ON AUTOMORPHISMS OF ARITHMETIC SUBGROUPS OF UNIPOTENT GROUPS IN POSITIVE CHARACTERISTIC

LUCY LIFSCHITZ AND DAVE WITTE

Abstract. Let $F$ be a local field of positive characteristic, and let $G$ be either a Heisenberg group over $F$, or a certain (nonabelian) two-dimensional unipotent group over $F$. If $\Gamma$ is an arithmetic subgroup of $G$, we provide an explicit description of every automorphism of $\Gamma$. From this description, it follows that every automorphism of $\Gamma$ virtually extends to a virtual automorphism of $G$.

1. Introduction

Roughly speaking, a discrete subgroup $\Gamma$ of a topological group $G$ is automorphism rigid if every automorphism of $\Gamma$ extends to a continuous automorphism of $G$. However, the formal definition below is slightly more complicated, because it allows for passage to finite-index subgroups.

1.1. Definition. It is traditional to say that a group $\Gamma$ virtually has a property if some finite-index subgroup of $\Gamma$ has the property. It is convenient to extend this terminology to group isomorphisms.

- A virtual isomorphism from $G_1$ to $G_2$ is an isomorphism $\Lambda: G'_1 \to G'_2$, where $G'_i$ is a finite-index, open subgroup of $G_i$.
- A virtual automorphism of $G$ is a virtual isomorphism from $G$ to $G$.
- A virtual isomorphism $\Lambda$ from $G_1$ to $G_2$ virtually extends an isomorphism $\lambda$ from $\Gamma_1$ to $\Gamma_2$ if there is a finite-index, open subgroup $\Gamma'_1$ of $\Gamma_1$, such that $\Gamma'_1 \subset G_1$, and $\Lambda|_{\Gamma'_1} = \lambda|_{\Gamma'_1}$.

1.2. Definition. A discrete subgroup $\Gamma$ of a topological group $G$ is automorphism rigid in $G$ if every virtual automorphism of $\Gamma$ virtually extends to a virtual automorphism of $G$.

A classical example is provided by the work of Malcev.

1.3. Definition ([Rag, Rem. 1.11, p. 21]). A discrete subgroup $\Gamma$ of a topological group $G$ is a (cocompact) lattice if $G/\Gamma$ is compact.

1.4. Theorem (Malcev [Mal], [Rag Cor. 2.11.1, p. 34]). If $\Gamma$ is a lattice in a 1-connected, nilpotent real Lie group $G$, then $\Gamma$ is automorphism rigid in $G$.

In fact, every virtual automorphism of $\Gamma$ extends to a unique automorphism of $G$.

Malcev’s Theorem can be restated in the terminology of algebraic groups (cf. [Rag, after Thm. 2.12, p. 34]). Recall that a matrix group $G$ is unipotent if, for every $g \in G$, there is some $n \in \mathbb{N}$, such that $(g - \text{Id})^n = 0$. (In other words, 1 is the only eigenvalue of $g$.)

Submitted to Transactions of the American Mathematical Society (July 2000). This version: 20 July 2000.
1.5. Corollary. Let $\Gamma$ be an arithmetic subgroup of a unipotent algebraic $\mathbb{Q}$-group $G$. Then $\Gamma$ is an automorphism rigid lattice in $G(\mathbb{R})$.

In this paper, we discuss the analogue of Malcev’s Theorem for unipotent groups over nonarchimedean local fields, instead of $\mathbb{R}$. It is well known that if $G$ is a unipotent algebraic group over a nonarchimedean local field $L$ of characteristic zero, then the group $G(L)$ of $L$-points of $G$ has no nontrivial discrete subgroups. (For example, $\mathbb{Z}$ is not discrete in the $p$-adic field $\mathbb{Q}_p$.) Thus the case of characteristic zero is not of interest in this setting; we will consider only local fields of positive characteristic.

For abelian groups, it is easy to prove automorphism rigidity.

1.6. Proposition. Let $\Gamma_1$ and $\Gamma_2$ be lattices in a totally disconnected, locally compact, abelian group $G$. Then every isomorphism $\lambda: \Gamma_1 \to \Gamma_2$ virtually extends to a virtual automorphism $\hat{\lambda}$ of $G$.

Proof. Since $\Gamma_1$ and $\Gamma_2$ are discrete, and $G$ is totally disconnected, there exists a compact, open subgroup $K$ of $G$, such that $\Gamma_1 \cap K = \Gamma_2 \cap K = e$. Let $\hat{\Gamma}_1 = \Gamma_1 K$ and $\hat{\Gamma}_2 = \Gamma_2 K$, so $\hat{\Gamma}_1$ and $\hat{\Gamma}_2$ are finite-index, open subgroups of $G$, and define $\hat{\lambda}: \hat{\Gamma}_1 \to \hat{\Gamma}_2$ by $\hat{\lambda}(\gamma c) = \lambda(\gamma) c$ for $\gamma \in \Gamma_1$ and $c \in K$.

For nonabelian groups, automorphism rigidity seems to be surprisingly more difficult to prove, but we provide examples of automorphism rigid lattices. Although we do not have a general theory, and we do not have enough evidence to support a specific conjecture, the examples suggest that there may be mild conditions that imply arithmetic lattices are automorphism rigid.

1.7. Notation. • Fix a prime $p$, and a power $q$ of $p$.
• $\mathbb{F}_q$ denotes the finite field of $q$ elements.
• $\mathbb{F}$ denotes the field $\mathbb{F}_q((t))$ of formal power series over $\mathbb{F}_q$.
• $\mathbb{F}^\circ$ denotes $\mathbb{F}_q[t^{-1}]$, the $\mathbb{F}_q$-subalgebra of $\mathbb{F}$ generated by $t^{-1}$.

Note that $\mathbb{F}$ is a local field of characteristic $p$. (Conversely, any local field of characteristic $p$ is isomorphic to $\mathbb{F}_q((t))$, for some $q$ [Wei, Thm. I.4.8, p. 20].) The subgroup $\mathbb{F}^\circ$ is a lattice in the additive group $(\mathbb{F}, +)$.

1.8. Definition. Let $G$ be a closed subgroup of $\text{GL}(m, \mathbb{F})$, for some $m \in \mathbb{N}$.
• Two discrete subgroups $\Gamma_1$ and $\Gamma_2$ of $G$ are commensurable if $\Gamma_1 \cap \Gamma_2$ is a finite-index subgroup of both $\Gamma_1$ and $\Gamma_2$ [Mar, p. 8].
• A subgroup $\Gamma$ of $G$ is arithmetic if it is commensurable with $\text{GL}(m, \mathbb{F}^\circ) \cap G$ (cf. Mar, §I.3.1, pp. 60–62)).

By definition, if $\Gamma_1$ and $\Gamma_2$ are arithmetic subgroups of $G$, then $\Gamma_1$ is commensurable with $\Gamma_2$. Thus, $\Gamma_1$ is a lattice in $G$ if and only if $\Gamma_2$ is a lattice in $G$.

1.9. Definition (cf. BS, Ex. 9.2). Fix a power $r$ of $p$, and let

$$G_2 = \left\{ \begin{pmatrix} 1 & y^r & z \\ 0 & 1 & y \\ 0 & 0 & 1 \end{pmatrix} \mid y, z \in \mathbb{F} \right\}.$$ 

So $G_2$ is a two-dimensional, unipotent $\mathbb{F}$-group, and has arithmetic lattices. Note that if $r > 1$, then $G_2$ is nonabelian.
The following theorem describes the virtual automorphisms of any arithmetic lattice in $G_2$.

1.10. Definition. For any continuous field automorphism $\tau$ of $F$ and any $a \in F \setminus \{0\}$, there is a continuous automorphism $\phi_{\tau,a}$ of $G_2$, defined by

$$
\phi_{\tau,a} \begin{pmatrix} 1 & y^r & z \\ 0 & 1 & y \\ 0 & 0 & 1 \end{pmatrix} = \begin{pmatrix} 1 & a^r \tau(y)^r & a^{r+1} \tau(z) \\ 0 & 1 & a \tau(y) \\ 0 & 0 & 1 \end{pmatrix}.
$$

Let us say that $\phi_{\tau,a}$ is standard if

1) there exist $\sigma \in \text{Gal}(F_q/F_p)$, $\alpha \in F_q \setminus \{0\}$, and $\beta \in F_q$, such that $\tau(f(t^{-1})) = \sigma(f(\alpha t^{-1} + \beta))$,

for all $f(t^{-1}) \in F$, and

2) there exists some nonzero $b \in F^-$, such that $ab \in F^-$.

Note that if $\phi_{\tau,a}$ is standard, and $\Gamma$ is an arithmetic lattice in $G_2$, then $\phi_{\tau,a}(\Gamma)$ is commensurable with $\Gamma$.

1.11. Theorem. Let

- $\Gamma$ be an arithmetic lattice in $G_2$; and
- $\lambda$ be a virtual automorphism of $\Gamma$.

If $r > 2$, then there exist

- a standard automorphism $\phi_{\tau,a}$ of $G_2$,
- a finite-index subgroup $\Gamma'$ of $\Gamma$, and
- a homomorphism $\zeta : \Gamma' \to Z(\Gamma)$,

such that $\lambda(\gamma) = \phi_{\tau,a}(\gamma) \zeta(\gamma)$, for all $\gamma \in \Gamma'$.

1.12. Corollary. If $r \neq 2$, then any arithmetic lattice in $G_2$ is automorphism rigid.

Theorem 1.11 and Corollary 1.12 are proved in Section 2. The authors do not know whether they remain true in the exceptional case $r = p = 2$.

1.13. Definition. Assume $p > 2$, let $[\cdot, \cdot] : F^{2m} \times F^{2m} \to F$ be a symplectic form, and, for notational convenience, let $Z = F$. The corresponding Heisenberg group is the group $H = (F^{2m} \times Z, \circ)$, where

$$(v_1, z_1) \circ (v_2, z_2) = (v_1 + v_2, z_1 + z_2 + [v_1, v_2]).$$

We remark that, up to a change of basis, the symplectic form $[\cdot, \cdot]$ on $F^{2m}$ is unique, so, up to isomorphism, the Heisenberg group $H$ is uniquely determined by $m$. Note that $Z$ is the center of $H$.

