)\) for all \(x \in \Omega\),

which satisfies (1.4)-(1.5) in the following weak sense

\[
\int_0^T \partial_t u_\theta, \phi \in (W^{1,q}(\Omega))^\prime, W^{1,q}(\Omega) dt
= -\int_0^T \int_\Omega M_\theta(u_\theta) \nabla \frac{\mu^\prime(u_\theta)}{g^\theta(u_\theta)} + (-\Delta)^{\frac{3}{2}} u_\theta, \phi \, dx \, dt
\]
for all $\phi \in L^2(0,T;W^{1,q}(\Omega))$ with $q > 2$. In addition, the following energy inequality holds for all $t > 0$.

$$
\int_\Omega \left( \frac{1}{2} |\nabla u_0(x,t)|^2 + q(u_0(x,t)) + u_0(x,t)(-\Delta)^{\frac{1}{2}} u_0 \right) dx \\
+ \int_0^t \int_\Omega M_0(u_0(x,\tau)) \left| \nabla u_0(x,\tau) + q'(u_0(x,\tau)) + (-\Delta)^{\frac{1}{2}} u_0 \right|^2 dx d\tau
\leq \int_\Omega \left( \frac{1}{2} |\nabla u_0(x)|^2 + q(u_0(x)) + u_0(x)(-\Delta)^{\frac{1}{2}} u_0 \right) dx.
$$

(5.15)

**Theorem 5.2.** For any $u_0 \in H^1(\Omega)$ and $T > 0$, there exists a function $u : \Omega_T = \Omega \times [0,T] \to \mathbb{R}$ satisfying

i) $u \in L^\infty(0,T;H^1(\Omega)) \cap C([0,T];L^s(\Omega))$, where $1 \leq s < \infty$,

ii) $g(u)\partial_t u \in L^p(0,T;(W^{1,q}(\Omega))'$ for $1 \leq p < 2$ and $q > 2$.

iii) $u(x,0) = u_0(x)$ for all $x \in \Omega$,

which solves (1.4)-(1.5) in the following weak sense

a) There exists a set $B \in \Omega_T$ with $|\Omega_T \setminus B| = 0$ and a function $\zeta : \Omega_T \to \mathbb{R}^n$

satisfying $\chi_{B^c \setminus P} \frac{M(u)\zeta}{\int_\Omega M(u)} \zeta \in L^{\frac{n}{n-1}}(0,T;L^\frac{n}{n-1}(\Omega,\mathbb{R}^n))$ such that

$$
\int_0^T < g(u)\partial_t u, \phi >_{(W^{1,q}(\Omega))',W^{1,q}(\Omega)} dt = -\int_{B \setminus \partial P} M(u)\zeta \cdot \nabla \phi dx dt
$$

for all $\phi \in L^p(0,T;W^{1,q}(\Omega))$ with $p,q > 2$. Here $P := \{(x,t) \in \Omega_T : |1-u^2| \neq 0\}$ is the set where $M(u),g(u)$ are nondegenerate and $\chi_{B^c \setminus P}$ is the characteristic function of set $B \cap P$.

b) Assume $u \in L^2(0,T;H^2(\Omega))$. For any open set $U \in \Omega_T$ on which $g(u) > 0$ and $\nabla u \in L^p(U)$ for some $p > 1$, we have

$$
\zeta = -\nabla \Delta u + \frac{g''(u)\nabla u + \nabla (-\Delta)^{\frac{1}{2}} u}{g(u)} - \frac{g'(u)}{g^2(u)} (-\Delta u + q'(u) + (-\Delta)^{\frac{1}{2}} u) \nabla u.
$$

a.e. in $U$.

Moreover, the following energy inequality holds for all $t > 0$.

$$
\int_\Omega \left( \frac{1}{2} |\nabla u(x,t)|^2 + q(u(x,t)) \right) dx + \int_{\Omega_t \cap B \setminus P} M(u(x,\tau))|\zeta(x,\tau)|^2 dx d\tau
\leq \int_\Omega \left( \frac{1}{2} |\nabla u_0(x)|^2 + q(u_0(x)) \right) dx.
$$