Because $H$ is isomorphic to a subgroup of $\text{GL}(m+2, F)$, namely,

$$H \cong \left\{ \begin{pmatrix} 1 & x_1 & x_2 & \cdots & x_m & z \\ 0 & 1 & 0 & \cdots & 0 & y_1 \\ 0 & 0 & 1 & \cdots & 0 & y_2 \\ \vdots & \vdots & \vdots & \ddots & \vdots & \vdots \\ 0 & 0 & 0 & \cdots & 1 & y_m \\ 0 & 0 & 0 & \cdots & 0 & 1 \end{pmatrix} \bigg| \begin{array}{l} x_1, \ldots, x_m \in F, \\
y_1, \ldots, y_m \in F, \\
z \in F \end{array} \right\},$$

...
we may speak of arithmetic subgroups of $H$.

We assume that $[\cdot, \cdot]$ is defined over $F^-$, by which we mean that $[F^-, F^-] \subset F^-$. Then we may assume that the above isomorphism has been chosen so that

- a subgroup $\Gamma$ of $H$ is arithmetic if and only if it is commensurable with $(F^-)^{2m} \times F^-$. 

Thus, $H$ has arithmetic lattices.

We remark that one may define Heisenberg groups even if $p = 2$, but, in this case, they are abelian, so they are not of particular interest.

1.14. Definition. We say $T \in \text{GL}(2m, F)$ is conformally symplectic if there exists some nonzero $c_T \in F$, such that, for all $v, w \in V$, we have

$$[T(v), T(w)] = c_T [v, w].$$

For every conformally symplectic $T \in \text{GL}(2m, F)$, and every continuous field automorphism $\tau$ of $F$, there is a continuous automorphism $\phi_{T,\tau}$ of $H$ defined by

$$\phi_{T,\tau}(v, z) = \left(\tau(T(v)), \tau(c_T z)\right).$$

Let us say that $\phi_{T,\tau}$ is standard if

1) there exist $\sigma \in \text{Gal}(\mathbb{F}_q/\mathbb{F}_p)$, $\alpha \in \mathbb{F}_q \setminus \{0\}$, and $\beta \in \mathbb{F}_q$, such that

$$\tau(f(t^{-1})) = \sigma(f(\alpha t^{-1} + \beta))$$

for all $f(t^{-1}) \in F$; and

2) there exists some nonzero $b \in F^-$, such that $bT \in \text{Mat}(2m, F^-)$.

Note that if $\phi_{T,\tau}$ is standard, then $\phi_{T,\tau}(\Gamma)$ is commensurable with $\Gamma$ for any arithmetic lattice $\Gamma$ of $H$.

1.15. Theorem. Assume $p > 2$. Let

- $\Gamma$ be an arithmetic lattice in a Heisenberg group $H$; and
- $\lambda$ be a virtual automorphism of $\Gamma$.

Then there exist

- a standard automorphism $\phi_{T,\tau}$ of $H$;
- a finite index subgroup $\Gamma'$ of $\Gamma$; and
- a homomorphism $\zeta: \Gamma' \to Z(\Gamma)$,

such that $\lambda(\gamma) = \phi_{T,\tau}(\gamma) \zeta(\gamma)$, for all $\gamma \in \Gamma'$.

1.16. Corollary. If $p > 2$, then any arithmetic lattice in a Heisenberg group $H$ is automorphism rigid.

Theorem 1.15 and Corollary 1.16 are proved in Section 3.

1.17. Remark. Malcev’s Theorem 1.4 does not extend to all lattices in solvable Lie groups. (See the work of A. Starkov [Sta] for a thorough discussion.) On the other hand, the Mostow Rigidity Theorem [Mos] implies that lattices in most semisimple Lie groups are automorphism rigid.

Superrigidity deals with extending homomorphisms, instead of only isomorphisms. The Margulis Superrigidity Theorem [Mar, Thm. VII.5.9, p. 230] implies that lattices in most semisimple Lie groups are superrigid. (Lattices in many non-semisimple Lie groups are
also superrigid \([\text{Wit}].\) The Superrigidity Theorem also applies to arithmetic subgroups of many semisimple groups defined over nonarchimedean local fields, whether they are of characteristic zero or not \([\text{Mar, Ven}].\)

1.18. Acknowledgments. Most of this research was carried out during productive visits to these institutions. Financial support was provided by the German-Israeli Foundation for Research and Development and the National Science Foundation (DMS-9801136).

2. Arithmetic subgroups of the two-dimensional unipotent group \(G_2\)

Recall that \(r\) and \(G_2\) are defined in Definition 1.9. (Also recall the definitions of \(p, q, F, F^-\) in Notation 1.7.)

Proof of Theorem 1.11. Let \(\Gamma_1\) and \(\Gamma_2\) be finite-index subgroups of \(\Gamma\), such that \(\lambda\) is an isomorphism from \(\Gamma_1\) to \(\Gamma_2\). Then \(\lambda\) induces isomorphisms \(\lambda^*: \Gamma_1/Z(\Gamma_1) \to \Gamma_2/Z(\Gamma_2)\) and \(\lambda_*: [\Gamma_1, \Gamma_1] \to [\Gamma_2, \Gamma_2]\).

By identifying each of \(G_2/Z(G_2)\) and \(Z(G_2)\) with \(F\) in the natural way (and noting that \(\Gamma_i \cap Z(G_2) = Z(\Gamma_i)\), we may think of \(\Gamma_i/Z(\Gamma_i)\) and \([\Gamma_i, \Gamma_i]\) as \(\mathbb{F}_p\)-subspaces of \(F\). By replacing \(\Gamma_1\) and \(\Gamma_2\) with finite-index subgroups, we may assume that these subspaces are contained in \(F^-\). Then, because \(\lambda\) is an isomorphism, we see that the conditions of Notation 2.3 are satisfied, so Theorem 2.4 below implies that there exist

- a standard automorphism \(\phi_{\tau,a}\) of \(G_2\), and
- a finite-index subgroup \(\Gamma'_1\) of \(\Gamma_1\),

such that \(\lambda(\gamma) \in \phi_{\tau,a}(\gamma)Z(G)\), for all \(\gamma \in \Gamma'_1\).

Because \(\phi_{\tau,a}(\Gamma_1)\) is an arithmetic lattice, it is commensurable with \(\Gamma_2\). Thus, replacing \(\Gamma'_1\) with a finite-index subgroup, we may assume that \(\phi_{\tau,a}(\Gamma'_1) \subset \Gamma_2\). Then we may define \(\zeta: \Gamma'_1 \to Z(\Gamma_2)\) by \(\zeta(\gamma) = \lambda(\gamma) \phi_{\tau,a}(\gamma)^{-1}\).

\(\square\)

2.1. Lemma. Let

- \(\Gamma\) be a lattice in a totally disconnected, locally compact group \(G\),
- \(A\) be a locally compact, abelian group, and
- \(\zeta: \Gamma \to A\) be a homomorphism.

Assume

1) there is a finite-index subgroup \(\Gamma'\) of \(\Gamma\), such that \(\Gamma' \cap [G,G] \subset [\Gamma, \Gamma]\), and
2) \(\Gamma \cap [G,G]\) is a lattice in \([G,G]\).

Then there is a finite-index, open subgroup \(\hat{G}\) of \(G\), such that \(\zeta\) extends to a continuous homomorphism \(\hat{\zeta}: \hat{G} \to A\) that is trivial on \([G,G]\).

Proof. By assumption, there exists a lattice \(\Gamma' \subset \Gamma\) such that \(\Gamma' \cap [G,G] \subset [\Gamma, \Gamma]\). Since \(\zeta: \Gamma \to A\), and \(A\) is abelian, we see that \([\Gamma, \Gamma] \subset \ker \zeta\). Therefore \([\Gamma, \Gamma] \subset \ker \zeta\), so, by the choice of \(\Gamma'\), we have \(\Gamma' \cap [G,G] \subset \ker \zeta\).

By assumption, \(\Gamma \cap [G,G]\) is a lattice in \([G,G]\), so \([G,G]/[G,G]\) is closed \([\text{Rag}, \text{Thm. 1.13, p. 23}]\), hence discrete. Thus, there is an open compact subgroup \(K/[G,G] \subset G/[G,G]\), such
that $K \cap (\Gamma'[G,G]) = e$. Let $\hat{G} = \Gamma'K[G,G]$, and extend $\zeta|_{\Gamma'}$ to a homomorphism $\hat{\zeta}: \hat{G}' \to A$ by defining it to be trivial on $K[G,G]$. 

**Proof of Corollary** [1.12]. We may assume $r > 2$. (Otherwise, we must have $r = 1$, which means $G_2$ is abelian, so Proposition [1.6] applies.) From Theorem [1.1], we may assume there exist

- a standard automorphism $\phi_{r,a}$ of $G_2$, and
- a homomorphism $\zeta: \Gamma_1 \to Z(\Gamma_2)$,

such that $\lambda(\gamma) = \phi_{r,a}(\gamma) \zeta(\gamma)$, for all $\gamma \in \Gamma_1$. From Lemma [2.1], we may assume that there is a finite-index subgroup $G_2'$ of $G_2$, such that $G_2'$ contains $[G_2, G_2]$, and $\zeta$ extends to a homomorphism $\hat{\zeta}: G_2' \to Z(G_2)$ that is trivial on $[G_2, G_2]$. Let $G_2'' = \phi_{r,a}(G_2')$.

Define $\hat{\lambda}: G_2' \to G_2$ by $\hat{\lambda}(g) = \phi_{r,a}(g) \hat{\zeta}(g)$, for $g \in G_2'$, so $\hat{\lambda}$ is a continuous homomorphism that extends $\lambda$. Because $\hat{\zeta}$ is trivial on $[G_2, G_2]$, we know that $\hat{\lambda}|_{G_2,G_2} = \phi_{r,a}|_{G_2,G_2}$. Also, because $\hat{\zeta}(G_2') \subset Z(G_2) = [G_2, G_2]$, we know that $\hat{\lambda}(g) \in \phi_{r,a}(g)[G_2, G_2]$ for all $g \in G_2'$. Thus, $\hat{\lambda}$ induces an automorphism of $[G_2, G_2]$, and an isomorphism $G_2''/[G_2, G_2] \to G_2''/[G_2, G_2]$, so $\hat{\lambda}$ is an isomorphism.

**2A. Using linear algebra to prove Theorem** [1.11]. The remainder of this section is devoted to the statement and proof of Theorem [2.4]. This result is a reformulation of Theorem [1.11] in terms of linear algebra. The reformulation is not of intrinsic interest, but it clarifies the essential ideas of the proof, and provides more flexibility, by allowing us to focus on the important aspects of the internal structure of $\Gamma$ that arise from the structure of $F^-$ as a polynomial algebra, without being constrained by the external structure imposed by the group-theoretic embedding of $\Gamma$ in $G_2$.

**2.2. Notation.** Define an $\mathbb{F}_p$-bilinear form $[,] : F^- \times F^- \to F^-$ by

$$[a, b] = a^*b - ab^*.$$

For any $V, W \subset F^-$, $[V, W]$ denotes the $\mathbb{F}_p$-subspace of $F^-$ spanned by $\{ [v, w] \mid v \in V, w \in W \}$.

**2.3. Notation.** Throughout the remainder of this section, we assume that

- $r > 2$;
- $V_1$ and $V_2$ are $\mathbb{F}_p$-subspaces of finite codimension in $F^-$; and
- $\lambda^*: V_1 \to V_2$ and $\lambda_*: [V_1, V_1] \to [V_2, V_2]$ are $\mathbb{F}_p$-linear bijections,

such that

$$\lambda_*[a, b] = [\lambda^*(a), \lambda^*(b)],$$

for all $a, b \in V_1$.

**2.4. Theorem.** There exist

- a subspace $V_1'$ of finite codimension in $V_1$,
- $a \in b^{-1}F^-$, for some $b \in F^-$,
- $\alpha, \beta \in \mathbb{F}_q$, with $\alpha \neq 0$, and
- $\sigma \in \text{Gal}(\mathbb{F}_q/\mathbb{F}_p),$
such that
\[ \lambda^*(f(t^{-1})) = a \sigma(f(\alpha t^{-1} + \beta)), \]
for all \( f(t^{-1}) \in V'_1. \)

Let us outline the proof of Theorem 2.4, assuming, for simplicity, that \( V_1 = V_2 = F^- \). For any power \( Q > 1 \) of \( r \), we may define an equivalence relation on \( F^- \setminus \{0\} \) by \( a \equiv_Q b \) iff \( a/b \in F^Q \); let \( [a] \) denote the equivalence class of \( a \). For each \( a \in F^- \), the subspace \([a, F^-]\) has infinite codimension in \([F^-, F^-]\), but Proposition 2.3 shows that \([a, F^-]\) has finite codimension. Because Corollary 2.10 shows that \( \lambda^*([a]) = [\lambda^*(a)] \), this codimension is a useful invariant. Proposition 2.12 shows that it is closely related to the minimum degree of the elements of \([a]\). Using this, Corollary 2.22 shows that there is some \( a \in F^- \), a constant \( k \), and some \( Q \), such that \( \deg^- \lambda^*(b) = k + \deg^- b \) for all \( b \equiv_Q a \). Also, Corollary 2.24 shows that \( \lambda^* \) approximately preserves the degrees of greatest common divisors. Then Proposition 2.25 shows that the restriction of \( \lambda^* \) to the \( \mathbb{F}_p \)-rational elements of some equivalence class is of the desired form. Finally, we show that \( \lambda^* \) has the desired form on all of \( F^- \).

2.5. Notation. We use \( \dim W \) to denote the dimension of a vector space \( W \) over \( \mathbb{F}_p \).
- Let \( s = \dim \mathbb{F}_q \), so \( q = p^s \).
- For \( a = \sum_{i=0}^n \alpha_i t^{-i} \in F^- \), with each \( \alpha_i \in \mathbb{F}_q \), we let \( \deg^- a = n \) if \( \alpha_n \neq 0 \).

The following proposition is used in almost all of the following results. Because \( (\overline{1}) \Rightarrow \) requires the assumption that \( e > 2 \), it seems that a different approach will be needed for the exceptional case \( p = e = 2 \).

2.6. Proposition. 1) The subspace \([V_i, V_i]\) has finite codimension in \( F^- \).
2) Let \( a, b \in V_i \setminus \{0\} \) and assume \( a/b \notin \mathbb{F}_q \). The subspace \([a, V_i] + [b, V_i]\) has finite codimension in \([V_i, V_i]\) if and only if \( a/b \in F^r \).

Proof. Because \([a, V_i]\) and \([b, V_i]\) have finite codimension in \([a, F^-]\) and \([b, F^-]\)), respectively, we see that \([a, V_i] + [b, V_i]\) has finite codimension in \([a, F^-] + [b, F^-]\). Thus, in proving \( (\overline{1}) \), we may assume that \( V_i = F^- \).

\( (\overline{1}) \) This follows from our proof of \( (\overline{2}) \Leftrightarrow \) below.
\( (\overline{2}) \Leftrightarrow \) There are some nonzero \( u, v \in F^- \), such that \( au^r = bv^r \). Let \( x = a^r u - b^r v \).
We claim that \( x \neq 0 \). Otherwise, we have
\[ a^{r^2 - 1}(au^r) = (a^r u)^r = (b^r v)^r = b^{r^2 - 1}(bv^r) = b^{r^2 - 1}(au^r), \]
so \( a^{r^2 - 1} = b^{r^2 - 1} \). This implies \( a/b \in \mathbb{F}_q \), which is a contradiction. This completes the proof of the claim.
For any \( y \in F^- \), we have
\[ [a, uy] - [b, vy] = (a^r uy - au^r y^r) - (b^r vy - bv^r y^r) = (a^r uy - b^r vy) - (au^r y^r - bv^r y^r) = xy - 0, \]
so \([a, F^-] + [b, F^-]\) contains \( xF^- \), which is of finite codimension in \( F^- \).

\( (\overline{2}) \Rightarrow \) We may write \( b \) (uniquely) in the form \( b = x + y'a \), with \( x, y \in F \), and such that we may write \( x = \sum \alpha_i t^{-i} \) with \( \alpha_i = 0 \) whenever \( i \equiv \deg^-(a) \) (mod \( r \)). (Note that we do not assume \( x, y \in F^r \).)
For $u, v \in F^-$, we have
\[
[a, u] - [b, v] = (a^r u - au^r) - (b^r v - bv^r) = (a^r u - b^r v) - (au^r - (x + y^r a)v^r) = (a^r u - b^r v) - a(u - yv)^r - xv^r.
\]
Whenever either $\deg^- (u)$ or $\deg^- (v)$ is large, it is obvious that $\deg^- (a^r u - b^r v)$ is much smaller than $\max \{ \deg^- (u - yv)^r, \deg^- v^r \}$. Also, we may assume $x \neq 0$ (otherwise, we have $b/a = y^r \in F^r$, as desired), and, from the definition of $x$, we know that $\deg^- x \neq \deg^- a \pmod r$, so
\[
\deg^- (a(u - yv)^r - xv^r) = \max \{ \deg^- (a(u - yv)^r), \deg^- (xv^r) \}.
\]
Therefore, we conclude that
\[
\deg^- ([a, u] - [b, v]) \in \{ \deg^- (a(u - yv)^r), \deg^- (xv^r) \}
\]
must be congruent to either $\deg^- (a)$ or $\deg^- (x)$, modulo $r$. Thus, because of our assumption that $r > 2$, we see that $[a, F^-] + [b, F^-]$ does not contain elements of all large degrees, so it does not have finite codimension in $F^-$. Then, from (4), we conclude that it does not have finite codimension in $[F^-, F^-]$.

2.7. Corollary. Let $a_1, a_2 \in V_1 \setminus \{0\}$. We have $a_1/a_2 \in F^r$ if and only if there is some nonzero $b \in V_1$, such that the subspace $[a_j, V_1] + [b, V_1]$ has finite codimension in $[V_1, V_1]$, for $j = 1, 2$.

Proof. (⇒) Choose $b \in a_1 F^r \cap V_1 \setminus (\mathbb{F}_q a_1 \cup \mathbb{F}_q a_2)$. Then Proposition 2.6(2) implies the desired conclusion.

(⇐) From Proposition 2.3(2), we have $a_1/b \in F^r$ and $a_2/b \in F^r$, so $a_1/a_2 \in F^r$.

2.8. Lemma. Let $a_1, a_2 \in F^-$, and let $Q > 1$ be a power of $r$, such that $\lambda^*(a_1(F^-)^Q \cap V_1) = a_2(F^-)^Q \cap V_2$. Define
- subspaces $W_1$ and $W_2$ of finite codimension in $F^-$ by $a_i(F^-)^Q \cap V_i = a_i W_i^Q$;
- $\mu^*: W_1 \to W_2$ by $\mu^*(a_1 w^Q) = a_2 \mu^*(w)^Q$; and
- $\mu_*: [W_1, W_1] \to [W_2, W_2]$ by $\mu_*(a_1^{r+1} w^Q) = a_2^{r+1} \mu_*(w)^Q$.

Then $\mu^*$ and $\mu_*$ are $\mathbb{F}_p$-linear bijections, and we have
\[
\mu_* [a, b] = [\mu^*(a), \mu^*(b)],
\]
for all $a, b \in W_1$.

2.9. Definition. Let $Q > 1$ be a power of $p$. An element of $F^-$ is $Q$-separable if it is not divisible by a nonconstant $Q$th power.

2.10. Corollary. Let $a \in F^-$, and let $Q > 1$ be a power of $r$, such that $a$ is $Q$-separable. Then there is some $Q$-separable $b \in F^-$, such that $\lambda^*(a(F^-)^Q \cap V_1) = b(F^-)^Q \cap V_2$.

Proof. Assume, for the moment, that $Q = r$. For $a_1, a_2 \in F^- \setminus \{0\}$, define $a_1 \equiv a_2$ iff $a_1/a_2 \in F^r$. For nonzero $a, b \in V_1$, we see, from Notation 2.3, that $[a, V_1] + [b, V_1]$ has finite codimension in $V_1$ if and only if $[\lambda^*(a), V_2] + [\lambda^*(b), V_2]$ has finite codimension in $V_2$. Therefore, Corollary 2.7 implies that $a \equiv b$ iff $\lambda^*(a) \equiv \lambda^*(b)$. The equivalence classes are
precisely the sets of the form \( c(F^-)^r \cap V_i \), for some \( r \)-separable \( c \in F^- \), so the desired conclusion is immediate.

We may now assume \( Q > r \). Let \( Q' = Q/r \). There is some \( Q' \)-separable \( a' \in F^- \), such that \( a \in a'(F^-)^Q \). By induction on \( Q \), we know that there is some \( Q' \)-separable \( b' \in F^- \), such that \( \lambda^*(a'(F^-)^Q \cap V_i) = b'(F^-)^{Q'} \cap V_2 \).

From the definition of \( a' \), we know there is some \( a_1 \in F^- \), such that \( a = a'a_1^{Q'} \). Then, because \( a \) is \( Q \)-separable, we know that \( a_1 \) is \( r \)-separable.

Define \( W_1, W_2, \mu^* \), and \( \mu_* \) as in Lemma 2.8 (with \( Q', a' \), and \( b' \) in the places of \( Q, a, \) and \( b \), respectively). Because \( a_1 \) is \( r \)-separable, we know, from the case \( Q = r \) in the first paragraph of this proof, that there is some \( r \)-separable \( b_1 \in F^- \), such that \( \mu^*(a_1(F^-)^r \cap W_1) = b_1(F^-)^r \cap W_2 \). Therefore

\[
\lambda^*(a(F^-)^Q \cap V_1) = \lambda^*[a'(a_1(F^-)^r)^Q \cap V_1] \\
= \lambda^*[a'(a_1(F^-)^r \cap W_1)^Q] \\
= a'[\mu^*(a_1(F^-)^r \cap W_1)]^{Q'} \\
= b'(b_1(F^-)^r \cap W_2)^{Q'} \\
= b'(b_1(F^-)^r)^Q \cap V_2 \\
= b'b_1^Q(F^-)^Q \cap V_2,
\]

as desired. \( \square \)

2.11. Lemma. Let \( a \in V_i \), let \( Q > 1 \) be a power of \( r \), and let \( k \) be the codimension of \( V_i \) in \( F^- \). Then there is some nonzero \( b \in F^- \) with \( \deg^- b \leq r^2(k+1) \), such that \([a(F^-)^Q \cap V_i, V_i]\) contains a codimension-\(2k\) subspace of the ideal \( a'b^{Q/r}F^- \).

Proof. Choose \( c \in F^- \setminus \mathbb{F}_q \), such that \( ac^Q \in V_i \) and \( \deg^- c \leq k+1 \); let \( b = c^{r^2} - c \). For \( y \in F^- \), we have

\[
a^r b^{Q/r} y = a^r(c^Q - c^{Q/r})y \\
= (a^r c^Q y - ac^Q y) - (a^r c^{Q/r} y - ac^{Q/r} y) \\
= [ac^Q, y] - [a, c^{Q/r} y] \\
\in [ac^Q, F^-] + [a, F^-],
\]

so \([ac^Q, F^-] + [a, F^-]\) contains \( a'b^{Q/r}F^- \).

Because \([ac^Q, V_i]\) and \([a, V_i]\) contain codimension-\(k\) subspaces of \([ac^Q, F^-]\) and \([a, F^-]\), respectively, this implies that \([ac^Q, V_i] + [a, V_i]\) contains a codimension-\(2k\) subspace of \( a'b^{Q/r}F^- \). Because both \( ac^Q \) and \( a \) belong to \( a(F^-)^Q \cap V_i \), the desired conclusion follows. \( \square \)

2.12. Proposition. Let \( a \in V_i \), let \( Q > 1 \) be a power of \( r \), and let \( k \) be the codimension of \( V_i \) in \( F^- \). Then

\[
\dim \frac{F^-}{[a(F^-)^Q \cap V_i, V_i]} = s(r - 1)(\deg^- a) + S + X,
\]

where

- \( S = s \max\{ \deg^- c | c^r | a, c \in F^- \} \), and
• $0 \leq X \leq sr(k+1)Q + 3k$.

Proof. Choose $b$ as in Lemma 2.11 and let $I = a^rb^{Q/r}F^-$ and $F^- = F^-/I$. It suffices to show

$$(2.13) \quad \dim \frac{F^-}{[a(F^-)^Q, F^-]} \geq s(r-1)(\text{deg}^{-}a) + S$$

and

$$(2.14) \quad \dim \frac{F^-}{[a, F^-]} \leq S + sr^2(k+1)Q/r + s(r-1) \text{deg}^{-}a.$$

Let $u_1, u_2, \ldots, u_N$ be the irreducible factors of $a^rb^{Q/r}$. Then we may write

$$a = u_1^{m_1} u_2^{m_2} \cdots u_f^{m_f}, \quad b^{Q/r} = u_1^{e_1} u_2^{e_2} \cdots u_f^{e_f}, \quad \text{and} \quad a^rb^{Q/r} = u_1^{m_1} u_2^{m_2} \cdots u_f^{m_f},$$

where $n_j = rm_j + \varepsilon_j$.

From the Chinese Remainder Theorem, we know that the natural ring homomorphism from $F^-$ to

$$\bigoplus_{j=1}^N \frac{F^-}{u_j^{m_j}F^-}$$

is an isomorphism. Thus, we may work in each factor $F^-/u_j^{m_j}F^-$, and add up the resulting codimensions.

Define $\phi_j : F^- \to F^-/(u_j^{rm_j}F^-)$ by $\phi_j(x) = ax^r$. Then, letting $m_j' = m_j - \lfloor m_j/r \rfloor$, we have

$$\ker \phi_j = \{ x \in F^- \mid u_j^{m_j'}|x \},$$

so

$$\dim \frac{F^-}{u_j^{rm_j}F^- + a(F^-)^r} = \dim \frac{\ker \phi_j}{u_j^{rm_j}F^-} = s \dim_{F^-} \frac{\ker \phi_j}{u_j^{rm_j}F^-} = s(rm_j - m_j') \text{deg}^{-}u_j = s(r - 1) \text{deg}^{-} u_j^{m_j} + s|m_j/r| \text{deg}^{-} u_j.$$

We have $a^r \in u_j^{rm_j}F^-$, so

$$(2.15) \quad [a(F^-)^Q, F^-] \subset a^r(F^-)^Q F^- + a(F^-)^Q(F^-)^r \subset u_j^{rm_j}F^- + a(F^-)^r$$

and

$$(2.16) \quad [a, F^-] + u_j^{rm_j}F^- = u_j^{rm_j}F^- + a(F^-)^r.$$

From (2.15), we have

$$\dim \frac{F^-}{[a(F^-)^Q, F^-] + u_j^{rm_j}F^-} \geq \dim \frac{F^-}{[a(F^-)^Q, F^-] + u_j^{rm_j}F^-} \geq \dim \frac{F^-}{u_j^{rm_j}F^- + a(F^-)^r} = s(r - 1) \text{deg}^{-} u_j^{m_j} + s|m_j/r| \text{deg}^{-} u_j,$$
Then the proof is completed by induction on \( n \)
\[ \dim \frac{F^-}{[a(F^-)^Q, F^-]} \geq \sum_{j=1}^{N} \left( s(r-1) \deg^- u_j^{m_j} \right) + s\lfloor m_j/r \rfloor \deg^- u_j \]
\[ = s(r-1) \deg^- a + S. \]

This establishes (2.13).

Because \( \dim(u_j^{m_j}F^-/u_j^{n_j}F^-) = s \varepsilon_j \deg^- u_j \), and from (2.16), we have
\[ \dim \frac{F^-}{[a, F^-] + u_j^{n_j}F^-} \leq \dim \frac{F^-}{[a, F^-] + u_j^{m_j}F^-} + s \varepsilon_j \deg^- u_j \]
\[ = \dim \frac{F^-}{u_j^{m_j}F^- + a(F^-)^r} + s \varepsilon_j \deg^- u_j \]
\[ = s(r-1) \deg^- u_j^{m_j} + s \lfloor m_j/r \rfloor \deg^- u_j + s \varepsilon_j \deg^- u_j, \]
so
\[ \dim \frac{F^-}{[a, F^-]} \leq \sum_{j=1}^{N} \left( s(r-1) \deg^- u_j^{m_j} + s \lfloor m_j/r \rfloor \deg^- u_j + s \varepsilon_j \deg^- u_j \right) \]
\[ = s(r-1) \deg^- a + S + s \deg^- b^{Q/r} \]
\[ \leq s(r-1) \deg^- a + S + sr^2(k+1)Q/r. \]

This establishes (2.14).

2.17. Lemma. For any \( a \in F^- \) and any \( n \geq 0 \), we have
\[ [a, F^-] + [1, F^-] \subset [a^{rn}, F^-] + [1, F^-]. \]

Proof. For any \( v \in F^- \), we have
\[ [v, a] = v^r a - va^r \]
\[ = v^r a - (v^2 a^r - v a^r^2) - (v^r a^r^2 - v^r a^r) - va^r \]
\[ = [v^r a, 1] + [v a^r, 1] + [v a^r, 1] \]
\[ \subset [1, F^-] + [a^r, F^-]. \]

Then the proof is completed by induction on \( n \).

2.18. Proposition. There is some \( N \in \mathbb{N} \) (depending only on the codimensions of \( V_1 \) and \( V_2 \), not on the choice of \( V_1, V_2, \lambda^*, \) or \( \lambda_r \)), such that \( \deg^- \lambda^*(1) \leq N \).

Proof. Let \( k \) be the codimension of \( V_1 \). Choose a power \( Q > 1 \) of \( r \) so large that \( \lambda^*(1) \) is \( Q \)-separable. Then Corollary 2.10 implies \( \lambda^*((F^-)^Q \cap V_1) = \lambda^*(1)(F^-)^Q \cap V_2 \).

Choose \( c \in F^- \setminus F_q \), such that \( c^Q \in V_1 \) and \( \deg^- c \leq r + 1 \). We have
\[ [(F^-)^Q \cap V_1, V_1] \supset [1, V_1] + [c^Q, V_1] \]
\[ \approx [1, F^-] + [c^Q, F^-] \]
\[ \supset [1, F^-] + [c^r, F^-] \]
(see 2.17)
\[ \supset (c^r - c)F^- \]
(proof of (2.11)).
So \([F^{-}]Q \cap V_{1}, V_{i}]\) has small codimension in \([V_{1}, V_{1}]\). Therefore \([\lambda^{*}(1)(F^{-})Q \cap V_{2}, V_{2}] = \lambda_{*}[F^{-}]Q \cap V_{1}, V_{1}]\) must have small codimension in \([V_{2}, V_{2}]\), so \(\deg^{-} \lambda^{*}(1)\) must be small, as desired.

2.19. Corollary. There is some \(N \in \mathbb{N}\) (depending only on the codimensions of \(V_{1}\) and \(V_{2}\), not on the choice of \(V_{1}\), \(V_{2}\), \(\lambda^{*}\), or \(\lambda_{*}\)), such that, for every power \(Q > 1\) of \(r\) and every \(Q\)-separable element \(a\) of \(V_{1}\), we have \(\deg^{-} \lambda^{*}(a) - \deg^{-} a' \leq QN\), where \(a'\) is the \(Q\)-separable element of \(\lambda^{*}(a)F^{Q}\).

Proof. Apply Proposition 2.18 to the map \(\mu^{*}\) of Lemma 2.8.

2.20. Proposition. There is a power \(Q > 1\) of \(r\), and some \(d > 0\), such that, for every \(v \in V_{i}\) with \(\deg^{-} v > d\), there are \(Q\)-separable elements \(v_{1}, \ldots, v_{m}\) of \(V_{i}\), such that \(v = v_{1} + \cdots + v_{m}\) and \(\deg^{-} v_{j} \leq \deg^{-} v\), for \(j = 1, \ldots, m\).

Proof. Let \(k\) be the codimension of \(V_{i}\) in \(F^{-}\), and choose \(Q > k + 4\) so large that, for every \(m \geq Q\), the subspace \(V_{i}\) contains elements of degree \(m\) whose leading coefficients span \(F_{q}\). For any element of \(V_{i}\) of degree \(m\), we show that there is a \(Q\)-separable element of \(V_{i}\) of degree \(m\) with the same leading coefficient.

Let \(a\) be the leading coefficient of some element of \(V_{i}\) of degree \(m\). Then \(V_{i}\) contains exactly \(r^{m-k}\) elements of degree \(m\) with leading coefficient \(a\).

On the other hand, if \(a\) is an element of \(F^{-}\) that is of degree \(m\) and is not \(Q\)-separable, then \(a\) must be of the form \(a = xQy\), where \(x\) is an element of \(F^{-}\) of some degree \(j\), and \(y\) is an element of \(F^{-}\) of degree \(m - Qj\). Thus, the number of such elements \(a\) of degree \(m\) is no more than

\[
\sum_{j=1}^{\infty} q^{j+1} q^{m-Qj+1} = q^{m+2} \sum_{j=1}^{\infty} q^{j(1-Q)} = \frac{q^{m+2}}{q^{Q-1} - 1} \leq q^{m+2} < Q^{m-Q+4} < \frac{Q^{m}}{r^{k}}.
\]

Therefore, not every element of \(V_{i}\) of degree \(m\) whose leading coefficient is \(a\) can be such an element \(a\), so \(V_{i}\) has a \(Q\)-separable element of degree \(m\) with leading term \(a\), as desired.

2.21. Corollary. For each \(b \in F^{-}\), there exists \(N \in \mathbb{N}\), such that, for every \(a \in b(F^{-})^{r} \cap V_{1}\), we have \(\left| \deg^{-} \lambda^{*}(a) - \deg^{-} a \right| \leq N\).

Proof. By symmetry, it suffices to show \(\deg^{-} \lambda^{*}(a) \leq \deg^{-} a + N\). We may assume \(b\) is \(r\)-separable. By combining Proposition 2.20 with Lemma 2.8, we may choose a power \(Q > 1\) of \(r\), such that each element of \(b(F^{-})^{r}\) is a sum of \(Q\)-separable elements of \(b(F^{-})^{r}\) of smaller degree. Thus, we may assume \(a\) is \(Q\)-separable (and our bound \(N\) may depend on \(Q\)).

Define \(S\) as in the statement of Proposition 2.12, and let \(k_{i}\) be the codimension of \(V_{i}\). Because \(a \in b(F^{-})^{r}\) and \(b\) is \(r\)-separable, we have \(S = s(\deg^{-} a - \deg^{-} b)/r\), so Proposition 2.12 implies

\[
\left| \dim \frac{F^{-}}{a(F^{-})^{r} \cap V_{1}, V_{1}] - s(r - 1 + \frac{1}{r}) \deg^{-} a} \right| \leq \frac{s \deg^{-} b}{r} + (sr(k_{1} + 1)Q + 3k_{1})
\]

is bounded. Similarly, letting \(a'\) be the \(Q\)-separable element of \(\lambda^{*}(a)F^{Q}\), and \(b'\) be the \(r\)-separable element of \(\lambda^{*}(b)F^{r}\), we know that

\[
\left| \dim \frac{F^{-}}{a'(F^{-})^{r} \cap V_{2}, V_{2}] - s(r - 1 + \frac{1}{r}) \deg^{-} a'} \right| \leq \frac{s \deg^{-} b'}{r} + (sr(k_{2} + 1)Q + 3k_{2})
\]
is bounded. Then, because
\[\dim \frac{[V_1, V_i]}{[\alpha(F^-)^Q \cap V_1, V_i]} = \dim \frac{[V_2, V_j]}{[\alpha(F^-)^Q \cap V_2, V_j]},\]
we conclude that \(|\deg^- a' - \deg^- a|\) is bounded. Corollary 2.19 asserts that \(|\deg^- \lambda^*(a) - \deg^- a'|\) is also bounded.

2.22. Corollary. For each \(b \in F^-\), there is a power \(Q\) of \(r\), such that, for every \(a_1, a_2 \in b(F^-)^Q \cap V_i\), we have \(\deg^- \lambda^*(a_1) - \deg^- \lambda^*(a_2) = \deg^- a_1 - \deg^- a_2\).

Proof. Choose \(N\) as in Corollary 2.21. Now choose \(Q > 2N\). Because
\[\deg^- \lambda^*(a_1) \equiv \deg^- \lambda^*(a_2) \pmod{Q}\]
and \(\deg^- a_1 \equiv \deg^- a_2 \pmod{Q}\), we have
\[\deg^- \lambda^*(a_1) - \deg^- a_1 \equiv \deg^- \lambda^*(a_2) - \deg^- a_2 \pmod{Q},\]
so, from the choice of \(N\) and \(Q\), we conclude that \(\deg^- \lambda^*(a_1) - \deg^- a_1 = \deg^- \lambda^*(a_2) - \deg^- a_2\).

2.23. Proposition. There is a constant \(C > 0\), such that, for all \(a_1, a_2 \in V_i\), and every power \(Q\) of \(r\), we have
\[s \deg^- \gcd(a_1, a_2) - C \leq \dim \frac{[V_1, V_i]}{[a_1(F^-)^Q \cap V_i, V_i]} + [a_2(F^-)^Q \cap V_i, V_i] \leq C \deg^- \gcd(a_1, a_2) + C.\]

Proof. Because
\[[a_1(F^-)^Q \cap V_i, V_i] + [a_2(F^-)^Q \cap V_i, V_i] \subset \gcd(a_1, a_2) F^-\]
the left-hand inequality is obvious.

Let \(c = \gcd(a_1, a_2)\) and let \(k\) be the codimension of \(V_i\). Then Lemma 2.11 implies that there exist nonzero \(b_1, b_2 \in F^-\) with \(\deg^- b_i \leq r^2(k + 1)\), such that \([a_j(F^-)^Q \cap V_i, V_i]\) contains a codimension-2k subspace of \(a_j b_j^{Q/r} F^-\) for \(j = 1, 2\). Then, letting \(b = b_1 b_2\), we have \(\deg^- b \leq 2r^2(k + 1)\), and \([a_1(F^-)^Q \cap V_i, V_i] + [a_2(F^-)^Q \cap V_i, V_i]\) contains a codimension-4k subspace of the ideal \(I = c^r b^{Q/r} F^-\). Thus, it suffices to show that the codimension of \([a_1, F^-] + [a_2, F^-] + I\) in \(F^-\) is bounded above by \(s(r + 2) \deg^- c + s \deg^- b\).

Let \(u_1, \ldots, u_N\) be the irreducible factors of \(c^r b^{Q/r}\), so we may write \(c = u_1^{m_1} \cdots u_N^{m_N}, b = u_1^{e_1} \cdots u_N^{e_N}\), and \(c^r b^{Q/r} = u_1^{n_1} \cdots u_N^{n_N}\), where \(n_j = rm_j + e_j Q/r\). From the Chinese Remainder Theorem, we have \(F^- / I \cong \bigoplus_{j=1}^N F^- / u_j^{n_j} F^-\), so we may calculate the codimension in each factor, and then add them up.

Fix \(j\). By interchanging \(a_1\) and \(a_2\) if necessary, we may assume that \(u_j^{m_j+1} \nmid a_1\). It suffices to show that
\[\dim \frac{F^-}{[a_1, F^-] + u_j^{n_j} F^-} \leq s((r + 2)m_j + e_j) \deg^- u_j;\]
thus (because \(m_j + e_j \geq 1\), we need only show that \(u_j^{(r+1)m_j+1} F^- \subset [a_1, F^-] + u_j^{n_j} F^-\). To show this, let \(M\) be minimal, such that \(u_j^{M+1} F^- \subset [a, F^-] + u_j^{n_j} F^-\). (Obviously, we have
$M < n_j$; we wish to show $M \leq (r + 1)m_j$. Suppose $M > (r + 1)m_j$. (This will lead to a contradiction.) We have $m_j + r(M - rm_j) > M$, so

$$u_j^M F^- = u_j^{rm_j}u_j^{M-rm_j} F^- \subset u_j^{M-rm_j} F^- + u_j F^-$$

$$\subset [a_1, u_j^{M-rm_j} F^-] + a_1 u_j^{r(M-rm_j)} F^- + u_j F^-$$

$$\subset [a_1, F^-] + u_j^{m_j+r(M-rm_j)} F^- + u_j F^-$$

$$\subset [a_1, F^-] + u_j^{M+1} F^- + u_j F^-$$

$$= [a_1, F^-] + u_j F^-.$$

This contradicts the minimality of $M$. \hfill \Box

2.24. Corollary. There is a constant $C > 0$, such that, for all $a, b \in V_1$, we have

$$\frac{\deg^- \gcd(a, b)}{C} - C \leq \deg^- \gcd(\lambda^*(a), \lambda^*(b)) \leq C \deg^- \gcd(a, b) + C.$$

2.25. Proposition. There exist $b \in V_1$, $b' \in V_2$, $\alpha, \beta \in \mathbb{F}_q$, and some $Q$ that is a power of both $r$ and $q$, such that, for all $bf(t^{-Q}) \in b(\mathbb{F}_p[t^{-1}])^Q \cap V_1$, we have $\lambda^*(bf(t^{-Q})) = b' f(at^{-Q} + \beta)$.

Proof. Corollary 2.22 shows that, by replacing $V_1$ with some $(F^-)^Q \cap V_1$ (using Lemma 2.8), we may assume $\deg^- \lambda^*(a) = \deg^- a$, for every $a \in V_1$.

The terms $-C$ and $+C$ in Corollary 2.24 are significant only when $\deg^- \gcd(a, b)$ is small. On the other hand, $\deg^- \gcd(a, b)$ can never be small (and nonzero) if $a, b \in (F^-)^Q$ for some large $Q$. Thus, by replacing $V_1$ with some $(F^-)^Q \cap V_1$ (using Lemma 2.8), we may assume

$$\frac{1}{C} \deg^- \gcd(a, b) \leq \deg^- \gcd(\lambda^*(a), \lambda^*(b)) \leq C \deg^- \gcd(a, b),$$

for every $a, b \in V_1$. In particular, $\gcd(a, b) = 1$ if and only if $\gcd(\lambda^*(a), \lambda^*(b)) = 1$.

Let $k$ be the codimension of $V_1$ in $F^-$. Choose some $N > 4\left(C(C + k)p^{C+k+1} + k + 1\right)$.

Choose a power $Q$ of $r$, such that $Q > Nk$. There is some nonzero $b \in \mathbb{F}_p[t^{-1}]$, with $\deg^- b \leq Nk$, such that

$$b(\mathbb{F}_p + t^{-Q}\mathbb{F}_p + t^{-2Q}\mathbb{F}_p + \cdots + t^{-NQ}\mathbb{F}_p) \subset V_1.$$

Because $\deg^- b < Q$, we know that $b$ is $Q$-separable, so, by applying Lemma 2.8 to $b(F^-)^Q \cap V_1$, we may assume

$$\mathbb{F}_p + t^{-1}\mathbb{F}_p + t^{-2}\mathbb{F}_p + \cdots + t^{-N}\mathbb{F}_p \subset V_1.$$

By composing $\lambda^*$ with a map of the form $f(t^{-1}) \mapsto \gamma f(\alpha t^{-1} + \beta)$, for some $\alpha, \beta, \gamma \in \mathbb{F}_q$ (with $\alpha \gamma \neq 0$), we may assume $\lambda^*(1) = 1$ and $\lambda^*(t^{-1}) = t^{-1}$, so $\lambda^*_{|_{\mathbb{F}_p + \mathbb{F}_p t^{-1}}} = \text{Id}$.

Let $V_1^{F_0} = V_1 \cap \mathbb{F}_p[t^{-1}]$. It suffices to show $\lambda^*(a) = a$ for every $a \in V_1^{F_0}$.

Suppose $\lambda^*_{|_{V_1^{F_0}}} \neq \text{Id}$, and let

$$m = \min \left\{ \deg^- a \mid \lambda^*(a) \neq a, a \in V_1^{F_0} \right\} \geq 2.$$
Let $\Delta = \lambda^*(a) - a$, for any monic $a \in V_1^{F_p}$ with $\deg^- a = m$. (Note that the definition of $m$ implies that $\Delta$ is independent of the choice of $a$.)

**Case 1.** Assume $m \leq N$. Let $u$ be any irreducible element of $\mathbb{F}_p[t^{-1}]$ with $\deg^- u \leq m - 1$.

We claim that $V_1^{F_p}$ contains a (monic) element $a$, such that $\deg^- a = m$ and $u|a$. To see this, let $b \in V_1^{F_p}$ with $\deg^- b = m$. There is some $a \in F^-$, such that $u|a$ and $\deg^- (a - b) < \deg^- b$. Because $\deg^- b \leq N$, this implies $a - b \in V_1^{F_p}$, so $a \in V_1^{F_p}$.

Because $u|a$ (and $\lambda^*(u) = u$), we know $\gcd(u, \lambda^*(a)) \neq 1$. Because $u$ is irreducible, we conclude that $u|\lambda^*(a)$. We also have $u|a$, so this implies $u|(|\lambda^*(a) - a)$ = $\Delta$.

Thus, we see that $\Delta$ is divisible by every irreducible polynomial over $\mathbb{F}_p$ of degree $\leq m - 1$, so $\Delta$ is divisible by $t^{-p^{m-1}} - 1$. Therefore $\deg^- \Delta \geq p^{m-1}$. However, we also know $\deg^- \Delta \leq \deg^- a = m$ (and all nonzero polynomials in $\mathbb{F}_2[t^{-1}]$ are monic, so $\deg^- \Delta \leq m$ if $p = 2$). This is a contradiction.

**Case 2.** Assume $m > N$. Choose some monic $a \in V_1^{F_p}$, with $\deg^- a = m$. By subtracting a polynomial of degree $\leq k$, we may assume $t^{-(k+1)}a$; let $u = a/t^{-(k+1)}$. There is some nonzero $x \in \mathbb{F}_p[t^{-1}]$ with $\deg^- x \leq k$, such that $ux \in V_1^{F_p}$. (Note that $\deg^- ux \leq k + \deg^- u < m$.)

Let $$C = \{ c \in \mathbb{F}_p[t^{-1}] \setminus \{0\} \mid \deg^- c < C \},$$ and $$b = \prod_{\deg^- c \leq C+k} c,$$ so $\deg^- b < (C + k)p^{C+k+1}$. Now, for each $c \in C$, let $$u_c = (u + c)x$$ and $$u'_c = \frac{u_c}{\gcd(u_c, b)}.$$

For $c \in C$, we have $\{cx, ct^{-(k+1)}\} \subset V_1^{F_p}$, so $u_c \in V_1^{F_p}$ and $a + ct^{-(k+1)} \in V_1^{F_p}$. Also, because $a = ut^{-(k+1)}$, we have $u_c (a + t^{-(k+1)})$. Then, since $\lambda^*(u + c) = u + c$, we have $\deg^- \gcd(\lambda^*(a + ct^{-(k+1)}), u + c) \geq (\deg^- (u + c))/C$, so

$$\begin{align*}
\deg^- \gcd(\Delta, u'_c) &\geq \deg^- \gcd(\Delta, u_c) - \deg^- b \\
&= \deg^- \gcd(\lambda^*(a + ct^{-(k+1)}), u_c) - \deg^- b \\
&\geq \frac{\deg^- (u + c)}{C} - \deg^- b \\
&\geq \frac{m - k - 1}{C} - (C + k)p^{C+k+1} \\
&\geq \frac{m}{4C}.
\end{align*}$$

Also, for $c_1, c_2 \in C$, we have

$$\deg^- \gcd(u_{c_1}, u_{c_2}) \leq \deg^- (u_{c_1} - u_{c_2}) = \deg^- ((c_1 - c_2)x) \leq C + k,$$

so we see that $\gcd(u'_{c_1}, u'_{c_2}) = 1$ whenever $c_1 \neq c_2$. Thus, we conclude that $$\deg^- \Delta \geq p^C \frac{m}{4C} > m.$$ This is a contradiction. \qed
Proof of Theorem 2.4. Choose $b, b', \alpha, \beta, Q$ as in Proposition 2.23. By replacing $\lambda^*$ with $x \mapsto (b')^{-1} \lambda^*(bx)$ and replacing $\lambda_*$ with $x \mapsto (b')^{-t+1} \lambda^*(b'^{-1}x)$, we may assume $b = b' = 1$. Then, by composing $\lambda^*$ and $\lambda_*$ with $t^{-1} \mapsto \alpha^{-1}(t^{-1} - \beta)$, we may assume $\alpha = 1$ and $\beta = 0$. Thus,

\[ \lambda^*(a) = a \text{ for all } a \in \mathbb{F}_p[t^{-Q}] \cap V_1. \]

We wish to show that there is some $\sigma \in \text{Gal}(\mathbb{F}_q/\mathbb{F}_p)$, such that, for every $a \in V_1$, we have $\lambda^*(a) = \sigma(a)$.

Step 1. For each $a \in V_1$, there is some $\sigma \in \text{Gal}(\mathbb{F}_q/\mathbb{F}_p)$, such that $\lambda^*(a) = \sigma(a)$. Fix $a \in V_1$. Choose $C$ as in Corollary 2.24, let $k$ be the codimension of $V_1$, and choose $b \in \mathbb{F}_p[t^{-Q}] \cap V_1$, such that

\[ \frac{\deg b}{C} - C > Q \left( s \left( \deg a + \deg \lambda^*(a) \right) + k \right). \]

Let

\[ c = \prod_{\sigma \in \text{Gal}(\mathbb{F}_q/\mathbb{F}_p)} (b - \sigma(a)) \in \mathbb{F}_p[t^{-1}], \]

and choose some nonzero $x \in \mathbb{F}_p[t^{-1}]$, such that $(cx)^Q \in V_1$ and $\deg x \leq k$.

We have

\[ Q \left( \deg \gcd(b - \lambda^*(a), c) + k \right) \geq \deg \gcd(b - \lambda^*(a), (cx)^Q) \]

\[ = \deg \gcd(\lambda^*(b - a), \lambda^*((cx)^Q)) \quad \text{(see 2.26)} \]

\[ \geq \frac{\deg \gcd(b - a, (cx)^Q)}{C} - C \quad \text{(choice of $C$)} \]

\[ = \frac{(\deg b)}{C} - C \quad \text{($(b - a)|c$)} \]

\[ > Q \left( s \left( \deg a + \deg \lambda^*(a) \right) + k \right) \quad \text{(choice of $b$)}. \]

Thus, from the definition of $c$, we conclude that there is some $\sigma \in \text{Gal}(\mathbb{F}_q/\mathbb{F}_p)$, such that

\[ \deg \gcd(b - \lambda^*(a), b - \sigma(a)) > \deg a + \deg \lambda^*(a) \]

\[ = \deg \sigma(a) + \deg \lambda^*(a) \]

\[ \geq \deg (\sigma(a) - \lambda^*(a)) \]

\[ = \deg ((b - \lambda^*(a)) - (b - \sigma(a))). \]

Therefore $(b - \lambda^*(a)) - (b - \sigma(a)) = 0$, so $\lambda^*(a) = \sigma(a)$.

Step 2. There is some $\sigma \in \text{Gal}(\mathbb{F}_q/\mathbb{F}_p)$, such that $\lambda^*(a) = \sigma(a)$ for every $a \in V_1$. For $v \in F^-$, let $\overline{v}$ denote the leading coefficient of $v$. Choose $b \in V_1$, such that $\overline{b}$ generates $\mathbb{F}_q$, that is, $\mathbb{F}_q = \mathbb{F}_p[\overline{b}]$. From Step 4, we know there is some $\sigma \in \text{Gal}(\mathbb{F}_q/\mathbb{F}_p)$, such that $\lambda^*(b) = \sigma(b)$. We show $\lambda^*(a) = \sigma(a)$ for every $a \in V_1$.

Given $a \in V_1$, choose some $c \in V_1$, such that $\overline{c}$ generates $\mathbb{F}_q$, and such that $\deg c > \max\{\deg a, \deg b\}$. From Step 4, there exist $\sigma', \sigma'' \in \text{Gal}(\mathbb{F}_q/\mathbb{F}_p)$, such that $\lambda^*(c) = \sigma'(c)$ and $\lambda^*(a+c) = \sigma''(a+c)$. Because $\deg c > \deg a$, we have $\overline{c} = \overline{a+c}$ and $\overline{\lambda^*(a+c)} = \overline{\lambda^*(c)}$. Thus, we have

\[ \sigma''(\overline{c}) = \sigma''(\overline{a+c}) = \overline{\lambda^*(a+c)} = \overline{\lambda^*(a)} + \overline{\lambda^*(c)} = \overline{\lambda^*(c)} = \sigma'(\overline{c}). \]
Because $\overline{\tau}$ generates $\mathbb{F}_q$, we conclude that $\sigma'' = \sigma'$. Therefore

$$\lambda^*(a) = \lambda^*(a + c) - \lambda^*(c) = \sigma''(a + c) - \sigma'(c) = \sigma'(a + c) - \sigma'(c) = \sigma'(a).$$

Similarly, we have $\lambda^*(b) = \sigma'(b)$. Because we also have $\lambda^*(b) = \sigma(b)$, and $\overline{b}$ generates $\mathbb{F}_q$, we conclude that $\sigma' = \sigma$.

Therefore $\lambda^*(a) = \sigma'(a) = \sigma(a)$, as desired. \qed

3. Arithmetic subgroups of Heisenberg groups

**Proof of Theorem 3.15.** Let $\Gamma_1$, $\Gamma_2$ be finite-index subgroups of $\Gamma$, such that $\lambda: \Gamma_1 \to \Gamma_2$ is an isomorphism. Let $\Gamma_i$, $i = 1, 2$ be the image of $\Gamma_i$ in $F^{2m}$ under the projection $H \to F^{2m}$ with kernel $Z$. By passing to a finite-index subgroup, we can assume that $\Gamma_i \subset (F^-)^{2m}$. Since $Z(\Gamma_i) = \Gamma_i \cap Z$, we can identify $\Gamma_i$ with $\Gamma_i / Z(\Gamma_i)$, so $\lambda$ induces an isomorphism $\overline{\lambda}: \Gamma_1 \to \Gamma_2$.

**Step 1.** We can assume $\overline{\lambda}(av) = a\overline{\lambda}(v)$ for all $a \in F^-$ and $v \in \Gamma_1$, such that $av \in \Gamma_1$. For each nonzero $v \in \Gamma_1$, let $A_v = \{ a \in F^- | av \in \Gamma_1 \}$. Note that $A_v$ is a finite-index subgroup of $F^-$. For $g, h \in \Gamma_i$, we have $F\overline{g} = F\overline{h}$ if and only if $C_{\Gamma_i}(g) = C_{\Gamma_i}(h)$, so $\overline{\lambda}(A_v) = F\overline{\lambda}(v) \cap \Gamma_2$. Thus, we can define a function $\tau_v: A_v \to F$ by $\tau_v(a)\overline{\lambda}(v) = \overline{\lambda}(av)$. Let $w \in \Gamma_1$ be such that $[v, w] \neq 0$, and let $a \in A_v \cap A_w$. Then

$$\tau_v(a)[\overline{\lambda}(v), \overline{\lambda}(w)] = [\overline{\lambda}(av), \overline{\lambda}(w)]$$

$$= \lambda([av, w])$$

$$= \lambda([v, aw])$$

$$= [\overline{\lambda}(v), \overline{\lambda}(aw)]$$

$$= \tau_w(a)[\overline{\lambda}(v), \overline{\lambda}(w)].$$

Thus

(3.1) \hspace{1cm} $\tau_v = \tau_w$ on $A_v \cap A_w$ whenever $[v, w] \neq 0$.

For any nonzero $v, w \in \Gamma_1$ and any $a \in A_v \cap A_w$, since $\Gamma_1 \cap a^{-1}\Gamma_1$ is of finite index in $\Gamma_1$, we can find $u \in \Gamma_1$ so that $a \in A_u$, $[u, v] \neq 0$, and $[u, w] \neq 0$. Then it follows from Equation (3.1) that $\tau_v(a) = \tau_u(a) = \tau_w(a)$. Since $a \in A_v \cap A_w$ was arbitrary, we conclude that

(3.2) \hspace{1cm} $\tau_v = \tau_w$ on $A_v \cap A_w$, for all nonzero $v, w \in \Gamma_1$.

For an arbitrary $a \in F^-$ we can always find $w \in \Gamma_1$ so that $a \in A_w$, thus we can define a function $\tau: F^- \to F$, by $\tau(a) = \tau_w(a)$. Equation (3.2) implies that $\tau$ is well defined. Note that $\tau(1) = 1$. Since

$$\tau(a)\tau(b)[\overline{\lambda}(u), \overline{\lambda}(v)] = [\overline{\lambda}(au), \overline{\lambda}(bv)]$$

$$= \lambda([au, bv])$$

$$= \lambda([abu, v])$$

$$= [\overline{\lambda}(abu), \overline{\lambda}(v)]$$

$$= \tau(ab)[\overline{\lambda}(u), \overline{\lambda}(v)];$$

we have $\tau(a)\tau(b) = \tau(ab)$. Since $\tau$ is also an additive homomorphism, and $\overline{\lambda}$ is an isomorphism, we conclude that $\tau$ is a ring automorphism of $F^-$. Therefore $\tau(f(t^{-1})) = -ta$.
\( \sigma(f(at^{-1} + \beta)) \) for \( f(t^{-1}) \in F^- \), where \( \sigma \in \text{Gal}(F_q/F_p) \), \( \alpha \in F_q \setminus \{0\} \), and \( \beta \in F_q \). Hence, by composing with the standard automorphism \( T_{\text{id}, \tau^{-1}} \), we obtain the claim.

**Step 2.** We may assume that \( \lambda|_{Z(\Gamma_1)} \) is the identity map. Let \( v_1, w_1, v_2, w_2 \in \Gamma \) with \([v_i, w_i] \neq 0\). There is a finite-index subgroup \( A \) of \( F^- \), such that \( av_i \in \Gamma \), for every \( a \in A \) and \( i = 1, 2 \). Then, for all \( a \in A \), Step 1 implies that

\[
\frac{\lambda(a[v_i, w_i])}{a[v_i, w_i]} = \frac{\lambda([v_i, w_i])}{[v_i, w_i]}
\]

Thus, choosing \( a_1, a_2 \in A \), such that \( a_1[v_1, w_1] = a_2[v_2, w_2] \), we have

\[
\frac{\lambda([v_1, w_1])}{[v_1, w_1]} = \frac{\lambda(a_1[v_1, w_1])}{a_1[v_1, w_1]} = \frac{\lambda(a_2[v_2, w_2])}{a_2[v_2, w_2]} = \frac{\lambda([v_2, w_2])}{[v_2, w_2]}
\]

We conclude that \( \lambda(z)/z = C \) is constant, for \( z \in [\Gamma_1, \Gamma_1] \setminus \{0\} \).

By composing with a standard automorphism \( \phi_{T, \text{id}} \), such that \( c_T = 1/C \), we may assume that \( C = 1 \), so \( \lambda|_{[\Gamma_1, \Gamma_1]} = \text{Id} \). Then, by replacing \( \Gamma_1 \) with a finite-index subgroup \( \Gamma'_1 \), such that \( \Gamma'_1 \cap Z \subset [\Gamma_1, \Gamma_1] \), we may assume \( \lambda|_{Z(\Gamma_1)} = \text{Id} \).

**Step 3.** \( \lambda : \Gamma_1 \to \Gamma_1 \) can be extended to a conformally symplectic map \( \overline{\lambda} : F^{2m} \to F^{2m} \), with \( c_{\overline{\lambda}} = 1 \). By Step 1, \( \overline{\lambda}(av) = a\overline{\lambda}(v) \) for all \( a \in F^- \) and \( v \in \Gamma_1 \) such that \( av \in \Gamma_1 \). Because \( \Gamma_1 \) is commensurable with \( (F^-)^{2m} \), this implies that \( \overline{\lambda} \) extends (uniquely) to an \( F \)-linear map \( \overline{\lambda} : F^{2m} \to F^{2m} \). For any \( v, w \in \Gamma_1 \), we have

\[
[\overline{\lambda}(v), \overline{\lambda}(w)] = [\overline{\lambda}(v), \overline{\lambda}(w)] = \lambda([v, w]) = [v, w],
\]

by Step 2. Because \( \Gamma_1 \) spans \( F^{2m} \), this implies that \( \overline{\lambda} \) is conformally symplectic, with \( c_{\overline{\lambda}} = 1 \).

**Step 4.** Completion of the proof. Define \( \hat{\lambda} : H \to H \) by \( \hat{\lambda}(v, z) = (\overline{\lambda}(v), z) \). From Step 3, we see that \( \hat{\lambda} \) is an automorphism. Denote by \( \zeta : \Gamma_1 \to Z(H) \) the map defined by \( \zeta(\gamma) = \hat{\lambda}(\gamma)^{-1}\lambda(\gamma) \). Then \( \zeta \) is a homomorphism and \( \lambda(\gamma) = \zeta(\gamma) \hat{\lambda}(\gamma) \), for \( \gamma \in \Gamma_1 \).

**Proof of Corollary 1.16.** From Theorem 1.13, we may assume there exist

- a standard automorphism \( \phi_{T, \tau} \) of \( H \); and
- a homomorphism \( \zeta : \Gamma_1 \to Z(H) \),

such that \( \lambda(\gamma) = \phi_{T, \tau}(\gamma) \zeta(\gamma) \) for all \( \gamma \in \Gamma_1 \). By Lemma 2.1, there exists a finite-index open subgroup \( \hat{H} \) of \( H \), containing \([H, H]\), such that \( \zeta \) extends to \( \hat{\zeta} : \hat{H} \to Z(H) \). Let \( H' = \phi_{T, \tau}(\hat{H}) \).

Define \( \hat{\lambda} : \hat{H} \to H \) by \( \hat{\lambda}(h) = \phi_{T, \tau}(h) \hat{\zeta}(h) \), so that \( \hat{\lambda} \) is a continuous homomorphism virtually extending \( \lambda \). Because \( \hat{\zeta} \) is trivial on \([H, H]\), we have \( \hat{\lambda}|_{[H, H]} = \phi_{T, \tau}|_{[H, H]} \), so \( \hat{\lambda}|_{[H, H]} \) is an automorphism. Because \( \hat{\zeta}(\hat{H}) \subset Z(H) = [H, H] \), we see that \( \hat{\lambda} \) induces an isomorphism \( \hat{H}/[H, H] \to H'/[H, H] \). So \( \hat{\lambda} : \hat{H} \to H' \) is an isomorphism.
3.3. Definition. Let

\[
H_p = \left\{ \begin{pmatrix} 1 & x_1^p & x_2^p & \cdots & x_m^p & z \\ 1 & 0 & y_2^p & \vdots \\ 0 & \ddots & \ddots \\ 0 & 1 & y_m^p \\ \end{pmatrix} \mid x_1, \ldots, x_m \in F, \quad y_1, \ldots, y_m, z \in F \right\}.
\]

3.4. Remark. \(H_p\) could also be described as the \(F\)-points of the group obtained from \(H\) by applying the isogeny of factoring by the Lie algebra of \(Z(H)\) [Bor, Prop. V.17.4, p. 215].

3.5. Corollary. Any arithmetic lattice in \(H_p\) is automorphism rigid.

Proof. Let \(\lambda_p : \Gamma_1 \to \Gamma_2\) be an isomorphism, where \(\Gamma_1\) and \(\Gamma_2\) are arithmetic lattices in \(H_p\). Define

\[
H'_p = \left\{ \begin{pmatrix} 1 & x_1^p & x_2^p & \cdots & x_m^p & z^p \\ 1 & 0 & y_2^p & \vdots \\ 0 & \ddots & \ddots \\ 0 & 1 & y_m^p \\ \end{pmatrix} \mid x_1, \ldots, x_m \in F, \quad y_1, \ldots, y_m, z \in F \right\}
\]

and

\[
A = \left\{ \begin{pmatrix} 1 & 0 & 0 & \cdots & 0 \\ 1 & 0 & 0 & \vdots \\ 0 & \ddots & \ddots \\ 0 & 1 & 0 \\ \end{pmatrix} \right\} \quad z = \sum_{\substack{\alpha_i t^{-i} \mid 0 \leq i \leq n \quad i \neq 0 \pmod{p} \\ n \in \mathbb{N}, \quad \alpha_i \in \mathbb{F}_q}}
\]

Then \(H_p = H'_p \times A\). By passing to a finite-index subgroup we may assume that \(\Gamma_1 = \Gamma_1' \times \Gamma_{1,A}\), where \(\Gamma_1' = \Gamma_1 \cap H'_p\) and \(\Gamma_{1,A} = \Gamma_1 \cap A\). Let \(\Omega = \lambda_p(\Gamma_{1,A}) \subset Z(\Gamma_2)\) and \(\Gamma'_2 = \lambda_p(\Gamma'_1)\). Then, by passing to a finite-index subgroup, we may assume \(\Omega \cap H'_p = e\) and \(\Gamma'_2 \cap A = e\).

Step 1. Let \(\pi_A : Z(H_p) \to A\) denote the projection with kernel \(H'_p\). Then \(\pi_A \circ \lambda_p : \Gamma_{1,A} \to \pi_A(\Omega)\) virtually extends to a virtual automorphism \(\Psi\) of \(A\). It is easy to see that \(\pi_A(Z(\Gamma_2))\) is closed in \(A\) and hence is a lattice. Because \(Z(\Gamma'_1) \times \Gamma_{1,A}\) has finite index in \(Z(\Gamma_1)\), we know \(\lambda_p(Z(\Gamma'_1)) \times \lambda_p(\Gamma_{1,A})\) has finite index in \(Z(\Gamma_2)\). Then, since \([\Gamma'_1, \Gamma'_1]\) has finite index in \(Z(\Gamma'_1)\) and

\[
\lambda_p([\Gamma'_1, \Gamma'_1]) \subset [\Gamma'_2, \Gamma'_2] \subset H'_p = \ker \pi_A
\]

we conclude that \(\pi_A(\Omega) = \pi_A(\lambda_p(\Gamma_{1,A}))\) has finite index in \(\pi_A(Z(\Gamma_2))\). Hence \(\pi_A(\Omega)\) is a lattice in \(A\). By Proposition 1.6, \(\pi_A \circ \lambda_p : \Gamma_{1,A} \to \pi_A(\Omega)\) virtually extends to a virtual automorphism \(\Psi\) of \(A\).

Step 2. Let \(\pi' : H_p \to H'_p\) be the projection with kernel \(A\), and let \(\mu_p = \pi' \circ \lambda_p | \Gamma'_1 : \Gamma'_1 \to \pi'(\Gamma'_2)\). Then \(\mu_p\) virtual extends to a virtual automorphism of \(H'_p\).
We claim that \( \pi'(\Gamma'_2) \) is an arithmetic lattice in \( H'_p \). Because \( \Gamma_1 = \Gamma'_1 \times \Gamma_{1,A} \) and \( \Gamma_{1,A} \subset Z(\Gamma_1) \), we have

\[
\Gamma_2 = \Gamma'_2 \times \Omega \subset \Gamma'_2 Z(H_p).
\]

Then, because \( \Gamma'_2 \subset \Gamma_2 \), we conclude that \( \Gamma'_2 Z(H_p) = \Gamma'_2 Z(H_p) \) is a lattice in \( H_p/Z(H_p) \cong H'_p/Z(H'_p) \). So the image of \( \pi'(\Gamma'_2) \) in \( H'_p/Z(H'_p) \) is a lattice. Also,

\[
\pi'(\Gamma'_2) \cap Z(H'_p) \supset [\Gamma'_2, \Gamma'_2] = [\Gamma_2, \Gamma_2],
\]

so \( \pi'(\Gamma'_2) \cap Z(H'_p) \) is a lattice in \( [H_p, H_p] = Z(H'_p) \). Thus, we conclude that \( \pi'(\Gamma'_2) \) is a lattice in \( H'_p \). Because \( \pi'(\Gamma'_2) \) is contained in the arithmetic lattice \( \pi'(\Gamma_2) \), this implies that \( \pi'(\Gamma'_2) \) is arithmetic.

From the preceding paragraph, we know that \( \mu_p \) is an isomorphism of arithmetic lattices in \( H'_p \). Let \( \text{Fr}: H \to H'_p \) denote the group isomorphism induced by the Frobenius automorphism \( x \to x^p \) of the ground field \( F \). Then there exist arithmetic lattices \( \hat{\Gamma}_1, \hat{\Gamma}_2 \) in \( H \), such that \( \text{Fr}(\hat{\Gamma}_1) = \Gamma'_1 \) and \( \text{Fr}(\hat{\Gamma}_2) = \pi'(\Gamma'_2) \), and an isomorphism \( \lambda = \text{Fr}^{-1} \circ \mu_p \circ \text{Fr}: \hat{\Gamma}_1 \to \hat{\Gamma}_2 \). By Corollary 1.10, we can virtually extend \( \lambda \) to a virtual automorphism \( \Lambda \) of \( H \). Then \( \Lambda'_p = \text{Fr} \circ \Lambda \circ \text{Fr}^{-1} \) is a virtual automorphism of \( H'_p \) virtually extending \( \mu_p \).

Let \( \tilde{\Lambda}_p = \Lambda'_p \times \Psi \), so \( \tilde{\Lambda}_p \) is a virtual automorphism of \( H_p \). We can define a map \( \zeta \) on some finite index subgroup of \( \Gamma_1 \) by \( \zeta(\gamma) = \lambda_p(\gamma) \tilde{\Lambda}_p(\gamma)^{-1} \). By Lemma 2.1, \( \zeta \) virtually extends to \( \hat{\zeta}: H_p \to Z(H_p) \). Then \( \Lambda_p = \tilde{\Lambda}_p \hat{\zeta} \) is a virtual endomorphism of \( H_p \). Since \( \ker(\hat{\zeta}) \supset [H_p, H_p] \), we conclude (much as in the proof of Corollary 1.12) that \( \Lambda_p \) is a virtual automorphism. It is easy to see that it virtually extends \( \lambda_p \).
